Objects worked in jade by prehistoric man are known from many parts of Central and South America as well as from Europe and Asia. A well-known instance is the occurrence of jade ornaments among the lake-dwellings of Switzerland. Until late in last century no nephrite or jadeite was known to occur *in situ* in either Europe or America, and the source of the materials used by the primitive peoples of these two continents was a matter of controversy. Nephrite, however, is now known to occur in Alaska and elsewhere in America, and in the Eastern Alps, Switzerland, Germany, and elsewhere in Europe. It seems likely, however, from the difficulty of locating any extensive European occurrences, that, while some of the artifacts were made of local material, the greater part of the jade, whether in the form of the crude

mineral or as fashioned implements and ornaments, was imported by commerce from the Orient.

See Fischer, *Nephrit und Jadeit* (2d ed. Stuttgart, 1881); and Laufer, *Jade, a Study in Chinese Archeology and Religion* (Field Museum of Natural History, Chicago, 1912).

Jadeite, essentially a metasilicate of sodium and aluminium, is a mineral belonging to the monoclinic division of the pyroxene group. Its colours are various shades of green, greenish-white, and nearly white; sometimes white with spots of bright green. It ranges in texture from massive crystalline to fibrous foliated and finely compact. The hardness is 6·5 to 7, and density 3·3. It is extremely tough. (See JADE.)

Jael. See DEBORAH.

Jaén, a city of Spain, capital of the province of the same name, is picturesquely situated on a tributary of the Guadalquivir, 50 miles N. by W. of Granada. Its old Moorish walls are fast crumbling away. It is the see of a bishop; the cathedral dates from 1532. Population, 33,000. By the Moors the town was called *Jayyenu-l-harrir*, 'Jaén of the Silk,' on account of its silk manufactures, for which, however, it is no longer famous.—The province (area, 5184 sq. m.; population, 592,000), part of Andalusia (q.v.), lies wholly within the basin of the Guadalquivir, and is for the most part mountainous. Conquered by the Moors on their entrance into Spain, Jaén maintained its independence as a Moorish state till 1246, when it fell into the hands of Ferdinand III. of Castile.

Jaffa, or JOPPA (Heb. *Iafō*; in New Testament, *Ioppē*; Arab. *Yāfā*), a town on the sea-coast of Palestine, 53 miles NW. of Jerusalem, of which it was the port in King David's time. Here Perseus rescued Andromeda; hence Jonah sailed for Tarshish; here Peter had his vision. Under Constantine the place, which had been destroyed by Vespasian, became a bishop's see, and, as the great landing-place of the Crusaders, was taken and retaken by Christian and Moslem. In 1799 Napoleon stormed it and massacred his prisoners; in 1832 it was taken by Mehemet Ali, and restored to the Turks by British help. The open roadstead, the ancient walls, the yellow sand-dunes, and the extensive orange gardens are now the chief features of the brown town on its hillock, which possesses many monasteries, and several hospitals and schools. There is a (bad) carriage-way to Jerusalem, and a railway opened in 1892. The population has risen since 1880 from 15,000 to 48,000 (one-half Mohammedan, one-fourth Jewish, one-fourth Christian), while the export of oranges increased very much, largely through the German colony, established in 1869. The exports are oranges and other fruits, oil, sesame, soap, wine, and *objets de piété*.—The Zionist suburb of Tel-Aviv, on the sand-dunes, has grown with great rapidity into a rival city. It has an admirable agricultural research station. Pop. 22,000.

Jaffnapatam, or JAFFNA, a seaport in the extreme north of Ceylon, on an island of the same name, has been peopled by Tamils for more than 2000 years; population, 42,000. A large sprinkling of the European population are of Dutch descent.

Jagannāth, or PURI, is the name of a town on the coast of Orissa, at the southern end of the delta of the Mahanadi, celebrated as one of the chief holy places in India. With a resident population of about 38,000, and accommodation for about 20,000 pilgrims, it owes its reputation to a temple erected there in honour of Vishnu, and containing an idol of this Hindu god, called *Jagannāth* or *Juggernaut* (Sanskrit *Jaganātha*—i.e. Lord of the World). It was long a sacred city of the Buddhists, the abode of the Golden Tooth of

Buddha. The first historical mention of Jagannáth is in 318 A.D. He represents Vishnu in all his manifestations, and is in a special sense the god of the people. The great festival in 1892 brought 200,000 pilgrims, but pilgrims now visit Puri throughout the year, and the numbers at the principal festivals are not so great as formerly. The number for 1907 was estimated at 75,000. The average income of the temple from all sources from 1903-7 is said to have been about £9300 a year. The temple enclosure comprises 120 temples, the chief pagoda being that of Jagannáth, with a tower 192 feet high. There are twenty-four annual festivals in his honour, the chief being the car festival, when Jagannáth (who is armless) is dragged on his car (45 feet high, 35 feet square, with sixteen wheels, each 7 feet in diameter) to his country-house. This is less than a mile distant from the temple, but the heavy sand extends the short journey to several days, until the exhausted devotees resign the task to professional car-pullers, who have also to assist the idol home again. The car festival has been currently believed to be the occasion of numerous cases of self-immolation, the frantic devotees committing suicide by throwing themselves before the wheels of the heavy car. This is, it would appear, a calumny of English writers. See Sir W. W. Hunter's work on Orissa (1872), in which 'he carefully examined the whole evidence on the subject, from 1580, when Abul Fazl wrote, through a long series of travellers, down to the police reports of 1870,' and came to 'the conclusion which H. H. Wilson had arrived at from quite different sources, that self-immolation was entirely opposed to the worship of Jagannáth, and that the rare deaths at the car festival were almost always accidental.'

Jagatal, a central-Asiatic dialect of Turkish, named after a son of Genghis Khan (q.v.). See TURKS, TURKESTAN.

Jagellons, the name of an illustrious dynasty which reigned in Lithuania, Poland, Hungary, and Bohemia. The name is derived from Jagello, the last of a line of hereditary grand-dukes of Lithuania, who succeeded to his patrimonial possession in 1381, and was (1386) appointed successor to his father-in-law, Louis the Great, king of Poland and Hungary, in the former of these kingdoms, after having embraced Christianity, and changed his name to Ladislaus II. He was succeeded on the throne of Poland by six kings of his house, the last of whom, Sigismund Augustus, died in 1572. Through a sister of the last, however, the Jagellon dynasty was continued on the Polish throne till 1668. See POLAND.

Ladislaus, the fourth son of the Jagellon Casimir IV. of Poland, was elected king of Bohemia in 1471, on the death of George Podiebrad, and also succeeded Mathias Corvinus in Hungary in 1490. Ladislaus died in 1516, and was succeeded in both kingdoms by his son, Louis II., who was defeated and slain by the Turks at Mohács (29th August 1526), and with whom terminated the Jagellons of Bohemia and Hungary.

Jäger, GUSTAV, born at Burg in Württemberg in 1832, taught zoology at Vienna, and settled in medical practice in Stuttgart. He wrote on zoology, on heredity, and on Darwinism and morals, but is identified mainly with his contention that human clothes should be limited to animal substances (mainly wool), and should not include any vegetable fibre.

Jägerndorf (Czech *Krnov*), a town of Czechoslovakia, close to the frontier, 18 miles NW. of Troppau, has manufactures of woollen cloth, linen, organs, &c.; pop. 21,000. The principality of Jägerndorf lost its independence to Austria in the Thirty Years' War. Frederick II.'s claim to it

was the occasion of the first Silesian war, and in 1742 the territory was divided between Prussian and Austrian Silesia, Austria retaining the town.

Jagersfontein, in the Orange Free State, 60 miles SW. of Bloemfontein, has a valuable diamond mine opened in 1870, and a pop. of 3700.

Jaggery. See DATE PALM.

Jaghabub, or JARABUB, an oasis on the border of Egypt and Libia Italiana. See SENUSSI.

Jaguar (*Felis onca*), one of the largest and most beautiful of the Felidae, and by far the strongest and fiercest of the American beasts of

Jaguar (*Felis onca*).

prey. The jaguar is nearly equal to the tiger in size, but is less massive, and has shorter legs. The soft, rich fur varies in colour from yellowish-white to very dark brown or black; the sides, shoulders, and thighs are marked with dark ring-like spots, larger, and arranged in more regular patterns than those of the leopard. Each ring usually encloses several small black points. The black-furred jaguar is sometimes regarded as a different species, but the characteristic markings can be seen in certain lights, and the ground-colour varies greatly even in members of the same litter. The jaguar is found all over South America except in some parts of Patagonia, and in North America as far north as the borders of Texas and South California, inhabiting chiefly the outskirts of forests and the shady banks of rivers and lakes. The food of the jaguar is very varied. Wild horses and mules are his favourite prey, but birds, turtles, and fish are readily eaten, while he is often forced to depend for subsistence on the timid, stupid capybaras. The flesh of the peccary, too, is a dainty which he exercises all his ingenuity to procure, for even a jaguar dare not openly attack a herd of these courageous little pigs. His method, it is said, is to conceal himself in a tree till a herd passes, drop down on one and kill it, then spring into the tree again and wait patiently until the angry herd is a safe distance off. The jaguar is hunted sometimes with the lasso, but most frequently with dogs and poisoned arrows, and the skins are imported into Europe in large numbers.

Jahde, or JADE, a bay in the north of Oldenburg, now belonging to Prussia, which constructed a naval station on its shores. See WILHELMSHAVEN.

Jahn, FRIEDRICH. See GYMNASTICS.

Jahn, JOHANN, a Catholic biblical critic, was born at Tasswitz, in Moravia, in 1750. He became professor of Oriental Languages at Olmütz, and, in 1789, at the university of Vienna; but the unwonted boldness of his criticism, as that Job, Tobit, and Judith were didactic poems, and that the New Testament demoniacal possession was the result of natural disease, although not formally condemned, led in 1806 to his honourable retire-

ment to a canonry of St Stephen's, Vienna. He died 16th August 1816.

Jahn, OTTO, a famous archaeologist and biographer, was born at Kiel, 16th June 1813, and studied at Kiel, Leipzig, and Berlin. He next travelled in France and Italy, making a lengthened stay in Rome, and returned in 1839 to lecture at Kiel, whence he was called to Greifswald. In 1847 he accepted the chair of Archaeology at Leipzig, and here he founded an archaeological society, and served as director of an archaeological museum. Deprived in 1851 for his part in the political movements of 1848-49, he became in 1855 professor of the Science of Antiquity, and director of the Academic Art Museum at Bonn, whence he was summoned in 1867 to fill Gerhard's chair at Berlin. He died, however, before entering on his new duties, at Göttingen, 9th September 1869.

Jahn's contributions to archaeology were numberless, and of the first importance. Here may only be named works on Polygnotus, *Die Hellenische Kunst* (1846), *Peitho* (1846); a description of the vases in King Ludwig's collection (1854), and works on the representations of ancient life on vases (1861, 1868); and a work on the evil eye (1850). His works in philology include editions of Persius (1843), Censorinus (1845), Florus (1852), *Pausanias descriptio arcis Atheniensis* (1860), the *Brutus* (1849) and *Orator* (1851) of Cicero, Juvenal (1851), the *Perioche* of Livy (1853), the *Psyche et Cupido* of Apuleius (1856), the *Electra* of Sophocles (1861), the *Symposium* of Plato (1864), and Longinus (1867). He wrote also an elaborate and masterly biography of Mozart (1856-60) and many essays on music.

Jaice, JAJCE, or JAITZE, a Yugoslav (Bosnian) town on a rocky platform on the influx of a small stream into the Vrbas, 70 miles NW. of Sarajevo, has a strong situation and a fortress which, once the home of Serbian princes, sustained a long and fierce struggle between the Moslem Turk and the Christian defenders.

Jail Fever (known also as Putrid or Pestilential Fever) is now considered to have been merely a severe form of Typhus Fever (q.v.). At the present time, owing to improved sanitary regulations, such outbreaks among prisoners in jails are almost unknown; but we learn from Howard's *Account of the State of Prisons* that, in his time, the disease was very frequent in the prisons of England, although unknown in those of the continental countries. In the celebrated Black Assize (q.v.), held at Oxford in 1577, there is no evidence that the disease prevailed among the prisoners, and yet it broke out among the persons present at the trial. So late as May 1750 the lord mayor, an alderman, two judges, most of the jury, and a large number of spectators caught this disease from attending the assizes at the Old Bailey; and many of those who were infected died.

Jains is the name of a heterodox sect of Hindus, found in most parts of Upper India, numerous more especially to the westward, but also scattered throughout the peninsula. They are important from their wealth and influence rather than from their number. Their tenets are in several respects analogous to those of the Buddhists (see BUDDHISM), but they resemble in others those of the Brahmanical Hindus. With the Buddhists they share in the denial of the divine origin and authority of the Veda. With the Brahmanical Hindus, on the other hand, they agree in admitting the institution of caste, in performing the essential ceremonies called *Sanskāras*, and in recognising some of the subordinate deities of the Hindu pantheon; but they disregard completely all those Brahmanical rites which involve the destruction of animal life.

According to their doctrine, all objects, material or abstract, are arranged under nine categories,

called *Tattvas*, truths or principles, of which we need notice only the ninth and last, called *Moksha*, or liberation of the vital spirit from the bonds of action—i.e. final emancipation. In reference to it the Jains not only affirm that there is such a state of emancipation, but they define the size of the emancipated souls, the place where they live, their parts, natures, and numbers.

The principles of faith are common to all classes of Jains, but some differences occur in their duties, as they are divided into religious and lay orders, *Yatis* and *S'rāvakas*. The *Yati* has to lead a life of abstinence, taciturnity, and continence; he should wear a thin cloth over his mouth, to prevent insects from flying into it, and he should carry a brush to sweep the place on which he is about to sit, to remove any living creature out of the way of danger; but, in turn, he may dispense with all acts of worship; whilst the *S'rāvaka* has to add to the observance of the religious and moral duties the worship of the saints, and a profound reverence for his more pious brethren. The secular Jain must, like the ascetic, practise the four virtues—liberality, gentleness, piety, and penance; he must govern his mind, tongue, and acts; abstain, at certain seasons, from salt, flowers, green fruits, roots, honey, grapes, tobacco; drink water thrice strained, and never leave a liquid uncovered, lest an insect should be drowned in it; it is his duty also to visit daily a temple where some of the images of the Jain saints are placed, walk round it three times, make an obeisance to the image, and make some offerings of fruits or flowers. The reader in a Jain temple is a *Yati*, but the ministrant priest is not seldom a Brahman, since the Jains have no priests of their own.

The Jains fall into two principal divisions, *Digambaras* and *S'wetāmbaras*. The former word means 'sky-clad,' or naked, but in the present day ascetics of this division wear coloured garments, and confine the disuse of clothes to the period of their meals. *S'wetāmbara* means 'one who wears white garments;' but the points of difference between the two divisions are said to be 700, of which 84 are of paramount importance. In the south of India the Jains are divided into two castes; in Upper Hindustan they are all of one caste. It is remarkable, however, that amongst themselves they recognise a number of families between which no intermarriage can take place.

As regards the pantheon of the Jain creed, it is still more fantastical than that of the Brahmanical sects. The highest rank amongst their numberless hosts of divine beings—divided by them into four classes, with various subdivisions—they assign to the deified saints, which they call *Jina* (whence the usual name of the sect), or *Arhat*, or *Tīrthakara*, besides a variety of other generic names. The Jains enumerate twenty-four *Tīrthakaras* of their past age, twenty-four of the present, and twenty-four of the age to come; and they invest these holy personages with thirty-six superhuman attributes of the most extravagant character. They distinguish the twenty-four *Jinas* of the present age from each other in colour, stature, and longevity. *Rishabha*, the first *Jina* of this age, was 500 poles in stature, and lived 8,400,000 great years; whereas *Mahāvīra*, the 24th, had degenerated to the size of a man, and was no more than forty years on earth. The present worship is almost restricted to the last two *Tīrthakaras*. The old view, endorsed by Professor Weber, was that the Jains are a remnant of the Indian Buddhists who succeeded in maintaining their existence by a compromise with Hinduism. The Jains themselves strongly insist that their faith is older than Buddhism; and Jacobi proves from the Jain texts that Buddhism and Jainism were developed out of Brahmanism by a very

gradual movement, Jainism being probably the earlier. Modern Jainism Sir W. W. Hunter describes as 'a religion allied in doctrine to ancient Buddhism, but humanised by saint-worship.' In 1921 there were in India 1,178,596 Jains.

See Oldenberg, *Buddha* (Eng. trans. 1882); Thomas, *Jainism* (1877); Bühler, *Jainas* (ed. Burgess, 1904); Rhys Davids, *Hibbert Lectures* (1881); Jacobi, *Gaina Sūtras* (1885); Mrs Sinclair Stevenson, *The Heart of Jainism* (1915); Jagmenderlal Jaini, *Outlines of Jainism* (1916); and for the numerous and beautiful Jain temples, see Fergusson's *Cave Temples of India* (1880), and Burgess's *Buddhist and Jaina Caves* (2 vols. 1881-83).

Jaipur. See JEYPORE.

Jaisalmer (*Jaysulmere*), capital of the Indian state (area, 16,000 sq. m.; pop. 68,000) of Jaisalmer, in Rajputana, stands on the edge of the Indian Desert, and was founded in 1156; pop. 4800.

Jakutsk. See YAKUTSK.

Jalalabad. See JELALABAD.

Jalalpur, a town of India, 8 miles NE. of the city of Gujrat in the Punjab; pop. 11,000; and there is a ruined Jalalpur on the Jhelum River.

Jalāl-uddin Rumi. See PERSIA (*Literature*).

Jalandhar. See JULLUNDER.

Jalap, a well-known purgative medicine, is the root of *Ipomoea Purga*, a plant of the natural order Convolvulaceae. It is a native of the eastern slopes

of the Mexican sierras, growing at an elevation of about 6000 feet. Named from the town of Jalapa, it is a perennial twining plant, with large flowers and a turnip-like root, varying from the size of a hazel-nut to that of a man's fist. The roots when fresh are white and fleshy, and abound in a milky juice. They are dug up at all seasons of the year, and hence one great cause of their variation in size and activity. After being dried the roots are brown and wrinkled externally, of a deep yellowish-gray colour internally, and have the consistence of wood. Their odour is faint and disagreeable, and the taste is nauseous. For use in medicine the roots are finely powdered. Jalap-root contains starch, sugar, lignin, and other ingredients, but the active part is a mixture of resins which is official under the name of *Jalapæ Resina*. The amount of this resin varies from 12 to 21 per cent. It is extracted from the root by means of dilute alcohol, and consists chiefly of a body called convolvulin. Jalap is a hydragogue cathartic, and may be given alone or in combination with calomel or cream of tartar. It and its preparations are used in constipation, renal disease, and cerebral affections. Its action is limited to the production of severe purgation. Jalap was first used in England about the beginning of the 17th century. The ordinary dose of powdered jalap for an adult varies from ten to thirty grains, twenty grains generally acting smartly and 'safely'; for children under a year old the dose is from two to five grains. The dose of the compound powder is double that of the ordinary powder.

Jalap (*Ipomoea Purga*):
a, the root.

Jalapa, capital of the Mexican state of Vera Cruz, is 60 miles by rail NW. of Vera Cruz city. It is situated in a charming and fertile district, in a healthy and temperate climate, 4330 feet above the sea, and is neatly built and surrounded with pleasant gardens. The principal buildings are the old Franciscan monastery (1556), the church of St Joseph, and a hospital. Pop. 28,000. There is another Jalapa in Guatemala.

Jalisco, a state of Mexico, on the Pacific, with an area of 32,000 sq. m. It is traversed by the Sierra Madre, and in great part forms a plateau. The climate is healthy away from the coast. The principal river is the Río Grande de Santiago; in the south-east is the lake of Chapala (q.v.). Silver and copper mining and agriculture have been the chief industries; but within recent years a number of cotton, woollen, paper, and tobacco factories have been established. Pop. (1879) 983,484; (1895) 1,107,863; (1921) 1,199,325. The capital is Guadalajara (q.v.).

Jalna, a town and, till 1903, a British cantonment in the Nizam's Dominions, India, 210 miles NE. of Bombay. Its fruit is celebrated, being sent to Hyderabad, Bombay, and other large towns. Pop. 17,000.

Jam. See PRESERVED PROVISIONS.

Jamaica, aboriginally *Xaymaca* ('Land of Springs'), the largest and most important of the British West Indies, is about 90 miles to the south of Cuba. Its area is 4200 sq. m. The greatest length is 144 miles; the greatest breadth, 50 miles. Turks and Caicos Islands, as well as the three Cayman Islands, are dependencies of Jamaica. The island is traversed from east to west by a range of mountains—in the east called the Blue Mountains—which rise to 7400 feet. From this range nearly 120 streams descend to the coasts, but owing to the shortness and steepness of their courses they are not navigable, with the exception of Black River, which affords, for small craft, a passage into the interior for 30 miles. Excellent harbours are everywhere to be found. Incomparably the best of these is Kingston (q.v.) harbour, a deep and capacious basin in the south-east quarter of the island. Jamaica is believed to be rich in mineral wealth, but not much is extracted. The chief towns are Kingston (pop. 63,000), the capital, and Spanish Town, formerly the seat of the government (pop. 8700), on the south-east of the island; Savanna-la-Mar (3400), on the south-west; Montego Bay (pop. 6600), in the north-west; Port Antonio (7000), Port Maria (2800), and St Ann's Bay (2600) in the north-east. Port Royal, situated at the western extremity of the spit of sand that shuts in the harbour of Kingston, was, before the great earthquake of 1692, one of the chief cities in the West Indies; when in 1905 it ceased to be a dockyard and naval station, it had only 1200 inhabitants.

The climate varies. The temperature falls on an average 1° F. for every 300 feet in altitude. At Kingston, on the coast, the thermometer usually registers about 70° F. at night and 87° F. during the day, the mean being 78° F.; but the heat is tempered by the sea-breezes. A corresponding regularity is observable in the upland regions. On the whole, the island is very healthy; invalids enjoy the salubrious air of the interior. There are two rainy seasons, one in the middle of spring and the other towards the middle and end of summer. In the latter the rains are exceptionally heavy. Cyclones in 1880, 1886, 1893, 1899, 1903, and 1912 did extensive damage. The earthquake of 14th January 1907 shook Kingston into ruins, killed 800 persons, and injured 1000.

The vegetation is very luxuriant. The primeval

woods are rapidly disappearing; yet there are still many valuable trees, such as balata, mahogany, logwood, lignum vitae, fustic, ebony, satinwood, coconut and other palms, cactuses, &c. Tropical and other fruits are grown in great variety and exported in huge quantities. Spices, dye-woods, medicinal plants, and food plants, such as ginger, cochineal, castor-oil, arrowroot, maize, vanilla, pimento (all-spice), &c., are grown. One-sixth of the cultivated area is devoted to the growing of Guinea grass. This and pasture-land occupy most of the north and west. In the south and east the principal crops are sugar, which is undergoing great expansion, coffee, vegetables, and fruits. A little cinchona and cacao are also grown. The mongoose, imported to prey on the rats that infested the sugar estates, has, after exterminating the rats, become a plague, and has nearly extirpated lizards, harmless snakes, and small birds, so that insect pests (especially the troublesome ticks) abound. The negroes, who are mostly small holders, are the chief growers of fruit. The exports consist chiefly of bananas and other fruits, grape fruit, coffee, cocoa, logwood and its extract, sugar and rum, ginger, allspice, cigars, skins and hides; the imports are (food-stuffs, clothing, &c.) about the same value. About one-third of the trade is with the United Kingdom, and about one-half with the United States.

Since the middle of the 19th century the white inhabitants have increased far less rapidly in numbers than the black and coloured population. In 1861 the total population was 441,255 (13,816 white and 427,439 black and coloured); in 1881 the figures were respectively 580,804 (14,432 and 554,132, besides immigrant coolies). In 1921 the population was 858,118, whereof 14,476 were white, 660,420 black, 157,223 coloured, 18,610 East Indians, 3696 Chinese, 3693 unspecified. There is no established Church. Leading denominations are the Church of England, Baptists, Methodists, Moravians, Presbyterians. There are some 700 government schools, with 68,000 pupils; besides government training-colleges for teachers. Secondary education is partly supported by government. Jamaica has 200 miles of railway and 1200 miles of telegraph. The defences of the island include a British garrison and a local artillery militia and rifle corps. There is also a semi-military police force. The government is in the hands of a governor appointed by the crown, assisted by a privy-council (which fulfils the offices of an executive) and a legislative council, containing, *ex officio*, elected and nominated members.

Jamaica was discovered by Columbus in 1494, and definitely taken possession of by the Spaniards in 1509. The original inhabitants were peace-loving Arawak Indians (not Caribs); but they were practically extinct in 1655, when the island was conquered by the English, an expedition having been sent out for that purpose by Oliver Cromwell, under Admiral Penn and Venables. Jamaica was formally ceded to England by the treaty of Madrid in 1670. The place of the native Indians was taken by negro slaves, imported by the Spaniards, and by Irish and colonial immigrants, who arrived soon after the capture of the island. During the 18th century more than half a million slaves were brought over from Africa. Under English rule the chief events in the history of Jamaica were frequent rebellions of the Maroons, a community of runaway slaves, who had obtained a tract of land on the north side of the island; in 1831-32, a negro insurrection; and on August 1, 1834, the emancipation of the slaves, Jamaica receiving £6,161,927 as her share of the compensation money. The chief result of this last event was to ruin the sugar-growing of Jamaica, principally owing to the

difficulty of procuring labour. The negroes refused to work, now they were free. The liberation was followed by concessions of representative and constitutional rights to the newly-liberated slaves. But the experiment proved a failure. The negroes considered it a grievance that offices in the magistracy were not more frequently conferred on them. They wished to suppress coolie immigration, which tended to keep down wages. They sought to obtain land without rent. The more violent even suggested the expulsion of the whole white population of the island. In 1865 the discontent was at its height. In October of that year the negroes rose in revolt and massacred twenty-three whites. Martial law was proclaimed by Governor Eyre, who suppressed the rising with resolute vigour, though the punishments inflicted on the rioters were in some cases perhaps unnecessarily severe. For the course he had taken Governor Eyre was thanked by the Jamaica Assembly; but in England a different view was taken of his conduct (see EYRE). He was recalled, and the representative constitution was suspended. A new constitution was framed in 1866, under which the island is now governed like an ordinary crown colony. There seems to be good authority for the statement that from the catastrophe of 1865 a new life has sprung. Crime has diminished; and education has everywhere advanced among the black population. New roads have been formed, harbours constructed. Although Jamaica has not recovered its former commercial prosperity, the negroes cannot now be described as idle. They cultivate their provision grounds with care, and are especially active in developing the fruit trade. Extreme poverty is unknown among them, and they are law-abiding and inoffensive. Women were enfranchised in 1919. Constitutional reform is demanding attention.

See the official *Handbook of Jamaica*; J. Johnston, *Jamaica, the New Riviera* (1903); P. Burry, *Ethiopia in Exile* (1905); Gardner, *History of Jamaica* (1872; new ed. 1909); Fawcett and Rendle, *Flora of Jamaica*.

Jamaica Pepper. See PIMENTO.

Jambusar, a town of British India, presidency of Bombay, is situated 30 miles SW. of Baroda. Cotton ginning, tanning, and calico printing are carried on. Pop. 10,200.

James, the name of three men who figured in the history of the early Church: (1) James the Apostle, the son of Zebedee and Salome, and the brother of John, was from the first one of the most eminent among the disciples of Jesus, and afterwards became one of the leaders of the Church at Jerusalem. He was the first of the apostles to be martyred, being put to death by Herod Agrippa in 44 A.D. (Acts xii. 1). There is a later tradition, which, however, is of little value, that he was the first Christian missionary to preach the gospel in Spain. (2) James, the son of Alphæus (generally called 'the little,' or, less accurately, 'the less'), was also one of the disciples of Jesus, and in all the lists is placed at the head of third group, the other three members of the group being Thaddæus, Judas, and Simon Zelotes. (3) James, the brother of the Lord. According to Paul's statement in 1 Cor. xv. 7, Jesus appeared to him after his resurrection, and he afterwards became the leader of the Church in Jerusalem, where Paul met him on the occasion of both his earlier visits to that city (Gal. i. 18-19, ii. 9). He presided at the council which was held at Jerusalem (Acts, xv.), summed up the discussion, and proposed the resolution which was adopted by the Church. Later on, about the year 58, he warned the Apostle Paul, on his return from his third missionary journey, to make concessions

to Jewish prejudices (Acts, xxi. 21-24). After this point he disappears from the New Testament narrative, but we learn from a statement of Hegeppus which has been preserved by Eusebius (1) that he was called 'the Just,' (2) that he was a Nazirite and an ascetic, (3) that he refuted the sects of the Jews, and that they cast him down from the pinnacle of the temple and afterwards stoned him to death. Josephus corroborates the account of the martyrdom by stoning, and dates it at the time of the death of Festus (about 62 A.D.).

James, THE EPISTLE OF, one of the Catholic epistles of the New Testament, ascribed by tradition to James, the brother of Jesus. The epistle is almost entirely ethical and practical, and it is the most untheological book in the New Testament. Apart from two specific references to Christ (i. 1, ii. 1), an allusion to the Parousia (v. 7), the mention of the elders of the church (v. 14), and the general similarity between its ethical ideas and the teaching of Jesus, there is little to indicate the Christian origin of the epistle. Among the problems which have been raised in connection with the book in modern times are:

(a) *The Relationship between the Epistle and the Writings of Paul.* In both Paul and James there is a discussion on the doctrine of faith and works. Paul's fundamental teaching was that justification is through faith and not through works. James, on the other hand, maintains that faith without works is vain. The apparent discrepancy is generally accounted for by the theory that Paul and James use the word 'faith' in entirely different senses. To James 'faith' means creed or orthodoxy, and his aim is to show that a correct belief by itself, unless it is translated into life and character, is useless. To Paul, on the other hand, faith means the total surrender of the soul to Christ and its consecration to his service. But it is doubtful whether so simple a solution really explains the facts. One difference, at any rate, seems still to separate the two positions. As Schwegler puts it, 'With Paul justification comes between faith and works; with James works come between faith and justification.' If the question were asked, 'At what point can a man be said to be justified,' Paul and James would give different answers. Paul would say, 'As soon as he believes.' James's position would be, 'Not till his faith has been proved by works.' There are four views held to-day as to the relation between the two writers on this point: (1) Mayor maintains that the Epistle of James was written first, and that Paul in the Epistle to the Romans is endeavouring to correct the misinterpretation of its statements. (2) Cone, in the *Encyclopædia Biblica*, takes the reverse position, and holds that James sets himself to correct what he considered to be the dangerous elements in Paul's conception of faith. (3) Sanday and Headlam, on the other hand, deny that there is any literary connection between James and Romans, but think that James is directed against 'hearsay reports of Paul's teaching and the perverted construction that might be put upon it.' (4) Lightfoot and Knowling go further still, and deny that there is any kind of connection between the two writers. James is endeavouring to correct, not Christian, but Jewish misconceptions of faith.

(b) *The Question of Authorship.* The traditional theory which ascribes the epistle to James, the brother of Christ, is attacked to-day from many quarters. The main arguments that are brought against it are: (1) Could a writer who was so closely connected with Jesus have written an epistle in which such slight references are made to him? The reply which is generally offered to this criticism is that, while the absence of general statements must, of course, be admitted, yet the

epistle is so saturated with the teaching of Jesus that it could not possibly have been written by one who was not intimately acquainted with him. (2) The style of the epistle betrays an acquaintance with the best literary Greek of the period, and it is hard to believe that such an artistic mastery of the language could have been attained by a Palestinian Jew. We have to remember, however, that there was a wedge of Greek cities in the heart of Galilee (the Decapolis), with a Greek university of considerable influence, and with every facility for acquiring a knowledge of classical Greek. (3) The most weighty objection of all lies in the hesitation which was displayed in the Western half of the Church in admitting this epistle into the New Testament canon. It is difficult to explain why an epistle known to have been written by so important an authority as the brother of Jesus should have been rejected by the Muratorian Fragment, and why so many doubts should have been expressed by Patristic writers as to its right to a place in the canon of the New Testament. Origen, for instance, speaks of it as 'the so-called Epistle of Jesus,' and Eusebius calls it 'the epistle circulating under the name of James'. In view of the grave doubts which were raised in the third and fourth centuries, it is not easy to maintain the traditional view regarding the authorship of the book without serious misgivings.

(3) The date at which the epistle was written is another difficulty. Biblical criticism is divided into two camps. Some scholars (e.g. Zahn, Mayor, Salmon) hold that the document is very early (between 40 and 45), and claim that it was written before any other book of the New Testament. In support of their position they point to (a) the primitive character of the teaching of the epistle, (b) the primitive nature of the Church organisation. Other scholars take up the position that the epistle was not written till the close of the first century or the beginning of the third. They argue that the absence of theology and the emphasis that is laid on the practical side of Christianity need not necessarily imply primitiveness or an early date. Similar characteristics are found in the *Didache*, the Epistle of Clement of Rome, and the Shepherd of Hermas, with which writings the epistle seems to have many points of affinity. The validity of this argument is undeniable; it proves conclusively that, as far as its general tone is concerned, the epistle might have been written in the early decades of the second century, though it does not demonstrate, of course, that it must have been written at that date. It is very difficult to decide between these rival theories, but the elementary character of the Church organisation implied in the epistle, and the absence of any reference to bishops and deacons (both of whom became established institutions in the first quarter of the second century), seem to point definitely in the direction of the earlier date.

(4) The character of the epistle has called forth two very interesting theories in modern times. Impressed by the general absence of characteristic Christian elements and the Jewish tone and colouring of the book, Spitta put forward the hypothesis that the Epistle of James was a Jewish ethical treatise which was adopted and taken over by the Christian Church, after a few slight additions had been made to it. In favour of this theory, it is possible to point to a similar treatment of other Jewish documents—e.g. the *fourth book of Ezra*, the *Testament of the Twelve Patriarchs*, the *Ascension of Isaiah*, all of which have been christianised and adapted for use in Christian circles. It is generally thought, however, that Spitta has failed to make out his case. If the Christian elements in James appear to be slight on the surface of the book, we must not forget that the epistle repro-

duces the essential elements in the ethical teaching of Jesus. Moreover, it is hard to believe that the Christian redactor would have been so sparing in the additions which he made.

Another interesting theory is that propounded by Professor J. H. Moulton, who thinks that the epistle was written by James, not for Christians at all, but for unconverted Jews. The writer avoids direct reference to Jesus lest the mention of his name should alienate the sympathy of his readers. He introduces, however, a multitude of his sayings, hoping that 'their intrinsic beauty and power would win their way' and prepare them for more definite Christian teaching later on. On this theory, the Epistle of James is a unique experiment in early Christian apologetic. It is so unique, however, and so unlike all other forms of apologetic which were put forward in the early Church, that it is highly improbable. It is conceivable that a modern mind might have projected such a scheme for propagating Christianity, but it is extremely unlikely that such a plan would have suggested itself in early times.

The character of the epistle may be best explained by supposing that it represents a definite type of early Christianity—a type which receives further illustration in the pages of the Apostolic Fathers. It is a great mistake to suppose the existence of a uniform theology in the apostolic age. Christianity assumed many different shapes and types, and we have every reason to believe that the practical and ethical type was far more powerful and prevalent than the relative importance of the Epistle of James among the books of the New Testament would lead us to suppose.

The best modern expositions of the epistle are those of Mayor, Knowling, Bennett (*Century Bible*), Plumptre (*Cambridge Bible*), J. H. Moulton (*Peake's Commentary*). For discussions of the problems connected with the epistle see New Testament Introductions by Moffatt, Peake, Salmon, Allen, &c., and articles in *Hastings's Bible Dictionary* and the *Encyclopædia Biblica*.

James I., king of Scotland (1406–37), the second and only surviving son of Robert III., was born at Dunfermline in 1394. His education was entrusted to the learned Bishop Wardlaw of St Andrews. His elder brother, David, Duke of Rothesay, a reckless and dissipated youth, had died at Falkland—it was strongly suspected, but not proved, a victim to the unprincipled ambition of his uncle, the Duke of Albany, and King Robert resolved in 1406 to send his younger son for safety to France. But on the voyage the vessel was taken by Norfolk pirates; James was carried to London, and though a truce seemingly existed at the time with England, was handed over to Henry IV., who committed him, along with certain of his attendants, to the Tower. For the space of eighteen years, under Henry IV. and V., and in the first year of the minority of Henry VI., James was held captive in England—in the Tower, at Windsor, and elsewhere—the Duke of Albany, on whom the government of Scotland had devolved on the death of Robert III. in 1406, showing no anxiety for his royal nephew's release. While in captivity James was carefully instructed in all the knightly accomplishments of the age, and he not only became distinguished in martial and athletic exercises, but he could play well on the lute and harp and other musical instruments, was a skilful calligrapher, illuminator, and painter in miniature, and had also a considerable knowledge of medicine, philosophy, jurisprudence. On the death of the Duke of Albany in 1420 his son Murdoch succeeded to the regency. Under his feeble rule the country fell into a state of disorder, almost of anarchy, and this, and a favourable disposition to the project at

the time in England, made the movement opportune for procuring the return of the lawful sovereign. Steps to this end, to which Murdoch offered no obstacle, were taken, conditions of release being arranged in 1423. By these £40,000 was to be paid to defray the expense of James's maintenance and education, while provision was also made for his marriage to a high-born English lady. So it was that on 13th February 1424 James was wedded to Jane Beaufort (q.v.), with whom from a prison window he may or may not previously have fallen romantically in love. Thereafter James and his consort set out for Scotland, and the exchanges having been made at Durham and a truce entered into whereby neither country was to assist the enemies of the other, were received with joyous acclamation.

James found his kingdom a scene of lawless excess and rapine, mainly owing to the weakness of the government and the turbulence of the nobles. He at once set himself to restore the legitimate authority of the crown, and to rescue the commons from oppression and plunder; but in carrying out these praiseworthy objects he sometimes lost sight of both mercy and justice. Eight months after his restoration he suddenly swooped down upon his cousin the former Regent Albany, two of his sons, and his aged father-in-law, the Earl of Lennox. They were brought to trial, but the nature of the charges against them is not known. They were found guilty and executed amid general compassion and regret; the people believed that it was simply an act of cruel revenge. James then seized and imprisoned fifty of the Highland chiefs, and put to death the most obnoxious ringleaders. He deprived the powerful Earl of March of his estates, and on the death of the Earl of Mar, the victor at Harlaw, he seized the earldom and annexed its immense estates to the crown. Meanwhile, into the parliament he introduced the principle of representation, and for the first time caused its acts to be published in the language of the common people. Its enactments, which were judicious and enlightened beyond the age, comprehended the subjects of agriculture, commerce, foreign and domestic manufactures, the regulation of weights and measures, the impartial administration of justice, and the police of the country. He renewed commercial intercourse with the Netherlands, and concluded a satisfactory treaty with Denmark, Norway, and Sweden. He drew closer the ancient bond of alliance with France, and gave his eldest daughter in marriage to the Dauphin. But he unfortunately persisted in carrying out harshly, and sometimes unjustly, his measures for curbing the power of the nobles, which excited not without cause strong discontent and apprehension among the whole body.

His confiscation of the earldom of Strathearn, which had devolved on Patrick Graham, brought matters to a crisis. A conspiracy was formed against the king's life, headed by his uncle, the Earl of Athole; Sir Robert Stewart, his grandson; and Sir Robert Graham, uncle of the Earl of Strathearn, who had personal as well as family injuries to revenge. The plot was carried into effect at Perth on the 20th of February 1437. The king was about to retire for the night, when there was a great noise and clashing of arms heard, and a band of assassins led by Graham broke into the monastery of the Dominicans where the court was residing. The bolts had been removed from the chamber door, but Catharine Douglas heroically thrust her arm into the staple. It was instantly broken, and the ruffians burst into the chamber. The king, who had sought refuge in a vault under the floor, was discovered, and after a desperate resistance was

cruelly murdered. The murderers were all apprehended in less than a month, and put to death by tortures shocking to humanity. By his wife, the heroine of the *Kingis Quair*, he left one son (his successor) and six daughters, one of whom, Marguerite d'Écosse, dauphine of France, was a gifted poetess. James was unquestionably the ablest of the Stewart sovereigns, and was possessed of high poetical genius. *The Kingis Quair* (i.e. the king's quire or book), remarkable for tender delicacy of feeling, is the work of one of Chaucer's best pupils, probably the king himself, though Mr J. T. Brown thought otherwise (1896; see Jusserand's reply, 1897). The humorous pieces *Christ's Kirk on the Green* and *Pebbles to the Play* are much later compositions; but a 'Ballad of Good Counsel,' written, unlike *The Kingis Quair*, strictly in the Scottish dialect, is ascribed by Professor Skeat to James. See Professor Skeat's editions of *The Kingis Quair* (S.T.S. 1884 and 1911), Professor Lawson's (1910), and Rossetti's noble ballad, 'The King's Tragedy.'

James II., king of Scotland (1437–60), was only six years old at the time of his father's murder. So alarming was the aspect of affairs that the queen-mother deemed it necessary to take shelter with her son in the castle of Edinburgh. Along with Sir Alexander Livingston of Callendar she was entrusted with the care of the young king; but Sir William Crichton, who was appointed Chancellor, and was governor of Edinburgh Castle, kept possession of his person, until the queen contrived to convey her son out of the fortress concealed in a chest, and took refuge with Livingston in Stirling Castle. Crichton was besieged in his stronghold, and compelled to make his submission. Meanwhile the country was brought to the verge of ruin by the feuds of the nobles, and the death of the Earl of Douglas in 1439 removed the only restraining power. Livingston availed himself of the marriage of the queen-dowager to Sir James Stewart of Lorn to compel her to resign her office as guardian of the king. Crichton and Livingston became reconciled, and were now the sole rulers of the kingdom, till in 1449 the young king assumed the reins of government. He displayed great prudence and vigour in the management of public affairs, and inflicted condign punishment on the Livingstons for their treatment of his mother.

The truce which had for some years existed between England and Scotland expired in 1448, and war was renewed on the Borders. Peace, however, was restored in the following year by the conclusion of a permanent truce. In June 1449 James married Mary, the only daughter of Arnold, Duke of Gueldres. He procured from the parliament a number of judicious enactments for the repression of outrages, the impartial administration of justice, the protection of the tenants of the feudal barons from summary ejection from their lands, and for the punishment of marauders. But his efforts to promote the social welfare of the people were greatly obstructed and thwarted by the nobles, and especially by the Douglasses (see DOUGLAS); Earl William bent his whole energies to obtain pre-eminent position and power, and he entered into a treasonable bond with the Earls of Crawford and Ross. James invited him to the court at Stirling, and earnestly urged him to withdraw from his engagement with Crawford and Ross. Douglas in a haughty and insolent manner refused to comply with this request; and the king, whose temper was naturally fiery, lost all self-command, and stabbed the earl with his dagger. Some of the courtiers pierced his body with twenty-six wounds. After this atrocious murder the friends and vassals of the earl made war on the king until, by liberal

promises of land and honours, Lord Hamilton and other powerful nobles were induced to abandon their cause; their estates were then forfeited, and they were compelled to take refuge in England. James was so irritated at the conduct of the Yorkist faction in protecting and pensioning the exiled Douglasses that he unwisely suffered himself to be entangled in the contest between the rival houses of York and Lancaster, and marched for England in 1460 at the head of a powerful army. He laid siege to Roxburgh Castle, which was at that time in the hands of the English, and was killed by the bursting of a cannon.

James III. (1460–88), born 10th July 1451, succeeded James II. in 1460. The guardianship of the young monarch was entrusted to his mother and Kennedy, Bishop of St Andrews, a prelate of great sagacity and integrity, while the Earl of Angus, chief of the 'Red Douglasses,' was made lieutenant-general. Under their management the government of the kingdom was carried on judiciously and successfully; but the death of the earl in 1462 and of the bishop in 1466, while the king was still a boy, left the country a prey to the factious and ambitious nobles, conspicuous among whom was Lord Boyd, high justiciar. Lord Boyd's son was created Earl of Arran, and in 1467 he obtained the hand of the king's sister, the Princess Margaret. The ambition and arrogance of the family, however, led to their downfall. The Earl of Arran fled to the Continent; and after his death, which took place apparently before 1472, the Princess Margaret married Lord Hamilton (1474), whose descendants became by this alliance the nearest heirs to the crown. When the king reached manhood the defects of his character became apparent. He had a refined and cultivated mind and fine tastes, was fond of mathematics and of music, and possessed great skill in architecture; but he was quite unfit to rule a country like Scotland at that period and to keep in order its rude and turbulent nobles. He was fond of money and of pleasure, and spent his time in the society of architects, painters, and musicians. The nobles were indignant at the slight thus put upon them, and attached themselves to the king's brothers, the Duke of Albany and the Earl of Mar, who were distinguished for their courage and skill in military exercises. James became jealous of their popularity and put them in prison, whence Albany escaped to the Continent, but Mar died in confinement. Albany had, in fact, aspired to the crown and had engaged to hold it as the vassal of Edward, king of England. In retaliation for an invasion of the country by an English fleet, James summoned the array of the kingdom to make an inroad into England. The army had advanced as far as Lauder when the disaffected nobles suddenly seized the royal favourites and hanged them on a bridge over the river Leader—Angus obtaining the name of Bell-the-Cat from his boldness in taking the initiative. Returning to Edinburgh, they committed the king a close prisoner to the castle of Edinburgh. A reconciliation was effected between the king and his brother, but it was of short duration. The conspiracy among the nobles was speedily renewed. They rose in open rebellion, and induced the young heir to the throne to become their nominal head. The king was supported by the northern barons, but they were greatly outnumbered by the rebels. An encounter took place between the two bodies (11th June 1488) at Sauchieburn, about a mile from the famous field of Bannockburn. When the battle was going against his party the king galloped from the field, but was thrown from his horse at Beaton's Mill, and murdered. James left by his queen, Margaret of Denmark, three sons, the eldest of whom succeeded to the throne.

James IV. (1488–1513) was born in 1473. He was only in his sixteenth year when he was induced to join the disaffected barons in their rebellion against his father, but there is no reason to believe that he was a mere passive tool in their hands. The remorse which he felt on learning of his father's murder, shown by his wearing an iron chain round his waist and submitting to various other austerities by way of penance, affords conclusive evidence of his consciousness of guilt. His confederates in the rebellion, as might have been expected, turned their victory to their own advantage. They took possession of all the most important offices of state, of the money in the royal treasury, and of the late king's jewels. They had even the effrontery to accuse the loyal barons of treason, and to deprive them of their estates, which were divided among the leading conspirators.

When the young king reached maturity he exhibited great energy and good sense in the administration of public affairs, in vindicating law and punishing crime, in encouraging shipbuilding, and in developing the agriculture and manufactures of the country. He gradually withdrew his confidence from the barons who had used him as a tool to gain their own selfish ends, and transferred it to Sir Andrew Wood (q.v.) and other trustworthy counselors. James vigilantly guarded against the encroachments of the papal court, and firmly asserted the ecclesiastical independence of his kingdom. His romantic and rash disposition induced him to support the cause of the impostor, Perkin Warbeck, who visited Scotland in 1495, and to invade England in his behalf. However, in 1497 a truce for seven years was concluded between the two kingdoms, and in August 1503 the Scottish king was married to Margaret, eldest daughter of Henry VII.—an alliance which led ultimately to the union of the crowns. James's affable manners, frank disposition, and splendid hospitality made him highly popular among his subjects, and his friendship was courted by foreign sovereigns. Henry VIII., who ascended the English throne in 1509, joined the league against France, while James adhered to the ancient alliance with that country. Petty disputes arose between the borderers of the two countries, and inroads were made on both sides. James was indignant at the capture of two privateers commanded by the famous Andrew Barton, who fell in an engagement with two English men-of-war, and all redress was refused by Henry. The French king, hard pressed by the Spanish and English armies, made strenuous efforts to obtain assistance from the Scots, and the French queen addressed a letter to James calling herself his mistress, and entreating him for her sake to advance three feet into English ground. He was unfortunately induced to comply with her request, and, disregarding the entreaties of his queen and the remonstrances of his counsellors, he summoned the army of his kingdom and invaded England in the summer of 1513. He lingered about the Borders until the Earl of Surrey had collected a powerful army to repel the invasion. A battle took place at Flodden (q.v.), 9th September, in which the Scottish king and the flower of his nobility and gentry lost their lives. James possessed excellent abilities and great accomplishments, but he was headstrong, obstinate, and impatient of contradiction, licentious, and profuse in his expenditure. See Gregory Smith's *Days of James IV.* (1890), and a Life by Miss Taylor (1913).

James V. (1513–42), who was born on the 10th of April 1512, ascended the throne at a most critical period; for, though contrary to expectation the Earl of Surrey did not invade Scotland, the kingdom was torn by intestine feuds between rival factions. The queen-dowager, headstrong and passionate, was appointed regent. About eight

months after the king's death she gave birth to a son, who died in infancy; and four months later she married the young Earl of Angus, head of the Douglas family. Her marriage put an end to her regency, and the Duke of Albany, son of the younger brother of James III., was invited from France and chosen in her room. Amid the contentions of the rival French and English factions, and the private quarrels of the nobles, the country was reduced to a state of almost total anarchy. The intrigues of Henry contributed not a little to foment the prevailing disorders. Albany, who insisted on revisiting France, returned after the lapse of a few months to find the Hamiltons and Douglases at open war; and, after vain efforts to assert the authority of the government, he obtained permission in the beginning of 1524 to revisit France for a limited period, but did not return. Meanwhile the young king had been placed under the care of the poet Sir David Lyndsay, who instructed him in all manly and liberal accomplishments; but his mother interrupted his education, and, with the assistance of her brother Henry VIII. in 1524, when James had reached his thirteenth year, put him at the head of the government in order that she and her faction might misgovern the kingdom in his name. She had now become tired of her husband, and after a good deal of difficulty she succeeded in obtaining a divorce from him, and married young Henry Stewart, a son of Lord Avondale. In the following year the custody of the young king fell into the hands of the Douglases, who kept him a close prisoner until he made his escape in 1528, and assumed the position of an independent sovereign. He displayed great firmness and resolution in carrying out his judicious policy, though unfortunately his morals had been deeply injured by the manner in which the base sycophants of the court had pandered to his passions. He expelled from the kingdom the Douglases, who had entered into a traitorous league with England, severely punished the Border freebooters, chastised the insurgent Highlanders, renewed the ancient commercial treaty between Scotland and the Netherlands, instituted the College of Justice, and took measures to protect the peasantry against the tyranny of the barons. His sympathy with the common people and his habit of visiting their houses in disguise procured for him the designation of 'the king of the commons.' In 1536 James undertook a voyage to France, and on the 1st of January 1537 he was married to Magdalene, daughter of Francis I., who, however, died in the following July. In June 1538 James married Mary of Guise, widow of the Duke of Longueville and sister of the Duke of Guise.

Meanwhile the principles of the reformed faith were making progress in Scotland, and Henry VIII. tried to induce his nephew to follow his ecclesiastical policy and to repudiate the authority of the papal see. But James, though he looked with a severe eye upon the overgrown wealth, idleness, and corruption of the clergy, found it necessary to rely on their support in order to reduce the exorbitant power of the nobles. The bishops on their part strove to bring about a rupture with England. With the hope of gaining over his nephew to adopt his policy, Henry invited the Scottish king to meet him at York in the autumn of 1541, and waited there six days for him. But James was induced to break his engagement, and the proud temper of the English monarch fired at the insult. Other causes of offence arose, and war broke out between the two countries in 1542. An army of 30,000 men under the Duke of Norfolk were ordered to invade Scotland; but the attempt ended in nothing. A Scottish army levied to oppose the invaders advanced as far as Fala; the nobles, however, while willing

to support James within the kingdom, refused to follow him beyond the frontier. Another army was shortly after levied by the exertions of the clergy; but the command of this army having been unwisely given by the king to a favourite named Oliver Sinclair, the nobles again refused to act. While the Scottish army thus disputed, a body of English Borderers fell upon and completely routed them at Solway Moss, taking many prisoners. James was completely overwhelmed by this shameful discomfiture, and fell into a state of the deepest despondency. He retired to Falkland Palace attacked by a slow fever which no skill could remove, and he died there 14th December 1542, in the thirty-first year of his age. He left one legitimate child, the ill-fated Mary, who was only a few days old at his death, and six natural children, one of whom was the celebrated Regent Moray. See Bapst, *Les Mariages de Jacques V.* (1889).

James I. OF ENGLAND (1603-25) AND **VI. OF SCOTLAND** (1567-1625) was the only son of Mary, Queen of Scots, and Henry, Lord Darnley. He was born in Edinburgh Castle on the 19th June 1566, at which time unpleasant relations between Mary and her husband were beginning to develop themselves. Then followed the murder of Darnley in February 1567, the marriage of Mary to Bothwell in May, the rising of the nobles at Carberry Hill in June, and the subsequent imprisonment of Mary and enforced resignation of her crown. In consequence of this rapid course of events James was proclaimed king of Scotland, 29th July 1567. The nation at this time was rent by factions, and, as was customary in Scotland under 'bairn kings,' each faction sought to have possession of the person of the monarch. James was placed in Stirling Castle in the keeping of the Earl of Mar, and here he received his education under the famous scholar George Buchanan. Within eleven years Moray, Lennox, Mar, and Morton had successively held the regency of the kingdom, and when, in 1578, the Regent Morton was driven from power James himself nominally assumed the direction of affairs. But the government of his advisers was unpopular, and Morton once more succeeded in re-establishing himself in the regency. About this time James began to exhibit that partiality towards favourites which was so characteristic a feature of his life; and an accomplished, but truculent and unprincipled soldier, Captain James Stewart, whom he created Earl of Arran, was the favourite with whose help and that of the Duke of Lennox (another favourite) the king was enabled finally to break the power of Morton. After Morton's execution (1581) James ruled the kingdom through his two favourites, not without much discontent and grumbling on the part both of the kirk and the nobility. Hence, on 12th August 1582, occurred the well-known Raid of Ruthven (q.v.), when the king was forcibly seized by a party of his nobles, and under their direction was obliged to sanction the imprisonment of Arran and the banishment of Lennox. In 1583 a counter-plot effected the king's freedom, when he immediately restored Arran to power. The confederate lords were obliged to flee to England, whence, in 1585, through the connivance of Queen Elizabeth, they returned, and with an army of 10,000 men forced James to capitulate in Stirling Castle. Arran once more was banished, and never again restored to power.

In 1586 Queen Mary, then a prisoner in England, was condemned by the English court to be executed. James's conduct at this time, taken in connection with his previous attitude towards his mother, and his subsequent friendly alliance with Elizabeth, has been severely censured by Mary's partisans, and in truth does not admit of much defence. In the winter of 1589 he went to Denmark,

where he married the Princess Anne (1574-1619), daughter of Frederick II., king of that country. During these and subsequent years James was frequently in conflict with the Presbyterians on the one hand, and with the Roman Catholics on the other. Like Elizabeth, he hated Puritanism, and was not disinclined towards some modified form of Romanism. The spirit of Presbyterianism he regarded as too democratic, and was therefore disposed to introduce Episcopacy into Scotland, and did ultimately (in 1600) succeed in establishing bishops. In consequence of this tendency the king had frequent theological discussions with the Presbyterian ministers; which discussions, however, were not altogether unwelcome to him, as he had a strong taste for polemics. From 1591 to 1594 the Roman Catholic lords in the north were in a state of semi-insurrection; but James finally marched against them, and the disturbances were suppressed. In 1600 occurred that strange episode, the Gowrie Conspiracy (q.v.).

During the whole of Elizabeth's long reign the disturbing element in English politics had been the question of the succession to the throne; this was finally settled when, on the death of that queen in 1603, James VI. of Scotland ascended the English throne. He was at first well received by his subjects in England, but subsequently became unpopular by reason of his continued partiality towards favourites. He also degraded the prerogative of the crown by the sale of titles of dignity: the title of baronet, which he originated, could be bought for £1000, a barony for £5000, and an earldom for £20,000. His chief favourite at this time was Robert Kerr, or Carre, a Scotchman of the Border family of Kerr of Ferniehirst, on whom he showered honours and emoluments, finally creating him Earl of Somerset. When Carre fell out of favour he was succeeded by the notorious Buckingham. The king really governed through these minions, and the name and prestige of England, so formidable under Elizabeth, sank into insignificance. In 1617 James revisited Scotland, signalling his reappearance among his Scottish subjects by several angry disputes with the clergy, in which the king did not always come off victorious. His eldest son, Henry, Prince of Wales, having, to the great grief of the nation, died in 1612, the succession devolved upon his second son Charles (afterwards Charles I.), between whom and a Spanish princess the king was long anxious to effect a marriage, but after years of negotiation the project was not successful. Buckingham, who was entrusted too much with the conduct of the affair, acted rashly and unwisely, with the consequence that war broke out between the two countries.

James died on 27th March 1625. His character has been painted in various colours by different historians. Sully epigrammatically described him as 'the wisest fool in Christendom,' and Macaulay, in one of his antithetical sentences, exaggerates this aspect of James's character by stating that 'he was indeed made up of two men—a witty, well-read scholar, who wrote, disputed, and harangued, and a nervous, drivelling idiot who acted.' By more recent historians, however, such as Von Ranke and Mr S. R. Gardiner, his character has been treated more broadly and mildly; but perhaps the best popular estimate of the man, his manners, and his peculiarities, is the representation of him which is given by Scott in *The Fortunes of Nigel*.

The literary tastes which James had acquired under the tuition of Buchanan appeared in after life in various works which he issued, but none of which ever became popular. These are *Essays of a Prentice in the Divine Art of Poesie* (1584); *Poetical Exercises at Vacant Hours* (1591); *Demonologie* (1597); *Basilicon Doron* (q.v.); and the *Counterblast to Tobacco* (1616). Westcott edited

his unpublished verse (1912), C. H. McIlwain his *Political Works* (1919).

See the historians already named; Burton, Tytler, Calderwood, &c.; Henderson, *James I. and VI.* (1904); Goodman, *Court of James I.*, ed. J. S. Brewer (1839); *The Secret History of the Court of King James I.*, ed. Sir W. Scott (1811), containing Osborne's *Memoirs*, Weldon's valuable *Court of King James*, &c.

James II. of England and VII. of Scotland (1685-88) was the second surviving son of Charles I., and was born 14th October 1633. A short time before his father's execution he escaped to Holland, and shortly after went to France. He served for some time in the French army under Turenne, and when he was obliged to leave the French territory on the conclusion of peace between the English Commonwealth and Louis XIV. he entered the military service of Spain. At the Restoration (1660) James was recognised as Duke of York, and was made Lord High Admiral of England. In November 1659 he had married Anne Hyde, daughter of the Chancellor, afterwards Earl of Clarendon. He had some skill in maritime affairs, and in 1665 he commanded an English squadron which gained a signal victory over a Dutch fleet under Admiral Opdam. In 1671 he again encountered, off the coast of Suffolk, the Dutch led by the celebrated De Ruyter, and the conflict, which was obstinately contested, terminated at nightfall in a drawn battle. On the death of Anne Hyde in 1671 James made a public avowal of his conversion to the Roman Catholic faith. In 1673 the English parliament passed the Test Act, requiring all civil and military officers to subscribe a declaration against transubstantiation, and to receive the sacrament according to the rites of the Church of England. James was consequently obliged to resign the office of Lord High Admiral. Shortly after he married Mary, daughter of the Duke of Modena. The national ferment occasioned by the supposed Popish Plot became so formidable that he was under the necessity of retiring to the Continent, and during his absence an attempt was made to exclude him from the throne. He returned at the close of 1679, but King Charles found it necessary to require him to remove again from the court, and he was sent down to Scotland to take the management of its affairs. The cruelties which he inflicted on the Covenanters have left an indelible stain upon his memory. Meanwhile the Exclusion Bill was again introduced, and was twice passed by the Commons, but in the first instance it was rejected by the Lords, and on the second occasion it was lost by the dissolution of the parliament. James then returned to England, and in direct violation of the law took his seat in the council, and resumed the direction of naval affairs.

At the death of Charles in 1685 James ascended the throne, and on taking his seat at the head of the council board he declared his resolution to maintain the established government both in church and state, and to respect the liberties of the people. But immediately after his accession he proceeded to levy, on his own warrant, without waiting for the meeting of parliament, the customs and excise duties which they had granted to Charles only for life. He sent a mission to Rome, heard mass ostentatiously in public with regal splendour, became, like his brother, the pensioned slave of the French king, and made the interests of his kingdom subservient to the arbitrary and ambitious designs of that monarch. In Scotland, at his instance, the persecution of the Covenanters was renewed with increased severity and cruelty, and a law was passed enacting that attendance at a conventicle, either as a preacher or a hearer, should be punished with death and confiscation of goods. After the futile rebellion of James's nephew, Monmouth (q.v.), came the 'Bloody

Assize,' presided over by the infamous Jeffreys, in which 320 persons were hanged; the judicial murder of Alice Lisle and Elizabeth Gaunt produced an especially strong impression on the public mind. The suspension of the Test Act by the king's own authority, his prosecution of the seven bishops on a charge of seditious libel, his conferring ecclesiastical benefices on Roman Catholics, his violation of the rights of the universities of Oxford and Cambridge, his plan for packing parliament, and numerous other arbitrary and despotic acts showed his fixed determination to destroy the constitution and to overthrow the church. The indignation of the people was at length roused against him, and it became evident that his expulsion from the throne was necessary for the welfare and safety of the nation. The interposition of William, Prince of Orange, James's son-in-law, was formally solicited by seven influential politicians, and was readily granted. He landed at Torbay on the 4th of November 1688 at the head of a powerful army, and began his march towards London. He was everywhere hailed as a deliverer, while James was deserted not only by his ministers and troops, but even by his daughter the Princess Anne. The unfortunate king, on the first appearance of danger, had sent his wife and infant son to France, and he soon after made his escape from the country and joined them at St Germain. He was hospitably received by Louis XIV., who settled a pension on him. In the following year, aided by a small body of French troops, he proceeded to Ireland and made an ineffectual attempt to regain his throne. He was defeated at the battle of the Boyne, and returned to St Germain, where he resided until his death, 6th September 1701, in the sixty-eighth year of his age. He left two daughters—Mary, married to the Prince of Orange, and Anne, afterwards queen—and one son by his second wife, James Francis Edward, 'the Chevalier de St George' (see JACOBITES). He had also several illegitimate children—one of whom was Marshal Berwick.

See the histories of England by Macaulay, Ranke, Lingard; Burnet's *History of His Own Time*; Macpherson's *History of Great Britain* (1775) and *Original Papers* (1775); the *Lives* by C. J. Fox and Clarke (1816); Wellwood's *Memoirs*, and Luttrell's *Relation of State Affairs*; Wilson's *James II. and the Duke of Berwick* (1876); Campana de Cavelli, *Les Derniers Stuarts à St Germain* (Paris, 1871); Bloxam's *Magdalen College and James II.* (1886); E. and M. S. Grew, *English Court in Exile* (1911); works cited at CHARLES II.; and articles SEVEN BISHOPS, &c.

James, GEORGE PAYNE RAINSFORD, romance-writer, was born in London in 1801. The son of a well-known physician, he was educated at Putney and in France, and by seventeen had written some Eastern tales, which found favour with Washington Irving. Thereafter he ceased to write, dictating instead to an amanuensis his 'thick-coming fancies.' In all he published seventy-seven works, in 198 volumes—historical romances mostly, but also biographies, poems, &c. The best were among the earliest—*Richelieu* (1829) and *Henry Masterton* (1832). He was British consul at Richmond, Virginia, from 1852 till 1858, and then at Venice till his death there on 9th May 1860. 'G. P. R. James' may be classed as a hybrid—a productive hybrid—between Dumas and Mrs Ann Radcliffe. Leigh Hunt writes kindly of him, and Sir Archibald Alison could 'revert with pleasure to his varied compositions.' But his two horsemen will be remembered best, if not indeed solely, by Thackeray's parody *Barbazur*. A revised edition of his works in 21 volumes appeared in 1844-49.

James, SIR HENRY, director of the Geological Survey of Ireland and of the Ordnance Survey of the United Kingdom, was born near St Agnes in

Cornwall in 1803. He passed in 1825 from the Royal Military Academy, Woolwich, into the Royal Engineers. In 1844 he was appointed director of the Geological Survey of Ireland; in 1846 head of the Admiralty works at Portsmouth; in 1852 director of the Ordnance Survey of the United Kingdom; and in 1857 chief of the Statistical and Topographical Department of the War Office. He was knighted in 1860, and made major-general in 1868. He died at Southampton on 15th June 1877. From his pen came several works on geology, surveying, &c., including *Ordnance Trigonometrical Survey of Ireland* (1858) and *Account of the Principal Triangulation of the United Kingdom* (1864). By means of zincography, a process which he invented in 1859, he produced fac-similes of *Domesday Book* (32 vols.) and of national MSS. of England (to Anne's reign), of Scotland, and of Ireland.

JAMES OF HEREFORD, HENRY, BARON (1828-1911), born at Hereford, went to school at Cheltenham College, and was called to the bar of the Middle Temple in 1852. In 1850, and again in 1851, he had attained legal distinction as lecturer's prizeman at the Inner Temple. He became a Queen's Counsel in 1869, a bencher of his Inn in 1870; and in March 1869 entered the House of Commons for Taunton. He continued to represent Taunton in the Liberal interest until 1885, when he was returned for Bury, in Lancashire. He made a considerable mark in the debates on the Judicature Bill in 1872, and in the succeeding year was appointed by Mr Gladstone Solicitor-general. In 1873 he became Attorney-general, and was knighted; and in 1880, on the return of Mr Gladstone to power, he again became Attorney-general. He ably conducted the Corrupt Practices Bill through the House of Commons in 1883. Sir Henry James was offered the Lord Chancellorship on the formation of Mr Gladstone's third administration in 1886, but he declined in consequence of his inability to support the Home Rule policy; and in 1886 he was re-elected for Bury unopposed, as a Liberal Unionist. Created Lord James of Hereford in 1895, he was Chancellor of the Duchy of Lancaster in 1895-1902. He opposed the second Home Rule Bill, Mr Chamberlain's tariff scheme, and the rejection of the 1909 budget by the House of Lords.

JAMES, HENRY, an eminent American novelist, was born in New York, 15th April 1843. He was until his father's death known to the reading public as Henry James, junior, the father (1811-82) being a well-known and original theological writer and lecturer, the exponent in turn of Sandemanianism and the system of Swedenborg. The boy was cosmopolitan from his cradle, and was educated under his father's eye in New York, Geneva, Paris, and Boulogne. In 1862 he entered the Harvard law-school, but his destiny was to be solely a man of letters, and, after the usual preliminaries of magazine-writing and shorter stories, he took his place among contemporary novelists with *Roderick Hudson* in 1875. Already in 1869 he had migrated to Europe, there to reside by turns in England and in Italy. He died 28th February 1916, half a year after being naturalised as British. Notable novels are *The American* (1878), *The Europeans* (1878), *Daisy Miller* (1878), *A Bundle of Letters* (1879), *Washington Square* (1880), *The Portrait of a Lady* (1881), *The Bostonians* (1886), *Princess Casamassima* (1886), *The Tragic Muse* (1890), *What Maisie Knew* (1897), *The Awkward Age* (1899), *The Sacred Fount* (1901), *The Wings of a Dove* (1902), *The Ambassador* (1903), *The Golden Bowl* (1905); besides collections such as *Stories Revived* (1885), *The Reverberator* (1888), *The Aspern Papers* (1888), *A London Life* (1889), *The Finer*

Grain (1910). His delicate critical power was shown in his *French Poets and Novelists* (1878), *Partial Portraits, Hawthorne, W. W. Story* (1903), and *Notes on Novelists* (1914). There is a geographical thread in *Portraits of Places* (1884), *A Little Tour in France, English Hours, Italian Hours, The American Scene* (1907). *The Question of our Speech* (1905) deals with the nature of fiction; *A Small Boy and Others* (1913), *Notes of a Son and Brother* (1914), and *The Middle Years* (1917) are biographical and autobiographical. A selection of his *Letters* appeared in 1920. In fiction James was a leader in the analytical school, whose method he carried to a degree of refinement which sometimes approaches morbidity. The subtlety and cleverness amaze, the allusiveness and the elliptical dialogue perplex the impatient.

See studies by Cary (1905), Hueffer (1913), West (1916), Theodora Bosanquet (1924).

JAMES, WILLIAM, elder brother of the preceding, was born in New York in 1842, and, educated at home and in Europe, took the Harvard M.D.; and from 1872 he lectured at Harvard on anatomy, physiology, psychology, and philosophy in succession. He became a professor in 1881. A keen and pregnant thinker, a luminous and attractive writer, he defended what have been thought theological paradoxes on non-theological grounds, maintained orthodox positions in an unorthodox and original manner, and combined empirical method with a strongly idealistic body of thought. As an analytical psychologist of the school of Wundt and Ribot he exercised even more influence than as a metaphysician—the exponent of *Pragmatism* (1907; see PRAGMATISM) and *A Pluralistic Universe* (1909). His works comprise *Principles of Psychology* (1900), and a smaller manual (1902); *The Will to Believe*; *Human Immortality*; *The Varieties of Religious Experience* (the Gifford Lectures at Edinburgh in 1899-1901). In 1884 he edited his father's *Literary Remains*; and he died in August 1910. See studies by Royce (1912) and Boutroux (1911), the biographical work by his brother above mentioned, and his *Letters* (1920).

JAMES, JOHN ANGELL, Congregationalist minister, was born at Blandford Forum, Dorsetshire, June 6, 1785, was apprenticed to a linen-draper, studied at a dissenting college at Gosport, and as a popular preacher was at twenty settled as pastor at Birmingham, where he remained till his death, October 1, 1859. He published a multitude (17 vols. collected) of sermons, tracts, addresses, and religious works, one of them the *Anxious Inquirer*. See *Life* by Dale (1861).

JAMESON, ANNA, art critic and general writer, daughter of an Irish miniature-painter named Brownell Murphy, was born at Dublin in 1794, and for a dozen years had been a governess when in 1825 she married Robert Jameson, who in 1829 was appointed a judge in Dominica. His neglect led her to refuse to accompany him; and save during a visit to Canada in 1836-38, she ceased to live with him. In 1831 she published *Memoirs of Female Sovereigns*, and this was succeeded in the following year by her subtle and fascinating *Characteristics of Shakespeare's Women*. Among other topics upon which she wrote at this time were female labour, penitentiaries, and hospital nursing. She further published, in 1833, *Beauties of the Court of Charles II.*, in 1837 *Sketches of Germany*, in 1839 *Rambles in Canada*, and in 1846 *Memoirs and Essays*. But it is as an art-critic that she is best remembered, for her *Handbook to Public Galleries in and near London* (1832); *Lives of Early Italian Painters* (1845); *Poetry of Sacred and Legendary Art* (1848); *Legends of the Monastic Orders* (1850); *Legends of the Madonna* (1852); and a

Commonplace Book of Thoughts, Memories, and Fancies (1854). Her work on *Our Lord and John the Baptist* as represented in art was completed by Lady Eastlake. She died at Ealing, 19th March 1860. See the Memoirs by her niece (1878), and the new edition of her works (6 vols. 1890).

Jameson, SIR LEANDER STARR, leader of the raid into the Transvaal, was born at Edinburgh 8th February 1853, studied medicine there and at London, and having gone to the Cape, settled in medical practice at Kimberley in 1878. Through Cecil Rhodes he took part in pioneer work, was made administrator for the South Africa Company at Fort Salisbury, and conciliated enormous influence and popularity. During the troubles at Johannesburg between the Uitlander reform party and the Boer government Jameson, who by order of Rhodes, then Cape Premier, had concentrated the military forces of Rhodesia at Mafeking on the Transvaal frontier, started with 500 troopers to support the Reformers (29th December 1895) just when they had been intimidated by President Kruger; and after riding foodless for twenty-four hours the party encountered on 1st January 1896 an overwhelming Boer force strongly posted at Krugersdorp, to the west of Johannesburg. Surprised and disappointed that no support came to them from Johannesburg, they fought gallantly till their ammunition was exhausted and till Boer reinforcements brought up artillery. Then Jameson and 450 men surrendered, and were imprisoned at Pretoria, but handed over ere long to the British authorities for trial. Jameson, who arrived in England two months after the raid, was in August condemned to fifteen months' imprisonment, without hard labour, his officers to minor terms of imprisonment. He fell ill in prison, and was released in December. He served in the war in 1899-1900, and in 1900 was elected to the Cape Legislative Assembly for Kimberley. In 1902 he was made director, in 1913 president, of the South African Company, and in 1904-8 was (Progressive) Premier of Cape Colony. He retired from politics in 1912, and died 26th November 1917. See *Life* by Ian Colvin (1922).

Jameson, ROBERT (1772-1854), geologist and mineralogist, born at Leith, and educated at Edinburgh University and under Werner at Freiberg (1800-2), was elected in 1804 to the chair of Natural History in the university of Edinburgh. At first a Wernerian, he adopted Hutton's views; and he published half-a-dozen works on mineralogy and geognosy.

Jamesone, GEORGE, portrait-painter, was born in Aberdeen, probably in 1588, a son of Andrew Jamesone, a master-mason and burgess of guild of the city. A baseless tradition affirmed that he studied painting in Antwerp under Rubens along with Van Dyck. Really he was in 1612 apprenticed for eight years to 'John Anderson, paynter' (see *Academy*, 14th April 1894). The dates inscribed upon his works prove that in 1620 he practised his art at Aberdeen, and afterwards mainly in Edinburgh, of which he became a burgess in 1633. He was soon in excellent repute as a portrait-painter, and likenesses by his hand of many of his most eminent contemporaries still exist. One of his chief patrons was Sir Colin Campbell of Glenorchy, for whom he executed an extensive series of portraits, both from the life and from earlier pictures, which are now preserved at Taymouth Castle and Langton House, Duns. Many works attributed to Jamesone—in not a few cases falsely attributed to him—are preserved in the mansions of Scotland. His authentic works are painted with considerable delicacy, but are marred by very pronounced mannerisms, and

their painter has little claim to his customary title of 'the Scottish Van Dyck.' He died at Edinburgh in 1644. See J. Bulloch's *George Jamesone* (1885).

James Bay, the southerly arm of Hudson Bay, about 250 miles long from north to south, and 175 miles wide. It is greatly beset with islands, and its navigation is dangerous.

James River is formed by the union of the Jackson and Cowpasture streams in the west of Virginia, and has its entire course in that state. It flows in a generally east-south-east direction, passing Lynchburgh and Richmond; and, widening into an estuary for the last 60 miles of its course, it falls into the Atlantic at the southern extremity of Chesapeake Bay. It is 450 miles in length, and is navigable for large steamers to City Point, at the mouth of the Appomattox. It was at Jamestown, now a ruined village on the north bank of this river, that the first English settlement in America was formed (1607). The James River and Kanawha Canal, which extends from Richmond to the White Sulphur Springs, follows the windings of the river for a considerable distance.

James's Powder is the modern representative of an old nostrum of Dr Robert James (1705-76) of London. The preparation in the Pharmacopœia which is supposed to have similar virtues in febrile affections consists of oxide of antimony and phosphate of lime. It is but little used now.

Jamestown, a city of New York, on Chautauqua Lake, 70 miles S. by W. of Buffalo by rail. It has manufactures of woollens, pianos, furniture, &c. Pop. (1880) 9357; (1920) 38,917. See also JAMES RIVER.

James Town, the chief place and only seaport of St Helena (q.v.).

Jamet, MARIE (1820-93). See SISTERHOODS.

Jami, the last classical poet of Persia, 1419-92. See PERSIA (*Literature*).

Jamieson, JOHN, D.D., a meritorious Scottish scholar, was born in Glasgow, March 3, 1759, studied for the ministry, and in 1781 was ordained pastor of the Secession (Anti-burgher) congregation at Forfar. In 1797 he was translated to Edinburgh, where he died July 12, 1838. Jamieson's reputation rests on his *Etymological Dictionary of the Scottish Language* (1808-9; supplement 1825; best edition by David Donaldson, 4 vols. 1879-87). It is a work of great industry, and of very considerable value as a collection of Scots words, phrases, customs, &c.; but it possesses little critical or philological merit, according to the present standard. His preliminary dissertation on the 'Origin of the Scots Language' is an elaborate but unsuccessful attempt to prove that the Scottish language is really the Pictish language, and that the Picts were not Celts, but Scandinavian Goths. Jamieson also wrote on the Culdees, on the affinities of the Greek and Latin languages to the Gothic, on the royal palaces of Scotland, &c.; and he published editions of Barbour's *Bruce*, Blind Harry's *Sir William Wallace*, and Slezer's *Theatrum Scotiæ*.

Jammes, FRANCIS, French poet and prose-writer, was born at Tournay, Hautes-Pyrénées, in 1868. His earlier poems were collected in *De l'Angélus de l'Aube à l'Angélus du Soir* (1898), which was followed by *Deuil des Primevères* (1901), *Le Triomphe de la Vie* (1904), a number of prose romances, such as *Le Roman du Lièvre* (1903). *Le Poète Rustique* (1920) is also in prose.

Jammu (Jummoo), a town of Kashmir, on an affluent of the Chenab; pop. 31,700.

Jamnotri, hot springs near the source of the Jumna, in northern India, in 30° 59' N. lat. and

78° 35' E. long., 10,849 feet above the sea. Their temperature is 194.7° F., nearly that of boiling water at their elevation. They are overhung by three connected mountains known as the Jamnotri Peaks (20,100 to 21,150 feet).

Janesville, a city of Wisconsin, lies mostly between bluffs in the narrow bottom-land of Rock River, which is crossed here by six bridges, 91 miles NW. of Chicago, at the junction of four railways. The river is crossed by dams, and its water-power is utilised in numerous manufactories of various kinds. Pop. 18,000.

Janet, PAUL, an eminent French philosopher, born at Paris, 30th April 1823. He was educated at the Normal School, and was in turn teacher in the gymnasium at Bourges, and professor of Philosophy in the faculty at Strasburg and of Logic in the Lycée Louis-le-Grand. In 1864 he was elected to the Academy of Moral and Political Sciences, and then he lectured in the Sorbonne at Paris. He died 4th October 1899.

Janin, JULES GABRIEL, French critic and novelist, was born at St Etienne, December 24, 1804, and had his education there and at Paris. He took early to journalism, writing for the *Figaro*, the *Quotidienne*, and the *Journal des Débats*, and his dramatic criticisms in the last-named journal made him a reputation by their wit and vivacity. Janin wrote with fatal fluency, and his numberless articles, prefaces, books of travel, and miscellaneous pieces of task-work pleased his readers and filled his pockets, but did nothing for a future fame. But the 'prince of critics' wrote gaily for the present, lacking the instinct of perpetuity. Yet twice he came near to writing things of permanent value. His strange and at least half-serious story *L'Âne mort et la Femme guillotinée* (1829) was followed by *Barnave* (1831), an interesting book, half historical novel, half polemic against the Orleans family. Janin succeeded to Sainte-Beuve's chair in the French Academy in 1870, and died 19th June 1874. His *Œuvres Choies* appeared in 1875-78, his *Correspondance* in 1877. Like Dumas he lent his name to works not his own.

Janina, YANINA, or JOANNINA, capital formerly of a vilayet in Turkish Albania, now of a Greek nomarchy, stands in a striking situation on a lake (12 miles long by 3 broad) of the same name, 50 miles inland from the shore opposite the island of Corfu. Its buildings include many churches, and the ruined castle of Ali Pasha (q.v.), whose headquarters were there. Gold lace is extensively manufactured, as well as morocco leather, silk goods, and coloured linen. The district produces cattle, sheep, olives, and olive-oil. Pop. 40,000 under Ali Pasha, now about 20,000. The town had been under Turkish rule from 1430 when Essad Pasha and 30,000 Turks surrendered to the Crown Prince Constantine of Greece, 6th March 1913. It was occupied by the Italians in June 1917.

Janizaries (Turkish, meaning 'new soldiers'), the first regular standing army of the Turks, formed by Sultan Orkhan, about 1330, of Christian prisoners compelled to embrace Mohammedanism, and of the children of Christians forcibly trained as Mussulmans. It was more perfectly organised by Orkhan's son, Amurath I., after 1362, especial privileges being conferred on those who belonged to it. This soon induced many Turks to join its ranks. There were two classes of Janizaries, one regularly organised, dwelling in barracks in Constantinople and other towns, whose numbers sometimes amounted to 100,000, and the other composing an irregular militia, scattered throughout the empire, and amounting to 300,000 or 400,000. At the head of the whole force was an *aga*, who

was held in most reverential respect, and whose power extended to life and death. In time of peace the Janizaries acted as a police force. In war they served on foot, and were noted for the wild impetuosity of their attack. The sultan's bodyguard was formed of them. But success and special privileges produced their usual effects; the history of the Janizaries abounds in conspiracies, assassinations of sultans, viziers, agas, &c., and atrocities of every kind, and in the end they became more dangerous to the sultans than any foreign enemies. More than one sultan attempted, but unsuccessfully, to reform or dissolve them. At last Sultan Mahmoud II., in 1826, having organised a new force after the pattern of the European armies, displayed the flag of the Prophet, and after some sanguinary fighting drove back the Janizaries into their barracks, which he burned, 8000 perishing in the flames. Not fewer than 15,000 were executed, and more than 20,000 banished. By a proclamation of June 17, 1826, the Janizary force was finally dissolved; its place was taken by the Nizam, modern regulars organised on a European plan.

Jan Mayen, a volcanic island in the Arctic Ocean, named after the Dutch navigator for whom its discovery (1611) used to be claimed. It lies between Iceland and Spitsbergen, and is 35 miles long. Its highest point is the extinct volcano of Beerenberg, 8000 feet, the sides of which are covered with immense glaciers and frozen waterfalls. In 1882-83 it was made the station of the Austrian polar expedition. Seal and whale fishings are carried on when the seasons permit. It was occupied by Norway in 1920. See Dufferin, *Letters from High Latitudes*; Duke of Orleans, *Hunters and Hunting in the Arctic* (trans. 1912); Murray and Hjort, *The Depths of the Ocean* (1912).

Jansen, CORNELIUS, was born in 1585, at Acquoi, near Leerdam, in Holland. He made his studies at Utrecht, Louvain, and Paris, and from early youth was familiar with some of the disciples of Bajus (q.v.), and with the Abbé de St Cyran. For some time he filled a chair at Bayonne; and in 1617 he was called to Louvain, where in 1630 he was appointed professor of Theology. In 1636 he was made Bishop of Ypres, and in this city he died of the plague, May 6, 1638, just as he had completed his great work of more than twenty years' preparation, the *Augustinus, seu Doctrina S. Aug. de Hum. Naturæ Sanitate, Aegritudine, Medicina, adversus Pelagianos et Massilienses* (4 vols.), which proved the occasion of a great theological controversy. The main object of this work was to prove, by an elaborate analysis of St Augustine's works, that the teaching of this Father against the Pelagians and semi-Pelagians on Grace, Free-will, and Predestination was directly opposed to the teaching of the modern, and especially of the Jesuit schools, which latter teaching he held to be identical with that of the semi-Pelagians. Jansen repudiated the ordinary Catholic dogma of the freedom of the will, understood to mean the power to choose at the time good or evil (*libertas contradictionis*), asserting merely the existence of freedom from external constraint (*libertas a coactione*), not inward necessity. He also refused to admit merely sufficient grace, maintaining that interior grace is irresistible, and that Christ died for all. In the preface Jansen submitted the work to the judgment of the holy see; and on its publication, under the care of Frommond, in 1640, being received with loud clamour, especially by the Jesuits, the *Augustinus* was prohibited by a decree of the Inquisition in 1641; in the following year it was condemned in general terms, as renewing the errors of Bajus, by Urban VIII in the bull *In Eminentissimis*. This bull encountered much opposition in Flanders; and in

France the *Augustinus* found many partisans, animated both by doctrinal predilection and antipathy to the alleged laxity of moral teaching in the schools of the Jesuits, with whom the opposition to the *Augustinus* was identified. Most eminent among these were the celebrated scholars and divines who formed the community of Port Royal (q.v.), Arnauld, Nicole, Pascal, and others. Nevertheless, the syndic of the Sorbonne extracted from the *Augustinus* seven propositions (subsequently reduced to five) which were definitively condemned as heretical by Innocent X. in 1653. The friends of the *Augustinus*, while they admitted that in point of *right* the five propositions were justly condemned as heretical, yet denied that in point of *fact* these propositions were to be found in the *Augustinus*, at least in the sense imputed to them by the bull. Arnauld in a celebrated *Lettre* admitted the church's infallibility on the former question, and the duty of entire submission, but held that the latter was a question of historical fact on which the church might err, and that it was sufficient if the faithful received her decision on it with 'respectful silence.' Meantime the controversy had produced one work that holds its immortality as securely as any book in the range of literature, the *Lettres Provinciales* of Pascal. Arnauld's distinction between right and fact was at length condemned by the Sorbonne, and himself and sixty other doctors expelled, and in October 1656 a further condemnation of the *Augustinus*, 'in the sense of the author,' was issued by Alexander VII., rigidly enforced in France, and generally accepted; and early in 1669 peace was partially restored by Clement IX.—at least all overt opposition was repressed by the iron rule of Louis XIV.

The more rigid Jansenists, however, and at their head Antoine Arnauld, emigrated from France, and formed a kind of community in the Low Countries. The controversy was revived with new acrimony by the dispute on the so-called 'case of conscience,' whether a dying ecclesiastic could lawfully be absolved who was not convinced that the five propositions as condemned by the church were contained in the *Augustinus*; and still more angrily in the person of the celebrated Quesnel, whose *Moral Reflections on the New Testament* was denounced to the pope, Clement XI., as a text-book of undisguised Jansenism. This pope had already in 1705 decided the case of conscience by the bull 'Vineam Domini,' when in 1713 he condemned by the bull 'Unigenitus' as many as 101 propositions extracted from the *Moral Reflections*. After the death of Louis XIV. the regent, the Duke of Orleans, was urged to refer the whole controversy to a national council, and the leaders of the Jansenist party appealed to a general council. The party thus formed, which numbered in 1717 four bishops and many inferior ecclesiastics, were called, from this circumstance, the Appellants. The firmness of the pope, and a change in the policy of the regent, brought them into disfavour. An edict was published, June 4, 1720, receiving the bull; and even the parliament of Paris submitted to register it, although with a reservation in favour of the liberties of the Gallican Church. The Appellants for the most part submitted, the recusants being visited with severe penalties; and on the coming of age of the new king, Louis XV., the unconditional acceptance of the bull was at length formally accomplished. From this time forward the Appellants were rigorously repressed, and a large number emigrated to the Netherlands, where they formed a community, with Utrecht as a centre. The party still remaining in France persisted in their inveterate opposition to the bull, but the real significance of Jansenism may almost be said to have died with Quesnel in 1719, and, indeed,

the movement inaugurated by such intellects as Arnauld and Pascal ended in France before the middle of the century in fanaticism and superstition. The miracles in the St Médard cemetery, and the physical convulsions that became common, brought Jansenism in France to a discredited conclusion (see CONVULSIONARIES).

In one locality alone, Utrecht, and its dependent churches, can the sect be said to have had a regular and permanent organisation. The vicar-apostolic, Peter Kodde, having been suspended for Jansenist sympathies by Clement XI. in 1702, the chapter of Utrecht refused to acknowledge the new vicar named in his place, and angrily joined themselves to the Appellant party in France, many of whom had found a refuge in Utrecht. At length, in 1723, they elected an archbishop, Cornelius Steenhoven, for whom the form of episcopal consecration was obtained from the French bishop Varlet (titular of Babylon), who had been suspended for Jansenist opinions. A later Jansenist Archbishop of Utrecht, Meindarts, established Haarlem and Deventer as his suffragan sees; and in 1763 a synod was held, which sent its acts to Rome, in recognition of the primacy of that see. Since that time the formal succession has been maintained, each bishop, on being appointed, notifying his election to the pope, and craving confirmation. The popes, however, have uniformly rejected all advances, except on the condition of the acceptance of the bull *Unigenitus*; and the definition as of Catholic faith of the dogma of the Immaculate Conception of the Blessed Virgin Mary (1854) and the Papal Infallibility (1870) have been the occasion of fresh protests. Loos, the Jansenist Archbishop of Utrecht, consecrated Dr Reinkens bishop for the German Old Catholics. Pius IX. restored the Dutch hierarchy in 1851, so that there is now an orthodox Archbishop of Utrecht. The Dutch Jansenists are in doctrine and discipline strictly orthodox Roman Catholics, being known by their countrymen as Oude Roomsche ('Old Roman').

Janssen, CORNELIS, born in London in 1593, died at Amsterdam about 1664, lived and worked in England from about 1618 to 1643, and acquired a reputation as a fine painter of portraits and historical subjects.

Janssens, ABRAHAM, a Dutch painter, who called himself Janssens van Nuyssen, was born in Antwerp about 1575, and entered the guild of St Luke in 1601. He died at Antwerp in 1632. His most famous pictures are the 'Entombment of Christ' and the 'Adoration of the Magi.' From his vigorous drawing and admirable colouring he ranks next to Rubens among the historical painters of the period.

Janssens, VICTOR HONORIUS, was born at Brussels in 1664, and died there in 1739. He painted chiefly in Rome and at Brussels.

Janthina. See IANTHINA.

Januarius, ST., or SAN GENNARO, a martyr of the Christian faith under Diocletian, was a native of Benevento, or at least became bishop of that see in the later part of the 3d century. According to the Neapolitan tradition, he was taken prisoner at Nola; and the place of his martyrdom, in 305, was Pozzuoli, where many Christians suffered the same fate. His body is preserved at Naples, in the crypt of the cathedral, and in a chapel of the same church are also preserved the head of the martyr, and two phials (*ampullæ*) supposed to contain his blood. On three festivals each year—the chief of which is the day of the martyrdom, September 19, the others the first Sunday evening in May and the 16th December—as well as on occasions of public danger or calamity, as earthquakes or eruptions,

the head and the phials of the blood are carried in solemn procession to the high-altar of the cathedral, or of the church of St Clare, where, after prayer of longer or shorter duration, the blood, on the phials being brought into contact with the head, is believed to liquefy, and in this condition is presented for the veneration of the people, or for the conviction of the doubter. It occasionally happens that a considerable time elapses before the liquefaction takes place, and sometimes it altogether fails. The latter is regarded as an omen of the worst import; and on those occasions when the miracle is delayed beyond the ordinary time the alarm and excitement of the congregation rise to the highest pitch. Cardinal Newman accepted the miracle in full faith (see his *Life by Wilfrid Ward*, 1912). On this celebrated legend there is a wealth of documents in the sixth volume of the Bollandist *Acta Sanctorum* for September. The modern ceremony is described in most recent works on Naples.

January, the first month of the year. It was, among the Romans, held sacred to Janus (q.v.), from whom it derived its name, and was added to the calendar along with February by Numa. It was not till the 18th century that January was universally adopted by European nations as the first month of the year, although the Romans considered it as such as far back as 251 B.C.

Janupa Hemp. See CROTALARIA, FIBROUS SUBSTANCES.

Janus, an ancient Italian god. The distinctive mark of Roman religion and Roman gods as opposed to Greek gods is that the former are abstract, whilst Greek thought was marked by its anthropomorphism. In the belief of the Roman everything and every action had its corresponding spirit—even such processes as ploughing, harrowing, &c. Janus, tried by this test, approves himself as peculiarly Italian. He is 'the spirit of opening,' and there is nothing in the mythology of any other Aryan nation to correspond to him. His name is derived from the same root as the Latin word *janua*, 'a gate' or 'opening.' As the spirit of opening he was invoked at the beginning of all undertakings (at the beginning of human life as *Coniuvius*). For the same reason he was the god of the beginning of day, *Matutinus Pater*, and of the beginning of the (agricultural) year, the first month of which, January (though originally the eleventh of the calendar year), was dedicated to him. Hence, too, may be explained the fact that he took precedence of all other gods, even of Jupiter, and that he is called in the Saliaric Hymn *Deorum Deus* (Macrob. *Sat.* i. 9), and even *Summanus*. In the next place, as the spirit of openings, Janus was the god under whose care were all *januæ*, or gates, in Rome; above all, he it was under whose protection was the archway out of which the army marched to war and by which it returned. This archway, which in later times was replaced by a temple of Janus, naturally had its gates open in time of war and closed in time of peace. The tutelary god of the gate that opened both ways was, by a natural transference of thought, himself represented by an image having a double head that looked both ways (see AS). His connection with the year was sometimes indicated by the fact that three fingers of the right hand were bent so as to indicate the numeral CCC (300), while the fingers of the left hand were spread so as to denote the numerals L (50)+V (5), or in later times L+V+V+V—that is, in all, the 355 days of the older, and the 365 days of the reformed Julian, year. As the god of gates he naturally carries keys. As an auspicious god he is crowned with laurel. The interpretation of

Janus as originally a god of light fails to explain his functions, is at variance with the spirit of Roman religion, and is based on a false etymology: Janus cannot be the masculine of Diana, because the *i* is long (and therefore cannot be consonantal); and, moreover, the real masculine of Diana is preserved in an inscription (C. I. L. 5, 783), *Jovi Dianô*. Janus is not derived from a root meaning 'to shine,' but from one meaning 'to go.'

Japan, the English form of the name Ji-pân, signifying 'the source of the sun,' originally given by China to Japan, and subsequently adopted by the Japanese in the form of Nihon, or Nippon, their readings of the Chinese characters with which the word is written. Japan has also names of native origin, the best known of which is Yamato. The area of the Japanese empire has undergone frequent changes since the middle of the 19th century. At the time of Commodore Perry's visit in 1853 the territories administered by the Japanese government consisted of the four islands known as Hondo (main island), Shikoku, Kiûshû, and Yezo. Japan was also in joint possession with Russia of the island of Sakhalin (Saghalien or Karafuto), and had a disputed claim to the Kuriles. In 1875 Japan ceded her rights in Sakhalin in exchange for the Kuriles, and in 1879 she annexed the Riûkiû (Luchu or Loochoo) Islands. In 1895 Formosa and the Pescadores were ceded to her; ten years later, after the triumphant war with Russia, she acquired southern Sakhalin, the lease of the Liaotung peninsula, and the south Manchurian railway as far as the town of Chang-chun; and in August 1910 she annexed Korea, over which she had previously exercised a protectorate. By the treaty of Versailles Germany ceded her rights in Shantung (including Kiaochow) to Japan. Restoration to China followed the Washington treaty (1922). Subsequent arrangements secured for Japan a mandate for the German islands in the Pacific, north of the equator (Caroline, Pelew, Marshall, and Ladrões). Northern Sakhalin and part of the Siberian mainland were seized and held during the Russian troubles. The present Japanese empire, exclusive of the occupied and mandatory territory, extends from 21° 45' to 50° 56' N. lat. Its area is 240,648 sq. m., to which Korea contributes 70,000. Of this total not more than 12 per cent. is cultivable. The population of the Japanese empire according to the census of 1920 was 77,500,000. This includes Korea, Formosa, and Karafuto. In the old territories the population was about 56,000,000.

Physical Features.—The territory of the Japanese empire is all more or less mountainous, and much of it is volcanic in character. It has been suggested that the Japanese islands are the advance frontier of the Asiatic continent, and there are indications in the fauna and flora of the country which point to its connection at some remote geological period with the continent of America. Earthquakes occur frequently, and there are many volcanoes. Some of these are active; others quiescent or extinct. The chief active volcanoes are Oshima (Vries Island), at the entrance to Tôkyô Bay; Aso-san, in Kiûshû; Asama-yama, Shiranê-san, and Bandai-san, in the centre and east of the main island; and Koma-ga-také, in Yezo. An eruption of Sakurashima, on an island in Kagoshima Bay (Kiûshû), did much damage to the town of Kagoshima in January 1912. The highest mountain is Mount Morrison (14,000 feet) in Formosa. Many of the mountains in Japan are sacred, pilgrimages being made to them at stated times in the year. Amongst these Fujiyama (12,370 feet), a quiescent volcano, the last eruption of which occurred in 1708, easily takes the first place. National sentiment has gathered round it, and it is a favourite

subject with artists and designers. Japan abounds in solfataras and in hot springs. She has few lakes. The only large one is Lake Biwa, near Kyōto, which is some 50 miles long. There are many rivers, but they are all short, and, with one or two exceptions, are of little use for navigation. Kūshū and Shikoku and the shores of the main island which front the Pacific are well supplied with safe and commodious harbours. Other portions of the coast-line are, however, deficient in this respect. One remarkable feature of Japan proper is the Inland Sea, which separates Shikoku, and, farther west, Kūshū, from the main island. This landlocked stretch of water is only accessible by narrow, dangerous, and easily defensible entrances at each end, and furnishes a magnificent natural waterway for the commerce of the country.

Climate.—Extending as it does through nearly thirty degrees of latitude, it is only natural that the climatic conditions of different parts of the Japanese empire should vary widely. The temperature in the extreme north ranges from below zero in the winter to 70° F. in the summer months; while in the extreme south the range is from 41° F. in the winter to 96° F. in the hottest time of the year. The annual average temperature of Tōkyō is about 57° F., the temperature throughout the year ranging between a mean minimum of 28° F. in January and a mean maximum in August of 86° F. The warm ocean current known as the *Kuroshio* (Black Stream) skirts the Pacific shores of Japan, and similarly two smaller cold currents flow from the north. The influence of these currents, and the prevalence during the winter of NW. winds, produce a marked difference in climate between the districts which border on the Pacific and those facing the Sea of Japan, the winters being milder in the former, and the summers less hot. The effects of these currents are also shown in the excessive humidity of the Japanese climate, and the prevalence of fog in certain places. The rainfall varies much in different years, being heaviest in the south. The yearly average in the neighbourhood of the capital is 58 inches. The driest months are November, December, and January; the wettest being June, September, and October. Typhoons are apt to occur in the summer and autumn. The heavy rain, which is a feature of these storms, causes extensive inundations. The climate of Japan is on the whole fairly healthy, though enervating to Europeans.

Vegetable Productions.—In Professor Matsu-mura's nomenclature of Japanese plants, published in 1895, a little over 3000 species are enumerated. Since then many fresh species have been discovered, and the number at present known to science is about 5000. Of these 266 are the same as British species. Conifers of numerous kinds, the elm, maple (24 species), oak (21 species and varieties), chestnut (both Spanish and horse), birch, horn-beam, magnolia, cypress, dwarf-oak, walnut, and beech all abound. The bamboo, of which there are more than 20 species—three being valuable for economic purposes—forms a conspicuous feature everywhere, except in the most northern districts. A palm, the *Chamaerops excelsa*, is cultivated for its fibre, used in the manufacture of rope; and the sugar-cane is grown in the southern districts. Amongst the specially characteristic trees and shrubs may be noted the *Kéaki* (*Zelkova Kéaki*), from which the best timber is obtained, the *hinoki* (*Chamaecyparis obtusa*) and the *Cryptomeria japonica*—both also valued for their timber; the *gingkō* (*Ginkgo biloba*), which often reaches a great size; the *Rhus vernicifera*, or lacquer-tree; the *Laurus camphora*, or camphor-tree; the *Morus alba*, or silk-mulberry; *Broussonetia papyrifera*, or paper-mulberry, and two other plants used in paper-

making; and the vegetable-wax tree of Japan, *Rhus succedanea*. The tea-shrub, tobacco-plant, indigo-plant, and rape are grown extensively. The hills in Japan are rich in wild flowers, many of which are common to Europe. The number of cereals and food-plants is very large. The list includes rice, wheat, barley, four kinds of millet, maize, buckwheat, the ground-nut (*Arachis hypogaea*), the soy-bean (*Glycine hispida*) and various other species of beans, the sweet-potato (*Batatas edulis*) and common potato, and the egg-plant, besides almost every vegetable which grows in Europe. The chief fruits are the orange, persimmon, grape, native pear (*Pyrus sinensis*), fig, plum, and melon, of which there are several kinds. In the hill districts whortle-berries, wild raspberries (of two kinds), and strawberries are fairly common. Of late years much success has attended the cultivation of foreign peaches, pears, and apples.

Zoology.—The land fauna of Japan appears to be closely related to that of the neighbouring continent. Neither the tiger, however, nor the leopard of the mainland is found. The fauna of Yezo and the Kuriles has also marked characteristics of its own. There are three bears in Japan—the black bear (*Ursus japonicus*, Schl.), the grizzly bear of North America (*Ursus ferox*), and the polar bear (*Ursus maritimus*). The first exists only south of Yezo; the two others are found in Yezo and the Kuriles, the last-named being only an occasional visitor. There are two wolves, a small species (*Canis hodophylax*) found in the main island, and a larger kind, peculiar to Yezo and the Kuriles, called by the Japanese *Okami*. Both the badger and the fox are common in Japan. The former (*Meles Anakuma*, Tem.) lives in the hills. A smaller so-called badger (the raccoon-dog), called by the Japanese *Tanuki*, is often found in or near towns. It is this smaller animal to which, in common with the fox, so much curious superstition attaches. The latter animal is worshipped, fox-shrines being numerous in all parts of the country, and the magical powers attributed to it play an important part in the national folklore. One species of monkey (*Inuus speciosus*, Tem.) is found everywhere south of Yezo. Other animals are the wild boar; a deer, the *Cervus sika*, Tem., common all over the country; the *Kamo-shika*, a kind of chamois (*Antelope crispata*, Tem.), which is found only in inaccessible places in the hills; several members of the marten tribe, including river and sea otters; tree, ground, and flying squirrels; and a small hare. Sheep do not thrive in Japan, and goats are not kept. Cattle-breeding is extending, owing to the increased consumption of meat and milk; and horse-breeding is encouraged chiefly for military purposes. The Japanese horse is small, and of poor quality. There are two kinds of dogs—the pariah dog, common to the East, and a toy spaniel, introduced originally from China. Of birds there is a great variety. The list includes most kinds of wild-fowl, cranes, bustards (now a rare bird), eagles, hawks, and owls; green, copper, and silver pheasants; and a large carrion-crow. In the plains there is a noticeable absence of singing-birds; but in the hills there is a great variety—the cuckoo, Canadian robin, and *uguisu* (*Cettia cantans*) being the most conspicuous. The domestic fowl of Japan closely resembles the pheasant in size, shape, and colouring. The province of Tosa is noted for a special breed of long-tailed fowls. The chief fresh-water fish are the salmon, sea-trout, *ai* (*Plecoglossus altivelis*), and carp. Whales are fairly abundant in the vicinity of the Japanese coasts, and on the shores of the northernmost islands the ordinary seal and fur-seal breed, but the latter kind is fast disappearing. Mackerel is the species of fish most largely represented. Sharks are

plentiful, and, together with cuttlefish and certain other molluscs, supply the materials for an extensive trade in dried 'fish' with China. Other fish are the tunny, and bream, of two kinds, the favourite fish of the Japanese. Of the eight species of Japanese snakes, only the *mamushi* (*Trigonocephalus Blomhoffi*) is poisonous. Frogs exist in myriads, and the giant salamander is also a native of Japan. Insects are abundantly represented, more especially in the mountainous regions. The beetles and butterflies are perhaps best known. Amongst the former the stag-beetle occupies a prominent place, and there are many varieties conspicuous for their brilliant colouring. The butterflies include swallow-tails, red, white, and blue admirals, and fritillaries, and in many hill districts the purple emperor is as common as he is rare in England. To the list of insects may be added flies and gnats of many kinds, and the *sémi*, a species of cicada. Without the note of this insect, the Japanese summer in the plains would lose one of its chief characteristics.

Agriculture.—In Japan this has always taken the first place amongst industries. Small holdings are the rule, and much care is bestowed on the land, so that Japanese farming resembles the market-gardening of Europe. The soil is not naturally fertile, but by skilful rotation of crops, subsoil-working, constant manuring, and unsparing labour, assisted by a copious rainfall and plenty of sun, the peasant obtains favourable results. The collection and method of utilising night-soil from towns and villages is, as in China, a special feature of Japanese agriculture. Rice being the staple production, great attention is given to irrigation. In specially favoured localities the land bears two crops of rice in the year; and in many districts, as soon as the wheat harvest is over in May, the ground is prepared for the planting of rice. Rice is not, as in some parts of Asia, sown, like wheat, in the fields in which it is reaped, but is sown in 'nurseries,' from which the young plants are transferred to the rice-fields. Cotton is grown, but its shortness of staple makes it less suitable for manufacturing purposes than that produced elsewhere. The area of land used for the cultivation of the silk-mulberry and tea-shrub has, owing to the efforts of the government, been immensely increased, and much benefit has resulted from the establishment of agricultural colleges.

Mineralogy.—Japan's mineral wealth consists mainly of coal and copper, but there is a small annual production of gold, silver, lead, antimony, and manganese. The coal is of two kinds—anthracite, found in the island of Amakusa and in the Shimabara Gulf, and a bituminous coal, obtained chiefly in Kiūshū and Yezo. Japan has no valuable iron-mines. The only one of any importance is that at Kamaishi, in the Iwaté prefecture, on the N.E. coast of the main island; but the ore produced there is of poor quality, and Japan is dependent on China for her supply of iron for manufacturing purposes. Petroleum-wells are now being worked with some success in the province of Echigo. There are also considerable sulphur-deposits in the north of the main island, and in Yezo.

History.—According to the Japanese, their early history commences about 660 B.C. with the reign of the mythical monarch *Jimmu Tennō*. But it is more correct to assume that the real beginning of Japanese history dates from between the middle of the 6th and the early part of the 7th century of our era—that is to say, more than a thousand years later. It was about this time that Buddhism was introduced from Korea into Japan, where Chinese characters were already in use. Increased acquaintance with the Chinese written language led to closer intercourse between China and Japan, and resulted in what is known as 'the Great Reform,'

an administrative change copied from that country, and directed against the supremacy of the Soga family. The effects were far-reaching. A wave of Chinese influence swept over the country. Court ceremonies, official titles, laws, social and administrative organisation, taxation, all were remodelled on a Chinese basis. For a time this reform answered the purpose for which it was intended, and the authority of the sovereign was strengthened. But in the course of two or three generations things relapsed into the old groove, the place of the Soga family being taken by the Fujiwaras, who filled all the chief posts in the government. The power of the Fujiwara family declined in its turn, and the unsettled state of the country favoured the gradual assumption of power by the military class. This change took place towards the close of the 12th century, when the struggle for supremacy between the rival families of Taira and Minamoto had resulted in the victory of the latter. The Minamoto leader, Yoritomo, then became the virtual ruler of the country, receiving the appointment of Sei-Tai-Shōgun, or 'barbarian-quelling generalissimo,' the title having reference to the campaign continually in progress against the rapidly dwindling tribes of Ainus. The Japanese sovereigns had never, except during comparatively short intervals, really governed, but from the close of the 12th century they were formally relegated to the position of mere figure-head monarchs, the real administrative power being exercised by a succession of rulers called Shōguns. From this time dates the curious dual system of government which gave rise to so much misunderstanding on the part of foreigners.

Yoritomo's ability was not inherited by his successors, and for the next century the real power was wielded by the so-called 'regents' of the Hōjō family. It was during their administration that the only two invasions of Japan took place. In 1275, and again seven years later, Chinese armies effected a landing on the coast of Kiūshū. Both attacks were, however, repulsed, the Japanese defence being assisted in each instance by the occurrence of severe storms which crippled the Chinese fleets. For two centuries, from 1338 to 1565, the rulers of Japan were the Ashikaga Shōguns. During their rule the even course of Japanese history, so far as the imperial succession is concerned, was disturbed by the creation of two rival courts, the 'northern' and 'southern.' The civil war, which continued for sixty years, ended in the triumph of the northern dynasty. The last of the Shōguns of this line was a mere puppet, the country passing under the rule successively of two military administrators, Nobunaga and Hidéyoshi, neither of whom, however, assumed the office of Shōgun. The latter it was who planned and carried out the invasion of Korea. The campaign began in the spring of 1592, and the final land engagement was fought in the autumn of 1598. The war thus lasted more than six years. Before it had come to an end, Hidéyoshi died, and his death paved the way for the supremacy of Iyēyasu. Appointed ruler in 1603, he established the long line of Tokugawa Shōguns which governed Japan until the Restoration of 1868.

Meanwhile Japan's intercourse with the West had begun. In 1542 the Portuguese gained a footing in Japan. They were followed later by the Dutch and English, who were allowed to establish 'factories' in the island of Hirado; but the English withdrew after ten years. Until 1637 the Portuguese and Dutch continued to trade with Japan. In that year the persecution of Christian missionaries and converts, which had lasted for many years, culminated in the Shimabara rebellion. After that Japan was closed to all but the

Dutch and Chinese. But the privilege thus conceded to the traders of these two nations was deprived of much of its value by the hardships of the conditions under which it was exercised. During the last fifty or sixty years of the Dutch and Chinese trade with Japan at the port of Nagasaki, Russia had made her appearance in eastern Asia, where she was extending her boundaries to meet Japan; Americans were giving their attention to whale-fisheries in the Sea of Okhotsk, and to the opening up of a new sea-route between East and West which skirted the shores of Japan; and British and French enterprise was busily engaged in China. These were changes full of meaning for Japan. The duty of protecting American whalers in the conduct of their fishing operations, and the desirability of obtaining a coal depot somewhere on the Japanese coast for the convenience of steamers on the Pacific route, caused the American government to make the first serious effort in the direction of establishing commercial relations with Japan. The first attempt in 1845 was not successful, but eight years later the United States government despatched a naval mission to Japan under Commodore Perry. He arrived in the Bay of Tōkyō (then called Yedo) with four ships in August 1853, and having presented a letter from the president to the sovereign of Japan, left, saying he would return next year. He kept his word, appearing in the following spring with a still larger squadron. Before so formidable a force the Japanese resistance broke down, and after a few weeks' negotiation the treaty desired by America was signed. Other treaties followed with the British, the Dutch, and Russians. These earlier treaties and arrangements—three with America, three with Holland, the same number with Russia, and two with Great Britain—effected very little. So far as trade was concerned, the result was insignificant. It was only after they had been amplified and expanded by the treaties of 1858, to which a fifth power, France, became also a party—America again taking the lead—that the way was finally cleared for the development of foreign intercourse. This group of 1858 treaties served as a model for all the later conventions with other foreign countries. The rights of residence and trade acquired under them by foreigners applied only to the so-called treaty ports, five in number, and in a limited degree to the towns of Yedo (Tōkyō) and Osaka; and the right of travel, except by special permission not readily granted, did not extend beyond a certain area known as 'treaty limits' in the neighbourhood of each place. The rest of the country remained closed as before.

The next ten years were a stormy period for Japan. The nation had been forced to acquiesce much against its will in the revival of foreign intercourse on a treaty basis; but anti-foreign feeling was still very strong, and showed itself persistently for several years in steady official opposition to what was regarded as foreign encroachment, and in murderous assaults upon individual foreigners. And the unsettled condition of the country was aggravated by grave internal difficulties, of which the anti-foreign party took full advantage. Fortunately Japan's unreadiness for war prevented the anti-foreign demonstrations from provoking a serious rupture with treaty powers, and the bombardment of Kagoshima and Shimonoseki resulted in the recognition by the two clans concerned of the futility of further opposition to foreign intercourse. At the same time, however, the growing weakness of the Shōgunate gave strength to the movement in favour of the Restoration, and matters were brought to a crisis by the failure of the government's expedition against Chōchū. In the autumn of 1867 Prince Kéiki, the

last of the Shōguns, who had succeeded with reluctance to his high office, issued a manifesto, placing his resignation in the hands of the emperor. In ordinary times his action would have led to a pacific solution of the difficulty. But the concentration at Kyōto of forces of the hostile clans precipitated hostilities. The ex-Shōgun was encouraged to revoke his decision, and the result was civil war. Hostilities were, however, of short duration. Except in the north-eastern provinces of the main island, where a final gallant stand was made, and in Yezo, where a remnant of Tokugawa sympathisers held out until the following year, little resistance was offered to the imperial forces, and by the spring of 1869 peace was re-established everywhere.

When the Shōgun's resignation had been tendered in the autumn of 1867 it had been at once accepted by the emperor, who thereupon assumed, in name at least, the direction of state affairs. In March 1868 the government was reorganised on an ancient bureaucratic basis. The leading idea of this measure was imperialism, but it was imperialism with a strong leaven in it of the spirit of Western reform. How strong this spirit was was shown by the deliberative element expressly included in this new form of government, by the Oath of Five Articles taken by the emperor in the spring of the same year, by the experiment of a so-called parliament made in 1869, and by the abolition of feudalism in 1871. The surrender of the fiefs had been accepted in principle two years before, and the clan chiefs were administering their former territories simply as governors when the decree of abolition appeared. The ex-daimios received pensions, amounting to one-tenth of their previous revenues, and provision was made for the support of the clan *samurai*.

The abolition of feudalism was the final stroke dealt to the old order of things. The student of Japanese progress finds himself at this period on the threshold of modern Japan. During the early years of the *Meiji* government the influence of the past, the spirit of centuries of feudal thought and custom, pervaded everything, creating difficulties which could only be overcome by the patience, enthusiasm, energy, and genius of the reforming statesmen. Both in clearing away the wreck of feudalism, and in the direction of administrative reconstruction, the task before the new government was immense. Not the least of the difficulties which confronted them were those connected with domestic politics, and it was doubtless anxiety to divert attention from more burning questions at home quite as much as any ambitious and aggressive tendencies which inspired the bold foreign policy displayed in the Formosan expedition, the rigorous handling of Korean questions, and the annexation of Loochoo. The endeavour was not altogether successful, and Japan's development was arrested for a time by the outbreak of the Satsuma rebellion. With its suppression fresh activity was shown in the work of national progress and the adoption of Western reforms. In 1880 a constitution was promised. In 1889 the promise was fulfilled. The constitution was promulgated, and in 1890 it came into existence with the opening of the Imperial Diet. The first few years of parliamentary government were distinguished by the growth and consolidation of political parties, the formation of a strong opposition in parliament, and by much friction between the government and the Diet.

Since 1894 the history of Japan has become identified more and more with the history of the world. In that year the growing rivalry between Japan and China led to the Chino-Japanese war, which resulted in the complete triumph of the Japanese arms, the cession by China of Formosa and the Pescadores, and the payment of an in-

demnity. The interference of France, Russia, and Germany deprived Japan of some of the fruits of her victory, and was followed later on by the Russian occupation of Port Arthur and a portion of Manchuria, the establishment of Germany in the south of Shantung, and the British lease of Wei-hai-wei. In 1899 the last of the new treaties with foreign powers, in the arrangement of which Great Britain had taken the lead, and negotiations for which had lasted, with many interruptions, ever since 1882, came into operation, and the whole country was opened to foreign residence and trade. During the Boxer troubles of 1900 Japan took an active part in the operations conducted by the various foreign powers concerned. In 1902 the first alliance was concluded between Great Britain and Japan. The extension of Russian military power along the railway through Manchuria, and the non-fulfilment of Russian pledges to withdraw from that nominally Chinese province in 1903, led the Japanese to anticipate the progressive incorporation of Manchuria with the Asiatic dominions of the Tsar, and to fear their own exclusion by Russian influence from that predominant position in Korea which they held essential to the safety of their island empire. Negotiations were carried on for many months, but the Russians were procrastinating and unconciliatory. The rupture of diplomatic relations by the Japanese (6th February 1904) was immediately followed, before the formal declaration of war, by a successful torpedo attack on the Russian warships in Port Arthur outer harbour; the Japanese, commanding the sea, occupied Korea, while the Russians poured troops into Manchuria by railway; and in March Russians and Japanese faced one another on the frontiers. The Japanese forced the passage of the Yalu on 1st May; after a decisive victory by Oku at Kinchau on the neck of the peninsula (27th May), prepared to close in by land on Port Arthur, already 'sealed' by the fleet under Togo; the Russian army was, after a series of defeats at Liao-yang and elsewhere, steadily thrust northward towards the Sha-ho and Mukden by three Japanese armies, acting in concert, under Kuroki, Oku, and Nodzu, the Marquis Oyama being commander-in-chief; but Kuropatkin managed the successive Russian retreats with skill. The Russian fleet made futile sorties, but was shut helpless into Port Arthur harbour; and the long siege of eight months and a continuous series of Japanese successes ended, spite of a stubborn defence, in the surrender of Port Arthur by General Stoessel on 2d January 1905. After a fortnight's fighting, involving a loss of 175,000 (killed, wounded, and prisoners) to the Russians and 57,000 to the victors, the Japanese in March captured Mukden and drove the Russians northwards in disastrous flight; on 27th-28th May the Russian combined fleets under Rozhdestvensky were annihilated by Togo at the great naval battle of Tsushima in the straits of Korea; and with the mediation of the President of the United States, Russian and Japanese commissioners met at Portsmouth, New Hampshire, and peace was concluded on 5th September 1905. By the treaty between Russia and Japan, while the rest of Manchuria occupied by Russia was fully restored to China, the lease of the Liao-tung peninsula was transferred by Russia to Japan, together with Port Arthur. That portion of the heretofore Russian railway from Changchun to Port Arthur was also ceded to Japan, an engagement subsequently confirmed by negotiations between the Chinese and Japanese governments. Korea was declared independent, but under a Japanese protectorate; and the southern portion of Sakhalin, which Japan ceded to Russia in 1875, became once more Japanese. In August

of the same year during the course of this peace conference at Portsmouth in the United States the treaty of 1902 between Great Britain and Japan was replaced by a fresh instrument. The year 1911 was marked by the conclusion of two new treaties between Great Britain and Japan. On the 5th April a new treaty of commerce and navigation, for twelve years, unless terminated by twelve months' notice given by either party, was signed in London. This came into force on the 17th July. On the 20th July a new treaty of alliance for ten years was signed. From this the stipulation regarding the defence of India which appeared in the treaty of 1905 was omitted, and it contained a new provision by which any power which had an arbitration treaty with either of the two contracting parties was exempted from its application. With the death of the Emperor Mutsuhito in the summer of 1912, the year-period, or era, of *Meiji* (enlightened government), established after the Restoration in 1868, came to an end. This period constitutes an important landmark in Japanese history. It was ushered in by the adoption of many Western reforms, and the pursuance of a policy of progress on the lines of Western civilisation which culminated in the Russo-Japanese war, and the recognition of Japan as one of the Great Powers. The new year-period of *Paishō* (great righteousness) commenced with the accession of Yoshihito, the eldest son of Mutsuhito. The young emperor entered upon his reign under more favourable auspices than his predecessor, but the situation was not without grave perplexities. Parliamentary difficulties, financial stress, the embarrassing questions raised by Japanese immigration on the Pacific slope and elsewhere, and the unrest in China taxed all the resources of Japanese statesmanship and diplomacy. On the 15th August 1914 Japan, as Britain's ally, demanded of Germany the surrender of the Kiaochau leased territory, and on the 23d entered the War (q.v.). Tsing-tao, the port of the territory, was invested, with British co-operation, and fell on the 7th November. In the Marshall Islands Jaluit was seized (October 1914); and Japan participated in clearing the Pacific of German ships. Otherwise her share in the war was slight. Her operations against Tsing-tao gained her a footing in Shantung, which caused much uneasiness in China and elsewhere. In 1915 she wrung from China the treaty of the 'twenty-one points.' The Kwantung lease was extended to ninety-nine years. Japan was accorded advantages in southern Manchuria and Eastern Inner Mongolia; the reversion of German territory and privileges in Shantung was granted to her, under conditional promise of restoration of Kiaochau to China; and mining, railway, and other concessions were extorted. Revolutionary troubles were made the occasion of landing troops in Siberia in 1918. The Great War, like the two that preceded it, brought Japan a long way towards the hegemony of Asia; but her militaristic policy was not unopposed at home and abroad. Korea strove for independence; and in Japan proper questions of labour and democracy became more pressing. The demand for universal suffrage was not stayed by a great extension of the franchise in 1919. The Anglo-Japanese treaty of alliance was allowed to expire in 1921. The question had now taken on a new aspect owing to the formation of the League of Nations and the redistribution of power, and was complicated by immigration problems in California, Australia, and elsewhere, fears of Japanese aggression in China and Siberia, and the naval rivalry of Japan and the United States. The Washington treaties eased the situation in 1922, and Japan withdrew from Shantung, and reduced her army and navy.

Inhabitants.—The best authorities agree that

the Japanese race is a mixture of Mongol and Malay. There is probably also an Ainu strain derived from the aborigines of that name, a small remnant of which still survives in Yezo and the Kuriles. The Japanese are much smaller in stature than either the Chinese or Koreans, whom they otherwise resemble. The average height of the men is only 5 feet 3½ inches, and that of the women 4 feet 10½ inches. Very noticeable are the largeness of the head, the length of the trunk in proportion to the legs, which are short, and the tendency of the race to be bow-legged. The cheekbones are prominent, the complexion sallow or dark, and the men's faces usually hairless. The eyes are set obliquely in the head, and the inner corner is partly or entirely covered by a fold of the upper lid extending more or less into the lower one. The men have small and well-shaped feet and hands. The women's hands are small and delicately moulded, but their feet are flat, with thick ankles, due, it is said, to the wearing of heavy clogs and the habit of carrying children up to four and five years of age on the back. Two distinct types of face exist, though some ethnologists profess to notice more. In one of these the shape is oval, the nose slightly curved, the eyes very oblique and half-closed, and the mouth and ears small. In the other the shape is squarer, the eyes are more prominent, the nose is flat, and the ears and mouth are large and unshapely. The Japanese have black hair, which is coarse and does not curl. Some of the women are pretty, but they age quickly. The men are plain. Japanese are best-looking as children, before the features are fully formed, and when the complexion is at its freshest. In disposition the Japanese are naturally cheerful and light-hearted, but they are emphatically a people of moods, and merriness is apt to be followed by depression. They have been called the French and also the Spaniards of the East, and they answer to each description. They are sensitive and passionate, jealous, domineering, and fond of pleasure; wanting, perhaps, in stability and perseverance; and callous, if not actively cruel. On the other hand, they have many good qualities. They are kindly, courteous, and brave, law-abiding, cleanly in their habits, frugal, and patriotic; and the doctrines of self-sacrifice, and respect to parents, elders, and rulers in which they are brought up, have the effect of creating in them a strong sense of propriety and duty, and a high feeling of personal honour. Nowhere, too, are good manners and artistic culture so widespread. The lack of chivalry towards women is an unpleasing feature of the national life, but the position of women is being improved by modern education and by the operation of the new codes, and change in national feeling in this respect may be looked for in the course of time.

Whether the Japanese as a race are equal to Europeans in energy, physique, and endurance is a question at present much discussed. Most persons who have had a long acquaintance with them in their own country will be inclined to give them credit for great energy and adaptability to new conditions; for a genius for co-operation, partly natural and partly acquired; for singular deftness and a surprising activity. But their physical strength is not remarkable; they offer little resistance to certain diseases; nor is there reason to think that in constitutional vigour, the power of sustained effort and general endurance, they can be regarded as quite equal to European races.

The native dress of both men and women consists in the summer of a loose, flowing robe folded from right to left over the breast, where it is left slightly open, and fastened by a girdle at the waist. In the winter a second robe is worn over the first, and

at both seasons of the year, in the case of the well-to-do classes, an outer loose, wide-sleeved jacket of thin material is added. The men wear also wide pleated trousers, ending just below the calf of the leg. White or blue cotton socks, cleft at the great toe, and clogs complete the attire. This is the costume of the country. Western intercourse has had a great effect on the dress and habits of the people. Hats of foreign make, merino drawers, and boots are worn now by men in the towns; the old coiffure for men is no longer seen; and even the women have taken to dressing their hair occasionally in a different and more simple way. Most Japanese men now lead what may be called a double life. In government offices, places of business, foreign restaurants, and factories foreign dress is usually worn, and tables and chairs are used. With the return home after business hours foreign dress is exchanged for Japanese, and the wearer sits on the mats as before. With the women this is not so much the case, but at dinner-parties and other functions foreign dress is the rule; shawls and a kind of over-all, modified to suit Japanese taste, are much worn; a new article of attire in the shape of a divided skirt has been adopted by girl students.

Mode of Living.—There is little architectural variety in Japan, the houses everywhere in town and country being built of wood, with thatched or tiled roofs, and on one common plan. The imperial palaces, both in Tōkyō and Kyōto, are built of wood. Of late years, however, there has been a tendency to construct public buildings, factories, and places of business either wholly or partly of brick, and this change has reduced the damage caused by conflagrations, which in the towns are of frequent occurrence. The usual plainness of the exterior of the average Japanese dwelling is counterbalanced to some extent, in the better class of houses, by the finish given to the woodwork of the interior and the fineness and variety of the timber employed. In place of doors and windows, Japanese houses are furnished with an inner set of doors, made of paper stretched on a wooden frame, and an outer set of wooden shutters, both sliding in grooves. The floors are covered with thick straw mats with a fine woven surface. On these the inmates sit, eat, and sleep, the bed-quilts being kept in cupboards. Cooking is done in little open ovens, and the rooms are warmed by means of charcoal boxes, either movable or let into the floor. Rice is the staple food of the people, but in the poorer districts barley, millet, and buckwheat take its place. Fish, seaweed, and bean-curd are also much eaten, and soups of various kinds enter largely into the diet of the people. Soy, the chief ingredient used in the manufacture of several European sauces, is the universal condiment. The consumption of milk and meat has increased very much of recent years. The chief beverage is tea, which is drunk at all times, without sugar or milk. Saké, a liquor brewed from rice, is the alcoholic drink of the country. It is usually drunk hot. A great deal of beer of the light German kind is now brewed in Japan, and the consumption of this beverage is increasing every year.

Health and Sanitation.—The most prevalent diseases in Japan are consumption, pulmonary complaints, dyspepsia, dysentery and a mild type of cholera in the hot months, rheumatism, and neuralgia. There is also a good deal of leprosy. The hot-springs of Kusatsu, in the province of Shinano, are efficacious in cases of this disease. The disease called *kakke* also calls for special notice. It is similar to the disease known in India and the Malay Peninsula under the name of *Beriberi* (q.v.), and has some of the characteristics of both paralysis and dropsy. Men are more liable to

it than women. The progress made in Japan of recent years in medicine and sanitation has shown good results in the health of the population; and the establishment of waterworks in the vicinity of the chief towns, and the general improvement in the water-supply in all parts of the country, tend to operate in the same direction.

Manners and Customs.—The influx of modern ideas has had a noticeable effect on the manners and customs of the people. The practice of *Hara-kiri* (q. v.), the wearing of swords, tattooing, the style of wearing the hair (peculiar to the Japanese men of former days), and the blackening of women's teeth have all more or less disappeared. The time-honoured *Cha-no-yū* ceremony survives, however, and the customs which form the special features of the family system, such as abdication, adoption, and the rules regulating the social position of women, remain, and have been embodied in the new civil code. Concubinage also is still a recognised institution, and exists in the highest circles, provision being made by Japanese law for the succession of the offspring of a concubine to the headship of a family. Public prostitution is licensed, the Yoshiwara, or prostitute quarter, being a recognised feature of all large towns. Great respect is paid to the dead, posthumous titles and other honours being conferred after death. In the direction of popular amusements, foreign influences have so far not had much effect. Music and dancing are confined chiefly to the professional class of dancing-girls (*geisha*) and to the inmates of the Yoshiwara. The principal Japanese instruments are the *koto*, a sort of horizontal harp; the *samisen*, a three-stringed guitar introduced from Manila; the *kokyū*, a sort of three-stringed violin; and the *biwa*, a four-stringed lute. The chief forms of evening entertainments are story-telling by professional story-tellers, and flower-fairs. No nation is fonder of flowers than the Japanese, and nothing is more characteristic of Japanese city life than the flower-fairs. Almost every night in the week throughout the year a flower-fair takes place in one quarter or another of the capital. Into these a religious element enters, for they are always connected with the festival of some temple in the district. Festivals of all kinds, mostly of religious origin, play an important part in the life of the people. That of the New Year is perhaps the most important, and is distinguished by many quaint customs and ceremonies. There is a special festival for girls, held on the 3d March, when the dolls of each household are displayed; and a similar boys' festival takes place on the 1st of May, when paper fish, usually the gifts of friends, are flown on high poles to celebrate the birth of male children during the preceding twelve months. And there is the great Buddhist festival of the dead in July, when the spirits of deceased ancestors are supposed to visit the family altars. The various Japanese festivals are so numerous as to make a serious call on the time and energies of the people. Kite-flying, juggling, and archery are favourite amusements, and wrestling of two kinds (*sumō* and *jū-jitsu*) attracts large and enthusiastic crowds. The theatre in Japan occupies a peculiar position. Acting (in city theatres) is a profession limited to men, though troupes of strolling actresses are to be seen in some of the provinces. The upper classes go little to the theatre, and men form only a small portion of the audience, which consists almost entirely of women. Japanese theatres are day-theatres. The performances begin in the morning, and go on all day, lasting sometimes until late in the evening. The plays given in these theatres are of three kinds—tragedies and historical dramas varied by dancing, melodrama, and comedies. The dances in the first-named class of plays were origi-

nally marionette dances, accompanied by explanatory songs. This, as we are told in *Things Japanese*, explains the retention of the chorus and the peculiar poses of the actors, borrowed from the stiff movements of their prototypes, the marionettes. The *nō*, or classical dramas and comedies of Shintō origin, stand on a different footing. They are not performed in theatres, but on platforms made for the purpose, and frequently in the open air. They are popular with all classes of the people, and though most fashionable in the higher circles of society, they may be often seen during religious festivals in the street of a country village. With the improvement of the roads, the native *jūrikisha*, invented in 1872, has superseded the palanquin, and wheeled traffic is everywhere on the increase. In hilly districts, however, the palanquin and pack-horse are still used.

Language and Literature.—The Japanese language is generally recognised as belonging, like Korean, Mongol, and Manchu, to the so-called Altaic group of languages. It is what philologists term an agglutinative language, building up its words and grammatical forms by means of suffixes added to the root, which does not change. The verbs, which have frequently honorific endings, come, as in German, at the end of a sentence. There are no definite and indefinite articles, nor is there any gender; prepositions follow the words they govern, and cases are indicated by the adjunct of particles to the noun. These, stated shortly, are the leading features of the Japanese language, or rather of 'pure Japanese,' for there are two sides to the Japanese language—'pure Japanese' and 'Chinese-Japanese.' Until the 7th century of our era Japan had her own language. This was spoken, not written; there was at that time no written language. Then she followed the example of Korea, which had also spoken dialects of her own, but no native script, and adopted the written language of China. Later on, from the Chinese characters thus borrowed, she evolved syllabaries, filling the place for her of our alphabet for us, and in this way was developed a script of her own. This native written language never triumphed completely in its competition with the Chinese characters from which it was derived. Though it is the language of native classical literature and of native poetry, both ancient and modern, and of women's letters and of telegraphic correspondence, in other directions it has not succeeded in holding its own with the mixed Chinese and Japanese language. It is this latter, a combination of the native script with Chinese characters, which is for most purposes the chief written language of Japan to-day. The Chinese side of the language has developed since the Restoration out of all proportion to pure Japanese. It lends itself with peculiar facility to the formation of new words to express the new ideas which have come with foreign intercourse. Thus we find in Japan to-day a colloquial language, which is a mixture of pure Japanese and Chinese-Japanese words, and two written languages, the native script and the mixed Chinese-Japanese language. And the literature of the country is complicated by the addition of two more—the classical language of Japan, written in the native script, and classical Chinese. Full information on the literature of Japan will be found in the books on this subject by Aston and Florenz. The oldest Japanese literature is represented by the *Kojiki*, or 'Record of Ancient Matters,' translated by Chamberlain; the *Nihongi*, or 'Chronicles of Japan,' translated by Aston; the *Kujiki*, or 'Ancient Records,' a contemporaneous record of doubtful authenticity, which has not been translated; the *Manyōshū*, or 'Collection of a Myriad Leaves,' an anthology of ancient poems.

The date of all four is the 8th century. The most important standard history, apart from the three already named, is the *Dai-Nihon-Shi*, or 'History of Great Japan,' compiled at the end of the 17th century. Other so-called histories, or historical romances, are the *Mitsu Kagami*, or 'Three Mirrors,' the *Genpei Seisuiiki*, or 'Rise and Fall of the Taira and Minamoto Families,' and the *Heiké Monogatari*, or 'Stories of the Taira Family,' all written in the 12th century; the *Taiheiki*, or 'Chronicles of the Great Peace,' and the *Nihon Gwaishū*, or 'History of Japan,' published in 1827. Mention should also be made of the classical romances, the most noted of which are the *Genji Monogatari*, the *Utsubo Monogatari*, and the *Isé Monogatari*, all written in the 10th century. To this list may be added the *Tsu-zure-gusa*, a miscellany written in the 14th century.

Religion of Japan.—When Buddhism was introduced into Japan through Korea in the 6th century, it found a native religion, Shintō, already in possession of the field. Increasing intercourse with China in the 7th century led to the introduction of Confucianism and Geomancy; and later on, in the 16th century, Christianity was introduced by Roman Catholic missionaries, and flourished for the best part of a century. Since the reopening of Japan to foreign intercourse, Christianity has spread again. The Japan of to-day has therefore many religions. Of Japan's earliest religion, Shintō, no very exact definition has ever been given. It may be described as a primitive cult, having its origin in mythology, and vague ancestor and nature worship, associated with the deification of emperors, and characterised on the one hand by the absence of any ethical or doctrinal code, and of any ideas of a future state, and on the other hand by the existence of a priesthood, and by the use of formulas of prayer and purification.

Japanese Buddhism follows in the main the teaching of what is known as the 'Great Vehicle,' and differs therefore in some essentials from the Buddhism of southern Asia. The chief sects now existing in Japan are the Tendai, Shingon, Jōdo, and Zen, which are of Chinese origin; and the Shin (or Monto) and Nichiren (or Hokkē), both of which originated in Japan, and date from the 13th century. For some time after the advent of Buddhism the two religions kept aloof from each other, and it was not till the end of the 8th century that the fusion of the two took place. Then, according to Aston, began a process of peaceful penetration of the weaker by the stronger cult, the Buddhist church having recourse to the pious device of representing Shintō gods as being temporary manifestations of Buddhist deities. Most of the Shintō temples throughout the country fell into the hands of the Buddhist priesthood, which introduced the architecture and ceremonial of their own religion. In some cases a temple came to belong to both religions, the services of each of the two faiths being conducted by its own priests. The national shrines of Isé and Idzumo were an exception to the general rule, and remained purely Shintō. The close of the 17th century saw the beginning of the movement known as the 'Revival of Pure Shintō. It was carried on by the famous scholars Mabuchi, Motōri, and Hirata. It was both political and religious in its character, and the triumph of the imperial cause in 1868 resulted in the establishment of Shintō as the state religion, and the disestablishment and disendowment of Buddhism. Since then a reaction has taken place, and no one religion, to the exclusion of others, has the position of the state religion. But the principle of state policy which favours Shintō survives. In the department of the imperial household there is a special Shintō bureau. The services in the palace, at which the

emperor personally officiates, and the worship performed by imperial proxies on fixed occasions at the chief shrines in different parts of the country, secure for the Shintō faith the first place in public importance. The curious joint hold on the popular mind which the two religions possess is noticeable in the family rites of the people. Each household has its Shintō and Buddhist altars. To the latter

Torii of Temple, Suwa.

the cenotaphs of deceased members of the family, originally attached to the former, have been transferred, the Shintō altar serving as the depository of charms from the great shrine at Isé, and the various tutelary family temples.

Christian Missions.—The first Christian missionaries who visited Japan were Francisco Xavier (q.v.) and his two companions, Torres and Fernandez. The Christianity introduced by them in 1549 spread rapidly for many years. In 1614, however, a fierce persecution broke out. Twenty-four years later all missionaries had been expelled, and the Christian religion had ceased to exist. The first missionaries to reappear on the scene after the revival of foreign intercourse in 1854 were two agents of the American Protestant Episcopal Church, who settled in Nagasaki in 1859. They were followed by others from the Presbyterian and Reformed Churches of the United States. The abolition of the Shōgunate in 1868, and the substitution in its place of a progressive government, led to increased activity in the Christian field. In 1869 the American Congregational Church sent representatives to Japan, and in 1872 the first Japanese church was founded in Yokohama. In 1875 Joseph Neesima founded a Japanese Christian college, the Dōshisha, in Kyōto. By the year 1889 there were 30,000 Protestant communicants. It was at this time that the working of a new movement became visible amongst many of the Christian communities. Hitherto the Japanese clergy had been content to play a subordinate part in administration, and to look for direction and guidance to the foreign pastors. A new spirit now arose. They aspired to lead where before they had followed. The movement seems to have been met in a wise spirit by the foreign missionaries of all denominations, who recognised that it was only part of a wider national movement, and that guidance, rather than too rigid control, was the direction in which missionary energies might best be utilised. The total number of Japanese Christians in 1910 was about 210,000, divided as follows: Protestants, 100,000; Roman Catholics, 80,000; Greek Church, 30,000.

Education.—Under the Tokugawa administration, education for all classes was obtained chiefly in private schools. But for the special benefit of the military class there existed also in Yedo an academy, dating from the end of the 18th century, and other schools maintained by the Shōgunate, and in the provinces there were colleges supported by the feudal nobility. The education given in these various establishments was mainly confined to the Chinese classics. With the revival of foreign intercourse, the old system of education crumbled away, its place being taken by a system based on Western models. After the Restoration of 1868 the work of educational reform was taken up with fresh energy. In 1871 the Department of Education was established, and in the following year the first educational code, since frequently amended, was promulgated. By this education was made universal and compulsory. The present educational system for boys begins with kindergarten, after which come primary schools (ordinary and higher). After six years in the ordinary and two years in the higher primary schools, a boy passes on to the middle school, where the course is usually five years. He next enters the higher school, the course for which is three years, and may then pass on to the university; or he may enter a technical college or the higher normal school. There are also in Tōkyō military and naval academies, a nautical school, an agricultural school, a fine arts school, a higher commercial school, the nobles' college, and a musical academy. There are universities at Tōkyō and Kyōto, and less complete universities at Sendai (university of Tōhoku), Fukuoka (university of Kiūshū), and Sapporo (university of Hokkaidō). Besides these government establishments there are in Tōkyō the Waseda University, the Keiō Gijuku, and many private schools. The education of girls runs on somewhat parallel lines. In the girls' high school the course is usually four years, with a supplementary course of two. The Tōkyō University includes the faculties of law, medicine, engineering, literature, science, and agriculture.

Army and Navy.—The organisation of the Japanese army on a modern basis began before the Restoration, when a few French officers were employed as instructors. Later on much assistance was rendered for many years by French and German officers. In 1872 conscription was introduced, and the army and navy were placed under different departments. Military service commences with the attainment of twenty years of age. Service in the Active Army (*Jōbigun*) lasts for two or three years; in the Army Reserve (*Yōbigun*) for five (or four) years and four months, according to length of service in the Active Army; and in the Landwehr (*Kōbigun*) for another term of ten years. There is also a Conscript Reserve (*Hōjiūgun*), and there is the Landsturm, or Territorial Army (*Kokumin-gun*). Provision is made for one-year volunteers, as formerly in Germany, and there is a special period of service for primary school teachers. The Japanese army numbers on a peace footing perhaps 233,000, and on a war footing 1,250,000 men. In the early organisation and training of the Japanese navy British naval officers rendered great service. The Japanese Admiralty dates from 1872. Service in the navy is partly volunteer service and partly conscription, the advantage in numbers of recruits resting with the former. The end of the Great War found the Japanese navy third in the world in strength, and rapidly increasing. Reduction followed the Washington treaty. There are naval arsenals and docks at Yokosuka (wrecked by the great earthquake of 1923), Kuré, Sasebo, Maizuru, and Muroran.

Railways.—The first railway in Japan was built in 1872. It connected the capital with the port of Yokohama, and was 18 miles in length. In 1883 the first private railway company was established. In 1920 the railway mileage amounted to 9500 miles, mostly state railways. The regulation gauge of the government railways was 3 feet 6 inches; but a change to 4'8½ feet is expected to be completed in 1943. Early in 1906 a bill for the nationalisation of railways was passed by the Diet. It provided for the purchase of the seventeen chief private railways, and the measure was carried out within one year. Considerable progress has been made in the construction of electric tramways. There were in operation in 1924 about 30,000 miles of telegraph line, and 13,000 miles of telephone line.

Mechanical Arts.—Her art industries Japan has borrowed from China, but she has shown herself an apt pupil. In one or two special branches, such as lacquer-ware, enamel, ivory-carving, and paper manufacture, she has developed a higher degree of skill than that attained by the Chinese; she has improved on the processes she has borrowed, and added something original in the direction of design. What is perhaps most striking and typical in Japanese art industry is the amount of artistic care bestowed on inexpensive trifles. Cups and saucers intended for common use, wooden utensils, cheap fans, picture-frames, trays, boxes, and chests of drawers, upon all is lavished a wealth of artistic fancy, as regards shape, colour, and design, very nearly as great as is expended on articles of greater value. The explanation is that the whole people, from the highest to the lowest, have an artistic sense, which is as widely diffused as their love of flowers. The principal art industries of Japan are her lacquer-work, ceramics, metal-work, enamel, ivory-carving, silk and cotton tissues, embroidery, cut-velvet and paper manufactures. The Japanese ceramic industry includes porcelain (*ishiyaki*), earthenware (*tsuchi-yaki*), and stoneware (*banko-yaki*). The most noted localities for the manufacture of porcelain are the provinces of Satsuma, Hizen, Kaga, and Owari, and the neighbourhood of Kyōto. Earthenware is made, amongst other places, in the vicinity of Tōkyō and Nagoya, and in parts of Kiūshū; stoneware is made chiefly in the provinces of Isé and Bizen. It is generally recognised that Japanese potters have never been able to vie with the Chinese in the production of glazes. Lacquer-work is one of the oldest of Japan's art industries. The lacquer-tree, introduced originally from China, flourishes in Japan better than anywhere else. In the making of lacquer-work there are many complicated and tedious processes. The number of tools required would fill a long list. Only the best kinds of wood are suitable for the purpose, and great care has to be taken in order to obtain the absolutely smooth surface which is essential for the proper application of the lacquer. The bronze and inlaid metal-work of Japan has a high reputation, and there is a constantly increasing demand for her brocades, embroideries, and cut-velvet. The Japanese excel as carpenters and cabinetmakers.

Pictorial Art.—The primitive school of painting in Japan was moulded first of all by Chinese and later on by Buddhist influences. The first native school was the Yamato Riu, which dates from the 11th century. Two centuries later its name was changed to the Tosa Riu. It was marked from the first by certain peculiarities—by its lack of perspective, by a simplicity of treatment, and by a grotesque humour. The last quality is especially noticeable in the work of one of its best-known representatives, the Abbot Toba. Japanese painting is considered by native authorities to have

reached its high-water mark in the 15th century. A revival of classical tendencies then set in, and among a list of famous names those of Chō-Densu, Josetsu, Mitsunobu, Sesshi-u, Shi-unbun, and Kano Mesanobu are prominent. The last named founded a classical school of his own. The beginning of the movement in favour of a more natural and popular school of painting is discernible at the close of the 16th century; but it was not till a century later that Moronobu and Itcho came into notice by their coloured illustrations of books. Then in the 18th century came Ōkyo, the great painter of nature, especially birds, and his pupil, Sōsen, the painter of monkeys. The genius of these two artists gave an immense stimulus to the popular style of painting, and the movement, which showed itself in the increased production of coloured prints (*Ukiyo-e*), reached its full force under the influence of Hokusai (1760-1849), who has more foreign than Japanese admirers.

Commerce and Industries.—In the general domain of commerce and industry, as in that of agriculture, Japan has made very striking progress. This progress is due very largely to the unremitting efforts of the government. By careful and systematic legislation, generous expenditure, and intelligent administrative action much has been done to supplement the efforts of the people. The result has been an extraordinary increase in the area of silk and tea cultivation, a great development in the production of woven tissues, and the creation of flourishing industries in the shape of cotton spinning and weaving, match-making and straw-plaiting, not to mention other branches of industrial activity. Japan now heads the list of silk-producing countries. Her chief productions, besides those mentioned, are rice, copper, coal, and marine products. The following figures speak eloquently for Japan's commercial development. In 1871 the value of her total foreign trade, exclusive of bullion, was little more than £7,000,000. In 1909 it had reached a total of £82,413,034, imports amounting to £40,239,048, and exports to £42,171,902. During the Great War Japan's trade rose by leaps and bounds, both in relative and in absolute value, though not without subsequent depression. In 1919 the imports amounted to £217,331,933, exports to £209,887,261; in 1923, £198,706,300 and £144,774,900. Her leading exports are: raw silk, cotton tissues and yarn, silk manufactures, tea, coal, matches, earthenware, sugar, copper, and camphor. The chief imports are: raw cotton, rice, iron, oil-cake, machinery, and wool. Of the total exports, Asia (chiefly China) takes nearly one-half, the U.S.A. about a third, and Europe (chiefly Great Britain, France, and Italy) a sixth. As regards imports the distribution is roughly: Asia (chiefly British India, China, the Dutch Indies, and French Indo-China) one-half, and the U.S.A. one-fourth. Japan's imports usually greatly exceed her exports. Great Britain imports from Japan silk (raw and manufactures), copper, straw-plaits, peas, zinc, camphor, and rice; and exports thither cotton yarn, cotton and woollen piece-goods, iron manufactures, steel, machinery, and chemicals. The Japanese mercantile marine has shared in the general prosperity. Since 1899 the whole country has been opened to foreign residence and trade. The former open ports have therefore lost their special character, but they still continue to be the chief centres of trade. Of the fourteen places at which foreign trade is now conducted it is only at four that any considerable commerce is carried on, and two of these, Yokohama and Kobe, account for more than three times the trade of all the rest combined.

Government and Administration.—The government is a hereditary monarchy, the succession being now exclusively in the male line. There are ten

administrative departments—the Imperial Household, Foreign Office, and the Ministries of the Interior, Finance, War, Navy, Justice, Education, Agriculture and Commerce, and Communications. The ministers who hold these portfolios, with the exception of the minister of the Household, constitute the Cabinet. There is also a minister-president, who may combine the charge of a department of state with the post of premier. The Cabinet is responsible only to the emperor, and is independent of the Diet. There is also a privy-council. The constitution, modelled on imperial German lines, came into force on the 29th November 1890, when the first session of the Diet was opened. The Diet consists of two chambers—the House of Peers and the House of Representatives. Debates are open to the public, but provision is made for secret sessions. Before a measure becomes law it must be passed by each chamber. The Upper House contains about 370 members. These are hereditary, elected, or appointed. Imperial princes, and nobles who are princes and marquises, are hereditary members; other members of the nobility are elected by peers of the same rank; there are life-members appointed by the emperor; and each prefecture supplies one representative. The Lower House has 464 members. The property qualification for members which formerly existed was abolished in 1900. Members are chosen by the vote of male electors, who must be twenty-five years of age, and pay a direct tax amounting to not less than 3 yen (6s. 1½d.) per annum. For administrative purposes Japan is for the most part divided into urban prefectures (the towns of Tōkyō, Kyōto, and Ōsaka) called *Fu*, and rural prefectures called *Ken*. The total revenue for the financial year 1923-24, as estimated in the budget, was £137,600,000. The total expenditure was the same. The ordinary revenue was estimated at £125,300,000, and the extraordinary at £12,300,000; the distribution of expenditure being: ordinary, £99,150,000; and extraordinary, £38,450,000. The total outstanding national debt in 1924 was £389,000,000—namely, internal debt, £257,000,000; and foreign debt, £132,000,000. The gold standard was adopted in 1907. The Japanese yen is normally equivalent to about 2s. 0½d. Codes of law drafted on European lines, but modified to suit national requirements, have been in force for several years, and the reorganisation of the law-courts has been carried out on a Western basis.

Bibliography.—For information in regard to books on Japan, Von Wenckstern's Bibliography should be consulted. The long list includes the works of Kaempfer, Siebold, and Titsingh (among the earlier writers); Hildreth's *Japan as It Was and Is* (1855); Mitford's (Lord Redesdale's) *Tales of Old Japan* (2d ed. 1874); Adams's *History of Japan* (2 vols. 1874); Rein's *Japan* (Eng. trans. 1889) and *Industries of Japan* (1889); Griffin's *The Mikado's Empire* (new ed. 1912); Brinkley's *Japan* (8 vols. 1901-4) and *History of the Japanese People* (new ed. 1921); Satow's *Voyage of John Saris* (1900); the same author's *Japan, 1858-64* (2d ed. 1905; trans.); and *Kinsē Shirakoku* (2d ed. 1906; trans.); the works of Lafcadio Hearn (1894-1904); Chamberlain's *Things Japanese* (3d ed. 1898). Other well-known writers on Japan are Bishop, Bacon, Dixon, Lowell, Lloyd, Appert, Clement, Ransome, Dyer, Okakura, Longford, Iyénaga, Murray, Sladen, and Norman. Writers on art and industries, besides those already named, are Anderson, Dresser, Fenellosa, Morse, and Morison (1911); on language and literature, Satow, Aston, Chamberlain, Gubbins, Imbrie, and Lange; and on law, currency, and taxation, Lönholm and Gubbins. Amongst more recent books may be noted Count Okuma's *Fifty Years of Japan* (2 vols. 1909); Murdoch's *History of Japan* (1903-II); Uyéhara's *Political Development of Japan* (1910); Inoué's *Home Life in Tōkyō* (1910); Papinot's *History and Geography of Japan* (1910); Longford's *Story of Old Japan* (1910), &c.; Gubbins's *Progress of Japan, 1853-71*

(1911); Lawton's *Empires of the Far East* (1912); D'Autremere's *Japanese Empire and its Economic Conditions* (1915); Porter's *Rise of a Modern Power* (1917); Pooley's *Japan at the Cross Roads* (1917) and *Japanese Foreign Policies* (1920); Latonrette's *Development of Japan* (1919); Brown's *Mastery of the Far East* (1919); McGovern's *Modern Japan* (1920); J. H. Gubbins's *Making of Modern Japan* (1922).

Japanese Cedar. See CRYPTOMERIA.

Japanese Medlar. See LOQUAT.

Japan Lacquer. is furnished by *Rhus vernicifera*. See LACQUER, SUMACH.

Japan Laurel. See AUCUBA.

Japanning is the art of producing, by the aid of heat, a hard coating of coloured varnish upon metal, wood, or papier-mâché. Articles so coated resemble the lacquer wares of Japan and China (see LACQUER). A japanned surface differs from an ordinary painted surface in being harder and more durable, and also in not being easily injured by hot water or by being placed near a fire. A good brown 'japan' is prepared by separately heating equal quantities of amber and asphaltum, and adding to each one-half the quantity by weight of boiled linseed-oil. Both compounds are then mixed together. Copal resin may be substituted for the amber, but it is not so durable. Tinned iron goods are most largely japanned, and for them brown and black colours are chiefly used. Both are obtained by the use of brown japan, the metal getting a preliminary coating of black paint when black is required. Only one coating of brown japan is given to cheap goods, but for better wares two or more coatings are applied. After each coating the articles are heated for ten or twelve hours in an oven at from 135° to 165° F., or even up to a much higher temperature. The japanned surface is then rubbed with fine ground pumice, next with rottenstone, and the final polish given to it by the palm of the hand. Gold or bronze bands or floral decoration, or both, are generally added. These are first painted on in japanner's gold size, and then the gold leaf is applied or the bronzed powder dusted on, after which the objects are again placed in the oven. After they are removed the gilt or bronzed portions get a protecting coat of white spirit varnish. When white or other light colours are used for japanning they are mixed with japanner's varnish. These require more careful heating in the oven than dark brown or black. Such articles as tea-trays, coal-boxes, cash-boxes, tin canisters, and the like are japanned in great numbers in Birmingham. Portable baths are usually finished internally in white japan; and it may be remarked that this would last much longer than it often does if care were taken not to leave soapy water in the baths after being used. The varnishing or japanning of the surface of papier-mâché wares is a similar process to the above, but in the case of these shell or metal inlaying is often worked into the japan.

Japhet, according to the Hebrew record, the second son of Noah, whose descendants peopled first the north and west of Asia, after which they proceeded to occupy the 'isles of the Gentiles.' The term Japhetic or Japetic was at one time used loosely for peoples of the European stock as opposed to Semitic and Hamitic.

Japonica. See QUINCE.

Japurá (Yapurá), or CAQUETÁ, an important tributary of the Amazon, rises in southern Colombia, on the east side of the Andes, flows ESE., and enters the Amazon opposite Tefe by several arms. Its upper course is broken by many falls, but in the lower part it is navigable for river-steamers to nearly 70° W. long., or almost 500 miles.

Jargons. See CHINA (for Pidgin English), CHINOOKS, ESPERANTO, IDO, LINGOA GERAL, LINGUA-FRANCA, SHELTA, SLANG, UNIVERSAL LANGUAGE, VOLAPÜK.—For *Beach-la-Mar*, the trade speech of the Western Pacific (cf. *Bêche-de-Mer*) see a book by W. Churchill (Wash. 1911).

Jargoon. See JACINTH.

Jarl. See EARL.

Jarnac, a village in the French department of Charente, 23 miles by rail W. of Angoulême, where, on 13th March 1569, the Duke of Anjou, afterwards Henry III., and 26,000 Catholics defeated 15,000 Huguenots under Louis I., Prince of Condé (q.v.).

Jaroslav (pronounced *Yaroslaf*), capital of the Russian government of that name, stands at the junction of the Volga with its affluent the Kotorost, 173 miles by rail NE. of Moscow. The town has broad streets, a fine quay, 2 miles long, beside the Volga, churches, monasteries, and a university (1919); it is the seat of an archbishop. The staple industry of the place is the manufacture of cotton stuffs; next comes the weaving of linen, wool, and silk. Jaroslav is an important river-port. Pop. 90,000. The town was founded in 1026, and was the capital of an independent principality until 1471, when it fell to Moscow.—Another JAROSLAV (JAROSLAU), in Galicia, was taken by the Russians in September 1914, and is now Polish; pop. 20,000.

Jarrah. See EUCALYPTUS, TIMBER.

Jarrow, a municipal borough and seaport of Durham, situated on the Tyne, 3 miles by rail SW. of South Shields, and 7 miles E. of Newcastle. Its growth from a small colliery village to a thriving town has been due to the construction of its docks (since 1859), and to the establishment of iron-shipbuilding and marine engine works, blast-furnaces, iron-foundries, gun-factory, &c. Chemicals are also manufactured, and coal is shipped in large quantities. At Jarrow in 682 Benedict Biscop founded the Benedictine monastery with which the name of Bede (q.v.) is inseparably associated. The chancel of the parish church, reconstructed in the 11th century, retains portions of Benedict's work; the nave was rebuilt in 1783, and again in 1866. Bede's chair is still preserved in the church. Jarrow was made a municipality in 1875. It has had a suffragan bishop since 1906. Pop. (1871) 18,115; (1921) 35,590. See Jewitt's *Jarrow Church* (1864).

Jasher, BOOK OF (*Jashar* in Revised Version; Heb. *Sepher ha-yashar*, 'the Book of the Upright'; translated by the LXX. *Biblion tou Euthous*, and by the Vulgate *Liber Justorum*; but the Peshito has *Sepher Hashir*, 'Book of Praises or Hymns'), is one of the lost books of the ancient Hebrews, which is quoted twice (Joshua, x. 13; 2 Samuel, i. 18). Regarding its character and contents there has been much speculation. Talmudic and later Jewish authorities identified it variously with Genesis (sometimes called 'the Book of the Upright'), Deuteronomy, Judges, &c., to all which notions there is the obvious and fatal objection that the two quotations from it which survive are not to be found in any of these books, and could not possibly be found in the first two, as they refer to incidents which occurred at a subsequent period in the national history. The conjecture of the Syriac and Arabic translators has been adopted by Dr Lowth, Herder, and other scholars—viz. that the Book of Jasher was a collection of national ballads, recording the warlike deeds of the national heroes or singing the praises of otherwise celebrated men. Gesenius is inclined to adopt the same view, and suggests that it may have acquired its name, 'the Book of the Upright,' from having been written

chiefly in praise of upright men. Donaldson, in an over-ingenious work, *Jashar* (1854), contended for its being a composition of the age of Solomon, and a work of Nathan and Gad. He conceived that it originated in the desire of the more religious of the community to possess a record of the national history which should chiefly set forth the righteousness of the true Hebrews, and he attempted to extract from the so-called canonical books of the Old Testament such passages as he believed to have originally formed part of it. The actual book could not have been earlier than the age of Solomon, especially if a fragment relating to the building of the temple in the Septuagint of 1 Kings, viii. be from that work. In the 12-14th centuries no less than three different works professing to be the lost Book of Jasher were produced; and in 1751 a preposterous forgery under this name (and ultimately traced to one Ilive, a London printer) created some excitement. It claimed to have been translated from Hebrew by 'Alcuin of Britain,' and was reprinted in 1829.

Jashpur, an Indian state of the Central Provinces; area, 1963 sq. m.; pop. (1921) 154,156. The country is a tableland, ranging from 2200 to 3500 feet in height, and has excellent soil.

Jasmin, JACQUES, a modern Gascon poet, was born at Agen, 6th March 1798. He has given in his *Soubanis* (1830) a humorous account of the poverty and privations of his early life. He earned his living as a barber; but wrote poetry in his native Languedoc dialect. His first volume, entitled *Papillotos* ('Curl Papers'), appeared in 1835. He greatly enhanced his reputation by reciting his own poems in public. His poetry is full of beauty and power; the pathos of his serious and the wit of his comic pieces are of a high order. His poems were received with enthusiasm in France and even other parts of Europe. He was made a Chevalier of the Legion of Honour in 1846, and in 1852 his works were crowned by the French Academy and a prize awarded to him. He published four volumes of poems in all; the best pieces are *The Charivari* (1825), a mock-heroic poem; *The Blind Girl of Castel-Cuillé* (1835), trans. by Longfellow; *Françonetto* (1840); *The Twin Brothers* (1841); *Martha the Simple* (1845); and *The Son's Week* (1849). These poems raised Jasmin's native tongue to the dignity of a literary language, and initiated a literary and linguistic movement in the south of France which has gone on spreading and thriving since his death (at Agen, on 4th October 1864). See French Lives by Rabaire (1867) and J. Andrieu (1882), vol. iii. of Sainte-Beuve's *Portraits Contemporains*, and the Life by Samuel Smiles (1892).

Jasmine, or JESSAMINE (*Jasminum*), a genus of plants of the natural order Oleaceæ. The genus Jasmine has its calyx and corolla each 5 or 8 cleft, two stamens attached to and included within the tube of the corolla, and a two-lobed berry, one of the lobes generally abortive. The name Jasmine is from Arabic and Persian *yāsmīn*. The date of introduction of the Common Jasmine (*J. officinale*) from Persia and Afghanistan is unknown, but according to Gerard it was in common use as a wall-shrub and for covering arbours as far back as 1597, and it is naturalised in many parts of Europe, Asia, and South America. The perfume is obtained from the flowers by means of absorption in a fatty substance. An essential oil is also distilled from jasmine. The commercial oil of jasmine, however, is merely oil of ben or the like flavoured with jasmine.—*J. grandiflorum*, a native of the East Indies, has flowers still more fragrant. *J. Sambac* is used in China for flavouring tea.—Several other species, some with erect and some with twining stems, are not uncommon in gardens

and greenhouses. Some have white, and some have yellow flowers.—Cape Jasmine is a name

Jasminum nudiflorum.

for Gardenia (q.v.), and the Carolina Jasmine is Gelsemium (q.v.).

Jason. See ARGONAUTS.

Jasper (Gr. *iaspis*), a mineral generally regarded as one of the varieties of Quartz (q.v.), and distinguished by its opacity, owing to a mixture of clay or other substances with the silica of which it is chiefly composed. There are many kinds of jasper, some of them of one colour, as brown, red, yellow, green, white, blue, or black, and some variously striped, spotted, or clouded with different colours. Jasper is a very abundant mineral; it is found in veins and embedded masses in many rocks, sometimes appears as a rock of which whole hills are formed, and is very common in the shape of pebbles. It has been prized from the most ancient times for ornamental purposes, as it takes a high polish. The kind called *Porcelain jasper* is rather rare. It is often full of minute holes, or is cracked in all directions. It is regarded as a kind of natural porcelain, and is found in places where coal-seams have taken fire: it is thus simply a baked clay. Similar baked clays are not infrequently met with in the vicinity of intrusive igneous rocks.

Jassy (Rum. *Iasi*), capital of Moldavia, the north central division of Rumania, stands 5 miles W. of the Pruth, 205 miles by rail NW. of Odessa, and 289 NNE. of Bucharest. The town was almost destroyed by fire in 1827, after which it was rebuilt. The streets are broad, and are paved with asphalt, and the houses mostly one-storied and built of wood. There are more than forty Greek churches and close upon sixty Jewish synagogues. The most noticeable secular buildings are the palaces of the boyars or Rumanian nobles, both in the city and in its environs. The town has a small university. The industry is unimportant; but there are textile manufactures, and an active trade in corn, spirits, and wine, mostly with Galatz on the Danube. Pop. 76,000, of whom three-fourths are Jews, besides Armenians, Russians, Gypsies, &c. Jassy was the residence of the Moldavian princes from 1565, and was the seat of the Rumanian government during the German invasion of 1916-17. Here peace was concluded between Russia and Turkey in 1792. During Ypsilanti's insurrection the town was almost destroyed by the Turkish Janizaries (1822). On a height close to the town is the residence of the former woiwodes or governors of Moldavia.

Jászberény, a town of Hungary, 39 miles E. of Budapest; pop. 33,000, employed in agriculture, cloth manufacture, and wine-making.

Jātaka (literally, 'relating to birth'), the name of a collection of legends, containing an account of the 550 previous births of Śākya Muni,

or the Buddha. It forms a part of the *Suttapitaka*, or 'baskets of discourses,' of Pāli literature, and an edition of the text, with commentary, was issued by Fausbøll in 7 vols. (Lond. 1877-96). These are of great importance as the earliest collection of popular stories, many of which at an early date found their way by one channel or other to the West, and are still current as fables of Æsop or as traditional and apparently indigenous folk-tales. The best English translation is by various scholars, edited by Professor Cowell (6 vols. 1895-1907).

Játiva, or **XATIVA**, **SAN FELIPE DE**, a town of Spain, 35 miles by rail SSW. of Valencia. As the *Setabis* of the Romans it was famous for its linen manufactures. It was Moorish until taken by Jayme I. in 1224. Here was born the painter Ribera (Lo Spagnoletto) in 1588. It was also the home of the notorious Borgia (Borja) family. Pop. 14,000.

Jatropa. See **PHYSIC NUT**.

Jats, the most numerous and valuable section of the agricultural population of the Punjab, number about 5½ millions. They are by many identified with the *Getae*; and some accept the theory that they are descended from Scythian invaders of India in prehistoric times. Some scholars believe them cognate with the Gypsies (q.v.).

Jauer, a town of Prussian Silesia, on the Neisse, 13 miles by rail S. of Liegnitz. It is famous for its sausages and its weekly corn-market, held regularly since 1404. Jauer was formerly the market for the linen-trade of Silesia and the capital of a principality; but the Thirty Years' War ruined it. It now manufactures sugar, leather, cloth, &c. Pop. 15,000.

Jauf. See **ARABIA**.

Jaundice, a yellow colour of the skin and conjunctiva of the eye, arising from the presence of the colouring matter of the bile in the blood and tissues, is a symptom of various disordered conditions of the system rather than a special disease. With this colouring of the skin and eyes the following symptoms are associated: the faeces are of a grayish or dirty-white tint, in consequence of the absence of bile, and the urine is of the colour of saffron, or is even as dark as porter, in consequence of the presence of the colouring matter of the bile. There is sometimes, but not in the majority of cases, an extreme itching of the skin. It is a popular belief, as old as the time of Lucretius, that to a jaundiced eye everything appears yellow. This, however, is a very rare symptom.

The causes of jaundice naturally fall into two classes, those where there is mechanical obstruction of the bile-duct, and those where there is no obstruction. Mechanical obstruction may be produced by gall-stones (see **CALCULUS**) or thickened bile within the duct; by inflammatory swelling of its lining membrane or that of the duodenum, into which it discharges (*catarrhal jaundice*); by the pressure upon it of tumours of neighbouring parts, or of accumulations of faeces in the bowels. Jaundice may result without obstruction of the ducts from congestion or cirrhosis of the liver (though in such cases the small ducts within the liver are compressed), and especially from the action of various poisons—e.g. phosphorus, arsenic, mercury, snake-poison—and of various acute diseases—e.g. typhus fever, pyæmia, and above all yellow fever. In cases of obstructive jaundice, all authorities are agreed in referring the yellow staining of the skin and other tissues to absorption by the lymphatics and veins of the bile-pigment, which is secreted by the liver but not discharged into the intestine. The explanation of non-obstructive jaundice is, however, not so clear, and raises complicated physiological questions. According to one theory,

the bile-pigments are formed in the blood and merely excreted by the liver; and on this view non-obstructive jaundice is caused by their defective elimination owing to diminished activity of the liver-cells. Others hold that the bile-pigments are not formed except by the action of the liver-cells; that in non-obstructive jaundice also secretion and re-absorption always take place; and that the bile-pigments continue in the circulation owing to some defect not fully understood in the processes occurring in the blood. The question must be regarded as an open one; but the latter theory seems at present most in favour.

Both prognosis and treatment of jaundice depend entirely upon the recognition of the cause to which it is due. In cases of gall-stones, catarrhal jaundice due to transitory inflammation and swelling of the bile-duct, and congestion of the liver, the case usually terminates favourably; in cases of tumour and of cirrhosis of the liver the outlook is always grave; in poisoning and in acute diseases jaundice is often a very serious symptom; a serious form due to acute yellow atrophy of the liver sometimes occurs in pregnant women, and is of very grave import. See **LIVER (DISEASES OF)**.

Jaunpur, the capital of a district in the United Provinces of India, is situated on the Gumti, here crossed by a bridge (1569-73) 712 feet in length. The former capital of a Mohammedan kingdom, Jaunpur has several splendid architectural monuments, including Ibrahim's baths (1420), mosques, and ruins of mosques and of the fort. Pop. (1881) 44,845; (1911) 32,880; (1921) 32,569.

Jaures, **JEAN**, French Socialist leader, was born at Castres (Tarn) in 1859, lectured on philosophy at Toulouse, became a deputy in 1885, founded the Socialist paper *L'Humanité* in 1904, and was assassinated at Paris, 31st July 1914, just as the Great War began. He wrote *Studies in Socialism* (Eng. trans. 1906), and was editor, and in part author, of *Histoire Socialiste* (1901 et seq.).

Java (**Djává**), an island of the Dutch East Indies, the seat of the colonial government. It is situated between 5° 52' (St Nicholas Point) and 8° 50' (South Cape) S. lat., and 105° 13' and 114° 39' E. long. The island is washed on the N. by the Sea of Java, on the E. by the Strait of Bali, on

the S. by the Indian Ocean, and on the W. by Sunda Strait. It extends almost due west and east, declining about 15° to the south. The extreme length is about 600 miles, the breadth 40 to 125 miles, the superficial area about 49,000 sq. m. (excluding Madura, q.v.). The coast-line is not much developed; a few large bays, protected by islands, furnish safe anchorage for vessels. From end to end of the island (most probably corresponding to a volcanic line of fissure) there is a mountain-chain, named Gunung Kendang, and, especially in the western part of the island, several parallel shorter chains. To the north there are a few isolated mountains in the alluvial plain. Towards the south the island falls in general steeply towards the sea. There are forty-three volcanoes,

several of which are still active. The rivers are generally small, but become torrents when swollen by rain; only a few of them are navigable. The climate depends on the altitude; it is rather hot and unhealthy on the coast, but pleasant in the hills. The thermometer seldom indicates more than 95° F. In Batavia the average temperature is 78·5°, the extremes being 92·7° and 66·9°. The mountains rise to about 12,000 feet, and are clothed up to 9000 or 10,000 feet with luxuriant foliage; on the loftiest eminences the thermometer sometimes sinks to 32°. Generally, even in the hills, the days are hot, but moderated by land and sea breezes, which blow regularly across the island; the nights especially in the highlands, are cool. The rainy season lasts from November to March.

The population of Java has rapidly increased; in 1850 it was 9,570,000, and in 1894, 24,643,000. In 1900 the total population (with Madura, 1,850,000) was 28,746,638; in 1920, 35,017,204, including about 135,000 Europeans and 420,000 Asiatics (Chinese, Arabs, Hindus, &c.). The chief towns are Batavia, 254,000; Surakarta, 134,000; Surabaja, 192,000; and Samarang, 158,000. The natives belong to the Malay (q.v.) race. The Madurese, in the eastern part of the island, the Sundanese, living in the western part, and the Javanese proper differ in physique and in language. Most of them are Mohammedans, at least in name, for much of the belief of their ancestors survives in the Islam that is now practised. A few tribes, however, profess the old religion (viz. the Baduwis in Bantam and the 'Heathens' of the Tengger Mountains). There are many native Christians and a few hundred Chinese Christians. Every form of religious belief is free. How many half-castes are counted among the Europeans it is impossible to say. The inhabitants are more civilised than those of the other islands of the archipelago. One of the chief vices is opium-smoking.

The chief wealth of Java consists in its luxuriant vegetation, though the producing power seems to be now a little exhausted, at least to judge from the many diseases by which the plantations have been visited of late. The character of the vegetation varies with the soil and the elevation. The division (of Junghuhn) into four botanical zones, up to 2000, 4500, 7500, and above 7500 feet altitude, has been commonly adopted. The fauna differs from that of the other islands of the archipelago. The animal kingdom is not very rich: tigers (which are a scourge to some parts of the island), rhinoceros, deer, and wild swine are the chief representatives of the quadrupeds; there are only a few birds that are conspicuous for their plumage, and hardly any that are distinguished by their song. Several species of serpents (some venomous) and crocodiles are found on the island. The geology of Java is still largely undetermined. For the greater part, the island belongs to the Tertiary formation, altered by many eruptions of more recent date. Some parts of Java seem to belong to the Pleistocene period; sedimentary formations of recent date are especially considerable along the north-west part of the island. Though in old times Java was called the 'land of gold,' little of that metal has been found of late; silver is scarce; and there are no other metals at all. Salt, the manufacture of which is a government monopoly, is prepared from sea-water; coal is worked in the Preanger, marble in the Madiun residency; and petroleum is got.

Formerly Java used to be considered as affording almost a perfect answer to the question, How can a colony best be governed? The material prosperity which resulted to the mother-country from this possession was owing, for the greater part, to the system of General Van den Bosch (introduced

in 1830). Under that system the natives were compelled to cultivate part of the ground and plant staple articles on it, whilst the produce was delivered at a fixed price to the magazines of the government, and from them shipped to Europe and sold by the Netherlands Trading Company. Although this system brought large sums into the treasury of the Netherlands, a vigorous opposition against it existed almost from the beginning, since it pressed very hard on the natives. As time went on the opposition gained ground, and in name the system was given up and private planters admitted. But in point of fact, at least so far as the coffee-plantations were concerned, the system was still continued, because the income derived from this item could not be dispensed with. In 1882-1914 the enforced services were abolished, annual payments per head being substituted. In 1890 the natives received fifteen florins (£1, 5s.) for one picul (133½ lb. avoird.), which they had to deliver at the magazines. Though private planters had been admitted before 1870, the 'Agrarian Law,' which then was promulgated, greatly facilitated the establishment of plantations by private individuals; but still the competition of the government prevented an unrestrained development. In some parts of the island (especially in the western part) where private persons are owners of the ground, or hire it from the native princes, private industry was in better circumstances; but of late diseases in the crops and a falling-off in prices have done much damage. Sugar, coffee, indigo, tea, and tobacco are planted for export. Rice is grown extensively for native consumption (and a little for export); but it is not sufficient, and other food-crops (maize, &c.) have to be cultivated. The teak-forests belong exclusively to the government, but they are managed by private persons, working under contract. The live-stock includes buffaloes, cattle, and horses. The manufactures are insignificant.

Java may be considered the centre of the commerce and trade of a great part of the Dutch East Indies. The chief articles of export are sugar, coffee, tobacco, rice, cinchona bark, quinine, tea, copra, indigo, hides, timber, india-rubber, gutta-percha, cocoa, tapioca, spices, and the silk-cotton from the tree called Kapok, which goes mostly to Australia. The tea goes chiefly to Holland; the quinine forms the greater part of the world's supply. The countries which trade most extensively with Java are Holland, the Straits Settlements, and Great Britain. The leading articles of import are cotton and linen goods, wine and spirits, provisions, machinery, railway-plant, &c. Java has frequent intercourse with Europe, viz. Singapore or directly by Dutch steamers, and is connected by cable with Europe and with Australia. The telegraph system of the island is very extensive. There are good roads and railways, partly belonging to the government, partly to private companies. There are over 3000 miles of tramways and railways (running both across and from end to end of the island).

The island (without Madura) is divided into sixteen residencies: Bantam, Batavia, Preanger Regencies, Cheribon, Pekalongan, Samarang, Rembang, Surabaja (or Soerabaja), Pasuruan, Besuki (including Banyuwangi), Banyumas, Kadu, Jokjakarta (or Djokjakarta), Surakarta (or Soerakarta), Madiun, Kediri—two of which (Surakarta and Jokjakarta) are under native princes. Over each residency a Dutch resident exercises a general control. The residencies are divided into *afdeelingen*, under assistant-residents, to whom are subject the controllers. Subject to the supervision of these European officers, the administration is carried on by native functionaries.

—regents at the head of the regencies (generally corresponding to the *afdeelingen*), to whom are subject the *wedono* or *demang*; the regents have substitutes called *patih*.

The languages are Javanese, a Malayan tongue, divided into an aristocratic dialect and a popular dialect, Sundanese, and Madurese. Besides there is another language used in old inscriptions and manuscripts, called *Kawi* (better, Old Javanese). The Javanese alphabet is derived from the Devanagari. Many antiquities were left by the early Hindu conquerors, especially in middle and eastern Java (Boro Budor (q.v.), Brambanan, Dieng). The literature of modern Java is rather insignificant. *Babad's* ('chronicles') and the *wayang* ('puppet-plays') stories should be mentioned.

The history of Java can only be given in outline. The first important visit of Hindus seems to have been about A.D. 75. In 412 A.D. Fa-Hien visited Hindu colonies in Java. About the year 800 the intercourse of the Hindus with the island appears to have become more important. Already by that time the Javanese had attained to a considerable degree of civilisation. To judge from the antiquities, there were three periods of Hindu ascendancy—a period of Buddhism, a period of Sivaism, and a period of compromise. Several powerful Hindu states were established, among which Madjâpahit must be mentioned. At the beginning of the 15th century Mohammedanism reached the island and quickly got a firm footing. At the end of the 16th century European merchant-adventurers established themselves in Java; whilst the Dutch rule in the island began in 1610 (the first governor-general, Pieter Both). Then began a long, tough struggle with the natives, but with the lapse of time the Dutch gained ground. The most important native state then was Mataram. In 1705 the company obtained possession of the Preanger Regencies, and in 1745 its authority was extended over all the north-east coast of the island. In 1755 the empire of Mataram was divided into two states, Surakarta and Jokjakarta. In 1808 the kingdom of Bantam was incorporated with the Dutch possessions; but these in 1811 became part of the French empire. In the same year Java was occupied by the English, and remained in their hands up to 1817. A short time after the Dutch had resumed possession of Java an insurrection burst out in Jokjakarta in 1825 under Dipâ Negârâ, and the struggle lasted until 1830, when the chief of the rebels submitted to the Dutch authorities. By that time the greater part of the states of the native provinces had been incorporated in the Dutch possessions, which then assumed the extension they have to-day.

See Sir Stamford Raffles's *History of Java* (Lond. 1817); De Jonge, *Nederlandsch Oost-Indië* (1862-88); Junghuhn, *Java* (1849-53); Worsfold, *A Visit to Java* (1893); P. J. Veth, *Java, Geographisch, Ethnologisch, Historisch* (3 vols. 1875-78); Chailley-Bert, *Java et ses Habitants* (1900; new ed. 1914); A. Cabaton, *Java, Sumatra, and other Islands of the Dutch East Indies* (Eng. trans. 1911); D. M. Campbell, *Java, Past and Present* (1915). See also R. Schulling, *Nederland in Oost en West* (a general description of the East Indian colonies, 1889); Clive Day, *The Policy and Administration of the Dutch in Java* (1904); *Staats- en Administratief-Recht van Nederl. Indië* (3d ed. 1884); Worsfold's *Visit to Java* (1893); Eliza Siddmore's *Java, the Garden of the East* (1898); and Douwes Dekker's romance, *Max Havelaar* (Eng. trans. 1868). Jaworow, a town of Galicia, 30 miles WNW. of Lemberg, was the favourite residence of John Sobieski, king of Poland; pop. 10,000.

Jaxartes, now called SIHÛN, or SYR-DARIA (both *syr* and *daria* mean 'river'), a river of Turkestan (q.v.), which rises at an altitude of 12,000 feet,

30 miles S. of Lake Issik-kul, in the Tian-Shan Mountains. Flowing W. and SW., the Naryn descends, through a wild narrow gorge, to the level of 6800 feet at Fort Narynsk, is joined by the Kara-Daria just below Namangan, and receives the name of Syr-Daria. A little west of Khojend it breaks through another gorge, then turns suddenly to the NW. for 1200 miles, through the province of Syr-Daria (q.v.), with the Kizil Kum desert on the left, and, passing Perovsk and Kasalinsk, enters the Sea of Aral by a delta. Its total length is 1800 miles. It is navigable from Chinaz (1100 m.), where the Transcasian railway to Tashkand crosses; but the Orenburg-Tashkand line renders the river traffic comparatively unimportant. The Jany-Daria, a branch from Perovsk, used to flow into the Aral Sea on the SE., but now loses itself in the sand. Some former tributaries no longer reach the Syr-Daria—e.g. the Tchu and the Sary-Su, which end about 100 miles E. of Perovsk, and the Sokh, absorbed for irrigation purposes at Khokand. Near the chief affluent, the Chirchik, stands Tashkand. The Kara-Daria and upper Syr-Daria irrigate Ferghana; its lower course is less utilised, but many schemes are projected.

Jay (*Garrulus*), a genus of short-winged, short-billed birds of the Crow family (Corvidæ), represented in the palaearctic region by about 12 species. The jays inhabit woodlands, and the adults are generally found alone or in pairs. They are almost omnivorous, feeding chiefly on berries, seeds, nuts, and fruits, but eating also worms, insects, larvae, birds' eggs, and even young mice and the nestlings of singing-birds. The well-known blue and black markings on the wing-coverts are characteristic of the whole genus, of which the Common Jay (*G. glandarius*), the only British species, may be taken

Common Jay (*Garrulus glandarius*).

as a type. This bird is comparatively common throughout England and Wales, and is found in the south and east of Ireland, and in Scotland as far north as Inverness-shire. Its numbers, however, are everywhere gradually decreasing, owing to the constant war waged against it by gamekeepers on account of its partiality for the eggs of game-birds. It is also sought after for its beautiful blue feathers, which are used in the making of artificial flies. The common jay builds, in thick trees or high bushes, a cup-shaped, basket-like nest of sticks lined with grasses. The eggs, 5 or 6 in number, are of a greenish-gray colour, thickly speckled with light-brown, and sometimes marked with fine black lines. The adult bird measures about 14 inches. The prevailing colour is a light brown, but the tail-feathers and quills are black; the wing-coverts are black, barred with bright blue and white; the head bears an erectile crest of whitish feathers with black streaks. Though the genus *Garrulus* is

strictly confined to the Old World, closely allied genera, Cyanocitta, the Blue Jays, and Xanthura, the Long-tailed Jays, are found in North and South America. The Common Blue Jay (*C. cristata*) measures 11½ inches, and is of a grayish-purple colour. It is common throughout Canada and the southern and eastern States, and sometimes does valuable service in ridding a district of caterpillars. When taken young jays are easily tamed, and are very popular as pets; for, though their natural note is harsh and unpleasant, they possess considerable powers of imitation.

Jay, JOHN, an American statesman and jurist, and first chief-justice of the supreme court of the United States, was born in New York city, December 12, 1745. He graduated at King's (now Columbia) College in 1764, and was admitted to the bar in 1768. Elected to the first Continental congress in 1774, and re-elected in 1775, he prepared addresses to the people of Great Britain and Canada, and to his own countrymen; drafted the constitution of New York state in 1777, and was appointed chief-justice of the state; was returned to congress in 1778 and elected its president, and in the following year was sent as minister to Spain. In 1782 he was added by congress to the peace commissioners, and it was mainly by his efforts that the treaty was brought to a conclusion on terms so satisfactory to the United States. In 1784-89 he was secretary for foreign affairs; on the adoption of the national constitution in 1789 he wrote in its favour in the *Federalist* (see HAMILTON); and after the organisation of the Federal government, Washington having offered him his choice of the offices in his gift, he selected that of chief-justice of the supreme court. In 1794 he concluded with Lord Grenville the convention familiarly known as 'Jay's treaty,' which provided for the recovery by British subjects of pre-revolutionary debts and by Americans of losses incurred by illegal capture by British cruisers, and the determination of the eastern frontier of what is now the state of Maine; the British were to surrender the western posts held by them in 1786, and there was to be reciprocity of inland trade between the United States and British North America. The treaty, though favourable to the United States, was passionately denounced by the Democrats as a surrender of American rights and a betrayal of France; but it was ratified by Washington in August 1795. Jay was governor of New York from 1795 to 1801. Then, though offered his former post of chief-justice, he retired from public life, and passed the remainder of his days at his estate of Bedford, in Westchester county, New York. There he died, May 17, 1829. There is a good *Life* (1833) by his son, William Jay (1789-1858), who was a notable leader in the anti-slavery movement, and whose writings in favour of arbitration in national disputes exerted a considerable influence. See also the *Lives* by W. Whitelock (N.Y., 1887) and Pellew (1890), and his *Correspondence and Public Papers* (ed. H. P. Johnston, 1890-3).

Jay, WILLIAM, an English Congregational minister, was born May 6, 1769, at Tisbury, in Wiltshire. He worked at his father's trade, that of a stonecutter and mason, until his sixteenth year. He was then sent to Marlborough Academy, a Congregational training college for the ministry. From 1791 he was pastor of Argyle Chapel at Bath till his death, 27th December 1853. Jay was an impressive and eloquent preacher and a popular writer. See his *Autobiography* (1854).

Jayadeva, the *nom de guerre*, meaning 'god of victory,' of a Hindu poet, who was born at Kenduli, in Birbhūm district, Bengal, in the 12th century. His great work is the *Gita Govinda*, a Sanskrit lyric drama, in which is celebrated the

love of Krishna and his wife Radha. The Hindu commentators give the poem a mystical interpretation. As the 'Indian Song of Songs' it was translated in 1875 into English by Sir Edwin Arnold.

Jazyges, a Sarmatian tribe, whose original home was to the north of the Sea of Azov. In the 1st century of the Christian era they moved westwards, finally settling in the plains between the Theiss and the Danube, though one band seems to have gone to the north side of the Carpathians, and to have been vanquished by Hermanric, the king of the Goths, in the early part of the 4th century. The southern division of the tribe maintained an almost incessant warfare against the Danubian provinces of Rome, in spite of numerous defeats, especially by Marcus Aurelius (172) and Carus (283). Their power was finally broken by the Huns and Goths. The Jazyges were bold, savage horsemen, who dwelt only in wagons and tents. See SARMATIANS.—JAZYGIA is a district in Hungary, ESE. of Budapest, whose inhabitants, Magyars, have no connection with the ancient Jazyges.

Jazz, dance music, generally syncopated, played by a band eccentrically composed. The jazz-drummer, a sort of one-man band, provides the characteristic feature of jazz, which is noise. The music and the dances associated therewith emerged from the negro shanties of New Orleans in 1915, and in 1916 Bert Kelly's 'Jazz Band,' the first to be so called, was engaged by the Boosters' Club of Chicago. The origin of the word is uncertain. The term has been applied also to noisy proceedings, to loud writing, to eccentric and discordant colouring.

Jeanne d'Albret (1528-72), queen of Navarre, was mother of Henry IV. of France (q.v.). Calvinist and Huguenot, she was noted for her beauty and intellect, and wrote both prose and verse. There are *Lives* by Freer (2d ed. 1861) and Bryan (1911).

Jeanne d'Arc. See JOAN OF ARC.

Jebb, SIR RICHARD CLAVERHOUSE (1841-1905), a great Greek scholar, born at Dundee, passed with marked distinction through St Columba's College, Dublin, the Charterhouse, and Trinity College, Cambridge, graduating as senior classic in 1862. Soon after he was elected Fellow of his college, and he took a prominent part in organising the system of Inter-Collegiate Classical Lectures, and served as secretary to the newly-founded Cambridge Philological Society. In 1869 he became public orator of the university, in 1872 classical examiner in the university of London, and tutor of his own college, in 1875 professor of Greek in the university of Glasgow, and in 1889 regius professor of Greek at Cambridge. In 1891 he was elected M.P. (Unionist) for Cambridge University. He had actively supported the teaching of modern Greek, and he helped to establish the British School of Archaeology at Athens. Jebb's books are *The Characters of Theophrastus* (1870); *The Attic Orators: Antiphon to Isaeus* (2 vols. 1876-80); *A Primer of Greek Literature* (1877); *Modern Greece* (1880); *Translations into Greek and Latin Verse* (1873); *Bentley* (1882); admirable school editions of the *Electra* and *Ajax* of Sophocles; an *Introduction to Homer* (1887); *Lectures on Greek Poetry* (1893); and *Humanism in Education* (1899). But perhaps his most important work is his monumental edition of the plays of Sophocles, with text, commentary, and prose translation (7 vols. 1883-96). The last gift to the world of his accurate and sane but brilliant scholarship was his *Bacchylides* (1905), a critical edition of the text, with elaborate notes. See his *Life and Letters*, by Lady Jebb (1907).

Jebell (anc. *Gabla*, *Gabal*, *Byblos*), a walled town on the Syrian coast, with a castle, 20 miles N. of Beirut, is associated with the stories of Osiris

(q.v.) and of Adonis (q.v.). Its temples, tombs, and works of art prove strong Egyptian influence from the XIIth dynasty or earlier. Byblos adhered to Egypt against the Amorites till Akhnaton's time. It was taken by the Crusaders (1103) and by Saladin (1189). For Philo of Byblus, see PHENICIA.

Jebel Druz, a state under the French mandate for Syria (q.v.); capital, Suweda. See DRUSES, HAURÂN.

Jebel Shammar, an emirate of Arabia (q.v.), conquered in 1921 by Nejd. See WAHHABIS.

Jedburgh, the county town of Roxburghshire, is beautifully situated on Jed Water, 56 miles by rail (by road 49) S.E. of Edinburgh. Of its magnificent Augustinian abbey, founded by David I. in 1118-47, and finally spoiled by the English in 1544-45, the ruined church only remains. This, Norman to Second Pointed in style, is 235 feet long, and has a central tower 86 feet high. The royal castle, where a skeleton appeared to Alexander III. at his marriage-feast (1285), was razed in 1409. Other memories has Jedburgh—of Mary Stuart and Prince Charles Edward, of Thomson, Burns, Scott, and Wordsworth, of Mary Somerville and Sir David Brewster. A Border town, it nurtured a warlike race, whose slogan, 'Jeddart's here!' was seldom long silent. Their chief weapon was the 'Jeddart axe,' a stout steel-headed pole, 4 feet long; and 'Jeddart justice' is still a byword for hanging first and trying afterwards. Ferniehirst Castle (rebuilt 1598; restored 1889) was the seat of the Kerrs. Jedburgh has been a royal burgh from time immemorial. Woollen goods have been manufactured here since 1728. Pop. (1841) 3277; (1921) 2426.

Jeddah. See JIDDAH.

Jefferies, JOHN RICHARD, generally known as RICHARD JEFFERIES, English writer on rural subjects, was born at the farmhouse of Coate, 2½ miles from Swindon, in Wiltshire, on 6th November 1848. He started life as a journalist on the staff of the *North Wilts Herald* about 1866, and for twelve years was busy with this kind of work and with writing crude novels. His name first became known by a long letter to the *Times*, in November 1872, on the labourers of Wiltshire. This procured him an opening to the magazines as a writer on agricultural and rural topics. In 1877 he abandoned country journalism, and moved nearer to London, hoping to make a living by his pen. In the following year he won his first real success with *The Gamekeeper at Home*; its subtitle, 'Sketches of Natural History and Rural Life,' indicates the kind of work by which his future fame was won. Other books written in the same vein, or on similar subjects, are *Wild Life in a Southern County* (1879), *The Amateur Poacher* (1880), *Round about a Great Estate* (1881), *Nature near London* (1883), *Life of the Fields* (1884), *Red Deer* (1884), and *The Open Air* (1885). The book entitled *The Story of My Heart* (1883) is a strange autobiography of inner life. Besides these he wrote some later novels of indifferent merit; *After London*, or *Wild England* (1885) is a curious romance of the future. Within his own province, although it was not a wide one, Jefferies was an admirable writer. He possessed a wonderful insight into the habits and ways of animals and birds and creeping things, and a great love of them. No English writer has shown a more minute and accurate acquaintance with the life of the hedge-rows and woodlands and fields of southern England. He had also a reverent feeling for nature, not only of her outward phases and aspects, but also of what may be termed her inner life. Nor were human beings excluded from the range of his observa-

tion and sympathy: he has left admirable sketches of country-folk—farmers, gamekeepers, labourers, village-loafers, &c. He died at Goring in Sussex on 14th August 1887, after a painful illness of six years' duration. See Sir Walter Besant's *Eulogy* (1888), and Lives by Salt (1893) and Thomas (1909).

Jefferson, JOSEPH, comedian, was born in Philadelphia on 20th February 1829. He came of a theatrical stock, his great-grandfather having been a member of Garrick's company at Drury Lane, while his father and grandfather were well-known American actors. With such an ancestry it is not wonderful that young Jefferson was on the stage from his very infancy, appearing as Cora's child in *Pizarro* when only three years of age, and dancing as a miniature 'Jim Crow' when only four. For many years he went through the hard training of a strolling actor, and then played in New York, where in 1857 he made a hit as Doctor Pangloss, and in 1858 created the part of Asa Trenchard in *Our American Cousin*, Sothorn playing Lord Dundreary. In 1865 he visited London, and at the Adelphi Theatre played for the first time his world-famous part of Rip Van Winkle (4th September 1865). With this character his name was identified, and, although he had shown himself an admirable comedian in many characters, to the English-speaking world he was always Rip Van Winkle, and his Rip was 'the Arcadian vagabond of the world of dreams.' Dr Pangloss (in Colman's *Heir-at-Law*) and Bob Acres (in *The Rivals*, revived by him at Philadelphia in 1880) were his other best-known characters. He attained distinction as a painter, and lived much on his Louisiana plantation, dying 23d April 1905. See his Autobiography (New York, 1890).

Jefferson, THOMAS, author of the Declaration of Independence, and third president of the United States, was born at Shadwell in Virginia, on the 13th April 1743. His father, Peter Jefferson, who died in 1757, was of Welsh descent, and was a planter and surveyor of note in the colony, and a member of the House of Burgesses; his mother was a granddaughter of William Randolph (1650-1711). Thomas Jefferson was the third child and eldest son of a family of ten children. He entered William and Mary College at the age of seventeen, three years after the death of his father, and remained there two years. In 1767 he was admitted to the bar, and practised with success. In 1769 he was a delegate to the House of Burgesses, and here his first important effort was in support of a motion for the easier emancipation of slaves. The passing of the Boston Port Bill, to take effect on 1st June 1774, decided Virginia to make common cause with Massachusetts, and Jefferson favoured the resolution passed in the Assembly of Virginia to set apart the first day of June as a day of fasting and prayer. The governor, Lord Dunmore, offended by this action, dissolved the Assembly, and the members met in the Raleigh Tavern, Williamsburgh, and resolved to advise the people of Virginia to send deputies to a convention to consider the affairs of the colony and elect delegates to a general colonial congress. Jefferson was chosen a member of the convention, and, unable to attend, he sent a communication which was published under the title of 'A Summary View of the Rights of British North America.' It was not adopted as written by Jefferson, still he was threatened by Lord Dunmore with prosecution for high-treason; and his name was included in a bill of attainder moved in parliament, but not pressed to a vote. Jefferson was a member of the second congress, which met at Philadelphia in 1775, and took his seat on 25th June, a few days after the battle of Bunker Hill. Here his

unswerving devotion to his country's cause, his close acquaintance with English law, and his manner, characterised by John Adams as 'prompt, frank, explicit, and decisive,' secured him the respect of the House. He was re-elected to the third congress (1776); and on 7th June Richard Henry Lee, of Virginia, as instructed by his constituents, moved that independence should be declared. Congress fixed 1st July for the consideration of Mr Lee's motion, and meanwhile appointed a committee of five to prepare a suitable declaration on which to act; Jefferson was chairman, and the others were Franklin, John Adams, Roger Sherman, and Robert R. Livingston. By request of his colleagues, Jefferson wrote the draft of the declaration which was submitted to the House on 28th June. Lee's resolution was passed July 2, and the formal declaration, essentially as submitted, was adopted July 4, 1776.

Jefferson now resigned his seat, and, although appointed a commissioner to France with Franklin and Silas Deane, he declined the office in order to serve the people of Virginia in forming a state constitution. Among the reforms largely due to him were laws converting estates tail into fee-simple, abolishing the principle of primogeniture, and establishing the freedom of religious opinion. He succeeded Patrick Henry as governor of Virginia in 1779-81; and during the invasion of the state by Arnold and Cornwallis he was equal to the emergency. In 1783 he was elected to congress, then sitting at Annapolis, Maryland, where he secured the adoption of the decimal system of coinage. He was sent in the summer of 1784 to act with Franklin and Adams as plenipotentiary in negotiating treaties of commerce with foreign nations; but in this mission they were not very successful, the only treaties effected being with Prussia and Morocco. The next year Jefferson succeeded Franklin as minister to France, just before the opening events of the Revolution. He remained during the stormy meetings of the National Assembly and the destruction of the Bastille, performing with much tact the delicate duties of ambassador, but evidently in sympathy with the revolutionary movement. In 1789 Washington appointed him secretary of state, but he did not enter on the duties of the office till March 1790. From the origin of the two political parties, Federal and Republican, Jefferson was the recognised head of the latter, while the other members of the cabinet and the president were Federalists. On 1st January 1794 Jefferson withdrew from public life to his estate at Monticello to devote his leisure to agricultural pursuits and his favourite literary and scientific studies.

From this retirement he was called to the vice-presidency of the United States in 1797; and in 1801 he was chosen president by the House of Representatives on the thirty-sixth ballot. The popular vote re-elected him by a large majority for the next presidential term. During the eight years of his administration party spirit ran high. Among the chief events of his first term were the war with Tripoli, the admission of Ohio, and the Louisiana purchase; of his second term, the firing on the *Chesapeake* by the *Leopard*, the Embargo, the trial of Aaron Burr for treason, and the prohibition of the slave-trade. For these and nearly all other acts and events of his administrations Jefferson was as warmly praised by some as blamed by others. In 1809, after nearly forty years of public service, he bade adieu to political life and strife. Henceforth his time was devoted to the cultivation of his estate, to boundless hospitality, to the interests of education, and especially to the establishment and superintendence of the University of Virginia. He died at Monticello, July 4, 1826, a few hours before the death of John

Adams. Among his papers was found this inscription for his tomb: 'Here lies buried Thomas Jefferson, author of the Declaration of American Independence, of the Statute of Virginia for Religious Freedom, and Father of the University of Virginia.' In person he was over six feet in height, with blue eyes, fair complexion, broad forehead, and, in early life, red hair. He was a good classical scholar, and proficient in the science of his day, a ready writer and fluent talker, but not an eloquent orator.

We have his *Writings, Correspondence, &c.* (9 vols. ed. by H. A. Washington, New York, 1853-54), his *Notes on Virginia* (Paris, 1781), and his *Manual of Parliamentary Practice*. See Lives by Tucker (1837), Parton (1874), and Morse (1883); Whitelaw Reid, *One Welshman* (1912); also Henry Adams, *History of the United States during the First and Second Administration of Thomas Jefferson* (4 vols. New York, 1891). His authorship of the Declaration of Independence has recently been disputed.

Jefferson City, since 1826 the capital of Missouri, is situated on the south bank of the Missouri River, 125 miles by rail W. of St. Louis. It has a state-house, governor's residence, U.S. court-house, state-armoury and penitentiary, state library, and the Lincoln Institute, a state-supported college for coloured students. Pop. 14,500.

Jeffersonville, a city of Indiana, on the Ohio River, opposite Louisville, Kentucky, with which it is connected by an iron railway bridge nearly a mile long. The falls of the river at this point are utilised in the various manufactories, which include railway workshops, foundries, machine-shops, flour-mills, &c. There are also shipyards. Pop. 10,000.

Jeffrey, FRANCIS, LORD, a Scottish judge, politician, and literary critic, was the son of a depute-clerk in the Court of Session, and was born at Edinburgh, 23d October 1773. After preliminary education at the High School there, with Scott and Brougham as schoolfellows, he spent two sessions at the university of Glasgow, and one at Oxford. In 1794 he was called to the Scottish bar, but, having adopted Whig politics at a time when Whig opinions were not favourable to professional advancement, he made little progress for many years; indeed for long his income did not exceed £100 per annum. He was early famed for the keenness and alacrity of his intellect and for his literary tastes. In after years, when his practice increased, he was, although not an orator, remarkably successful in jury-trials. In the trials for sedition between 1817 and 1822 he acquired his greatest reputation at the bar. In 1820 and again in 1823 he was elected Lord Rector of the university of Glasgow on account of the great literary distinction he had then attained as editor of the *Edinburgh Review*. In 1829 he was elected Dean of the Faculty of Advocates; in 1830 he entered parliament as member for Perth, and on the formation of Earl Grey's ministry was nominated Lord Advocate for Scotland. After the passing of the Reform Bill, with which he had much to do, especially in the measures relating to Scotland, he was returned for the city of Edinburgh, which he continued to represent until 1834, when, tired of politics, he accepted from Lord Melbourne the dignity of a lord of the Court of Session. As a judge he was noted for his carefulness and ability. From 1815 he lived at Craigcrook, where he died, 26th January 1850.

It is neither as lawyer, judge, nor politician that Jeffrey has secured his chief title to fame. It is as a literary critic and as leader in a new departure in literary enterprise. It was he who, along with Sydney Smith, Francis Horner, and a few others, established the *Edinburgh Review* (q.v.). The first proposer of the scheme is supposed to have been Sydney Smith, who was the nominal editor of the first three numbers, in 1802. After that, however, Jeffrey was appointed editor at a fixed salary of £50

per number, down to 1809, and then of £200 per number down to 1829, when he resigned. His own contributions were very numerous, especially at first, and were among the most brilliant and attractive of the papers. He himself appraised as his most valuable work a *Treatise on Beauty*, which nobody now reads. His style was easy and fluent, but diffuse and at times careless. He was exceedingly well informed on a great variety of topics, but not profound. He had a fine imagination, a satirical turn, and a quickness of perception which instantly detected errors in manner or offences against taste. He had the critical faculty without being a critic in the highest sense, for he devoted himself more to analysis of method than of matter and thought. His defect as a critic was strikingly illustrated by his mistaken estimate of the Lake poets. There was always much of the partisan about him, and a robustness, not to say brutality, in his treatment of opponents, which brought him many enemies. His contributions to the *Review* numbered about 200, and a selection from them was published in 4 vols. in 1844. See the *Life* by his friend Lord Cockburn (1852), as also Macvey Napier's *Correspondence* (1877) and Carlyle's *Reminiscences* (1881).

Jeffreys, GEORGE, BARON, the infamous judge, was born at Acton in Denbighshire in 1648, educated at Shrewsbury, St Paul's, and Westminster schools, and called to the bar in 1668. He rose rapidly into practice at the Old Bailey bar, and became in 1671 common serjeant of the City of London. Hitherto he had affected to belong to the Puritan party, but he now began to intrigue for court favour, was made solicitor to the Duke of York, was knighted in 1677, and became Recorder of London in the following year. He was actively concerned in many of the Popish Plot prosecutions, was made chief-justice of Chester and king's serjeant in 1680, baronet in 1681, and chief-justice of the King's Bench in 1683. His first exploit was the judicial murder of Algernon Sidney, but in every state-trial he proved himself a willing tool to the crown, thus earning the special favour of James, who raised him to the peerage soon after his accession. Among his earliest trials were those of Titus Oates and Richard Baxter, and in both he showed his customary brutality and vindictiveness. In the summer of 1685 he was sent to the west to try those involved in Monmouth's rising, and earned the Lord Chancellorship by a series of judicial murders which has left his name a byword for cruelty. Three hundred and twenty were hanged as rebels during the 'Bloody Assize,' as Jeffreys made his way through Dorset and Somerset, while eight hundred and forty-one were transported, and a still larger number imprisoned and whipped with merciless severity. A drunken and brutal bully, he heaped the foulest reproaches upon his unhappy victims, and gloated with fiendish malignity over their prospective sufferings. It was his boast that he had hanged more traitors than all his predecessors since the Conquest. He held the Great Seal from September 1685 until the downfall of James, and supported all the king's despotic measures as president of the newly-revived Court of High Commission, and in the trial of the seven bishops. Yet he had rational views on witchcraft, and was too honest to turn Catholic like many better men. On the flight of his master he tried to follow his example, but was caught disguised as a sailor at Wapping, and sent to the Tower to save him from being torn in pieces by the mob. Here he died four months after, his frame already worn out by hard drinking, 18th April 1689.

See the *Life* by Woolrych (1827), and the apologetic or eulogistic one by H. B. Irving (1898).

Jehan, See AURUNGZEBE, AGRA.

Jehlam. See JHELUM.

Jehovah, the distinctive name for God in the Old Testament, in the English Version is sometimes merely transliterated from the Massoretic Hebrew text, as above, but more frequently it is translated as 'LORD' (with capital letters). The word consists of the consonants JHVH or JHWH, with the vowels of a quite separate word, AdOnAy ('Lord'), an indistinct E being substituted for the first A. What its original vowels were is only matter of inference, for owing to a peculiar interpretation of such texts as Ex. xx. 7, Lev. xxiv. 11, the name came to be regarded as ineffable; the scribes in reading substituted 'Lord,' and the LXX. translation has *Kyrios*. The evidence of the Greek Church fathers, who give the forms *Jabe* and *Jab* as traditional, as well as the shortened Hebrew forms of the word, *Jah* (Ps. lxxviii. 4, &c.) and *Jahu* (in proper names, such as Jirmejahu or Jeremiah), indicate that most probably it was originally spoken *Jahweh* (pron. *Yahweh*). Etymologically, it is a third person singular, imperfect, probably of the verb *hawah* (or *hayah*), signifying 'to be;' but beyond this interpreters were not agreed, some supposing it to be causative, and translating 'he will cause to be' or 'he will cause to come to pass,' while others preferred to view it as a simple indicative. The text usually relied on for the explanation of the name is Ex. iii. 14, with its kindred passages. The older interpreters explain the verb (here used in the first person) in a highly metaphysical and abstract sense; the 'I am' is He who really is, the absolutely existent, the eternal. The tendency of modern exegesis is to read a more concrete and historical meaning into the expression, translating it 'I will be what I will be,' and taking it as referring to the divine sovereignty, autonomy, self-determination, freedom, but especially to the freedom of the divine grace. This view is confirmed by such a passage as Hos. i. 9: 'Ye are not my people and I am not I WILL BE for you.' Jehovah is 'He who will be'—all in all to his people; but 'eye hath not seen,' 'ear hath not heard,' 'it hath not entered into the heart of man,' nor can language express the ways in which his divine grace is to show itself to them; it must be left to unfold itself in the as yet undreamed-of actualities of their lives. The language of Ex. vi. 3 (which belongs to the priestly or latest portion of the Pentateuch) is taken as proving that the name Jehovah was of relatively late origin among the Hebrews; but, if this interpretation is correct, the representation is hardly reconcilable with what is said in Gen. iv. 26 (an older portion of the Pentateuch), or with the very early existence of proper names containing this divine name (Ex. vi. 20). The word is doubtless very old, and in all probability its earliest connotation, if known, would be found to represent a very primitive phase of religious thought (perhaps it may be 'he who causes to fall' [the rain or lightning]; see Job, xxxvii. 6, Hebrew, *hawāh*). At one time or another in the history of Israel and of the Christian church it has conveyed with various fullness and depth all shades of the metaphysical and religious meanings hinted at above. Certain portions of the Pentateuch, especially of Genesis, are distinguished by the almost unvarying use of this name of God, as also are certain sections of the Psalter—a peculiarity which has an important bearing on questions of Old Testament criticism (see BIBLICAL CRITICISM).

See further the lexicon of Gesenius (1906); Burney's *Judges*, pp. 243 sqq.; and Commentaries on Exodus.

Jeisk, or EISK, a town in Kuban, on a small bay, at the east end of the Sea of Azov, 65 miles SW. of Azov. Founded in 1848, it has grown

rapidly, exports corn, flax, and wool, and has cloth manufactures and tanneries. Pop. 40,000.

Jejeebhoy, SIR JAMSETJEE (Jamshedji Jijibhai; 1783-1859), a Parsee merchant-prince and philanthropist, born of poor parents at Bombay, was taken into partnership by his father-in-law, a Bombay merchant, in 1800. After Napoleon's fall Indian trade with Europe increased enormously, and by 1820 Jejeebhoy had amassed an immense fortune. He contributed very generously to educational and philanthropic institutions in Bombay, built the Mahim Causeway, and paid most of the expenses connected with the construction of Poona water-works.

Jejunum, the middle part of the small intestine. See DIGESTION.

Jelalabad, a town of Afghanistan, stands near the Kabul River, about half-way between Peshawur and Kabul. Formerly a strong fortress, it is now a dirty village of about 3000 inhabitants. It is interesting from its heroic defence by Sir R. Sale in 1841-42; in the war against Afghanistan (q.v.) of 1878 it was held by the British until 1880.

Jelál-ud-din, a Sufi Persian poet (1200-73). See PERSIA (*Literature*).

Jelatom, or ELATMA, a town in the north of the Russian province of Tambov, 170 miles ESE. of Moscow; pop. 10,000.

Jeletz, or ELETZ, a town of Russia, 120 miles by rail ESE. of Orel. It exports large quantities of wheat and flour, and has a great trade in cattle. Its industries include leather, soap, candles, iron goods, lace, and linen. Pop. 40,000.

Jelf, RICHARD WILLIAM, theologian, was born in 1798, second son of Sir James Jelf, was educated at Christ Church, Oxford, became fellow of Oriel, and, later, tutor. In 1826 he was appointed preceptor to Prince George of Cumberland, afterwards king of Hanover, in 1839 Canon of Christ Church, and in 1844 Principal of King's College, London. He died September 19, 1871. His most important work is his Bampton Lectures for 1844, *The Means of Grace*. A pillar of orthodoxy, he is best remembered for his part in the proceedings against Maurice (q.v.). His *Thirty-nine Articles Explained* was edited by J. R. King in 1873.

Jelf, WILLIAM EDWARD (1811-75), Greek grammarian, son of Sir James Jelf, of Oaklands, Gloucestershire, was born at Gloucester. He was educated at Eton and Christ Church, Oxford, took a first-class in 1833, and was successively tutor and censor of his college, public examiner and proctor of the university. He was one of the preachers at the Chapel Royal, Whitehall, 1846-48, and gave the Bampton Lectures in 1857 on *Christian Faith*. His *Greek Grammar* (1842-45) was based on Kühner's.

Jellachich (or JELLAČIĆ), JOSEPH, BARON, Austrian general and Ban of Croatia, was born at Peterwardein on 16th October 1801. His father attained some celebrity in the Turkish wars and in those of the French Revolution. The son, having won the entire confidence of the Croats, was in 1848 appointed Ban of Croatia; by this appointment Austria secured the support of the Slavonian Croats against the Magyars of Hungary. Jellachich took an active part in the suppression of the Hungarian rising. He died at Agram, 20th May 1859. He published a collection of his poems at Vienna in 1851. See M. Hartley, *The Man who Saved Austria* (1912).

Jellalabad. See JELALABAD.

Jellicoe of Scapa, JOHN RUSHWORTH (JELICOE), first VISCOUNT (1918), and EARL (1925), born 5th December 1859, entered the navy in 1872, served in Egypt (1882), China (1898-1901),

became rear-admiral (1907), admiral (1915), admiral of the fleet (1919). He was Second Sea Lord in 1912-14, had command of the Grand Fleet (1914-16) in the Great War (including the battle of Jutland), was First Sea Lord (1916), Chief of Naval Staff (1917). After a tour of the Dominions to advise on imperial naval problems, he was Governor-general of New Zealand in 1920-24. He wrote *The Grand Fleet: 1914-16* (1919), and *The Crisis of the Naval War* (1920). See WAR (GREAT).

Jelly. For jellies made with fruit, see PRE-SERVED PROVISIONS. The food-value of calves-foot jelly and similar jellies depends on their gelatine. See GELATINE, FOOD, DIET; also COLLOID.

Jelly-fish, a class of marine Coelentera or 'Stinging-animals,' technically known as Medusæ, Scyphomedusæ, Acraspeda, or Acalephæ. They are to be distinguished from the medusoids or swimming-bells which belong to the class of Hydrozoa. Most of them are free-swimming animals, moving by pulsations of the disc-like body (usually near the surface, but sometimes in deep water), but the Lucernarians live a more or less sedentary life attached by an aboral stalk to seaweeds and rock. The food consists of animals, usually small, which are paralysed by the abundant stinging threads. Some jelly-fish—e.g. Pelagia—are brilliantly phosphorescent; most have very beautiful colours. Many, like the *Aurelia aurita*

Aurelia aurita.

of all seas, have a complicated life-history. Some attain huge size; thus a specimen of Cyanea had a disc or umbrella $7\frac{1}{2}$ feet in diameter, and tentacles 120 feet long. Many are able to sting man somewhat virulently. Species of Rhopilema are used as food in China and Japan. It is interesting that, in spite of their gelatinous consistency, quite a number of impressions of 'fossil jelly-fish' have been found. See CELENTERATA, HYDROZOA, GENERATIONS (ALTERNATION OF).

Jemappes, a town in the Belgian province of Hainaut, 3 miles by rail SW. of Mons. Here the French republicans under Dumouriez, on 6th November 1792, defeated the Austrians, which victory placed Belgium in the power of the French. Much of the fighting of the battle of Mons was here. The town stands on one of the richest coal-fields of Belgium, and manufactures stoneware, glass, and chemicals. Pop. 15,000.

Jena, a town of Thuringia, at the Leutra's influx to the Saale, 14 miles by rail SE. of Weimar, and 31 NNE. of Saalfeld. It lies 518 feet above sea-level, engirt by steep chalk hills, of which the Hausberg (1069 feet) is crowned by the old Fuchsturm, and the Forstberg by a tower in memory of the Jena students who fell in the Franco-German war. It is still a quaint old-world place, with its ducal schloss, the 'Black Bear' inn where Luther halted on his flight from the Wartburg, and a church whose steeple is 311 feet high. Goethe here wrote his *Hermann and Dorothea*, Schiller his

Wullenstein; and the houses of these and of other illustrious residents were marked with tablets in 1358, on occasion of the tercentenary of the university, when, too, was erected a bronze statue of its founder, the Elector John Frederick of Saxony. He founded it in 1547-58 to take the place of Wittenberg as a seat of learning and evangelical doctrine; and it soon attained a high reputation, though not its zenith till the days of Goethe's patron, Duke Karl August (1787-1806). To that period belong the names of Fichte, Schelling, Hegel, Schiller, the Schlegels, Voss, Fries, Krause, and Oken; to our own, of Hase, Haeckel, and Eucken. It has a great library. In 1883 a memorial was erected of the Burschenschaft (q.v.). Jena is famous for its optical glass, to which it owes its rapid growth in the 20th century. Pop. 55,000.

The battle of Jena is often applied as a collective name to two separate engagements fought on the same day, 14th October 1806—one at Auerstädt (q.v.), 14 miles to the north, between 30,000 French under Davout and 48,000 Prussians under the Duke of Brunswick; the other, on the heights round Jena, between 70,000 Prussians under the Prince of Hohenlohe and 90,000 French under Napoleon in person. In both the Prussians were totally defeated; and their defeat entailed that utter prostration of the Fatherland which was typified two years later by the hare-hunt held on the battlefield of Jena by the French and Russian emperors. See, besides Ritter and Goltz (1883-85), *Napoleon's Conquest of Prussia* by F. L. Petre (1907).

Jenghiz Khan. See GENGHIS.

Jenissei. See YENISEI.

Jenkins, ROBERT, an English merchant captain, trading from Jamaica, who alleged that in 1731 his sloop had been boarded by a Spanish *guarda costa*, and that, though no proof of smuggling had been found, he had been tortured, and his ear torn off. The said ear—some said he had lost it in the pillory—he produced in 1738 in the House of Commons; and a member asking him what were his feelings in the hour of peril, he answered, 'I recommended my soul to God, and my cause to my country.' Walpole next year was forced by the popular clamour to consent to war against Spain.

Jenner, EDWARD, the discoverer of vaccination, was born at Berkeley, in Gloucestershire, on the 17th of May 1749, and was the third son of the Rev. Stephen Jenner, vicar of the parish, and rector of Rockhampton. His schooling over, he was apprenticed to Mr Ludlow, an eminent surgeon at Sodbury, near Bristol; and in his twenty-first year went to London to prosecute his professional studies under the celebrated John Hunter (q.v.), in whose family he resided for two years. The influence of the master exerted a lasting effect on the pupil, who became an expert anatomist, a sound pathologist, a careful experimenter, and a good naturalist. In 1773 Jenner settled in his native place, where he soon acquired a large practice. In 1788 his well-known memoir, *On the Natural History of the Cuckoo*, appeared in the Transactions of the Royal Society. In 1792, the fatigues of general practice having become irksome to him, he resolved to confine himself to medicine, and with that view he obtained the degree of M.D. from St Andrews.

The discovery of the prophylactic power of vaccination, by which the name of Jenner has become immortalised, was the result of a prolonged series of observations and experiments. He was pursuing his professional education in the house of his master at Sodbury, when a young country-woman came to seek advice. The subject

of smallpox being mentioned in her presence, she observed: 'I cannot take that disease, for I have had cow-pox.' This was before the year 1770. It was not till 1775 that, after his return to Gloucestershire, he had an opportunity of examining into the truth of the traditions respecting cow-pox; and in the month of May 1780, while riding with his friend Edward Gardner, on the road between Gloucester and Bristol, 'he went over the natural history of cow-pox; stated his opinion as to the origin of this affection from the heel of the horse [when suffering from the grease]; specified the different sorts of disease which attacked the milkers when they handled infected cows; dwelt upon that variety which afforded protection against smallpox; and with deep and anxious emotion mentioned his hope of being able to propagate that variety from one human being to another, till he had disseminated the practice all over the globe, to the total extinction of smallpox.' Many investigations delayed the actual discovery for no less than sixteen years, when at length the crowning experiment on James Phipps was made on the 14th of May 1796, and Jenner's task was virtually accomplished. This experiment was followed by many of the same kind; and in 1796 he published his first memoir, entitled *An Inquiry into the Causes and Effects of the Variolæ Vaccinæ*. Although the evidence accumulated by Jenner seemed conclusive, yet the practice met with violent opposition until a year had passed, when upwards of seventy of the principal physicians and surgeons in London signed a declaration of their entire confidence in it. His discovery was soon promulgated throughout the civilised world. Honours were conferred upon him by foreign courts, and he was elected an honorary member of nearly all the learned societies of Europe, though not of the College of Physicians, which required him to pass an examination in classics. Parliament voted him in 1802 a grant of £10,000, and in 1807 a second grant of £20,000; and in the year 1858 a public statue in his honour was erected in London. He died of apoplexy at Berkeley, 26th January 1823. See his *Life and Correspondence*, by Dr J. Baron (2 vols. 1827-38; 2d ed. 1850); also the article VACCINATION.

Jenner, SIR WILLIAM (1815-98), born at Chatham, was educated at University College, London, where he himself was professor in 1848-79. He was appointed physician in ordinary to Queen Victoria, and made a baronet and G.C.B. Elected a fellow of the Royal Society in 1864, he was president of the College of Physicians in 1881-88. He established the difference between typhus and typhoid fevers (1851), and published *Lectures on Fevers and Diphtheria* (1893).

Jennings, SARAH. See MARLBOROUGH.

Jenolan Caves, a series of caverns and tunnels in the limestone core of the Main Dividing Range of New South Wales, about 80 miles W. of Sydney (113 miles by rail and motor-coach). Their existence was known in 1841, but new caves are still being discovered. In 1866 the actual caves were made national property, and they now form the centre of a public reserve, 10 miles in diameter, within which the wild bush animals live unmolested. There is a government accommodation house. Only a few of the caves are vast, but in richness and variety the stalactitic formation is unsurpassed in the world.

Jensen, ADOLF, a German composer, was born in 1837 at Königsberg; from 1856 to 1868 was a musician successively at Posen, Copenhagen, and Berlin, and, his health giving way, next lived at Dresden, Gratz, and Baden-Baden, where he died, 23d January 1879. He is best known by his songs and compositions for the piano.

Jenyns, SOAME, was born in London in 1704; studied at St John's College, Cambridge; sat in parliament for Cambridgeshire, Dunwich, and Cambridge town; was a commissioner to the Board of Trade, and died in December 1787. As he was rich he easily acquired a literary reputation, but he lacked capacity for the high metaphysical problems that he attacked, and his books are long since securely forgotten. Indeed his name only survives from the accident that Dr Johnson criticised in the *Literary Magazine* his *Free Inquiry into the Nature and Origin of Evil* (1756). He condemned the book as shallow and inadequate, and this judgment Jenyns never forgave him. Indeed the argument was not worth his powder and shot, but Johnson in his criticism excelled himself. Jenyns, now grown orthodox, published in 1776 a no less shallow book, *View of the Internal Evidence of the Christian Religion*, for the divine origin of which he strangely argued from its utter variance with human reason.

Jephthah, one of the judges of Israel, was a base-born son of Gilead, and at his father's death was driven out from any share in his father's inheritance by the legitimate sons. He was a leader of freebooters on the border-land of Ammon until recalled by the Gileadite elders to head them in their attempt to throw off the yoke of Ammon. He collected his warriors from all parts of Gilead and Manasseh, and before the battle made his unhappy vow to offer up for a burnt-offering the first thing that came forth from the doors of his house on his return. The Ammonites were defeated with great slaughter, and twenty of their cities taken, but as the triumphant conqueror drew near his house at Mizpeh there came forth to meet him a procession of maidens with dances and timbrels, and first among them his daughter and only child. The high-spirited maiden asked only for two months in which to bewail her hapless fate with her companions among her native mountains, and then returned to her father, and 'he did unto her his vow.' Jephthah had next to subdue the tribe of Ephraim, envious of his glory, and this he did effectively, cutting off thousands of the fugitives at the fords of Jordan, where they were identified as Ephraimites by their inability to pronounce the word *Shibboleth*. Jephthah judged Israel for six years, and died. Many theologians have found it difficult to believe that one of the heroes of faith of Hebrews, chap. xi., should have offered a human sacrifice, and have taken refuge in Joseph Kimchi's suggestion that the conditions of the vow were satisfied by a sentence of perpetual virginity; but this is to take a dishonest liberty with the plain meaning of the passage. The story of Jephthah's daughter is closely paralleled by that of Iphigenia in Greek mythology.

Jerabub (better Jaghabub). See SENUSSI.

Jerash. See GERASA.

Jerba, a small island off the south-east coast of Tunis, in the Gulf of Gabes, separated from the mainland by a narrow channel. Area, 425 sq. m. The people are Berbers, with some Jews. The soil is very fertile, and is laid out in gardens, which produce olives, dates, &c. Fine woollen textiles are made. Jerba is a centre for the Tunisian sponge-fishing. It has been held to be the home of the ancient Lotophagi; ruins of the former capital, Meninx, still exist.

Jerboa (*Dipus*), a genus of rodent quadrupeds, belonging to a distinct family, Dipodidae, remarkable for the great length of the hind-legs and kangaroo-like power of jumping. The fore-legs are very small, hence the ancient Greek name

dipous ('two-footed'). The tail is long, cylindrical, covered with short hair, and tufted at the end. The jerboas are inhabitants of sandy deserts and wide grassy plains in Asia and the east of Europe and Africa. An allied form, *Dipodomys*, occurs in North America. They are burrowing animals, nocturnal, very destructive to grain and other crops, laying up hoards for their winter use. They

Jerboa (*Dipus cegyptius*).

take prodigious leaps when alarmed; the fore-feet are then not used at all, but by means of the hind-feet and the tail they leap, although they are small animals, several yards. Their flesh is said to resemble that of the rabbit.—Closely allied to the jerboas are the Gerbils (*Gerbillus*), small quadrupeds, also distinguished by great length of hind-legs and power of leaping, inhabitants of the warm and sandy portions of the Old World.

Jerdan, WILLIAM, an active journalist, born at Kelso in 1782. He removed to London in 1804, reported for the short-lived *Aurora* and the *Pilot* evening newspaper, next joined the staff of the *Morning Post*, and subsequently reported during three sessions for the *British Press*, contributing at the same time to the *Satirist*, or *Monthly Meteor*, the copyright of which he purchased. It was he who seized Bellingham after he had murdered Spencer Perceval in the lobby of the House of Commons on 11th May 1812. In 1813 Jerdan became editor of the *Sun*, but sold his share in 1817 to found the *Literary Gazette*, which he edited for thirty-three years. He lent his support to establish the Royal Society of Literature and the Melodists' Club, and in 1830 commenced the *Foreign Literary Gazette*, which died, however, in its thirteenth number. In 1852 Jerdan was granted a pension of £100, while a testimonial was presented to him subscribed to by many of the first men of the day. He published his *Autobiography* in 4 volumes in 1852-53, and in 1866 *Men I have known*. He died in 1869.

Jeremiah (Heb. *Jirmejárah*, or *Jirmejáh*), the prophet, son of Hilkiah, the priest, was a native of Anathoth (now Anata), in the territory of Benjamin, about 2½ miles NNW. of Jerusalem. In Anathoth while still young (i. 6) he received the prophetic call, described in the opening of his book, in the thirteenth year of Josiah (627-26 B.C.), and his prophetic activity, principally carried on in Jerusalem, continued for at least forty years thereafter. His teaching in its political, ethical, and religious aspects can be understood only after a careful study of the complicated circumstances of his time, which, of course, can only be broadly indicated here. It was after he had been for five years a prophet—in the eighteenth year of Josiah

—that the important occurrences connected with the finding of the book of the law (2 Kings, xxii., xxiii.) took place; and, although Jeremiah is not mentioned in the history as having had any part in these, he would be in sympathy with any reformation movement. But it is disputed how far his teaching can refer to the events recorded; and opinions differ as regards especially xi. 1-8; xvii. 19-27. In the thirty-first year of Josiah, when Jeremiah had been for eighteen years a prophet, occurred the death of that king on the battlefield of Megiddo, and Jehoahaz or Shallum, his immediate successor, was, after a brief reign of three months, deposed by Pharaoh-Necho, the conqueror, in favour of Jehoiakim, the subservient vassal of the Egyptian king. Jehoiakim had not been long on the throne before Jeremiah began to foretell the doom of Judah and Jerusalem, which he saw to be inevitably approaching, in the series of characteristic discourses preserved in chaps. vii.-ix. and xxvi., warning the Jewish leaders of the folly of the security with which they vainly trusted in the presence of the temple of the Lord among them, and bidding them look to the ruins of Shiloh. It was at the close of one of these discourses that he was seized by the priests and the prophets and all the people and brought before the authorities on the capital charge of having 'prophesied against the city,' and it was chiefly to the intervention of his fast friend Ahikam, the son of Shaphan, that he owed his acquittal and release. The battle of Carchemish, in the fourth year of Jehoiakim, when the defeat and retreat of Pharaoh-Necho laid the whole of Syria and Palestine open to the approach of the Chaldeans, naturally had a profound effect upon the foreign policy of Judah; the same year marked also a new departure in the prophesying of Jeremiah, in so far as he began henceforward to declare Nebuchadrezzar's divinely-appointed mission to be to lay upon Judah a period of desolation which was to last for 'seventy' years. It was in this year that he received the divine command to commit to writing the various oracles he had up to that time delivered, and this he did with the assistance of Baruch, his disciple and friend. The incidents of the public reading of this record, and of a subsequent partial reading in the presence of the king, which led to its being committed to the flames, are among the most graphic in the whole book (xxxvi.).

Jehoiakim after a reign of eleven years was succeeded by his son Jeconiah, whose brief and obscurely-recorded reign of three months terminated in the deportation of himself and a number of his subjects to Babylon, the incident alluded to in the parable of the two baskets of figs (xxiv.). To these exiles the prophet shortly afterwards addressed the letter contained in chap. xxix., with hopeful assurances, but warning them that the captivity would certainly last for seventy years. To King Zedekiah, who had succeeded, and his advisers, Jeremiah held equally decided language, declaring the futility of all their politic devices against the Chaldean power; the watchword of his policy was 'Serve the king of Babylon and live,' and this, in the teeth of angry and bitter opposition, he never failed to maintain, as, for example, in his public controversy in the temple court with the rival prophet Hananiah, whose theme was 'Ye shall not serve the king of Babylon' (xxviii.). At length, in consequence of Zedekiah's treacherous and impolitic alliance with Egypt, Nebuchadrezzar, in Zedekiah's ninth year, invaded Judæa. For a time he was compelled by the appearance of an Egyptian army to raise the siege of Jerusalem, a temporary relief which led the nobles to use their influence with the king to revoke the emancipation of the slaves

which shortly before had been proclaimed. This revocation, against which Jeremiah strongly protested, was the theme of his last public address (xxxiv.). Persuaded that the catastrophe he had so long foretold was only postponed, he was in the act of leaving Jerusalem in order to spend the rest of his days in retirement at Anathoth, when, on the suspicion that he was deserting to the Chaldeans, he was arrested and thrown into prison. Still adhering to his gloomy prophecy, he was consigned to the deepest dungeon, where but for the interference of Ebedmelech he would doubtless soon have perished. He was not restored to liberty until an eighteen months' siege had ended in the capture of the city, when he received from Nebuzar-adan permission to fix his residence where he chose. It was towards the end of the siege that he gave practical proof of his faith in the ultimate return of his countrymen to their own land by exercising his right of redemption over the ancestral lands of his family in Anathoth. Jeremiah now attached himself to Gedaliah, the governor whom the Babylonians had set over the Jews whom they had left, with his headquarters in Mizpah; after the murder of Gedaliah he accompanied his compatriots to Tahpanhes, the border city of Egypt, where, according to tradition, he died a martyr's death.

Viewed in the light of the preceding brief sketch of Jeremiah's life, it will be seen that the book of his prophecies as we now possess it does not follow any chronological order. It consists of the following four parts: (1) chaps. i.-xxxix., consisting of prophecies relating to Judah, mostly with some historical data attached, and all belonging to the period prior to the fall of Jerusalem; (2) chaps. xl.-xlv., narrative of events subsequent to the fall, along with certain prophecies belonging to that period, and also including an oracle relating to Baruch, spoken in the fourth year of Jehoiakim; (3) xlv.-li., oracles relating to foreign nations—Egypt, Philistia, Moab, Ammon, Edom, Damascus, Kedar, and the kingdoms of Hazer, Elam, Babylon—of various dates: according to most critics, i.-li. are not by Jeremiah, but by a prophet who wrote in Babylonia towards the close of the captivity; (4) chap. lii., a historical appendix closely parallel to 2 Kings, xxv.

Important critical questions are suggested by the fact that the LXX. version of Jeremiah differs considerably in its arrangement from that now seen in the Massoretic text, and that it is considerably shorter—by about one-eighth of the whole—mainly through the omission of words, clauses, and single verses. The relative value of the Greek and Hebrew recensions has not yet been conclusively determined; neither seems to deserve unqualified preference.

The distinctive advance of Jeremiah's teaching on that of his predecessors is due to his clear recognition of the fact that the divine purpose could not be realised under the forms of the Hebrew state, that the continuity and victory of the true faith could not be dependent on the continuity of the nation. Israel must be wholly dispersed, and can only be gathered again by a divine call addressed to individuals, and bringing them one by one into a new covenant with their God, written on their hearts (xxx.). Here for the first time in history the ultimate problem of faith is based on the relation of God to the individual soul; and it is to Jeremiah's idea of the new covenant that the New Testament teaching directly attaches itself.

Jeremy, EPISTLE OF, an apocryphal book appended to Baruch (q.v.).

Jérez de la Frontera. See XERES.

Jerfalcon. See FALCON.

Jericho, once one of the most flourishing cities of Palestine, 4 miles W. of the Jordan, 14 ENE. of Jerusalem, in a well-watered and fruitful district, yielding dates, raisins, balsam, and honey, and having rose-gardens. The capture of Jericho by the Israelites on their first entry into Canaan, its destruction, Joshua's curse on the rebel, and the rebuilding of it in the reign of Ahab are recorded in Josh. vi.; 1 Kings, xvi. 34. It appears to have been afterwards the seat of a school of prophets (2 Kings, ii. 4, &c.). It suffered during the Babylonian exile (Ezra, ii. 34). The groves of Jericho were given by Antony to Cleopatra, and passed to Herod the Great, who resided in Jericho, beautified it, and died there. It was destroyed in the reign of Vespasian, and again rebuilt under Hadrian. In the time of the crusades it was repeatedly captured, and at last completely destroyed. The place is now a shapeless ruin, with a miserable village, Rihâ or Arihâ. Excavations of the Canaanite town were made in 1907-8 by Professor Sellin. See the *Quarterly Statement* of the Palestine Exploration Fund, 1910.

Jerked-beef, beef preserved by drying in the sun. It is properly called *charqui*, and, like its name, is of Chilean origin.

Jeroboam, the first king of the divided kingdom of Israel. He belonged to the tribe of Ephraim, and for his capacity was raised by Solomon to be superintendent of the labours and taxes exacted from his tribe at the construction of the fortifications underneath the citadel of Zion. The growing disaffection of his tribesmen and the alienation from Solomon of the prophetic order fostered his own ambition; but he was soon obliged to flee to Egypt for safety. After Solomon's death he returned to head the revolt of the northern tribes against Rehoboam, and established his chief strongholds in Shechem on the west and Penuel on the east. In order to destroy the religious as well as the political unity of the ancient kingdom he now established shrines at Dan and Bethel to wean away his people from the sacred yearly pilgrimages to Jerusalem, and, further, set up in these images borrowed from the animal-worship of the Egyptians. Thus his name has descended in proverbial infamy as 'Jeroboam, the son of Nebat, who made Israel to sin,' and Roman Catholic writers found in him a convenient parallel to Henry VIII. at the time of the Reformation. Jeroboam suffered a defeat from Ahijah, son of Rehoboam, and died soon after in the twenty-second year of his reign.—**JEROBOAM II.** was the son of Joash, of the dynasty of Jehu. He thrust back the Syrian invaders, reconquered Ammon and Moab, but earned the denunciations of the prophets Amos and Hosea by failing to reform religion at home.

Jerome, ST (EUSEBIUS HIERONYMUS SOPHRONIUS), was born at Stridon, a town whose site is now unknown, on the confines of Dalmatia and Pannonia, at some period between 331 and 345—probably nearer to the latter year. His parents were both Christians. His early education was superintended by his father, after which he studied Greek and Latin rhetoric and philosophy under Ælius Donatus at Rome, where he was also admitted to the rite of baptism. After a residence in Gaul, he seems to have revisited Rome; but in the year 370 he had settled in Aquileia with his friend Rufinus. For some unknown reason he suddenly went hence to the East; and after a dangerous illness at Antioch, which appears to

have still further added to the religious fervour of his disposition, he retired, in 374, to the desert of Chalcis, where he spent four years in penitential exercises and in study, especially of the Hebrew language. In 379 he was ordained a priest at Antioch, after which he spent three years in Constantinople in close intimacy with Gregory of Nazianzus; and in 382 he came on a mission connected with the Meletian schism at Antioch to Rome, where he became secretary to the pope Damasus, and where, although already engaged in his great work of the revision of the Latin version of the Bible, he attained to great popularity and influence by his sanctity, learning, and eloquence. Many pious persons placed themselves under his spiritual direction, the most remarkable of whom were the lady Paula and her daughter Eustochion. These ladies followed him to the Holy Land, whither he returned in 385. He permanently fixed his residence at Bethlehem in 386, the lady Paula having founded four convents, three for nuns, and one for monks, the latter of which was governed by Jerome himself. It was in this retreat that Jerome pursued or completed the great literary labours of his life; and it was from these solitudes, all peaceful as they might seem, that he sent forth the fiery and vehement invectives which marked not only his controversy with the heretics Jovinian, Vigilantius, and the Pelagians, but even with his ancient ally, Rufinus, and, although in a minor degree, with St Augustine. His conflict with the Pelagians rendering even his life insecure at Bethlehem, he was compelled to go into concealment for above two years; and soon after his return to Bethlehem in 418 he was seized with a lingering illness, which terminated in his death, September 30, 420. His original works, consisting of letters, treatises, polemical and ascetical, commentaries on Holy Scripture, and his version and revision of former versions of the Bible, were first published by Erasmus, 9 vols. folio (Basel, 1516), and have been several times reprinted. The best editions are that of the Benedictines (5 vols. folio, Paris, 1693-1706) and, still more, that of Vallarsi (11 vols. Verona, 1734-42). St Jerome is universally regarded as the most learned and eloquent of the Latin Fathers. His commentaries on the Bible are especially valuable for the learning which they display; but his opinions are often exaggerated and fanciful, and through his controversial writings there runs a strain of violent invective, which contrasts unfavourably with the tone of his contemporary, St Augustine. See the article **VULGATE**; works by Zöckler (Gotha, 1865), Thierry (Paris, 1867), Goelzer (Paris, 1886), E. L. Cutts (1878), Mrs Martin (1888), Largent (trans. 1900), Grützmacher (1901); and translations by Fremantle (1893).

Jerome Bonaparte (1784-1860), king of Westphalia. See **BONAPARTE**.

Jerome of Prague, the friend and disciple of Huss, was born at Prague between 1360 and 1370. The statement that his family name was Faulfisch is incorrect. After attending the university of his native town, he studied for some time in Oxford, where he became a convert to Wyclif's doctrines. When he reached home he zealously taught the new doctrine he had learned in England. He further studied at Paris, Heidelberg, and Cologne, and acquired a reputation for learning and energy. Ladislaus II., king of Poland, employed him to help to reorganise the university of Cracow in 1410; and Sigismund, king of Hungary, invited him to preach before him at Budapest. Jerome entered with his whole soul into the contest carried on by Huss (q.v.) against the abuses of the hierarchy and the profriggity of the clergy. But his impatient zeal lead him to overstep the bounds

of prudence, and even to abuse the authority he possessed. When Huss was arrested at Constance Jerome voluntarily hastened to his side to defend him, although he was not provided with a safe-conduct. Arrived at Constance, he was met by sinister rumours as to the fate in store for Huss and himself. He hastily withdrew from the city, and applied for a safe-conduct. It was refused; thereupon Jerome set out to return to Prague, but was arrested at Hirschau in Bavaria in April 1415, and conveyed to Constance. After four months' imprisonment he recanted his opinions; but eight months later still (in May 1416) he boldly withdrew his recantation, and in the same heroic spirit went to the stake, 30th May 1416. See works in German by Helfert (1853) and Becker (1858), with others cited at HUSS and WYCLIF.

Jerrold, DOUGLAS WILLIAM, author, dramatist, and wit, was born in London, January 3, 1803. He was the youngest son of Samuel Jerrold, actor and manager, by his second wife. His infant years were passed at Wilsby, near Cranbrook in Kent. In 1807 his father became lessee of the theatre at Sheerness. Here, with Gesner's *Death of Abel* and *Roderick Random*, Douglas Jerrold as a child of six or seven began to manifest a voracious appetite for books. About the end of 1809 he was sent to school at Sheerness; in December 1813 he joined the navy as a midshipman. On the close of the war his ship was paid off; and the first day of January 1816 saw the arrival of the Jerrold family in London, where, from Broad Court, Bow Street, Douglas Jerrold started life anew as a printer's apprentice. In 1819 he was a compositor on the *Sunday Monitor*, when the following incident probably decided his bent towards literature: he had been to see *Der Freischütz*, and, having written a criticism on it, dropped it into his employer's letter-box, and the next morning was handed his own copy to set up, with an editorial note to the anonymous correspondent requesting further contributions. Jerrold's capacity for study was enormous, and his perseverance indefatigable; night and morning he worked at Latin, French, and Italian, besides getting through a vast amount of reading. He became dramatic critic, as well as compositor, on the *Monitor*. In 1824 he married Miss Mary Swann. Before this date he had already made a start as a dramatist; four of his pieces had been produced, the first of which, *More Frightened than Hurt* (written when Jerrold was about fifteen), came out in 1821. In 1825 Jerrold was engaged, at a weekly salary, to write dramas, farces, &c., as required, for the Coburg Theatre. In 1829 he was engaged at five pounds a week to write in a similar manner for the Surrey Theatre, where in that year *Black-eyed Susan* was acted for the first time. From this date up to 1854, when *The Heart of Gold* came out at the Princess's Theatre, numerous plays were produced, each one of which was characterised by the author's unique style and brilliant and sparkling dialogue. Jerrold's contributions to periodical literature began soon after he commenced life in London, with occasional verses and sketches in the various magazines of the day; as his position became more assured he contributed to the *Monthly*, the *New Monthly*, *The Ballot* (which he sub-edited), *Punch in London* (a short-lived prototype of the *Punch*), the *Athenæum*, *Blackwood's*, and other periodicals. *Punch* was started in 1841, and Jerrold was a constant and important contributor from its second number up to the time of his death. He successively edited the *Illuminated Magazine* (1843-44), *Douglas Jerrold's Shilling Magazine* (1845-48), and *Douglas Jerrold's Weekly Newspaper* (1846-48). In these periodicals, along with *Punch*, appeared much of his best work. In politics—and his was

no mean political force—Jerrold was Liberal, and in 1852 he accepted the editorship of *Lloyd's Weekly Newspaper* of which it has been said that he 'found it in the street, and annexed it to literature.' As a wit, for what has been well termed 'flashing insight,' Jerrold stands alone. He died at Kilburn on June 8, 1857. A collected edition of Jerrold's works, in eight volumes, was published during his lifetime; it contains his principal writings, *St Giles and St James*, *The Man made of Money*, *The Story of a Feather*, *Cakes and Ale*, *Punch's Letters to his Son*, *Punch's Complete Letter-writer*, *Chronicles of Clovernook*, *Mrs Caudle's Curtain Lectures*, &c., and fewer than half of Jerrold's dramatic works. A selection from Jerrold's political writings in *Lloyd's* was published in 1868 under the title of *Other Times*. See his *Life and Remains* by his son, W. Blanchard Jerrold (1859), and the *Life* by his grandson, W. Jerrold (1918).

WILLIAM BLANCHARD JERROLD, eldest son of the above, born in 1826, was named after Laman Blanchard (q.v.), who was his godfather, and whose daughter he married (1849). Educated as an artist, he took part in the production of Howe's *Illustrated Book of British Songs*. He early turned to journalism, and from his father's death to his own, 10th March 1884, was editor of *Lloyd's*. He was a facile and voluminous writer. Of his plays the best known is *Cool as a Cucumber* (1851), one of the most successful farces ever written.

Jerrymander. See GERRY.

Jersey, the chief of the Channel Islands (q.v.), 14 miles from the Norman coast, 120 from Southampton, 85 from Weymouth. Measuring 11 miles by 5½, it is nearly 45 sq. m. in area. Pop. (1806) 22,855; (1851) 57,020; (1891) 54,518; (1921) 49,494—the capital, St Helier (q.v.), accounting for over half. The land rises to the north to almost 500 feet, and slopes to the south and west. The climate is thus very sunny, mild, and somewhat relaxing. The mean temperature is 43° in winter, 60° in summer; average rainfall 34 inches. Figs, oleanders, myrtles, &c., flourish in the open. Rich loam and pasturage favour farming. St Helier, on the south coast, is the chief port, and has railways running west to St Aubin and Corbière Point, east to Gorey, whose harbour is dominated by the venerable Mont Orgueil Castle. Granite and euristic rocks and bedded shales prevail. There is a disused lead and silver mine at l'Étac in the NW. The coast rocks have been eroded by the sea, which has left a number of caverns and pinnacles of fantastic form. About the south-east are numerous dangerous reefs. Between Jersey and France, the Ecréhous, the Minquiers, the French-owned Îles Chausey, and other rocky islets, indicate a former connection with the mainland, and support traditions of a separation in comparatively recent times. It is also noticeable that moles and toads are found in Jersey and Alderney, but not in Guernsey. Agriculture is pursued on small farms held on feudal tenures resembling copyhold. The chief staple is the potato, which, coming into the London market before that of the west of England, commands a high temporary price. Nearly one-third of the island (once a great orchard for cider) is now under potatoes. The same fields yield a second crop (e.g. barley or tomatoes), and sometimes a third (turnips). Over half the surface is arable. Cattle-rearing is also lucrative. The purity of the famous breed is jealously guarded, and high prices are commanded in England and America (see CATTLE). Knitting of jerseys and woollen garments was long a local industry. Other industries are fishing, fruit-growing, tomato-canning, butter-making, quarrying, basket-making. The peculiar Jersey cabbage grows 7 to 12 feet

high; the stalks are made into walking-sticks. The chief imports are flour, grain, coal, and manure. The constitution is democratic. A lieutenant-governor represents the king, and can veto legislation. A bailiff (appointed by the crown) presides over the Cour Royale or Royal Court (the judicial body), and the States (the legislative body). In the States sit the rectors and constables of the twelve parishes, and deputies elected by the parishes; the twelve jurats or judges of the royal court; the lieutenant-governor and certain crown officers. In parish administration the constable is assisted by centeniers (originally responsible for 100 houses), vingteniers, and other officers. The language of deliberation and judicial business is French, but English was made optional in the States in 1900; among themselves the people use English, and a form of ancient Norman-French. A well-known picture by Copley commemorates the *Battle of Jersey* (8th January 1781), in which Major Peirson gallantly repelled the last French invasion under Baron de Rullecourt.

See CHANNEL ISLANDS; *Constitutional History of Jersey*, by Chas. le Quesne (1856); *Geology and Physical Geography of Jersey* and other works by J. Sinel; *Essai de Bibliographie Jersiaise*, by E. Duprez (1898); and publications of the Société Jersiaise.

Jersey City, after Newark the second city of New Jersey, and capital of Hudson county, is on the west bank of the Hudson River, opposite New York, of which it is; though in another state, an extension, and with which it is connected by steam ferries and tunnels, for rail and road traffic. It stands on a peninsula bounded on the west by the Hackensack River and Newark Bay; on the south-east it extends along New York Bay. Jersey City is a busy but not a beautiful city. It is the terminus of six great and as many local railways, and is connected with Easton, Pennsylvania, by canal; and at its wharves many ocean-steamers receive and discharge their freight. It is thus the entrepôt of a large trade, especially in iron, coal, and agricultural produce. Its own manufactures are on a large scale, and include sugar, flour, iron and steel, machinery, locomotives, soap, and much else. The city has large stock-yards and an extensive abattoir, where immense numbers of cattle and sheep are slaughtered for the New York market. Its grain elevators and sugar-refineries are among the largest in the world. The town became a municipality in 1832. Pop. (1920) 298,103.

Jerusalem. *The Name.*—In the cuneiform tablets (c. 1400 B.C.), found at Tell el-Amarna on the Nile, the name Uru-sa-lim occurs. This has been variously interpreted to mean 'City of Peace,' or, perhaps more probably, 'City of (the god) Salim.' At this early period the city was a fortified stronghold, and also probably a sacred place. Some centuries later we have mention of Adonizadek, king of Jerusalem (Josh. x. 1-27), and in Judges, xix. 10, 11, we find the name Jebus, and its inhabitants are called Jebusites (2 Sam. v. 9, &c.). In the 8th century B.C. it is called Ur-sa-limmu in the Assyrian inscriptions. During its long later history some form resembling Jerusalem has been most commonly used. Other names, however, occur. Thus Hadrian tried to get rid of the old name—together with the Jews—by calling the rebuilt pagan city *Ælia Capitolina*, but this name disappeared when paganism ceased to be the official religion. The Moslems called the city *El Kuds*, a shortened form of *Beit el Mukaddas*, 'the holy house.'

The Site.—Jerusalem is described as situated at 31° 46' 50" N. lat. and 35° 13' 25" E. long. It occupies a comparatively bare and rocky site from 2582

to 2364 feet above the Mediterranean, a little east of the central water-parting of Judæa. Shut in by higher ground elsewhere, its only distant outlook was across the wilderness of Judæa to the mountains of Moab, beyond the deep-sunk Dead Sea. The presence of a spring, once copious but now in the late summer only intermittent, was no doubt what attracted to this spot the earliest settled inhabitants, whose rude cave-dwellings have been excavated round the cave in which the water now rises. The steep hill rising above the cave afforded protection to the earliest buildings, and lent itself admirably to fortification. This spring is known in the Old Testament as Gihon, and is now commonly called the Virgin's fountain.

The area covered by the city during the historic period consists of two rocky ridges, divided from each other by a short central valley—now in places almost filled in with rubbish—known to Josephus as the Tyropeon, but receiving from the Arabs no more distinctive name than *El Wad*, i.e. the Valley. Of the two ridges, the eastern one is long and narrow, and was once crowned by the temple on its central highest point. The western ridge is broader and loftier, and is divided into two portions by a branch of the central valley (Tyropeon), which runs westwards from opposite the site of the temple until it terminates a little east of the Jaffa Gate. The line of this lateral valley is marked to-day by the steep street called by tourists 'David Street.' Like the main valley, this western branch now has its original depth obscured by accumulated débris, but in Old Testament times it was of great importance, as upon its southern edge ran the northern and most powerful section of the 'first' wall. The city in its greatest days covered practically the whole of the two ridges, and also the central valley. In modern times it has extended north and north-west beyond the walls over high ground, much of which was never included in the city till modern times. On the other hand, a considerable area to the south on both hills, and in the central valley, which was widely populated in Bible times, is now given over to cultivation.

The whole of the city area is isolated from the hills around on the west and south by the Wady er Rababi, known in the O.T. as the Valley of Hinnom. On the east it is separated from the lofty Mount of Olives by the Wady Sitti Miriam (Valley of the Lady Mary) or Kedron valley. This last was by mediæval tradition also given the name of the Valley of Jehoshaphat. The central valley joins the Kedron valley, and that in turn unites at the Bir Eyyub (En Rogel) with the Valley of Hinnom to form the Wady en Nâr, or 'Valley of Fire,' which winds, ever deeper and more torrid, through the wilderness of Judæa to the Dead Sea. The northern aspect of the city, in which direction alone it could expand, has always been exposed, with little or no natural strength of position. Consequently, upon this side three walls were constructed before the siege of Titus, and yet they were insufficient to secure the city's defence. The north has always been the city's vulnerable side.

The city has been described as occupying two rocky ridges with the valley between, but that was not so before the days of the Hebrew kings. The earliest city stood only upon the so-called 'Ophel Hill' at the southern end of the eastern ridge, and centred itself upon the all-important water-supply of Gihon. The walled city called Uru-sa-lim in the Tell el-Amarna tablets occupied only this hill, as did the 'Zion' of the Jebusites, which David captured and named the 'City of David.' The site was one well adapted for defence in ancient times. On the east lay the Kedron valley, from which the ridge rose with precipitous natural scarps. On the west was the Tyropeon. Here, in all but the

south, where the two valleys converge, the original steep cliffs are now hidden in soil and debris. To the north the ground sloped upwards to the lofty rocky plateau on which stood the city's thriving floors, where later, on the very summit, the temple was built. In the northern wall was the great city gate, defended no doubt by massive towers and protected by an artificial fosse, and partially by a natural valley. Within this area there lay, as has been shown by excavation at similar ancient city sites, the crowded dwellings of the common people, the city's temple-shrine, and doubtless the palace of the 'King'—later that of David, and, at the beginning of his reign, of Solomon. Within this area David, and for two centuries all his successors, were buried. The walls, the palaces, the houses, and the tombs are being excavated by the Palestine Excavation Fund and other societies. At a later age this hill, Zion, or part of it, came to be called Ophel. Josephus names all, or part of it, the Akra, i.e. the fortress.

After King David's capture of the city of the Jebusites the population must have rapidly increased. It spread beyond the old walls up the hill to the north, down into the Tyropœon, and very probably before his death houses began to arise upon the western hill. It would appear from Bliss's excavations that when Solomon erected his temple upon the summit of the eastern hill he erected a wall which, after enclosing the temple, crossed the Tyropœon main valley and ran on the southern edge of its western branch until it came near where the Jaffa Gate is to-day; then it turned south along the eastern edge of the Valley of Hinnom, until it made its south-western corner at the great tower, the foundations of which are to be seen at 'Bishop Gobat's School.' Here it turned east, enclosed the summit of the western hill, and again crossed the Tyropœon valley not far south of the line of the present wall, to join on to the ancient wall of the 'City of David.' Under later Hebrew kings the city wall skirted the edge of the Valley of Hinnom down to the mouth of the Tyropœon, which it crossed upon a massive dam, so as to leave the 'Pool of Siloam' within the city walls, and thence ascended on to the southern end of the eastern ridge to join the eastern ancient wall which Solomon had extended northwards to the temple enclosure. This 'first wall' continued to be the main fortification of the city until, at some uncertain date, at least two or three centuries before the time of Christ, the suburbs which had grown up along the great north road, up the northern end of the Tyropœon, were enclosed in a 'second wall' for their protection. The exact line of this wall continues to be a matter of dispute, as no foundation remains of it have ever been satisfactorily demonstrated. Josephus tells us that it began at the Gate Gannath and ran north-east to join the temple enclosure near the Antonia, but the site of this gate remains to be discovered. This second wall was probably never very extensive, nor was it of great strength. At a later period—after the Crucifixion—Herod Agrippa I., realising the weakness of the northern defences, enclosed with a 'third wall' an extensive area of new suburbs. This he commenced on a great scale, powerfully fortified by ninety towers, of which Psephinus at the north-west angle was 100 feet in height, but he was unable to complete his plan because of the jealous disfavour of the Emperor Claudius. This third wall was never put into a condition for defence, and then only hastily, until shortly before the siege by Titus. General opinion favours the view that the line of this wall was from the Jaffa Gate northwards, and then eastwards as far as 'Herod's Gate,' on the general line of the present walls.

From near this latter gate it ran south-eastward along the southern edge of a shallow valley, now largely filled with debris, and joined the present line of walls in the neighbourhood of St Stephen's Gate. In his description of Jerusalem Josephus calls that part of the city which lay upon the site of the old City of David and in the Tyropœon the 'Lower City,' while that on the western hill he calls the 'Upper City' or 'Upper Market Place'; a later age gave the name of 'Mount Zion' to the southern part of it. This upper city had an eastern wall of its own inside the regular city walls, and, as the Temple hill also had complete fortifications of its own, the Romans (70 A.D.), after capturing the 'Lower City,' had afterwards to take fortified parts of Jerusalem on their east and west. After the complete destruction of Jerusalem in the time of Hadrian the Romans made a four-square fortified camp, with Herod's great tower (now included in the citadel) at the north-west angle. This camp had for its northern defence the lateral valley of the Tyropœon, and was built upon the massive foundations of the 'first wall.' On the west it ran along the line of the present wall, and following the well-known dimensions of Roman camps, must have had its corner where the present south-west corner of the city is, thus explaining the position of the latter. This corner once having been established, though provided with no natural advantage for defence, has been followed by almost all the re-buildings of the walls in succeeding centuries, and has determined the lines of the southern city wall. This line leaves outside the walls a large area, once the site of the most crowded dwellings of ancient Jerusalem, as well as the whole site of the pre-Hebrew Jerusalem. This area remains to-day uninhabited except for a few buildings, of which the chief are gathered round the traditional Nebi Daoud, 'Tomb of David.'

The *Antiquarian Remains* of Jerusalem are extensive, and those above ground have been the subject of scientific investigation for many years. Under the surface much still remains to be done, but the excavations of Warren and Bliss have given us very great information. The results of the earlier work, conducted under the auspices of the Palestine Exploration Fund, are contained in the *Jerusalem* volume of the 'Memoirs.' Since this was published not a year has passed without some new observations or discoveries being recorded. The most important systematic excavations during this time are those which were carried out in 1894-97 by Messrs Bliss and Dickie, and are described in their book *Excavations at Jerusalem*.

The antiquities may be classified under five headings: those connected with (1) Water supply, (2) City walls, (3) Tombs, (4) Religious sites, and (5) Inscriptions.

1. *The Water Supply*.—The one perennial spring is that known as 'The Virgin's Fount' or Ain Umm ed Deraj, i.e. 'The Spring of the Steps'—so called because the cave in which the water rises is approached down thirty steps. This underground condition of the source is due to the vast accumulation of debris in the valley of the Kedron. In ancient times, when the spring was called Gihon, the water ran out from here down the valley, but King Hezekiah constructed an aqueduct which diverted the water into a pool at the mouth of the Tyropœon (2 Chron. xxxii. 4; 2 Kings, xx. 20). This rock-cut tunnel is 1700 feet long, 2 to 3 feet wide, and from 4 feet 6 inches to 16 feet in height. Its course, which can be traversed throughout, is very winding, mainly through primitive methods of engineering, but partly due to the fact that the king in constructing his tunnel utilised at the northern end (near the source) part of a far more

ancient rock cutting. This was a great tunnel constructed by the early pre-Hebrew settlers at the site. This great work runs backward from the cave of the spring some 67 feet, it then ascends perpendicularly for over 40 feet to reach the end of a wide cavern-like passage which runs upwards for over 100 feet to open on the highest point of the 'Ophel' hill. If, as seems probable, this elaborate tunnel belongs to the same age as the great water tunnel at Gaza (and similar constructions in other parts of Palestine), it dates to a remote period, many centuries before David. This tunnel has a peculiar interest for Bible students, because it would seem to be the 'watercourse' up which Joab and his men (1 Chron. xi. 6) made their entrance into the city (2 Sam. v. 8). Recent excavations have shown that there are many other rock-cut passages in the neighbourhood of the spring belonging to various periods. The water of the Virgin's fount, though used by the people of Silwan (Siloam) for all purposes, is contaminated with sewage, and in the later summer months the flow is often intermittent.

At the junction of the Kedron with the Hinnom valley there is a well 125 feet deep called Bir Eyyub (the well of Job), supposed by many to be the En Rogel of 1 Kings, i. 9. This well taps an underground supply of water of indifferent quality, but after heavy rain the water gushes out and flows down the valley like a true spring. There is an underground aqueduct connected with the spring which runs down the Wady en Nâr.

Thousands of rock-cut cisterns have been constructed at various periods for the storage of the copious winter rain; at the present time 6600 privately owned cisterns are in use. The largest of the entirely subterranean reservoirs are in the Haram, and some of these may go back to the foundation of the first temple. Some three dozen are known. The largest, the 'Great Sea,' is 40 feet deep, and contains 3 million gallons; into it the 'low level' aqueduct emptied its surplus water. There are a number of open reservoirs at various points in the city. Of these the most ancient is the Birket Silwân or Pool of Siloam mentioned in Josephus (*B. J.*, v. iii. 2) and in the N.T. (John, ix. 7). The Birket Mamilla, the so-called 'Upper Pool of Gihon,' but more probably the Serpent's Pool of Josephus (*B. J.*, v. iii. 2), lies in a modern Moslem cemetery to the west of the Jaffa Gate. Its waters are carried to within the city's walls by a stone aqueduct to the Hammam el Batrak (Bath of the Patriarch); traditionally, but impossible, it is called the 'Pool of Hezekiah' (2 Kings, xx. 20). It is, however, probably the 'Pool of the Tower' of Josephus (*B. J.*, v. xi. 4). The Birket es Sultan, so called the 'Lower Pool of Gihon,' is a purely mediæval construction made by throwing a dam across the valley of Hinnom. The 'Twin Pools' under the roadway near the 'Ecce Homo' arch, the so-called 'Pool of Bethesda,' near St Stephen's Gate and the Birket Isra'îl, just north of the Temple area, are certainly ancient, and probably date from the Roman occupation.

To the same period almost certainly belong the great aqueducts. The low level aqueduct, which may still be traced along its whole length, brought water from a distance of 13 miles due south of the city by a well-built, partially rock-cut, channel which winds along the sides of the hills, except at some points where it passes through tunnels, a total distance of 41 miles. The more important part, the work probably of Herod the Great, runs from four springs in the Wady Artas 7 miles due south of Jerusalem, where are the three great storage reservoirs known as Solomon's Pools. The southern extension of the aqueduct, 28 miles long,

may very probably be the work of Pontius Pilate (see Josephus, *Ant.*, XVIII. iii. 2). The springs tapped by the latter aqueduct are in the Wady Arrûb, and are those from which water has been pumped to Jerusalem since the British occupation.

The high-level aqueduct brought water from the highest spring in the Wady Artas, and delivered it at the level of the Jaffa Gate. It has been extensively destroyed, but sections of the massive stone pipes have been found, and as some of these have Latin inscriptions dating them to the reign of the emperor Severus (c. 195 A.D.), the whole work has been assigned to this period, but this is not necessarily so. There are also traces of an aqueduct from the north, which brought water into the 'Twin Pools.'

2. *The Walls.*—The existing city walls, with their eight gates (one walled up and one modern), are mainly the work of Suleiman the Magnificent (c. 1542 A.D.), but they include in their foundations much masonry belonging to earlier ages. In the walls of the Haram extensive remains of Herodian work exist. The line of the southern wall, though later than that of the other walls, probably goes back to Hadrian's city. The city wall of Hebrew times was considerably farther south. It can be traced, by the evidence of rock scarps still on the surface, from the south-west corner to the great tower foundations in 'Bishop Gobat's School'—the ancient tower of the furnaces—and thence westwards to another tower in the British cemetery. From here Bliss followed it, by means of his excavations, all the way to the Pool of Siloam. The foundations showed evidence of two or three reconstructions. Two gates were discovered—the 'Gate of the Gai,' or Valley Gate, in the British cemetery, and the 'Dung Gate,' a little south-west of the Pool of Siloam. The eastern end of this southern wall was traced, as far back as 1868, by Sir Charles Warren, for a distance of 700 feet south of the south-east corner of the Haram.

The so-called 'Tower of David,' or the Citadel, dates in its present form to the 14th century, but it probably covers the substructures of Herod's great towers, Hippicus and Pharsael. The position and names of the various gates in relation to history is a fascinating study to the keen student.

3. *The Tombs.*—Jerusalem is girdled by tombs and graves. To the north the so-called 'Tombs of the Kings' are almost certainly those made for Queen Helena of Adiabene, a convert to Judaism, and her family (c. 48 A.D.). On the opposite side of the valley is the tomb, much revered by the Jews as being—but on very slender evidence—that of Simon the Just, while farther north the same valley becomes a regular valley of tombs, but for whom these now empty sepulchres were originally made we know nothing. Near the Damascus Gate a great deal of attention has been directed to a tomb which in its present condition certainly belongs to the 5th Christian century, like its neighbours in the grounds of St Stephen's, but which many, without much evidence, have supposed to be the original 'Holy Sepulchre.' Those who believe in this tomb also consider that the adjoining hill is the original Calvary, a theory advocated by the late General Gordon on grounds more mystical than scientific. To the west of the city is a very interesting Greek tomb, which has been variously ascribed to Herod, to his wife Mariamne, and to the high priest Ananias.

On the lower slopes of the Mount of Olives are some very conspicuous monuments, notably 'Abraham's Tomb,' the 'Grotto of St James,' and the 'Tomb of Zechariah,' all belonging to the last two centuries before Christ. Still farther south, where the first houses of the village of Siloam begin, is the

interesting 'Egyptian Tomb,' traditionally that of Solomon's Egyptian wife, but probably belonging to the same period as the three above-mentioned tombs.

The traditional 'Holy Sepulchre' is now almost in the middle of the city, and for that reason many have doubted its authenticity. It must be remembered, however, that the Christian quarter of the city has grown to a considerable extent round the tomb. It is also incontrovertible that it is one of a group of Jewish tombs which must, when they were made, have been outside the walls. That the Basilica of the Anastasis, completed (335 A.D.) by Constantine the Great, stood here is undisputed, but beyond that the evidence rests largely upon tradition, of which the historical basis cannot now be verified. No archaeological evidence has been found which makes the genuineness of the site impossible. Around the tomb has grown up a collection of chapels belonging to various branches of the Church, each with shrines claiming our veneration, and all of considerable interest to the historian. Their claim to religious veneration depends largely on our belief in the genuineness of the Sepulchre itself, without which the later traditions regarding the 'Calvary,' the Chapel of the Finding of the Cross, &c., can have no convincing appeal.

4. *The Religious and Ecclesiastical Sites of Jerusalem* vary greatly in their claims on our credulity. That the Haram esh Shrif is the platform of Herod's great temple enclosure is indisputable, and that the beautiful Kubbet es Sakhra, or 'Dome of the Rock,' covers the great rock which formed a part of the original temple—according to most scholars the site of the brazen altar—is also certain. The great substructures under the southern end of the Haram are in their origin Herodian work, and 'Robinson's Arch,' which projects from the western wall near the south-west corner, was certainly part of the great bridge which connected the temple with the upper city. Excavations have shown that this arch was destroyed by Pompey, and again by Titus. A considerable section of the western wall of the Haram, including the 'Wailing Place' of the Jews, consists of Herodian masonry, and in the southern Haram wall can be seen the walled-up 'Single,' 'Double,' and 'Triple' gates, which in the N.T. led upwards from the lower city into the temple area. The mosque Al Aksa stands on part of the site of the Basilica built by the Emperor Justinian in honour of the Virgin Mary, and, during the days of the Latin kingdom of Jerusalem, the Knights Templars made this their headquarters, and tethered their horses in the vaults below. At the south-east corner of the Haram very much of the Herodian masonry remains in its original condition, and the marks of Herod's masons have been seen on the foundation corners 80 feet below the present level of the ground. The 'Golden Gate' was probably originally constructed by Justinian on the site of Herod's 'Shushan Gate,' but dates in its present form from the 7th century. Near the north-west corner of the Haram, the old Turkish barracks occupy part of the site of Herod's Antonia fort. The Via Dolorosa (which has changed its route several times through the centuries) commences here, and soon after passes under the 'Ecce Homo' arch, the central part of a triple Roman triumphal archway of the 2d century A.D. Nine stations of the Cross exist in the streets running from the 'Antonia' to the Church of the Holy Sepulchre; the remaining five are in the church itself. Other ecclesiastical sites which have some claim to consideration are the Cenaculum, the traditional site of the Last Supper, close to the so-called Tomb of David and the underground chapel-tomb of the Virgin Mary in the Kedron

valley. The adjoining Garden of Gethsemane has at least this claim, that an olive garden in this immediate neighbourhood must have been the scene of the opening phases of the Passion.

5. *Inscriptions.*—Of these, two are most important. The Siloam inscription (now in Constantinople), a graffito in Hebrew found at the lower end of the Siloam tunnel, records how the workmen joined up the tunnel after working from the two ends; presumably it belongs to the time of Hezekiah. The Greek inscription found in a tomb-enclosure near the 'Antonia,' which originally stood on the wall of division between the Court of the Israelites and that of the Gentiles, contains a warning against any non-Jew entering the sacred precincts. There are many short inscriptions in Hebrew and Greek on various tombs, and a number of Arabic inscriptions of considerable historic value.

History.—The first historical reference to Jerusalem is in the same cuneiform letters in the Tell el-Amarna collection, where the city occurs under the name of Uru-sa-lim. The governor was a vassal of Amenhotep IV., the heretic king who assumed the name of Kuenaten (see AKHNATON). At that time the city was fortified, and was garrisoned by Pharaoh's mercenary troops. There are reasons for thinking that the city may have been at that time a shrine of the god Aten—the Sun-disc. The territory of the city apparently extended westwards as far as Ajalon. Although it is recorded that Joshua burnt the city (Judges, i. 1-3), it never came into firm possession of the Hebrews until it was captured from the Jebusites by David in the eighth year of his reign (c. 1000 B.C.). From that time the city rapidly expanded, being the capital of the brilliant but short-lived united Hebrew monarchy, and Solomon built powerful and greatly extended city walls. After the disruption of the united kingdom Shishak (Sheshonk) Pharaoh of Egypt attacked the city, but was apparently bought off (1 Kings, 14-26). Some eighty years later in the reign of Jehoram (849-842 B.C.) it was pillaged by Arabs and Philistines (2 Chron. xxi. 16-17), and in the reign of Amaziah (797-729 B.C.) it was plundered and its fortifications extensively destroyed by Jehoash, King of Israel. His son Uzziah (Azariah) defeated the Arabs and Philistines, and he and his son Jotham greatly strengthened the city's defences (2 Chron. xxvi. 7-9; xxvii. 3). The very considerable material property of the city received a great setback at this time on account of a great earthquake (Zech. xiv. 4, &c.). Akaz, thanks to his grandfather's and father's efforts to strengthen the city's defences, was enabled to resist the combined attack of the kings of Syria and Israel (2 Kings, xvi. 5-6), while he strengthened his political safety by buying an alliance with Tiglath-Pileser, King of Assyria (2 Kings, xvi. 10-12). Hezekiah, his son, further strengthened the defences of the city by preventing any hostile force from having access to the water of Gihon (2 Chron. xxxii. 4-30). He also added to the strength of the walls by the construction of towers (2 Chron. xxxii. 5). The impending menace of Assyria was for a time averted during this and the succeeding long reign of Menasseh. The latter also strengthened the walls. He was the first of the kings of Judah to be buried outside the 'City of David.' Josiah introduced religious reforms, but was unable to stem the advancing tide of enemies, though he perished at Megiddo in trying to serve Assyria. His son Jehoichin voluntarily yielded up the city to the victorious Nebuchadnezzar (597), and was himself carried captive to Babylon. The city was despoiled, but, rebelling again eleven years later, it was besieged for a year and a half, and being captured (586), was with all its fortifications and its temple

reduced to ruins. All the surviving inhabitants, except the very poor peasants, were carried away captive.

Fifty years later under the Persian Cyrus 40,000 Jews received permission to return, and the foundations of the temple were commenced (Ezra, iii. 3; v. 16), but the work did not reach completion for twenty years. In 445 B.C. Nehemiah arrived, and we have in his account of his inspection and of his rebuilding of the ruined city walls a very good description of their position and condition. All having been prepared, the actual rebuilding, undertaken under conditions of danger and difficulty, took but fifty-two days.

Of the next hundred years under the Persians little is known. Alexander the Great took the surrender of Jerusalem on his way to Egypt, and after his death (323 B.C.) it, with Palestine, passed under the rule of the Ptolemies of Egypt, being captured by Ptolemy Soter (321) by a ruse on the Sabbath day. During the next century of political unsettlement, though the land suffered much, the city itself in its comparative isolation seems to have prospered. When in 198 Antiochus the Great won Palestine at the battle of Baniās the people of Jerusalem made him welcome. But years of great trouble and unrest were in store. On account of the Hellenising policy of Antiochus Epiphanes the more religious Jews were gradually goaded to rebellion. His treatment of the people and of their capital, which he twice captured and despoiled (170 and 160), at length led to the great uprising under the family of Mattathias. On the death of Antiochus Epiphanes, Judas Maccabeus obtained permission to restore the temple, which he fortified, but he was unable to expel the Syrian garrison from the Akra, and the siege of that fortress brought to its aid a great Syrian army under Lysias, who defeated the Jews (163) and captured the Holy City. After another eleven years of varying fortune at length the Maccabeans reached a reward to their unwearying efforts, and Jonathan became, by treaty, high-priest, and virtually a monarch. He repaired the city and the temple walls, and finally Simon, his successor, captured and destroyed the Akra. With the firm establishment of the Maccabean rulers a period of prosperity began. The Jews, for once in their history, reached the sea coast, and extended their power over the maritime plain. In Jerusalem new buildings arose, notably the Hasmonean palace, the bridge from the temple to the upper city and the Baris, a fortress to the north of the temple. Quarrels in the royal family, in the course of which the Arab Nabatæans were called in, led to the intervention of Rome. In 63 B.C. Pompey took the city by storm, desecrated the temple, and demolished the city walls. Judæa was annexed to Rome. The temple treasures, which Pompey had spared, were looted by Crassus (55 B.C.). Antipater the Idumæan became procurator in 47 B.C., and at the same time King Hyrcanus was permitted to rebuild the walls. In 40 B.C. Herod became procurator and later king of Judæa. This great king did much for the adornment of the city. His royal palace, the fortress Antonia (on the site of the Baris), a theatre, a hippodrome, and his great towers Hippicus and Pharsael made the architecture of the city worthy of the Roman empire. An even greater boon to the inhabitants was his great (low-level) aqueduct. To please the religious Jews he commenced greatly to enlarge and adorn the temple. The foundations of his great temple enclosure are those of the present Haram. Restless and unsettled years followed, a period familiar to us to some extent through the N.T. narrative—when the virtual power was in the hands of procurators, who had the hopeless task of placating Rome and of con-

ciliating the rising tide of Jewish rebellion. Herod Agrippa I. attempted to strengthen the fortifications of the city by building the 'third wall,' and his son (56 A.D.) enlarged the old Hasmonean palace, so that from it he might overlook the temple, an act which greatly offended the Jews. In 64 A.D. the long rebuilding of the temple, which Herod the Great had begun in 19 B.C., was at length completed. Two years later witnessed the outbreak of open rebellion against Gessius Florus with much destruction of public buildings, the beginning of troubles which culminated in the terrible siege of the city, which ended in its utter destruction in 70 A.D. by Titus. The frightful loss of life was greatly aggravated by the disastrous dissensions among the various factions within the walls. Sixty years later another uprising under Bar Cochbar led to the utter destruction of Jerusalem, the very site of the temple being ploughed up. Incidentally it led to the final severance of church and synagogue. In 138 Hadrian built a new and pagan city, which he called *Ælia Capitolina*. The new city walls were built on the general lines followed by those of to-day. An equestrian statue of the emperor stood where had been the Holy of Holies, and, according to ecclesiastical tradition, a Temple of Venus was erected over the Holy Sepulchre. Despite the pagan character of the city Christian pilgrims commenced to visit it. In 333 A.D., by order of Constantine, who had adopted Christianity, the church of the Anastasis, on the supposed site of the Holy Sepulchre, was begun. In 362 Julian made an attempt to rebuild the temple, but a mysterious explosion discouraged the workmen and stopped the enterprise. Some time in the 4th century the city walls were extended to include 'Mount Zion,' and in 450 the Empress Eudoxia, widow of Theodosius II., restored the southern walls—ruined since the time of Titus—on the lines of the ancient circuit. She also built the church at the Pool of Siloam and the church of St Stephen. The emperor Justinian (527–565) built the Church of St Mary on the site now occupied by the el-Aska mosque, and also, according to some authorities, the so-called 'Golden Gate' in the Haram.

In 614 Chosroes and his Persian hordes fell upon Palestine and ravished the whole land. His vengeance especially fell upon the ecclesiastics and their churches. Fifteen years later Heraclius the Byzantine emperor returned to the holy city bearing back the famous 'fragment of the true Cross' captured by the Persians, and undertook extensive restorations. But the triumph of Christendom was short. In 632 occurred the death of Mahommed, and by 636 his followers had won Palestine in the battle of Yarmuk. The following year Jerusalem was surrendered into the hands of the Khalif Omar, who granted generous terms to its inhabitants. He established a religious centre of Islam on the deserted site of the temple, building a wooden mosque over the sacred rock. This was replaced in 691 by the present Kubbet es Sakhrāh or 'Dome of the Rock.' Christians and Moslems appear to have lived for the next centuries on friendly terms, but in 1010 the mad Egyptian ruler Hakim did much wilful destruction of churches. In 1077 the city fell into the hands of the Seljuk Turks, the tales of whose cruelty and barbarism roused Christendom to the first crusade. In 1098 Jerusalem was captured, the triumph of the crusaders being signalled by a barbaric massacre. Godfrey de Bouillon became first king of Jerusalem (1100), and the line of Latin kings continued to hold the city till 1187, when its fall followed soon after Saladin's sweeping victory at Hattin. In 1229 the Emperor Frederick II. of Germany obtained possession of the city by treaty from the Sultan of

Egypt, but lost it ten years later through breaking his agreement not to rebuild the fortifications. In 1244 the Kharizmians from Central Asia burst through Palestine, seized Jerusalem, massacred its people, and destroyed all they could. Three years later they were ejected by the Egyptians, who held it till they were conquered by the Ottoman Turks. In 1832 the Egyptians again conquered it, but through the intervention of the European powers, especially Great Britain, they were compelled to return it to the Turks in 1840. From this time onward Jerusalem has come increasingly into wide-world prominence. The last half century before the Great War had witnessed a great increase in population, reaching some 70,000 in 1914. New buildings—monasteries and convents, hospitals and schools, churches and hotels—have grown up on all sides. The Russians first erected a great mass of buildings outside the old walls, but since that time every great European Power has had its share in building up the city. Amid these greater buildings have grown numbers of somewhat squalid Jewish settlements representing communities of Jews from all over the world. The Germans, after the visit of the Kaiser in 1898, showed great activity in building. They rebuilt the 'Church of the Redeemer' near the Church of the Holy Sepulchre, erected the Church of the Virgin near the 'Tomb of David,' the Hospice of St Paul outside the Damascus Gate, and the Great Kaiserin Augusta Victoria Stiftung on the Mount of Olives, now the centre of the British government in Jerusalem. The British have two hospitals, three churches, including the Cathedral Church of St George's and some mission schools. The French, Italians, Austrians, and the other powers all have religious, educational, or medical institutions. Few cities have had such a variety of nationalities, of languages, and of religious sects as the Holy City of this period.

Turkey, having to her own undoing come into the Great War on the side of Germany, attempted the invasion of Egypt. The British were compelled to take measures in reply. During the spring of 1917 General Sir A. Murray fought his way with success through the desert between Egypt in Palestine. Serious reverses during March and April at Gaza caused delay, but in October the British forces, now led by General Allenby, began an irresistible advance. Commencing by capturing the enemy's well-fortified lines between Gaza and Beersheba they advanced so rapidly that by 9th November Jerusalem surrendered without any fighting in its immediate vicinity. No army attacking Jerusalem compares in numbers or in variety of race and religion with this one, but never has Jerusalem been conquered with less material damage. With the new régime has begun a new, and we may hope a glorious, chapter in the long and stormy history of the Holy City.

² *Modern Jerusalem.*—One of the first acts of the new administration was to bring into the city a good water supply from the distant source in Wady Arrâb, which had been used nearly 2000 years before. A health service is now established to fight the insanitary conditions left by centuries of Turkish misrule, and especially to try and stamp out that age-long curse of the city—malarial fever. Political measures have been introduced which it is hoped will provide in time for complete self-government. The railway erected by the French in 1892 as a narrow-gauge line has now been relaid on the common gauge of the land. Motor traffic, which was unknown before the war, is steadily increasing. A Pro-Jerusalem Society is concerning itself with the preservation of ancient monuments and fostering the city's industries. There is a government archaeological committee with a

director of antiquities. Various scientific societies are established in the city, the British School of Archaeology and the Palestine Exploration Fund by Britain, the American School of Oriental Research by the United States, and the École Biblique de St Etienne in connection with the French Dominicans. A Jewish university is planned, and British high schools for boys and for girls have been established. Several missions are doing excellent educational and philanthropic work. The activity of the Zionists is increasingly seen in the school of art, libraries, educational establishments, musical societies, and perhaps most prominent of all in their numerous newspapers with their persistent agitation for increasing political power. These efforts are looked upon with great suspicion by the Moslems and Christians, who claim that Palestine is more really their national home than that of a people who have left it so many centuries. The clashing of so many interests—religious, national, and political—produces a feeling of uncertainty as to its immediate future, and makes the holding of the mandate for Palestine a heavy and anxious responsibility.

LITERATURE.—For general purposes, *Jerusalem from the Earliest Times to A.D. 70* (2 vols.), by Sir G. A. Smith, is invaluable. *Jerusalem in Bible Times*, by Professor L. B. Paton, is a condensed account of modern views on the city. Many of the articles in the recent Bible dictionaries are very good. As a guide-book it is hard to beat Baedeker's *Guide to Palestine and Syria*. For archaeology, Warren's *Underground Jerusalem* (1876), the *Jerusalem* volume of the P. E. F. Memoirs, Bliss and Dickie's *Excavations in Jerusalem* (1894-97), Vincent's *Underground Jerusalem* (1911), and Wilson's *Golgotha and the Holy Sepulchre* are useful. For history, The Bible and Josephus, Desant and Palmer's *History of Jerusalem*, Le Strange's *Palestine under the Moslems* (1890), Watson's *Story of Jerusalem*, Conder's *Latin Kingdom of Jerusalem*, and Bevan's *Jerusalem under the High Priests*.

Jerusalem, ORDER OF ST JOHN OF. See HOSPITALIERS.

Jerusalem Artichoke, or TOPINAMBURI (*Helianthus tuberosus*), a plant of the natural order Compositæ, and of the same genus with the common Sunflower (q.v.), is a native of Brazil. The word Jerusalem, in the English name, is a corruption of the Italian *girasole*, 'sunflower'; the name *artichoke* is merely from a supposed similarity of flavour in the eatable part—the tuber—to the Globe artichoke. The Jerusalem artichoke has straight, sparsely branching stems from 8 to 12 feet high, and many rough, ovate, acute stalked leaves; and in the end of autumn, though rarely in Scotland, produces yellow flowers resembling those of the common sunflower, but smaller. The thick, fleshy, and knotted perennial root produces, pretty closely around it, oval or roundish tubers, sometimes thirty or fifty in number, which are reddish on the outside, and whitish within, in appearance

Jerusalem Artichoke
(*Helianthus tuberosus*).

very similar to potatoes. They have a sweetish, mucilaginous taste when boiled, and are much more watery and less nourishing than potatoes. They are, however, very palatable when properly prepared with sauce, and make very good soup. The plant is also useful for fodder for cattle, yielded by its leaves and the more tender parts of the stems. The stems and leaves contain much nitre, and have been used for making potash. The fibre is used for making cordage and coarse cloth. The Jerusalem artichoke is scarcely an agricultural crop in Britain, although it is to some extent in some parts of Europe. It was known in English gardens before the potato, to which it in some measure gave place. It is generally propagated by small tubers, or cuttings of tubers, like the potato; and its cultivation is in most respects similar, although the aspect of the plant is very different. In America it is sometimes called Canada potato or Virginia potato.

Jerusalem Chamber. See WESTMINSTER.

Jervaulx Abbey (pronounced *Jarvis*), a ruined Cistercian abbey of Yorkshire, 13½ miles NW. of Ripon. It was built in 1156 by monks from the Yorkshire monastery of Byland, and was dismantled in 1539, its last and twenty-third abbot having been hanged two years before for his share in the Pilgrimage of Grace. Its scanty ruins were excavated in 1803 by the Earl of Ailesbury.

Jervis, SIR JOHN. See ST VINCENT (EARL).

Jervis Bay, in the south-east of New South Wales. Part of the coast (28 sq. m.) forms a detached portion of the Federal Territory acquired for the establishment of a port and a Federal Naval College.

Jesi, or **IESI** (anc. *Æsium* or *Æsis*), a walled town of Italy, 17 miles by rail SW. of Ancona, has a cathedral, a town-house with good pictures, manufactures of silk, paper, soap, &c., and a trade in wine, olive-oil, corn, and cheese. Here the Emperor Frederick II. was born. Pop. 26,000.

Jespersen, OTTO, philologist, born 16th July 1860, studied at Copenhagen, where he became professor of English in 1893. Notable works are *Growth and Structure of the English Language*; *Phonetics*; *A Modern English Grammar*; *Language, its Nature, Development, and Origin*; *Philosophy of Grammar*.

Jessamine. See JASMINE.

Jesse, EDWARD, a popular writer on natural history, was born at Hutton Cranswick, Yorkshire, 14th January 1780. He became clerk in a government office, and was successively secretary to Lord Dartmouth, commissioner of hackney-coaches, and deputy surveyor-general of the royal parks and palaces. He died at Brighton, 29th March 1868. His books include *Gleanings in Natural History* (1832-35), *An Angler's Rambles* (1836), *Scenes and Tales of Country Life* (1844), *Anecdotes of Dogs* (1846), and *Lectures on Natural History* (1861); besides editions of Walton's *Complete Angler*, White's *Selborne*, and Ritchie's *Windsor Castle*. See Mrs Houston's *Sylvanus Redivivus* (Lond. 1890). —**JOHN HENEAGE JESSE**, son of the foregoing, was born in 1815, and at an early age filled a place in the secretary's department of the Admiralty at Whitehall. He had already written poems and plays without success, when he found his work in a series of bright and interesting works in the field of domestic history, which have yet far more than their mere readableness to commend them to general readers, if not to serious students. He died 7th July 1874.

Jesse Window, a window that had the genealogical tree of Jesse, father of David, painted on its glass or sculptured on the mullions. Such were once common in churches.

Jessore, also called **KASBA**, a town of Bengal, capital of a district, 74 miles by rail NE. of Calcutta. Pop. 10,000. Since the opening of the Eastern Bengal Railway Jessore has developed into a trading-mart of some importance in local products.

Jest-books are of two kinds: collections of witty sayings and practical jokes which go under the names of certain men who were celebrated in their day as 'merry fellows,' and collections of facetiæ, gathered from many sources, ancient and modern. Of the first class *Tarlton's Jests* may be considered as a fair type among English books of facetiæ. Here all the jests and practical jokes are ascribed to that popular Elizabethan comedian, or rather buffoon; but probably not a single one of them is genuine or authentic. This book, in fact, is simply a catchpenny collection of jests taken out of older books, and fathered on Tarlton after his death in order to stimulate its sale and popularity. A notable example is found in Tarlton's device to reach London without expense, at a time when he was in the country and with an empty purse: he contrived to have himself arrested as a 'seminary priest' and taken up to the metropolis, where he was at once recognised and set at liberty. This is a variant of the well-known story of Rabelais, with his three packets of harmless wood-ashes, labelled 'Poison for the King,' 'Poison for the Queen,' 'Poison for the Dauphin.' And it reappears in another jest-book of the same class, in the composition of which the learned man under whose name it goes had no more share than he had in that of the Talmud, namely, *The Witty and Entertaining Exploits of George Buchanan, commonly called the King's Fool*. Another old English book of this kind is the *Jests of Scogin*, which the enterprising printer foisted on the public—as was also done in the case of the *Tales of the Mad Men of Gotham* (see **GOTHAM**)—as having been compiled by 'A. B. of Phisicke Doctour,' meaning the facetious Andrew Borde. In this book Scogin, or Scogan, 'a scholler of Oxford,' is represented as playing all sorts of tricks, most of which are found in earlier collections, and all are traceable to French, Italian, and Asiatic sources. For example, with the help of his 'chamber-fellow,' he cheats a simple rustic out of half his flock of sheep by persuading him that they are really hogs—a trick which not only occurs in medieval Latin collections and all the jest-books of Europe, but has its probable original in an old Indian work entitled *Hitopadesa* (a Sanskrit form of the Fables of Pilpay, or Bidpai), where, in like manner, three sharpers cheat a Brahman of a goat he is carrying to sacrifice, by making him believe it is a dog. Of other jest-books the *Pleasant Conceits of Old Hobson, the Merry Londoner*, is a good example, albeit, as usual, containing little that is not found elsewhere. Old Hobson is a confirmed practical joker, and many of his best conceits turn on merely verbal quibbles. Two more books of this class are the *Jests of George Peele*, the player, and *Archy Armstrong's Banquet of Jests*; and it is hardly necessary to say that their names are all that is theirs in the collections.

The oldest known English jest-book is *A Hundred Merry Talys* (about 1525), to which the lively Beatrice refers when she says to Benedick, in *Much Ado about Nothing* (Act II. scene i.), 'Will you tell me who told you that I was disdainful, and that I had all my good wit out of the *Hundred Merry Tales*?' Next in order of date—and of interest also—is *Mery Tales, Wittie Questions, and Quicke Answers, very Mery and Pleasunt to be Redde* (about 1535). From these two the compilers of subsequent jest-books in the early years of the 17th century drew very freely, with one notable exception, *Taylor's*

Wit and Mirth (i.e. John Taylor, the Water-poet), which, he tells us in the lengthy title-page, he 'chargeably collected out of Taverns, Ordinaries, Innes, Bowling-greenes and Alleys, Ale-houses, Tobacco-shops, Highwayes and Water-passages,' and which is 'made up and fashioned into Clinches, Bulls, Quirkies, Yerkes, Quips and Jerkes: apothegmatically bündled up at the request of John Garrett's Ghost' (1635). This is by far the most original of all our English jest-books—by which we mean that it contains very few of the tales found in the earlier collections. And if we seek for the reason of this, it is probably to be found in the superior advantages which Taylor possessed over mere literary hacks—who were able only 'to make new books as apothecaries make new mixtures, by pouring out of one vessel into another'—in his profession of a Thames waterman, which must have brought him into contact with all sorts and conditions of men, from whom, more especially sea-captains, he probably learned a goodly portion of the jests he tells so quaintly.

The best known of English collections of facetiæ is *Joe Miller's Jest-Book, or the Wit's Vade Mecum*, which, even in its original form (1739), is a mere compilation of witticisms, drawn by the versatile John Mottley mainly from 16th and 17th century jest-books, the best joke in it being the name of Joseph Miller (1684–1738) on the title-page; for, though a comedian by profession, it is said that he was never known to make a joke in his life. Those who are well acquainted with the humorous literature of other countries as well as that of our own must confess that if our jest-books, both ancient and modern, were stripped of all that is borrowed, the number of jokes that we can fairly claim would be exceedingly few indeed. But, for the matter of that, no other country is better.

Besides the books already incidentally mentioned, most collections of folklore and of chap-books contain jests. Again, many books of this class are roughly grouped as 'Facetiæ' in booksellers' lists, especially if more or less *grivois* in character. W. C. Hazlitt reprinted a good many collections in his *Shakespeare Jest-Books* (3 vols. 1868). Good English jest-books of the Cavalier period are the *Westminster Drollery*, *Choice Drollery*, and *Merry Drollery*, reprinted by R. Roberts of Boston (3 vols.). See articles BIDPAI, CHAP-BOOKS, FOLKLORE, and GOTHAM.

Jesters. See FOOLS.

Jesuits, or SOCIETY OF JESUS, a celebrated religious order of the Roman Catholic Church, which has filled a large space in the ecclesiastical and even the political history of the world. It was founded in 1534 by Ignatius Loyola (q.v.), in concert with five associates—Peter Le Fevre, a Savoyard; three Spaniards—James Lainez, Francis Xavier, and Nicholas Bobadilla; and a Portuguese named Rodriguez. Their original purpose was to undertake a mission to the Holy Land, and to labour there for the conversion of infidels; but as all access to the Holy Land was precluded by the outbreak of a war with the Turks, the associates turned their thoughts to a more comprehensive organisation, specially designed to meet those more modern requirements which had arisen since the Reformation. With this view, Ignatius Loyola, with Lainez and Le Fevre, having meanwhile recruited several new associates, repaired to Rome in 1539, and submitted to the pope, Paul III., the rule of the proposed order, the great aim of which was expressed in their adopted motto: *Ad Majorem Dei Gloriam* ('To the greater glory of God'); and the vows of which, in addition to the threefold obligations common to all Catholic religious orders, of chastity, poverty, and obedience, comprised a fourth, whereby the members bound themselves unreservedly to go as missionaries to any country

which the pope might indicate to them. The new rule was approved by a bull of 1540; and in the following year the association was practically inaugurated at Rome, by the election of Ignatius Loyola as its first general.

The original constitution of the society has undergone few modifications. Although it is commonly represented as absolutely monarchical, yet the authority of the general is, in many respects, strictly limited. It is true that the general—who is elected by a congregation of professed members, composed of two elected fathers in each province together with the provincial—holds his office for life; and, although he is aided in his government by a council of six assistants, he is not obliged to follow their advice even when unanimous. These assistants are elected by the same congregation that elects the general, and remain in office during his life. Each assistant has a more immediate charge of a group of provinces and missions called an *Assistancy*, formed mainly according to the principal European languages—Italian, German, French, Spanish, and English; to which has recently been added a sixth assistancy for America. But though the general is thus absolutely free in his decisions, he is strictly bound by the constitutions of the order; nor, although he may dispense in particular cases, is he competent of his own authority to annul or to alter any of the constitutions. Another check on merely arbitrary power and outlet for complaints may be mentioned. Every three years a Congregation of Procurators, as it is called, is summoned by the general. This is composed of a deputy chosen by vote in each province to go to Rome or elsewhere, and lay the condition and needs of the province personally before the general. When all the deputies are assembled, they have under the presidency of the general always to vote on and decide one question—whether there is any need of convoking a general congregation. Although no instance of deposition has ever occurred, the general himself is liable to be deposed by the sentence of such a general congregation, in certain contingencies which are specifically pointed out by the constitutions.

The body over which this general presides consists of four classes: (1) Professed, who, having passed through all preparatory stages, which commonly extend over ten or twelve years, or even a longer period, have solemnly taken the vows described above, including that of obedience to the pope. It is from this class alone that the general and all the higher officials of the society are chosen. (2) Coadjutors, spiritual and temporal: the former—who have completed their studies, and have (seldom before their thirty-second year, or even later) been admitted to holy orders—being designed to assist the professed in preaching, teaching, and the direction of souls; the latter being lay-brothers, to whom the minor and menial offices of the society are assigned. (3) Scholastics, who, having passed through the novitiate, are engaged for a long series of years, either in pursuing their own studies, or in teaching in the various schools of the order. (4) Lastly, novices, who, after a short trial as 'postulants' for admission, are engaged for two years exclusively in spiritual exercises, prayer, meditation, ascetic reading, or ascetic practices, and generally in a course of disciplinary training. The administrative and executive government of the society, throughout the various provinces or missions into which it is divided, is entrusted, under the general, to provincials, who are named by the general, and hold office commonly for at least three years. In each separate province there are three kinds of communities—professed houses or residences, colleges, and novitiates. The head-superior in each is

appointed by the general, who receives at stated intervals a detailed report of the character, conduct, and position of each member of the society. In all these gradations the subordination is complete, and the obligation of obedience is immediate and unreserved; and one of the most familiar accusations against the society is that this duty of blind and implicit obedience makes the superior the sole and final arbiter of conscience for all his subjects, the judge of good and evil, of virtue and of vice. Nevertheless, whatever may be said of the practical tendency of this relation, the Jesuits and their apologists plead that both in the rules of St Ignatius and in the so-called 'examen' of the candidate there is contained, in the duty of obedience to a superior, an explicit reservation for the subject, 'unless where the superior should command what is sinful.'

The system of training exhibits the most profound knowledge of the human heart, and the most correct appreciation of the religious instincts and impulses of mankind. The long exercises of the novitiate were designed by Ignatius to form the individual character in habits of personal holiness, and practices of personal piety. It was the business of their unwontedly protracted course of studies to equip them to be competent teachers of youth and directors of souls. To learning carefully adapted to the actual condition and progress of knowledge they sought to add manners and habits calculated to inspire confidence, and to disarm prejudice and suspicion. Unlike the older orders, they made no parade of a special calling, whether by a peculiar habit, or by obligatory austerities and practices of asceticism. They enjoyed, indeed, in these respects, some exemptions from the more austere practices of other orders. Their churches were but designed as supplementary to those of the parish clergy (whose ordinary costume they adopted as their own conventual dress), without being bound to sing the canonical 'Office' in choir and without much imposing or attractive ceremonial; being chiefly set apart for religious instruction, and for the duties of the confessional. Their casuistry avoided all harsh and excessive rigour; and it cannot be doubted that some of their writers carried it to the opposite extreme. But above all, they addressed themselves to the great want of their time—education; and through the mastery which they soon obtained in this important field, as well as their eminence in every department of learning, divinity, philosophy, history, scholarship, antiquities, and letters, they attained to unbounded influence in every department of society.

The organisation of the society is settled, in every important particular, by the original rules and constitutions of St Ignatius. The opponents of the Jesuits, however, allege that, in addition to these public and avowed constitutions, there exists in the society, for the guidance of their hidden actions, and for the private direction of the thoroughly initiated members, a secret code, entitled *Monita Secreta* ('Secret Instructions'), which was meant to be reserved solely for the private guidance of the more advanced members, and which was not only not to be communicated to the general body, but was to be boldly repudiated by all should its existence at any time be suspected or discovered. This singular code, a masterpiece of craft and duplicity, was first printed at Cracow in 1612, and has been repeatedly reprinted by the enemies of the Jesuits; but it is indignantly disclaimed by the society. The accounts of the time and circumstances of its discovery are suspicious and contradictory. The book has been repeatedly condemned, both at Rome and by other authorities, as well as by the society, and its apocryphal character is now commonly admitted.

The history of the society has varied in different countries, but in each may be divided into three stages—the rise, the suppression, and the restoration of the order. Settled first in Italy, its early career was brilliant and unclouded. Before the death of the first general, St Ignatius, in 1556, the Jesuits had swelled to 1000 in number, and the order was established throughout the world in twelve provinces. Their first check in Italy occurred in Venice. In the contest of this republic with Paul V. (q.v.) the Jesuits, taking the side of Rome, accepted in 1606 the alternative, proposed by the senate, of leaving the Venetian territory; nor was it till 1656 that they were re-established in Venice, from which time they continued to enjoy undisturbed influence in Italy until the suppression of the order. The earliest settlements outside of Italy were in Portugal and Spain. In 1540 Rodriguez (a Portuguese of good birth) and Francis Xavier opened colleges in Portugal, at the invitation of the king. Francis Borgia, Duke of Gandia, in Spain, was equally well received in his native country, where the order flourished so rapidly, that, at the time of the suppression, the Spanish Jesuits numbered above 6000.

In France, although a house for novices was founded in Paris by St Ignatius in 1542, the university of Paris opposed their introduction as unnecessary, and irreconcilable with its privileges. They were distasteful to supporters of the Gallican liberties, and still more to the Huguenots. The jurists, the parliament, and the partisans of absolutism were alarmed by the free political opinions which had found expression in some of the Jesuit schools. On the other hand, the democratic party attributed to them a sinister use of their influence with courts. And thus their progress in France was slow, and their position at all times precarious. It was with much difficulty that the parliament of Paris consented to register the royal decree which authorised their establishment. In more than one instance the university protested against their schools as invading its privileges. In the wars of the League they did not fail to make new enemies; and at length the assassination of Henry III. by Clement (although no evidence of any connection with the Jesuits appeared in his case), and the circumstance that Chatel, who attempted the life of Henry IV., had at one time been a pupil in their schools, led to their expulsion from France in 1594. They were reinstated, however, in 1603; but on the assassination of Henry IV. by Ravallac the outcry against them was renewed. Although it seems quite certain that this clamour was utterly without foundation, yet the opinions held by one of their order, Mariana (q.v.), on the right of revolt, although condemned by the general, gave a colour to this and every similar imputation. A less deep but more permanent and formidable movement against them was gradually stirred up at a later period, by a combination of all the causes of unpopularity already described, to which new point was given by the well-known Jansenist controversy, and by the questions as to the imputed laxity of the moral teaching of the Jesuits, and their alleged corrupt and demoralising casuistry. What the ponderous and indignant prelections of the Sorbonne, and the learned folios of the Dominican and Augustinian schools had failed to accomplish, the wit and brilliancy of the celebrated *Lettres Provinciales* of Pascal (q.v.) effectually achieved. The laxity of some of the Jesuit casuists was mercilessly exposed by this brilliant adversary, who represented it as the authorised teaching of the order, and the crafty maxims and practices popularly ascribed to the society were placed before the world in a light at once exquisitely amusing and fatal to the reputation of the body. The attempts

at rejoinder on the part of the Jesuits but served to fix the ridicule more firmly. Of the thousands who laughed at the happy humour, or sympathised with the vigorous raillery of Pascal, few, indeed, could plod through the learned but heavy scholasticism of his adversaries. In vain the Jesuits insisted that the obnoxious casuists had been condemned by the society itself; in vain they showed where their opinions differed from those imputed to them. The wit of Pascal remained unanswered; and whatever were the logical merits of the controversy, no doubt could be entertained as to its popular issue. The pungent pleasantries, too, of the *Provincial Letters* were but a foretaste of the acrimony of the later Jansenistical controversies, in which the Jesuits stored up for themselves an accumulation of animosities in the most various quarters, the divines, the lawyers, the courtiers, which were destined to bear bitter fruit in the later history of the society in France. Nevertheless, after a long conflict, they enjoyed a temporary triumph in the last years of the Regency and the beginning of the reign of Louis XV.

In Germany the Jesuit institute was received with general and immediate favour. In the Catholic territories, Austria, Bavaria, and the Rhenish principalities, they not only founded colleges and other establishments of their own, but they were appointed at Ingolstadt and other universities to hold important professorships, and received in many dioceses the charge of the episcopal seminaries then newly established. Before the death of the first general, St Ignatius, the order could reckon in Germany 26 colleges and 10 professed houses. In Hungary and Transylvania much bitterness arose out of their introduction; the same may be said of Bohemia and Moravia; and through the whole course of the Thirty Years' War the Jesuits, though in many instances wrongfully, were regarded by the belligerent Protestants as the soul and centre of the Catholic camp.

In the Netherlands they encountered some opposition at first; but in 1562 Lainez, the second general of the order, came to the Low Countries, and a college was opened at Louvain, which eventually became one of the greatest colleges of the order. In the Protestant kingdoms the Jesuits obtained entrance only as missionaries, and in some, as in England, Scotland, and Ireland, under circumstances of great difficulty and peril. From England they were excluded by the penal laws under pain of death; nevertheless, with a constancy and devotedness which it is impossible not to admire, they maintained through the worst times an unbroken succession of missionaries in many parts of England. They often resorted to the most singular disguises, and generally bore false names; and several of the old Roman Catholic mansions still show the 'Priest-hole,' which was contrived as a retreat for them in cases of sudden emergency. Into Ireland they effected an entrance almost at the first foundation, and, after many vicissitudes, towards the close of the reign of Charles II. they had more than one considerable college for the education of youth.

But a still more fertile field for the enterprise of the order was that of the missions to the heathen, in which they outstripped all the older orders in the church. In the Portuguese colonies of India the successes of Francis Xavier (q.v.) are well known. The results of their missions in China (under such men as Ricci, 1552-1610, and Schall, 1591-1699) and Japan were even more extraordinary, as also in Northern and Central America. Above all, their establishments in the southern continent, in Brazil, in Paraguay and Uruguay, upon the Pacific coast, in California, and the Philippine Islands were missions of civilisation as much as of religion.

Such was this association in the first stage of its history. At their first centenary jubilee the members already numbered 13,112, distributed over 32 provinces. At their suppression, a century later, they had increased to 22,589, and were possessed of 24 professed houses, 669 colleges, 176 seminaries, 61 novitiates, 335 residences, and 275 missionary stations in infidel countries or in the Protestant states of Europe.

The decline in the fortunes of the Jesuits was rapid and decisive in its consummation. The first blow which they sustained was in Portugal. An exchange of colonial territory having been effected between that kingdom and the crown of Spain, the so-called 'Reductions' of Paraguay (q.v.), in which the Jesuit missionaries possessed an authority all but sovereign, were transferred to Portugal. The native Indians having resisted this transfer, the Portuguese ascribed their disaffection to the Jesuit missionaries. The Portuguese minister, Pombal de Carvalho, to whom the Jesuits allege that their possessions in Portugal had long been an object of desire, instituted a commission of inquiry; and while it was still pending, an attempt on the life of the king, Joseph, which was laid to the charge of the Jesuits, furnished him with a fresh ground of impeachment; and, without awaiting any judicial proof of either accusation, he issued, in September 1759, a royal decree, by which the order was expelled from the kingdom. This example was followed in other kingdoms. In France, under the Duc de Choiseul, the immediate occasion of the disgrace of the Jesuits was a trial in the civil courts. Father Lavalette, as procurator of the order in Martinique, had consigned to a commercial house in Marseilles two valuable cargoes, which were seized by English cruisers, and, Lavalette being unable to meet the bills, the Marseilles merchants proceeded successfully against the order. The Jesuits replied that Lavalette acted not only without the authority of the order, but against its positive constitutions, and appealed to the parliament of Paris against the sentence. The inquiry thus raised presented an opportunity of which the ancient enemies of the order in the parliament eagerly availed themselves. A report on the constitutions of the society, highly damnatory, was speedily drawn up, and a demand was made for the suppression of the order, as being irreconcilable, in its constitution and practice, with the interests of the state and of society. A strong effort was made to arrest the proceeding; but a powerful court-faction, aided by the secret influence of the royal mistress, Madame de Pompadour, who was irritated by the refusal of her Jesuit confessor to grant her absolution unless on condition of her separating from the king, and supported in the press by the philosophic party, carried all voices, public and private, against the Jesuits. An attempt at compromise was proposed to the general, Father Ricci, by which the obnoxious constitutions might be abolished or modified; but his unbending attitude cut short all negotiation; and in 1764 a royal edict suppressed the society in French territory. This example was followed by Spain, in 1767, with circumstances of great harshness and severity; and by the minor Bourbon courts of Naples, Parma, and Modena. The court of Rome had zealously but vainly interposed in their behalf, and from Clement XIII., who (and not Father Ricci) used of them the famous words, *Sint ut sunt, aut non sint* ('Let them be as they are, or cease to be'), they received earnest support. But his successor, Clement XIV., inclining in this and all other questions of church and state to the side of peace, having in vain endeavoured to procure from the courts by which they were condemned a relaxation of their severity, and being pressed by the ambassadors of France and Spain, at length issued, July 21, 1773, the

celebrated bull 'Dominus ac Redemptor Noster,' by which, without adopting the charges made against the society, or entering in any way into the question of their justice, acting solely on the motive of 'the peace of the church,' he suppressed the society in all the states of Christendom. The bull was put into execution without delay. In Spain and Portugal alone the members of the society were driven into exile. In other Catholic countries they were permitted to remain as individuals engaged in the ministry or in literary occupations; and in two kingdoms, Prussia under Frederick the Great, and Russia under Catharine, they were even permitted to retain a quasi-corporate existence as a society for education.

What was meant, however, to be the suppression of the society proved but a temporary suspension. The ex-members continued in large numbers, especially in the Papal States and Northern Italy; and soon after the first storm of the Revolution had blown over measures began to be taken for the restoration of the society. The first overt reorganisation of them, barely tolerated by the pope, was in 1799, by the Duke of Parma; in 1801 Pius VII. permitted the re-establishment of the society in Lithuania and White Russia, and with still more formality in Sicily in the year 1804. It was not, however, until after the French Restoration, and the return of Pius VII. from captivity, that the complete rehabilitation of the Jesuit order was effected, by the publication of the bull 'Solicitudo Omnium Ecclesiarum,' August 7, 1814; and in 1824 their ancient college, the Collegio Romano, was restored to them. Once thus re-established by Pius VII., the Jesuit order as a religious order has remained on in the Catholic Church. But in different kingdoms of Europe it has had various fortunes. In Modena, Sardinia, and Naples it was re-established in 1815, as also in Spain. It was again suppressed in Spain from 1820 to 1825, from 1835 to 1844, from 1854 to 1858, and its members were banished once more in 1868. In Portugal they have never obtained a firm footing. Their position in France was one of sufferance rather than of positive authorisation; nevertheless, they were very numerous and influential, and their educational institutions held the highest rank. In 1880, however, the republic decreed the dissolution of the order, without giving it the alternative of seeking authorisation; and in July of that year the members were expelled from all their establishments save the educational, an additional month being allowed them for vacating the latter. In Belgium they reinstated themselves after the Revolution, and they now possess many great establishments, professed houses as well as colleges, which are largely attended both by Belgians and foreigners. In Holland also they possess several considerable houses, as well as in England, Ireland, the United States, and, within a recent period, Scotland. In Switzerland they opened in 1818 a college at Freiburg, which became a most flourishing establishment, and subsequently they extended themselves to Schwyz and Lucerne; but the war of the Sonderbund (one of the main causes of which arose out of the Jesuit question) ended in their expulsion from the Swiss territory. Of the German states Bavaria and Austria tolerated their re-establishment for educational purposes. In the Italian provinces of the former, as also in the Tyrol, they enjoyed a certain freedom until the revolution of 1848. In Russia they were placed under sharp restrictions in 1817; and in 1820, in consequence of their successful efforts at proselytism, they were banished by a final ukase from the Russian territory, whence they still remain excluded. The Italian revolution of 1848 seriously affected their position in that country. In that year Pius IX. found it expedient

to permit the breaking up of the college and other houses in Rome. They returned, however, with the pope himself, and resumed possession of their ancient establishments. On the proclamation of the kingdom of Italy they withdrew from Sardinia, Naples, Sicily, and the annexed territories in general. In the early legislation of the kingdom of Italy the Jesuits were visited with a special measure of repression. While each of the other principal religious orders was permitted to retain its 'mother house' at Rome, in which the general of the order might reside, the Jesuits were required to quit their principal convent of the Gesù. At the present time, however, the Jesuits in Italy are under no special disabilities. In Germany again they were treated with exceptional severity, being held responsible as the main agents and advisers of the measures adopted in the Vatican Council, which were complained of by the government as infringing the rights of the state. By a law of 1873 the order was excluded from the empire, its establishments were abolished, and all foreign Jesuits were ordered to be expelled, and the German members of the society, as well as of kindred orders and congregations, to be 'interned.' With regard to the present situation, this legislation again has either been repealed or has fallen into desuetude.

The twenty-six generals of the Society of Jesus have been the following (Italians, except where otherwise specified): Loyola (1541-56), Spaniard; Lainez (1558-65), Spaniard; Borgia (1565-72), Spaniard; Mercurian (1573-80), Belgian; Acquaviva (1581-1615); Vitelleschi (1615-45); Caraffa (1646-49); Piccolomini (1649-51); Gotti (1652); Nickel (1652-64), German; Oliva (1664-81); Noyelle (1682-86), Belgian; Gonzalez (1687-1705), Spaniard; Tamburini (1706-30); Retz (1730-50), Bohemian; Visconti (1751-55); Centurioni (1755-57); Ricci (1758-75); Brzozowski (1805-20), Pole; Fortis (1820-29); Roothaan (1829-53), Dutchman; Beckx (1853-84), Belgian; Anderledy (1884), Swiss; Martin (1892), Spaniard; Wernz (1906), German; Ledóchowski (1915), Pole. At the beginning of 1923 the total number of Jesuits in the world was 18,304, divided into thirty-two provinces.

The Jesuit historical literature is vast; it may be classified as (1) works written by members of the order; (2) independent; (3) hostile.

(1) Short general histories by T. Campbell (American) and J. Brucker (French); quasi-official histories of the different assistances by Astrain (Spain), Fouquieray (France), Tacchi-Venturi (Italy), Duhr (Germany), Pollen (England). For calumnies against the order see Duhr, *Jesuitenfabeln*; and for original documents, *Monumenta Historica S.J.* (Madrid).

(2) For Loyola and the early history of the order H. D. Sedgwick, *Ignatius Loyola* (1923), and Böhmer-Monod, *Les Jésuites* (1910).

(3) Histories by Nicolini (Eng.), Steinmetz (Eng.), Huber (Germ. and Fr.), Griesinger (Eng. trans.), Hönbröck (Eng. trans.), J. McCabe (Eng.); and for English Jesuits in particular, E. L. Taunton (1901) and W. Walsh (1903).

Jesus, son of Sirach. See ECCLESIASTICUS.

Jesus Christ. There is no personality in history whose life and teaching have aroused so much debate and discussion as Jesus Christ, and never was the divergence of opinion about him so great as it is to-day. The orthodox Christology of the Nicene and Chalcedonian formulæ may be said to represent one pole of thought, and the denial that the historical Jesus ever existed at all the other. Between these two poles are ranged an immense number of theories, some inclining to the one, and others to the other extreme. The modern demand for a return to Christ as a means

of escape from the morass of theological metaphysics and ecclesiastical dogmatism was hailed at first with general acclamation. It seemed to promise a speedy and easy exit from the incubus of patristic and medieval speculation. What could be simpler than to take the life and teaching of Jesus, as the story is told in the four gospels, as a basis and foundation for the reconstruction of faith? When, however, the attempt was made, it was discovered that the task was by no means as simple as had been generally supposed. The record of the modern investigation is told in Weinel's *Jesus in the Nineteenth Century*, and Schweitzer's *Von Reimarus zu Wrede, or The Quest for the Historical Jesus* (which is the title given to the book in the English translation). The results of the inquiry are bewildering in their diversity. The chasm that divides the conclusions of Harnack from those of Schweitzer, or still more the view of Bousset from the doctrines of Feine and Forsyth, is infinitely greater than the gulf which separated Arius and Athanasius, or the Protestant and the Roman Catholic, or Socinians and Reformers, or Arminians and Calvinists in the past. Let us take some of the most typical modern interpretations of Christ. (1) The most extreme view of all is the theory of Kalthoff and Drews that Jesus never existed at all, and that the portrait in the gospels is mythical from beginning to end. The figure in the gospels, it is maintained, is the natural precipitate of the religious and philosophical forces which were at work in the world at the time. Just as the Stoics invented an ideal figure, which they called 'the wise man,' to illustrate the meaning of their teaching, so the Christians invented the figure of Jesus to wear the drapery of their religious and ethical ideas. The history of early Christianity is on this theory the history of abstract thought gradually assuming concrete form and attaching itself to an imaginary person. This hypothesis does such violence to the facts, that it has only to be stated to be rejected. If there is one thing that is certain about the New Testament, it is that the concrete figure is the first historical fact in connection with the origin of Christianity, and the abstract ideas are of later growth. Unless the evidence of our existing documents is cast aside as worthless, the process of the evolution of Christianity was the exact reverse of that which Drews and Kalthoff assume. Not first the thought and then the fact, but first the fact and then the development of the thought is obviously the only legitimate conclusion that can be drawn from the evidence as it stands. Besides, there is not sufficient time between the date of the Crucifixion and the writing of the earliest books of the New Testament for the mythical figure of Christ to be created. Nor can it be said from what we know of the forces of thought that were at work in the world at the time that there is sufficient agreement between these forces and the picture of the life and teaching of Jesus in the gospels for the latter to be the product of the former. It is inconceivable, moreover, that the figure of Jesus should have arisen spontaneously from the fortuitous concourse of the religious and philosophical atoms with which the atmosphere of the age was charged, and there is no hint of the presence of a creative genius who could fuse the thought-germs of the time into the harmonious picture of Christ. (2) A second modern theory attempts to reduce the Christ of the gospels to the category of a prophet or teacher. This particular type of view is generally known as Liberalism. Its chief exponents are Strauss in his *New Life of Jesus* (1864); Keim, *Die Geschichte Jesu von Nazara* (1867-72); W. Bousset, *Jesu Predigt in ihrem Gegensatz zum Judentum* (1892); Schenkel, *Das Charakterbild*

Jesu (1864); Seeley, *Ecce Homo* (1865); Matthew Arnold, *Literature and Dogma* (1873); Harnack, *What is Christianity?* According to Harnack, 'the gospel consists of the knowledge and recognition of God as the Father, the certainty of Redemption, humility and joy in God, energy and brotherly love. Jesus directed men's attention to great questions. He promised them grace and mercy. He required them to decide whether they would have God or mammon, an eternal or an earthly life, humility or self-righteousness, love or selfishness,' and this statement may be taken as representing the general position of the Liberal school. Jesus is essentially a moral reformer, a preacher of righteousness, a revealer of the love and mercy of God, a supreme ethical teacher. This position is open to criticism from many points of view. It does not do justice to the statements in the gospels. It neglects half the data. It is not in accord with the verdict of the early church. And it fails to provide an answer to the question so pertinently raised by Schleiermacher, 'How a Jewish rabbi of philanthropic mind and somewhat Socratic morals with a few miracles, or at least what others took for miracles, and the ability to utter some clever parables—how one who was this and nothing more, and who, were he only this, would not be fit to stand before Moses or Mohammed, could have caused such an effect as a new religion and church—to be able to conceive how this were possible one must first take leave of his senses.' (3) A third view which has recently come into great prominence is known as the eschatological interpretation of Christ. It was launched upon the world in 1892 by Johannes Weiss in his *Die Predigt Jesu vom Reiche Gottes*, and has been strongly advocated in more recent times by A. Schweitzer. The eschatological school is a revolt from the ethical interpretation of Jesus, and lays stress upon elements in his teaching which had hitherto been ignored. The frequent references in the gospels to the Parousia, or the speedy return of Christ to the world after his Passion, had been glossed over or left out of account from most reconstructions of his life. Johannes Weiss claimed that these eschatological utterances were one of the most vital elements in the teaching of Jesus, and to neglect them was to overlook what was absolutely fundamental in his theology. In fact, he maintains that the expectation of the Parousia was an integral point in the faith of Jesus, and coloured his whole outlook. The teaching of Jesus revolves round the conception of the Kingdom—and the Kingdom is not a spiritual experience within the heart, but an actual entity which is to be set up on earth by a violent intervention of God in the way in which all the prophets and apocalyptic writers had portrayed its advent. This cataclysmic establishment of the Kingdom is the centre and core of the faith of Jesus, and he himself is to play the leading part in the great drama at his Parousia. The ethical teaching is altogether secondary and subordinate. It is not intended to embody a supreme moral ideal of eternal value and validity. It is merely an 'Interim-Ethik'—a code of principles and laws for the guidance of life during the brief interval which is to precede the coming of the Kingdom and the Parousia. It is to the credit of the eschatological school that they have recovered a note in the teaching of Jesus which had been either ignored or obscured by the advocates of Liberalism; and though they found few thorough-going followers, yet the majority of recent scholars have recognised the value of the new category which they discovered for the interpretation of Christ. Kirsopp Lake is perhaps the scholar who comes nearest to their position. In his *Stewardship of Faith* he maintains that the

legacy which Jesus left to his followers comprised three points: (a) the insistence upon the universal need of repentance in view of the speedy coming of the Kingdom; (b) the belief that he himself was the Messiah, though not in the full divine sense of the term; (c) the conviction that the Parousia would take place in the near future and be followed by the judgment of the wicked and the restitution of all things. Johannes Weiss and Schweitzer have certainly fastened upon what was undoubtedly a weak place in the Liberal reconstructions of the life of Christ. They have shown that apocalyptic was an essential factor in the outlook of Jesus. But, on the other hand, there can be little doubt that they have grossly exaggerated its influence. What they failed to do was to distinguish between the character of the Kingdom which Jesus preached and the mode of its advent. We need not hesitate to admit that the latter point was conceived in terms of Jewish apocalyptic, but the nature of the Kingdom is portrayed in ethical and religious categories. There is, for instance, only a minimum of apocalyptic in the Sermon on the Mount, and yet the Sermon on the Mount depicts the moral demands which are made upon those who strive to become members of the Kingdom. While we must not seek to minimise the significance of the eschatological utterances of Jesus, we must avoid the other extreme of supposing that the apocalyptic ideal represents the heart and core of his teaching.

We may now leave the modern attempts to appraise the person and teaching of Jesus, and try for ourselves to find the true and sound method of approaching the subject.

The sources of our knowledge of the life and teaching of Jesus are the first points which must be discussed. We have three sets of data: (a) The gospel narrative itself, and more particularly the sources from which the synoptics are derived (see GOSPELS). The narrative must, of course, be subjected to all the critical tests known to historical science. We may say that we have the following strata of evidence: (1) The evidence of the sources used by Matthew and Luke. (2) The additions made to the original material by Matthew and Luke. (3) The fourth gospel. (4) The fragments of the Gospel to the Hebrews: extra-canonical sayings of Jesus preserved by the Fathers and the Oxyrhynchus Logia; possible gleams of truth and fact, which may be obtained from the heretical and apocryphal gospels, though these as a rule are too unreliable to possess much value for us. Of course, the two earlier strata are of most value, and the first would be of supreme importance if only we were sure of our ground in the task of reconstructing it.

(b) Besides the evidence of the gospel narrative, we can obtain much valuable material from the faith of the primitive church. We can be certain that in its earliest form, at any rate, that faith must have been derived from the teaching of Jesus himself. Of course it is not always easy to reconstruct the faith of the early church. The epistles of St Paul do not help us much till after the year 50—though even at that date we must remember that their statements about the Christian facts are considerably earlier, and therefore more important, than the narrative in the synoptics. For the period 30–50 we depend chiefly upon the statements in Acts, and these are scanty at the best. But there is, at any rate, one important point which may be obtained from this set of data. We are enabled to realise the significance of the Resurrection of Jesus. The Resurrection is only the postscript to the gospels: in the faith of the early church it is the central fact around which everything else seems to revolve. (c) Another

method of supplementing the data in the synoptic gospels is to take the common elements which we find in the different types of theology in the New Testament. We may be sure that these common elements, which belong to all the types, reach back to a very primitive period, and afford us therefore a criterion for discovering the beliefs which were current in primitive Christianity, and which we have every reason for believing to have come from Jesus himself.

Our difficulty in using our documents is this. If we were dealing with an ordinary personality, the synoptic gospels (or rather their sources) ought to be our chief, if not our exclusive, court of appeal, and we should probably feel justified in ignoring the supernatural elements which they contain, because we should have to measure the statements by the standards of ordinary human possibility. But if Jesus was what the New Testament represents him to be, then the ordinary canons of historical criticism break down, for we have now to measure not by human but divine standards, and obviously the superhuman elements in the gospels, which could not be accepted as true if Jesus were only a human prophet, become not only possible, but even probable, if he is recognised as the Divine Son of God.

We may now attempt to set forth the main events in the life of Jesus.

Birth and Early Life.—There is no doubt that Jesus was the son of a Jewish mother, and that he was born probably at Bethlehem, and lived for the early part of his life in Nazareth. He had at any rate four brothers and some sisters (Matt. xiii. 55, 56), and the New Testament lends no support to the later tradition of the church that these were either half-brothers or cousins.

Our second stratum of evidence gives in both Matthew and Luke the story of the supernatural birth. There is much debate among modern scholars as to whether any reliance should be placed on this account of the Virgin Birth. It is pointed out on the one side (a) that the earliest stratum of evidence knows nothing at all about this story, and that St Mark's account of the Baptism (i. 9, 10) seems to imply that it was only at that point that Jesus became the Son of God. (b) That there is no corroboration of the story in the rest of the New Testament. The fourth gospel is silent on the point, unless, indeed, a variant reading in i. 13, which has the support of some of the versions, be accepted. The epistles must be regarded as neutral, since it is impossible for us to say for certain what is or is not implied in the phrase 'born of a woman' in Gal. iv. 4. (c) Numerous parallels of the growth of similar legends are adduced from other religions and mythologies.

On the other side it is argued (a) that the scantiness of the evidence is natural under the circumstances. By the very nature of the case the only testimony that could be of any material value would be that of Mary, and there is every likelihood that the narrative in Luke came from her. (b) If we reject every narrative that is derived from the second stratum, we should have to give up the parables of the prodigal son and the good Samaritan and all the rest of the record which cannot be traced back to the original sources. (c) Some explanation must be found for the personality of Jesus, and especially for the attribute of sinlessness which is almost unanimously ascribed to him, and the narrative of the Virgin Birth fulfils this function more adequately than any other theory.

Jesus seems to have lived the early part of his life in humble circumstances. He worked as a carpenter, and if the tradition that Joseph died while he was still young is to be credited, he was

probably the main support of his family. We have no accurate means of ascertaining the process of his spiritual development, but the evidence seems to point to the fact that he nourished his soul on the Old Testament and was well versed in contemporary apocalyptic literature.

Commencement of the Public Ministry.—The chronology of the life of Jesus cannot be fixed with anything like precision, but we can be tolerably certain that he did not enter upon his public work till he was nearly thirty years old. At the outset he associated himself with the mission of John the Baptist, and accepted baptism at his hands. It seems to have been at the baptism that he realised first of all the divine call. But even then he seems to have spent some months in silence, fighting the temptations which beset him in determining the form which his ministry was to assume. Should he take up the rôle of a popular Messiah, and make the conventional appeal to the patriotism of his people? Or should he strive to pursue his deeper convictions and strike at the heart of the sins of the nation and the formalism which characterised its religion? Should he seek to become a national hero, or should he preach repentance and try to turn men back to God? Should he rely on spiritual or political forces? Should he take the broad road of popularity, or pursue the narrow path that entailed poverty and suffering and would probably end in martyrdom? These were the issues which were fought out by Jesus in that inward struggle during the temptations in the wilderness. It was not till the imprisonment of John the Baptist that Jesus emerged from his solitude and entered on his public ministry. We cannot be sure as to the exact place where he commenced his work. Mark locates the preaching of the first sermon at Capernaum, Luke at Nazareth; the fourth gospel makes Jesus begin his work at Jerusalem. Most likely he started in Galilee, but whether at Capernaum or Nazareth we cannot determine. It was at a synagogue service. Jesus suddenly rose from the audience, and having read a passage from the prophet Isaiah, began to speak with such effect that the listeners began to cry out, 'What is this? A new doctrine! He speaks with authority.' There is no record of the sermon. We only know that Jesus quoted the words of Isaiah, 'The spirit of the Lord is upon me, because the Lord hath anointed me to preach deliverance to the captive and the opening of the prison doors to them that are bound.' The general tenor of his message, however, was a call to repentance. Jesus took up the work of John the Baptist, and began his work with the old appeal, 'Repent, for the Kingdom of Heaven is at hand.'

The Period of Popularity.—Jesus seems to have leapt by a single bound into instantaneous popularity. He won all hearts at first by his preaching and by his wonderful works of healing. The verdict of those who listened to his preaching was summed up in the words: 'Never man spake like this man,' 'He teaches with authority, and not as the scribes.' Miracle followed upon miracle in rapid succession. 'They brought unto him,' says Mark, 'all that were sick, and them that were possessed by devils, . . . and he healed many that were sick with divers diseases, and cast out many devils' (i. 32-34). He made a tour through all the synagogues of Galilee, and everywhere his words and his works created wonder and astonishment. So great did his fame become that he was forced to seek refuge in the solitudes of the wilderness. In the opening stages of his ministry he seems to have felt that preaching was the mission of his life. 'Let us go into the next towns,' he said on one occasion, 'that I may preach there also, for to this end came I forth' (Mark, i. 38). It is doubtful whether at first he

had any suspicion of the fate which finally awaited him in Jerusalem.

The Beginnings of Criticism.—How long the period of popularity lasted it is not possible to say, but it is certain that Jesus aroused the hostility of the religious leaders of the time before his ministry had proceeded very far. The following charges were brought against him by the scribes and Pharisees: (a) Blasphemy, because he had told the paralytic whom he healed that his sins were forgiven. 'He blasphemeth; who can forgive sins but one, even God?' (Mark, ii. 7). (b) Consorting with publicans and sinners. This charge was levelled at Jesus because he sought out the worst sinners of the time, and even went so far as to eat and drink with them. (c) The fact that Jesus did not insist upon the duty of fasting. (d) His attitude to the conventional rules of Sabbath observance. These criticisms convinced Jesus that it was not possible to put the new wine of the Gospel into the old wine-skins of Judaism, and that a breach with the conventional religion of the time was inevitable.

The Sphere of the Ministry.—When did Jesus begin his work in Jerusalem? The impression which we obtain from reading the synoptic narrative is that the only official visit which Jesus paid to Jerusalem in connection with his public ministry took place at the close of his career. There is no reference to work in Jerusalem till the end of the narrative. His preaching is confined to the synagogues of Galilee and the north. The fourth gospel, on the other hand, definitely brings Jesus to Jerusalem on a number of occasions, and makes it the scene of a considerable part of his ministry. It is difficult to believe that the fourth gospel can be completely at fault in this matter, and, when we look beneath the surface of the synoptic narrative, there are some important indications which seem to bear out the statements in St John. In Luke, iv. 44, for instance, if we accept the new reading, which, according to the testimony of the best MSS., substitutes Judea for Galilee, we have a definite and categorical statement that quite early in his ministry Jesus was preaching in the synagogues of Judea, and this must surely have involved a visit to Jerusalem. The lament which Jesus uttered over the city as he came within sight of it on the occasion of his last visit, 'O Jerusalem, Jerusalem, . . . how often would I have gathered thee' (Matt. xxiii. 37), must surely imply earlier visits. If the fourth gospel is correct in asserting that Mary and Martha lived at Bethany, the paragraph in Luke, x. 38-42, assumes that Jesus was within a few miles of the city midway through his ministry. If this be so, it is perfectly obvious that the synoptic narrative is merely a fragment of the life of Jesus, and that it omits a very important section of the story. Many attempts have been made to combine the Johannine and synoptic narratives, but the data are far too few and too insecure to enable us to reconstruct the march of events in the life of Jesus. We do not know how to piece the two accounts together, and every such arrangement must be more or less hypothetical.

The Duration of the Ministry.—How long did the ministry of Jesus last? Once again there seems to be a conflict between the synoptics and the fourth gospel. The synoptics have few date points, and it would be quite possible to argue that the events which they record fall within the scope of a single year. In the fourth gospel, on the other hand, there are considerable chronological data, and these imply that the ministry must have extended well into the third year. One Passover a few months after Jesus had commenced his work is mentioned in ii. 23, a second in vi. 4, and a third at the time of the Crucifixion. Another important feast is

mentioned in v. 1, which, however, is probably the Feast of Purim. The fact that the statements in the fourth gospel are explicit, while the argument from the synoptics is negative rather than positive, creates a presumption in favour of its reckoning. Hort, however, on the ground of some patristic evidence, which seems to favour a single year as the duration of the public ministry of Jesus, proposes to reduce the Johannine estimate to the level of the synoptic by regarding the term Passover in vi. 4 as a later addition to the text. In this suggestion, however, he has received very little support from scholars in general, and we may regard the estimate of a two and a half years' ministry as the generally accepted opinion of modern scholarship.

The Teaching of Jesus.—According to the version in Matthew, Jesus commenced his teaching ministry by giving a public manifesto, which is embodied in the Sermon on the Mount. There is considerable doubt, however, whether the Sermon on the Mount was ever delivered in the form in which it stands in the first gospel. In the first place, it is a habit of the writer of Matthew to group his incidents—he has chapters of miracles, chapters of parables, and chapters of teaching. In the second place, when we turn to the parallel account in Luke, we find quite a different arrangement. Roughly speaking, about a third of Matthew's Sermon on the Mount is found in Luke's Sermon on the Plain, about a third is found scattered up and down other parts of Luke's gospel and placed in a different historical context, and the remaining third is not found in Luke at all. Matthew and Luke cannot both be right in the arrangement of their material, and on the whole the balance of probability rests with Luke. One other preliminary problem arises before we come to consider the chief elements in the teaching of Jesus. What was the purpose of the parables? Two diametrically opposed suggestions are made in the synoptics. Mark (iv. 11-13) states that the object of Christ's parabolic teaching was to conceal rather than to reveal the truth, while Matthew, on the other hand (xiii. 13-17), says that its purpose was to reveal and not conceal. Luke (viii. 10) is in agreement with Mark. Both statements are, curiously enough, based on Isa. vi. 9, 10, but Mark and Luke use the Hebrew version of the passage, Matthew the softened version of the Septuagint. The character of the parables, however, seems to bear out Matthew's account of their purpose rather than that which is given by Mark and Luke.

We can now turn to the most prominent points in the teaching:

(a) *The Conception of God.*—The teaching of Jesus contains a new revelation of God. Jewish theology had made God remote and distant from man. If he was not the great Unknowable, he was, at any rate in current ritual, the great Unapproachable, save through the medium of intercessors and mediators. The ideas of Love and Fatherhood were indeed present in some degree in Jewish thought, but they were at the circumference of theology, and not at its centre. Jesus brought them from the circumference to the centre, and made them the governing principles of his new revelation. God to Jesus was essentially and primarily a Father—a Father who loves his children to the uttermost, provides for all their needs, is always ready to forgive their sins, and welcome them into the Kingdom of Heaven. Mercy and compassion are his supreme attributes, but, nevertheless, he displays a stern severity towards the obdurate sinner, and dooms him 'to the outer darkness, where there shall be weeping and gnashing of teeth.'

(b) The central idea in the teaching of Jesus is the conception of the *Kingdom of Heaven*, but

it is not always easy to discover what Jesus meant when he made use of this expression. Some scholars have maintained that the phrase signifies 'the rule of God' in the hearts of men, or, in other words, a great spiritual experience of his presence and lordship over our lives. Others have identified the Kingdom with the church. Others, again, hold that Jesus uses the phrase with the meaning which it bore in Jewish apocalyptic—i.e. the Kingdom of God which is to be set up at the end of history by a divine intervention. Others, again, think that he is looking forward to a time when the whole of human civilisation will be dominated by the rule of God, and when God's will will be done on earth as it is in heaven. Probably the last view is right, and what Jesus has in mind in using the term is the absolute subjection of the world to the kingship of God. Sometimes Jesus speaks as if the Kingdom were already present; at other times he regards it as belonging to the future. It is possible that Dr Charles is right in the suggestion which he makes that the idea that the Kingdom has already come belongs to the earlier phase of the teaching of Jesus, and it was his disappointment at the comparative failure of his work that led him at the end of his life into the region of apocalyptic, and made him feel that the Kingdom would only be realised by a divine intervention and the inbreak of God into human history.

(c) *The Teaching with Regard to Sin.*—It is often asserted that Jesus did not 'worry much about men's sins,' and if by this statement it is meant that Jesus did not say much about sin in the abstract, there is undoubtedly some truth in the assertion. But if the assumption is that Jesus displayed an indifference to sinful actions, and that his attitude was facile and easy-going in reference to them, the statement is absolutely false. As Beyschlag puts it, 'Jesus spoke little of sin in general, and proposed no doctrine of it, least of all a doctrine of its origin. He presupposed it as a fact, and showed its evil nature by the penalties he attached to it.' The keynote of his preaching is the word 'repent.' The true attitude of man to God is represented by the humble prayer of one who said, 'God, be merciful to me a sinner.' The repentance of a solitary sinner brings joy to the angels of heaven. Even sins of omission are punished in the severest way. What could be more stern than the doom pronounced upon the man who hid his talent in the earth, 'Cast ye out the unprofitable servant into the outer darkness'?

(d) *The new moral ideal* of Jesus is one of the most striking points in his teaching. Of course, this moral ideal has its points of affinity with the highest and best elements in preceding ethical thought the wide world over. But though parallels can be found to aspects of this ideal in the Old Testament, in Jewish apocalyptic literature, in Greek philosophy, in the Vedas of India, and the Analects of Confucius and elsewhere, taken in its totality it is unique and far superior to the highest teaching of the sages. It is impossible to reduce this ideal to a formula or even to describe it in brief terms. It is a new spirit rather than a new code of laws, a new attitude of soul rather than a new expression of duty. Among its most important characteristics may be noted (a) its inwardness. Virtue dwells not merely in the external act, but in the thought and motive which prompt it. It is the inner intention that determines the value of a deed. Purity of heart is the chief consideration, because out of the heart flow the chief issues of life. (b) Its universal application. In earlier codes of ethics a man's duty only extended to his equals. A Greek, for instance, had no responsibility to those who were not of his own race or even to his

slaves. Jesus, however, gave a universal sweep to his ethical teaching. The parable of the Good Samaritan shows conclusively that no racial limitations can be tolerated in the answer which is given to the question, Who is my neighbour? No one, not even a man of alien race, is outside the pale of Christian duty. (c) Jesus emphasised virtues which in other types of moral philosophy were held in low esteem. He laid the greatest stress, for instance, on humility and lowliness of mind and meekness and gentleness. (d) To Jesus, love lay at the base of all worthy action. If the teaching of Jesus were summed up in a single phrase, it would have to be in the words which he himself used, 'Thou shalt love the Lord thy God with all thy heart . . . and thy neighbour as thyself.' (e) Jesus constantly inculcated the duty of self-sacrifice. The man who seeks to save his life always loses it; the man who is willing to lose his life always finds it. (f) Jesus always insisted upon the connection between ethics and religion. The two were inseparable. Every action is not merely an action towards man, but an action towards God as well. God is always present as the third party to every human transaction: 'Inasmuch as ye did it to one of the least of these my little ones, ye did it unto me.'

(e) *The Eschatology of Jesus.*—There is no question as to the reality of the faith of Jesus in the future life, though it is only in the fourth gospel that the most explicit statements on the subject are found. More doubt arises, however, as to his teaching with regard to the punishment of the wicked. Different scholars have extracted from the gospels support for such different theories as eternal punishment, universal restoration, the annihilation of the wicked. (For a full discussion of this subject, see article HELL.) One point in his teaching which has been the storm-centre of recent debate is the belief, which he expressed on several important occasions, in the Parousia, or his own speedy return to the world after the Resurrection. Some scholars (e.g. Wellhausen and E. Haupt) have maintained that the Parousia utterances are a later addition to the narrative, and reflect the eschatology of the early church and not that of Jesus himself. Others regard them as due to the influence of current Jewish ideas upon his own mind. Others, again, treat them as metaphorical or poetical expressions, and say that they were intended to teach in parabolic form his disciples to believe that he would be eternally present in the history of the church. None of these theories, however, seems to meet the facts. The utterances of Jesus on this subject are too well authenticated to be lightly set aside. They are too integral to his teaching to be regarded as Jewish excrescences. They are too definite and precise to admit of their being interpreted as poetry. The significance of these utterances lies in the fact that though Jesus took over from Jewish thought much of its apocalyptic terminology, he made himself the hero of the apocalyptic drama and put himself in the centre of the apocalyptic picture. Nor is it a detraction to the value of these utterances that the prophecy was never fulfilled in the sense, at any rate, in which it was uttered.

(f) *The Teaching about Himself and the Meaning of His Death.*—It is not easy to determine what Jesus meant exactly by his own account of himself and his work. He spoke of himself constantly as the Son of Man, but the connotation of the phrase is uncertain. There has been much debate as to whether in the use of this expression Jesus intended to emphasise his Messiahship or the universal nature of his humanity. Jesus accepted the title Messiah, though not in the conventional sense of the term. The clearest and most unam-

biguous statement of Jesus, according to the synoptics, is found in Matt. xi. 27: 'All things are delivered unto me of my Father, and no man knoweth the Son save the Father; neither doth any man know the Father save the Son and he to whomsoever the Son willeth to reveal him.' It is perfectly clear from this passage, which almost sums up the essential teaching of the fourth gospel, that Jesus claimed a unique relationship to God, and maintained that he was giving to the world a unique revelation of God. With regard to his death, there is but little trace of any reference to the tragic ending of his life previous to Peter's acknowledgment of his Messiahship at Caesarea Philippi and the Transfiguration, but after those events Jesus became increasingly specific in his references to the Cross. There are only two instances in the synoptics where he seems to attach any theological value to his death—i.e. the phrase in Mark x. 45, 'The Son of Man came . . . to give his life a ransom for many;' and the words of the communion service (Matt. xxvi. 28), 'This is my blood of the covenant, which is shed for many.' Surprise is often expressed that Jesus says so little about the import of his death, while most of the other New Testament books lay great stress upon it as an act of atonement or reconciliation. But we should remember that it was only at the end of his life that Jesus was able to make his disciples understand at all the necessity for his death, and that if his words are not as clear as the language of St Paul and the writer of the Epistle to the Hebrews, his actions are quite decisive upon the point: 'He set his face to go up to Jerusalem.' He allowed nothing to deter him from this purpose. He knew the fate that must inevitably fall upon him, and yet he went bravely to meet it, knowing that the salvation of the world could come only from the Cross, and no prolongation of his work as a teacher could prove effectual in the task of redeeming the world.

The Miracles of Jesus.—The gospels record many stories of miracles performed by Jesus during his ministry. Most of these are miracles of healing, but a few of them are nature miracles—e.g. the calming of the storm on the sea of Galilee, the act of walking on the waves, &c. In the synoptics these miracles are described as 'works' or 'powers.' The fourth gospel treats them as 'signs' or 'proofs,' e.g. 'This beginning of miracles (or signs) did Jesus in Cana of Galilee, and manifested forth his glory.' Other New Testament writers speak of them as 'marvels.' It is significant that at first they were regarded as 'works' or 'powers,' and that Jesus always refused when he was asked to work a sign or marvel. The miracles of Jesus were, therefore, never a thaumaturgic display; they were the outflow of pity and compassion, deeds of mercy and of love. We cannot to-day, like the author of the fourth gospel and Paley in his *Christian Evidences*, use them as proofs of the divinity of Christ, because the miracles are more of a problem to us than Christ himself. We rather argue from Christ to the miracles. Given the personality of Christ, miracles seem naturally to follow, because what is supernatural to us was natural to him. And there is a growing tendency to recognise the fact of the miracles as undeniable. 'Much that was formerly rejected,' says Harnack, 'has been re-established on a close investigation and in the light of comprehensive experience. Who in these days, for example, could make such short work of the miraculous cures in the gospels as was the custom of scholars formerly?' Some of the gospel accounts of these miracles, however, are open to question, since illness is almost always connected with demon-possession, and every cure is regarded as an exorcism. As Sanday remarks,

'we may be sure that if the miracles of the first century had been wrought before trained spectators of the nineteenth, the version of them would have been different.' Let us take, for instance, the account in the synoptics of the cure of the Gadarene demoniac by exorcising the evil spirits and driving them into a herd of swine. This narrative has always been a difficulty, and on one occasion it was the subject of a famous controversy between Huxley and Gladstone. The germ of fact, on which the narrative in the gospels is based, is probably as follows: Jesus is accosted by an epileptic—a man of violent habits—who begs him to heal him. Jesus proceeds to work the cure. In the course of the work of healing the epileptic utters a fearful shriek, which so terrifies a herd of swine feeding near at hand that they rush panic-stricken over the cliff. We have abundant evidence to prove the terrifying effects on animals produced by the shriek of an epileptic. (For further discussion of the miraculous elements in the gospels, see article MIRACLE.)

The Final Journey to Jerusalem.—It is in St Luke that the full story of the journey to Jerusalem is told. The narrative commences in ix. 51, where we are told that 'Jesus stedfastly set his face to go up to Jerusalem,' but it is only in xix. 41 that the goal is reached. Throughout the record of the journey we note the rising tide of opposition to Jesus. The same accusations are brought against him as in the earlier period, but in an accentuated form. It is obvious that the controversy between Jesus and his opponents is coming to a head. We are told, in xiii. 31, that Herod was seeking the life of Jesus, and the rupture between Jesus and the Pharisees is constantly being intensified. It was during this journey that Jesus devoted himself to the training of the disciples. It may almost be said that during this part of his career Jesus lived to make twelve men that he might leave these twelve men to carry on his work after the Crucifixion.

The Crucifixion.—The visit to Jerusalem proved fatal to Jesus, as he had anticipated. Commencing with a popular triumph, it ended in the tragedy on Calvary. In the narrative of the last week of Jesus on earth the canvas of history is crowded with events. Each of the evangelists gives a full record of the dramatic story. It is not easy to piece together all the details, but the substance of the narrative is beyond all question. The chief actors were the Pharisees; the Sadducees who now appear as bitter opponents of Jesus; Judas, who according to all the accounts made it possible for the arrest to be made by his act of betrayal; Caiaphas, who took the initiative in securing his condemnation; and Pilate, who after many tergiversations finally gave his consent for the sentence passed on Jesus by the Sanhedrin to be carried out. The whole narrative can bear only one interpretation, i.e. that the condemnation of Jesus was one of the greatest travesties of justice known to history.

The Resurrection of Jesus.—The account of the Resurrection also occupies an important place in all four gospels. Unfortunately the original ending of Mark has been lost, and the present conclusion of the gospel is undoubtedly the work of a later writer. This, however, is much less of a loss than it would otherwise have been, because we have an earlier narrative preserved by Paul in 1 Corinthians, xv. 5-8. According to this record Jesus appeared after his Resurrection to Peter, then to the twelve, then to five hundred brethren, then to James, and finally to Paul himself, as 'to one born out of due time.' There can be no reasonable doubt as to the authenticity of this passage in 1 Corinthians. It was written in 57-58 at the

latest, possibly five years earlier still. It represents the unanimous opinion of the Christian church at the time, and it carries us back to the time of the conversion of St Paul, because it is quite certain that it was the conviction of the reality of the Resurrection that was the foremost factor in leading Paul to accept Christianity. The Corinthian passage, therefore, proves that the fact of the Resurrection was accepted by the church as early as 35 at any rate, and so corroborates the picture drawn in the Acts of the Apostles. The narrative of the history of the first decade of the Christian church falls to pieces and becomes inexplicable unless we assume the historicity of the Resurrection. But though the truth of the record is not nearly so much challenged to-day as it was a generation or two ago, opinion is very sharply divided as to whether the appearances of Jesus after the Resurrection were external, physical, and objective, or whether they were internal and spiritual.

The best books giving the history of modern research are: Schweitzer, *The Quest of the Historical Jesus*; Weinel, *Jesus in the Nineteenth Century*; and Sanday, *The Life of Christ in Recent Research*. The best modern lives of Jesus are: Sanday, *Outline of the Life of Jesus*; Edersheim, *Life and Times of Jesus the Messiah*; Oscar Holtzmann, *The Life of Jesus*; Farrar, *Life of Christ*; T. R. Glover, *The Jesus of History*; Headlam, *Life of Jesus*; Papini, *The Story of Christ*. See also Foakes-Jackson and Lake, *Beginnings of Christianity*, vol. i. The best books dealing with the teaching of Jesus are: Bruce, *The Kingdom of God and The Training of the Twelve*; Wendt, *The Teaching of Jesus*; Stevens, *The Teaching of Jesus*; Moffatt, *The Theology of the Gospels*; Montefiore, *The Religious Teaching of Jesus*; E. F. Scott, *The Kingdom and the Messiah*; and see article by H. G. Wood in *Peake's Commentary on the Bible*. On the historicity of Jesus: Conybeare, *The Historical Christ*; Thorburn, *The Mythical Interpretation of the Gospels*. On the miracles: Bruce, *The Miraculous Elements in the Gospels*; Mozley, *Lectures on Miracles*; Illingworth, *The Gospel Miracles*; Headlam, *The Miracles of the New Testament*. On the eschatological problem: Loisy, *L'Evangile et l'Eglise*; Tyrrell, *Christianity at the Cross Roads*; Von Dobschütz, *The Eschatology of the Gospels*; L. Jackson, *The Eschatology of Jesus*; article by H. T. Andrews on *The Significance of the Eschatological Utterances of Jesus*, in *London Theological Studies*.

Jet is a mineralised vegetable product; in some cases it is merely a dense variety of lignite, in others it appears to represent bituminous products which have collected in cavities in rocks. Whitby jet contains about 37½ per cent. of volatile matter. Jet has a resinous lustre and a conchoidal fracture. The harder varieties take on a high polish, and are used for making ornamental objects. It is electrical when rubbed; hence it has been called 'black amber' by the Prussian amber-diggers. It takes its name from Gagas or Gages in Asia Minor, where, according to Pliny, the substance was obtained. Its name was afterwards corrupted into Gagat, the modern German name, and jet.

Of substances used for trinkets and personal ornament, apart from metals, jet appears to be one of the most ancient. At numerous places throughout Great Britain necklaces, beads, buttons, and other small objects of jet have been discovered, showing that it had been used in the early bronze period. Probably at that remote time it was obtained from the Yorkshire coast about Whitby, whence the principal supply and the finest quality anywhere obtained continues to come. The jet occurs at Whitby in irregular interbedded patches in the Upper Lias shales, two kinds, hard and soft, being found; but only the hard is of value for ornaments. The industry there was an important one in the seventies, but has declined. It is also worked in France in the department of Aude, where it is formed into rosary

beads, crosses, and other trinkets. Spain also supplies fine jet, which, like that of the French workings, is found in irregular veins in the lower marls of the Cretaceous series, corresponding with the Sussex Gault. The Spanish jet is found at Villaviciosa, in the province of the Asturias, and is principally manufactured at Oviedo. As a material for mourning ornaments jet is admirably adapted, and for that purpose is largely used. Imitations of jet ornaments are made in the hardened india-rubber called Vulcanite or Ebonite, and in glass.

Jeton, a round, flat piece of metal, ivory, &c., formerly used for counting, or as counters at play, and also as a check given to members of a society passing in to its meetings.

Jetsam, JETTISON. See FLOTSAM.

Jeunesse Dorée ('gilded youth'), a party name given to those young men of Paris who, during the French Revolution, struggled to bring about the reaction or counter-revolution after Robespierre's fall (27th July 1794). Other nicknames bestowed upon the same party were *Muscadins* ('scented darlings') and *Petits-Maitres* ('elegants'). The term *jeunesse dorée* is still in use to designate young men about town, who always go elegantly dressed, have the air of spending money, and live a butterfly life of enjoyment and pleasure.

Jevons, WILLIAM STANLEY, born in Liverpool in 1835, was educated there and at University College, London, and from 1854 to 1859 held a position in the mint at Sydney. In the London M.A. examinations in 1862 he took the gold medal in philosophy; in 1866 he was appointed professor of Logic and Mental Philosophy, and of Political Economy, at Owens College, Manchester; and in 1876-81 he was professor of Political Economy at University College, London. He was elected F.R.S. in 1872, and received the degree of LL.D. from Edinburgh in 1876. On 13th August 1882 he was drowned whilst bathing at Bexhill. Jevons was the first to popularise the mathematical methods of Boole (q.v.), and so to bring symbolic logic within the capacity of beginners. Among his works in this field are his *Elementary Lessons in Logic* (1870), a very popular text-book; *The Principles of Science* (1874), perhaps his most important work; a collection of useful *Studies in Deductive Logic* (1880); and *Pure Logic, and other Minor Works* (1890). To political economy he contributed, besides a primer and several pamphlets, and a work on *The Coal Question* (1865), which led to the appointment of a Royal Commission, his valuable *Theory of Political Economy* (1871), in which the conception of 'final utility' was first distinctly formulated, and *The Principles of Economics* (a fragment; 1905). See his *Letters and Journals*, edited by his wife (1886).

Jew, WANDERING. See WANDERING JEW.

Jewel, JOHN, one of the fathers of English Protestantism, was born at Berryarbor, near Ilfracombe, in 1522, and was educated at Barnstaple school, and afterwards at Merton and Corpus Christi Colleges, Oxford. He was admitted B.A. in 1540, and must early have imbibed Reformed doctrines, as he was closely intimate with Peter Martyr during his visit to Oxford. Soon after the accession of Mary he went abroad for safety's sake, visiting Frankfurt and Strasburg, and returned on the accession of Elizabeth, by whom he was almost immediately appointed Bishop of Salisbury. His great controversial ability soon made him one of the foremost churchmen of his age, and indeed his famous *Apologia Ecclesie Anglicanæ* (1562) retains its value. He died 22d September 1571.

A collected edition of his works was published in folio in 1609. More recent editions are those by the Rev.

John Ayre in the Parker Society (4 vols. 1845-50), and by the Rev. Dr R. W. Jelf (Oxford, 8 vols. 1847-48). An early life is reprinted in Wordsworth's *Ecclesiastical Biography*. See also the Life by C. W. Le Bas (1835).

Jewellery, or JEWELRY (from Old French *jouel*, a diminutive of *joie*; Ital. *gioja*, 'joy'; Lat. *gaudia*), embraces primarily articles intended for personal decoration, made of precious metals, which may be enriched with stones or enamels. But objects not intended for personal use, such as caskets, when decorated with precious stones are said to be jewelled, and the term jewel has a further restricted signification when it is applied to one of the insignia of the knightly orders. The term precious metals is of variable significance. Of late platinum has been used for jewellery. Before the Iron Age began iron was a precious metal, and was made into beads and finger-rings in Egypt, Crete, Italy, and elsewhere. Popularly, there is much confusion between the terms gem and jewel; the former belongs especially to engraved stones (see GEM). It is a doctrine widely held by anthropologists that shells, teeth, pearls, amber, gold, and such substances were sought and worn by prehistoric man for the sake of their supposed life-giving powers (see MAGIC). No doubt this motive was early reinforced by love of personal ornamentation. And as on these adornments the highest art and skill at the command of any people was always lavished, they afford some measure of the condition of the handicrafts and of the artistic development of the people and the period to which they belong. Further, in the days when banking and money-lending were not a factor in commerce, the accumulation of jewellery formed one of the most convenient of methods for the storing of realised wealth. It is so in India at the present day. See RING-MONEY.

Before the use of metals was known, jewellery, if it can be so termed, consisted of carved beads and fragments of such bright substances as were at the command of prehistoric man. The earliest gold ornaments would be the native pellets of the metal as found, and when mankind possessed no mechanical resources beyond rude hammers of stone for beating out these pellets, the possibilities of decorative treatment of gold were very limited. The ability to melt metals and so to obtain masses of large size to work upon implies a very advanced knowledge, to which, however, artificers must have attained at a very early period. Among the numerous finds of gold jewellery of prehistoric times there are many specimens which show that the early artificers possessed considerable command over their material in hammering out plates to uniform thickness, drawing or beating the metal into wire, and plaiting and twisting it into torques, armillæ, rings, and other forms of ornament. In these earliest gold ornaments there is no attempt at decorative treatment other than what could be produced by the hammer; and it is only by degrees that simple efforts at chasing, engraving, and embossing marked their appearance. A gold bead found at Tell el-'Obeid is inscribed with the name of A-an-ni-pad-da, king of Ur (c. 4000 B.C.). The most archaic gold ornaments discovered by Dr Schliemann at Hissarlik are treated with the hammer alone; the later gold ornaments of Mycenæ are of a much more developed character, showing a knowledge of chasing and embossing. Fortunately the tombs of the dead, and hoards which have apparently been hid to escape the ravages of enemies, have been the means of preserving to our days a number of examples of jewellery of all times and all peoples sufficient to illustrate the nature of their ornament and the style of jewellery they wore. Thus from ancient Egyptian jewels we learn that the civilised people of the

Nile valley even in very early times had greatly improved on the arts of the bronze period. For we find the Egyptian artificers could engrave, chase, solder, enrich with enamel, and set precious stones in their jewellery—they were in fact complete masters of the most important processes of the modern jeweller. In fact the jewellery and engraved gold found in the tomb of Tutankhamen (1923) equals, if indeed it does not excel, anything of the kind attempted since those days. The jewellery of ancient Greece shows that perfection of form and purity of ornament which was only to be expected of the most highly-gifted artistic race of all times. The jewellery of the Romans was, like their art, inherited from the Greeks, and partook of their more robust but less refined character; but with the lapse of time and the influence of northern incursions it modified into Gothic forms. Contemporary with Greek art of the best period, the jewellery of the Etruscans forms the most remarkable example of fine metal-working of ancient times. The Etruscan jewellers were able to produce on the surface of their gold a rich granulated appearance, as if it were dusted over in a perfectly equal manner with gold powder, which it has long been the despair of jewellers to imitate. The cinquecento produced jeweller's work which reached its highest point in the beautiful workmanship of Benvenuto Cellini. Later many fine craftsmen were at work in France and England, and their work has come down the ages to show the beauty of their design and their very high technique. Among the finest examples of their work may be taken the jewels of knightly orders, such as the 'George' and the 'Toison d'Or,' and kingly regalia. During the Victorian age jewellery became heavy, and in many cases clumsy, but a new development has arisen, whereby extreme lightness and grace are given to jewelled work. This work is not the sole production of one man as of old, but the best of the jeweller's art of the 20th century is of a high standard of excellence. In the East, more particularly in China and Japan, the art of the ancient craftsmen survives in a commercial age, and magnificent examples of gold work and enamel are still being produced. Beauty of design and exquisite taste are blended to perfection in these works. In India a more florid type is admired, where gold (often finely engraved) is set with many coloured stones. Again, no other race of jewellers can with so small an amount of gold produce filigree work of such excellence. Traditional skill and ancient forms are also perpetuated in the peasant jewellery of the various European communities, which yet show in their purity the styles, combinations, and methods of working in use before the harsh mechanical forms of modern cheap jewellery came in to corrupt taste and supplant simple arts. In the same way the jewellery of the Scandinavian peoples shows vigour and individuality of character.

The distinction between jewellery of the present day and that of earlier times is found in the fundamental fact that the old work is the creation of the craftsman, while the modern jewel is the product of a manufacturer who adopts all labour-saving machines and appliances for the economical finishing of his wares. The lowest class of jewellery is so entirely devoid of taste and artistic significance that it hardly deserves the name. Many schools, however, are in existence over the world where art is considered of more value than money, and work of the highest type, worthy even of being compared with the work of the great masters of the past, is being produced.

Jews (corrupted from *Yehudim*), the name given, since the Babylonish captivity, to the descendants of the patriarch Abraham, who, about the year 2000 B.C.,¹ emigrated from Mesopotamia, on the east side of the Euphrates, to Canaan or Palestine. They were originally called Hebrews (see HEBREW LANGUAGE). In consequence of a famine in Canaan, Jacob, on the invitation of his son Joseph, who had become chief minister of the king of Egypt, went down thither with all his family, which numbered seventy 'souls,' and obtained from Pharaoh permission to settle in the land of Goshen. Here the Hebrews resided, according to Exod. xii. 40, 430 years. According to the genealogical table of the Levites, in Exod. vi. 16-25, however, their sojourn would not have lasted longer than 210 or 215 years; most of the commentators, therefore, take, with Josephus, the 430 years to indicate the period from Abraham to the Exodus (cf. Galat. iii. 17). During the lifetime of Joseph, and probably for some generations afterwards, the Hebrews were well treated, and prospered; but a new dynasty—probably the 19th—arose, and they were reduced to relentless slavery. A deliverer at length appeared in the person of Moses (q.v.). The circumstances of the exodus (about 1320 B.C.)²—such as the ten plagues and the crossing of the Red Sea—are a source of continual controversy between the Rationalistic and the Supra-naturalistic schools of biblical criticism; but the fact of an exodus would be disputed only by the wildest scepticism.

The wandering in the wilderness of the Sinaitic peninsula is said to have lasted forty years, though a record of the events of two years only has been preserved. These, however, are obviously the most important, as they contain an elaborate account of the giving of the Law (Exod. xix. *et seq.*), which is represented as a direct revelation made to Moses by Jehovah Himself, who descended upon Mount Sinai in fire, amid the roar of thunders and the quaking of hills. The antiquity, however, of the priestly or ecclesiastical portions of the Pentateuch is keenly disputed by a rapidly-growing majority of modern scholars, even so orthodox an authority as Fr. Delitzsch having become a convert to their views shortly before his death. The modern school seek to show the probability of such passages having been composed and inserted subsequent to the great organisation of the priesthood by David; and, in proof of this point, among other evidences, to the Book of Judges (q.v.), which narrates the history of the Hebrews some 200 years after the conquest of Canaan, and which yet contains scarcely a single trace of the existence of Mosaic institutions among them. For the origin of the Law as we now have it, the development of the

¹ The dates vary; S. R. Driver (*Genesis*, xxviii. ff.) proposes 2250; the *Cambridge Anc. Hist.*, 2100; Weidner, 1950; Flinders-Petrie, 2110; his chronology is best studied in his *Egypt and Israel* (London, 1911), which should be consulted for this and for subsequent dates.

² Here again scholars differ as to date: Prof. Sayce, 1213; Prof. Breasted, c. 1230; *Cambridge Anc. Hist.*, c. 1235 or 1890 (see *loc. cit.* ii. 260 n.). See A. H. McNeill, *Exodus*, pp. 75 ff.; S. A. Cook, in *Enc. Br.*, s.v. *Exodus*, and F. J. Foakes-Jackson, *Bibl. Hist. of the Heb.*, App. B. to chap. iii.

national consciousness, and the growth of the Old Testament literature, see BIBLE. There is a growing tendency among critics to localise the giving of the Law and the various events connected with revelation at Kadesh rather than in the so-called Sinaitic peninsula.

The 'land of promise' became theirs at last (about 1274 B.C.¹), under Joshua (q.v.), the successor of Moses. Tribe after tribe was swept from its ancient territory, and for the most part either annihilated or forced to flee. Yet the whole bulk of the native inhabitants was not extirpated or expelled, nor even subdued till a much later period. The country was now divided among the Hebrew tribes. The magnificent pastoral region to the east of the Jordan was now occupied by the tribes of Reuben, Gad, and the half-tribe of Manasseh; while the land west of the Jordan was parcelled out to the remaining—Judah, Simeon, Dan, Benjamin, Ephraim, the second half-tribe of Manasseh, Issachar, Zebulun, Naphtali, and Asher. The tribe of Levi received, instead of a province, forty-eight cities scattered throughout Canaan and the tenth part of the fruits of the field, and were allowed generally to settle individually throughout the land where they chose.

After the death of Joshua (about 1254 B.C.²) the want of a chief to the young state became sadly palpable. Little regard was paid to the Mosaic institutions; the single tribes pursued their own individual interests; intermarriages with the idolatrous natives weakened the bond of union still further; and the next consequence was that the tribes were singly subdued by the surrounding nations. At this juncture there arose at intervals valiant men and women, Judges (*Shofetim*), who liberated the people from their oppressors, the Moabites, Philistines, Ammonites, Amalekites, &c. Fifteen of these are named, some of whom appear to have been contemporary with each other, and to have exercised authority in different parts of the country. This period constitutes the 'heroic' age of Hebrew history. Among these Judges the prophetess Deborah, Gideon, Jephthah, the herculean Samson, and the prophet Samuel are especially notable; the last mentioned was, in every sense of the word, the greatest Hebrew that had as yet appeared since the days of Moses. The first of the prophets, he was also the last of the republican chiefs of the confederate tribes. Wearing of their intestine feuds, harassed by the incursions of their predatory neighbours, chiefly, however, goaded by the characteristic desire 'to be like all the other nations' (1 Sam. viii. 5), the people compelled him, in his old age, to choose for them a king (1067 B.C.³).

The first who exercised regal authority was Saul, the Benjamite (1067–1055 B.C.³). But, though a distinguished warrior, and a man of royal presence, he appears not to have possessed the mind of a statesman; and his wilfulness and paroxysms of insanity finally alienated from him many of the bravest and best of his subjects. After his death on Mount Gilboa, David (q.v.), his son-in-law, was proclaimed king (1055–1015 B.C.³). This monarch was by far the greatest that ever sat on the throne of Israel. His reign, and that of his equally famous son, Solomon, are regarded as the golden time of Hebrew history. The remaining aborigines of Canaan and its borders—viz. the Philistines, Edomites, Amalekites, Moabites, &c.—were thoroughly subdued; the boundaries of the Hebrew kingdom were extended

as far as the Euphrates and the Red Sea; Jerusalem was captured, and made the capital of the conqueror; the priesthood was reorganised on a splendid scale; the arts of poetry, music, and architecture were cultivated; schools of prophecy (first established, probably, by Samuel) began to flourish; a magnificent temple for the worship of Jehovah was built in the capital; and commercial intercourse was carried on with Phœnicia, Arabia, Egypt, with India and Ceylon, and perhaps with even Sumatra, Java, and the Spice Islands. But there was a canker at the root of all this prosperity. The enormous and wasteful expenditure of Solomon forced him to lay heavy taxes on the people. His wealth did not enrich them; it rather made them poorer; and although gifted with transcendent wisdom and the most brilliant mental powers, towards the end of his life he presents the sad spectacle of a common eastern despot, voluptuous, idolatrous, occasionally even cruel, and his reign (1015–977 B.C.⁴) cannot but be regarded, both politically and financially, as a splendid failure. After his death the Hebrew monarchy, in which the germs of dissension—chiefly jealousy against the influence of Judah—had been silently growing up for many a year, split under Rehoboam into two sections (c. 930 B.C.)—the kingdom of Judah, under Rehoboam, son of Solomon, and the kingdom of Israel, under Jeroboam, the Ephraimite. The former of these countries comprised the two tribes of Judah and Benjamin, together, probably, with some Danite and Simeonite cities; the latter, the remaining ten. After nineteen kings of different dynasties, among whom Jeroboam, Ahab, Joram, Jeroboam II., Pekah may be mentioned, had reigned in Israel, few of whom succeeded to the throne otherwise than by the murder of their predecessors, the country was finally conquered by Shalmaneser IV. and Sargon, kings of Assyria, its sovereign, Hoshea, thrown into prison, the mass of the people carried away captive (722–1 B.C.) into the far east, the mountainous regions of Media, and their place supplied by Assyrian colonists. These, mingling and intermarrying with the remnant of the Israelites, formed the mixed people called Samaritans (q.v.). Among the twenty kings of the House of David who ruled over Judah, Jehoshaphat, Uzziah, Hezekiah, and Josiah distinguished themselves both by their abilities as rulers and by their zeal for the worship of Jehovah. Yet even they were, for the most part, unable to stay the idolatrous practices of the people, against which the prophets' voices even could not prevail. Other kings were, for the most part, more or less unfaithful themselves to the religion of their fathers, and unable to withstand the power of the Egyptians, Assyrians, and Babylonians, to each of whom they in turn became tributary, until at last Nebuchadnezzar⁵ captured Jerusalem (587–6 B.C.), plundered and burned the Temple, put out the eyes of King Zedekiah, and carried off the most illustrious and wealthy of the inhabitants prisoners to Babylon. The Israelites, who had been exiled 134 years before the inhabitants of Judah, never returned. What became of them has always been matter of vaguest speculation (see BABYLONISH CAPTIVITY, ANGLO-ISRAELITE THEORY, BENI-ISRAEL).

All that we know of the condition of the Hebrews during the captivity relates exclusively to the inhabitants of the kingdom of Judah. And so mild, especially during the later years, was the treatment which they received in the Babylonian empire that, when liberty was announced to the whole body of the captives, only the lowest of

¹ The *Camd. Anc. Hist.* dates the age of Sisera and the Judges as 1115 B.C.

² According to the *Camd. Anc. Hist.* this would be about 1190–80.

³ The *Camd. Anc. Hist.* dates the age of Saul (doubtfully) as 1025, and the age of David (also doubtfully) as 1010.

⁴ G. A. Smith, 970–983.

⁵ Jeremiah gives the name more correctly as *Nebuchadrezzar*: this is a fair equivalent of original *Nabû-kudur-ussur*.

the low returned, together with the Levites and Priests. The Book of Esther bears testimony to the numbers that had remained scattered over the vast empire.

The influence of this exile, however, was of a most striking and lasting nature. Babylon henceforth became, and remained up to about 1000 A.D., the 'second land of Israel'—in many respects even more highly prized than Palestine. To this brief period of the captivity must be traced many of the most important institutions of the synagogue in its wider sense. Common religious meetings, with prayer, were established; many of the Mosaic laws were re-inforced in their primitive rigour; and the body of the 'oral law' began to shape itself, however rudely, then and there. Besides, there began to grow up and unfold itself the belief in a Messiah, a Deliverer, one who should redeem the people from their bondage. The writer of the last twenty-seven chapters of Isaiah, who is usually called by modern scholars the 'Younger Isaiah,' is held to belong to this period, and expresses in glowing language the hopes of the exiles; no less do many of the Psalms belong to this time. From this period, likewise, the belief in the resurrection of the body and the immortality of the soul, as well as the notion of angels and demons, begins to enter more distinctly into the general creed.

The exile is generally computed to have lasted seventy years. This is not strictly correct; it lasted seventy years if reckoned from the capture of Jerusalem in the reign of Jehoiakim (601), but only fifty counting from the destruction of Jerusalem. When Cyrus, the Persian king, had overthrown the Babylonian kingdom (538 B.C.) he issued an edict permitting the exiles to return home; and a minute account of the circumstances attending this joyous event is given in the Books of Ezra and Nehemiah.

The foundations of the Second Temple were laid in the second year of the return, but in consequence of the interference of the Samaritans the work had to be laid aside. It was not resumed till the second year of Darius Hystaspes (520 B.C.), and was finally completed in the sixth year (516 B.C.). The waste cities were likewise rebuilt and repopled. During the long reign of Darius the Jews were blessed with a high degree of material prosperity. Under his successor, Xerxes, probably occurred the incidents recorded in the Book of Esther. In the seventh year of Artaxerxes, the successor of Xerxes, Ezra the priest, invested with high powers, headed a second migration. Thirteen years later Nehemiah, Artaxerxes' cup-bearer, but a man of Jewish family, was ordered to proceed to Jerusalem, and, aided by Ezra and others, succeeded in secretly fortifying the city, notwithstanding the continuous opposition from Samaritans, Ammonites, and Arabians. The strictest observance of the 'written law,' even of those of its parts which had been for some reason or other disregarded, was now vigorously enforced, and many 'oral ordinances' were put into practice which do not seem to have been much heard of previously. The supreme spiritual authority was vested in a society of pious and pre-eminently learned men, founded by Ezra, out of which grew the 'Great Synagogue.' The compilation and transcription of the sacred records began, periodical public readings and expoundings of the law were instituted, and the vast Targumic, as well as the so-called rabbinical literature, generally dates—in its earliest beginnings—from this point. During the life of Nehemiah the breach between the Jews and Samaritans became final, by the erection on Mount Gerizim (q.v.) of a rival temple to that at Jerusalem, and the creation of a rival priesthood.

Alexander the Great, on his way to conquer the

whole East, did not deem it necessary to storm Jerusalem. The inhabitants submitted (332 B.C.), and he even deigned to have sacrifices offered on his behalf to the national god of his new subjects,¹ a great number of whom, and of Samaritans, he carried away to Egypt, and with these Jewish captives peopled a third of his newly-founded city Alexandria. After him Ptolemy Soter, one of his generals, who had become king of Egypt, invaded Syria, took Jerusalem (320 B.C.), and carried off 100,000 of the inhabitants, whom he forced to settle chiefly in Alexandria and Cyrene. The Egyptian or Alexandrian 'Dispersion' (*Golah*)—destined to be of vast importance in the development of Judaism and Christianity—gradually spread over the whole country, from Libya to Ethiopia. The Jews enjoyed equal rights with their fellow-subjects, both Egyptian and Greek, and were admitted to the highest dignities and offices, so that many further immigrants followed of their own free will.² The freedom they enjoyed enabled them to reach, under Greek auspices, the highest eminence in science and art. To this period belongs the Greek translation of the Bible, the Septuagint (q.v.), which, in its turn, while it estranged the people more and more from the language of their fathers, gave rise to a vast pseudepigraphical and apocryphal literature—not to mention the peculiar Græco-Jewish philosophy, which sprang from a mixture of Hellenism and Orientalism.

For a hundred years Judæa itself remained under Egyptian rule. During the reigns of the first three Ptolemies it prospered; but after the accession of Ptolemy Philopator a change for the worse came over the fortunes of the Jews. After his death Antiochus III. (q.v.) of Syria incorporated Palestine with the dominions of the Seleucidæ, and treated the Jews less favourably than their Egyptian masters had done. Their fate became harder still under his son, Antiochus Epiphanes, or Epimanes ('the Madman'), who, by every means a cruel and foolhardy policy could devise, outraged the religious feelings of the nation. To force the Jews into the Greek religion, the temple at Jerusalem was dedicated to Jupiter Olympius; idol altars were built in every village, and the people constrained to offer swine daily. Some yielded, many fled, the greater part preferred martyrdom in some shape or other.

At this juncture the heroic family of Mattathias, a priest of the house of the Hasmoneans, rose, together with a few patriots, against the immense power of the Syrians. The national cause quickly gathered strength, and after the death of Mattathias (166 B.C.), Judas Maccabæus (see MACCABEES) led the national hosts to victory against the Syrians. After his death (160) his brothers Jonathan and Simon completed the work of deliverance, and instituted the Sanhedrin (145).³ During their rule alliances were twice formed with the Romans, and the country once more began to prosper. Under Simon more especially Syrian rule became a mere shadow: his was an almost absolute power, so much so that in the year 170 of the Seleucidian era (142 B.C.) a new Jewish era was commenced, and

¹ The circumstances of Alexander's visit are much disputed.

² The life of the Jews in Egypt is now much illuminated by the Aramaic and (later) Greek papyri. See the various eds. of A. Cowley, E. Sachau, A. Ungnad, and D. W. Staerk (Aramaic), B. P. Grenfell and A. S. Hunt (Greek).

³ This may perhaps be inferred from 1 Macc. xiv. 28. The problems of the Sanhedrin are both numerous and involved. See *Jew. Encycl.*, s.v. Sanhedrin, Simon, &c.; C. Taylor, *Sayings, Excursions II.*; W. Bacher in Hastings, D. B. A. Büchler (*Das Synhedrium in Jerusalem*) maintains that there were two bodies, each called Sanhedrin. One was political and one religious. It is to the former that Josephus and the Gospels refer. This view is discussed by G. A. Smith, *Jerusalem*, vol. i. pp. 420 ff.

public documents bore date, 'In the first year of Simon, high-priest and chief of the Jews' (see 1 Macc. xiii. 41-2). Simon's son, John Hyrcanus (q.v.), after a brief period of vassalage to the Syrians, extended his authority over Samaria, Galilee, and Idumea—the Idumeans being converted to the Jewish religion. His son, Aristobulus, added Iturea to his dominions; Alexander Jannæus, succeeding his brother, further contrived to enlarge his territories. He was disliked by the mass of his countrymen, and a civil war of six years' duration ensued. His wife, Alexandra, securing the support of the Pharisees (q.v.), governed, on the whole, prudently for nine years. The Pharisaic party, however, abused the power which fell into their hands, and a reaction took place. Aristobulus, youngest son of the queen, marched to Jerusalem, and ejected his elder brother, Hyrcanus II., from the sovereignty. This led to the interference of the Romans, who were then fighting both in Syria and Armenia. Jerusalem was captured (63 B.C.) by Pompey, Judæa made dependent on the Roman province of Syria, and Hyrcanus appointed ethnarch and high-priest.

In 54 B.C. Licinius Crassus plundered the Temple, which Pompey had spared. When the war between Cæsar and Pompey broke out, the partisans of Pompey were numerous in Syria, and contrived to poison Aristobulus and execute his son Alexander, who were Cæsareans (49 B.C.). After the death of Pompey, however, things changed; and Hyrcanus, or rather Antipater the Idumean (who was both his minister and master), saw the necessity of securing the favour of Cæsar. With Hyrcanus II. ended the line of the *Hasmonean* princes. They were nominally both sovereigns and high-priests; but the real religious authority had passed into the hands of the priesthood, and especially of the Sanhedrin (q.v.). The *Idumean* dynasty virtually commenced with Antipater, who prevailed on Cæsar to restrict Hyrcanus to the high-priesthood, and obtained for himself the office of procurator of Judæa, while his eldest son Phazael was appointed governor of Jerusalem, and his younger son Herod governor of Galilee. The Jewish or national party took alarm at this sudden increase of Idumean power; strife ensued, and ultimately Antipater perished by poison; but Herod, by the assistance of the Romans, finally entered Jerusalem in triumph (37 B.C.), caused Antigonus, the last male representative of the *Hasmonean* line, and his most dangerous enemy, to be put to death, and commenced the difficult task of governing a people who were growing more and more unruly every day. For the history of the next period, see HEROD. After Herod's death (4 B.C.), Archelaus, one of his sons, ruled Judæa and Samaria; but his arbitrariness, and still more his constant attacks upon religion, made him hateful to the people; and Augustus, listening to their just complaints, deprived him of his power, and banished him to Vienne. Judæa was now thrown together with Syria, and was ruled by Roman governors.

In the year 38 A.D. the Emperor Caligula issued an edict ordering divine honours to be paid to himself. Everywhere throughout the Roman dominions the Jews refused to obey. At Alexandria a frightful massacre took place, and for a time it seemed as if the whole of the inhabitants of Judæa, too, were doomed to perish. Herod Agrippa obtained anew from Claudius the dominion over all the parts once ruled by his grandfather Herod, and many privileges were through his influence granted to his Jewish subjects, and even to foreign Jews. They received the rights of Roman citizenship (41 A.D.), and their ruler even tried to conciliate their religious prejudices by the strictness with which he observed their law; yet

the national party remained malcontent, and in an almost permanent state of mutiny.

After the death of Herod Agrippa I. the country was again subjected to Roman governors. The confusion soon became indescribable. The whole land was overrun with robbers and assassins, some of whom professed to be animated by religious motives, while others were mere ruffianly freebooters and cut-throats; the antipathy between Jews and Samaritans waxed fiercer and fiercer, and the latter waylaid and murdered the orthodox Galileans as they went up to worship at Jerusalem; all sorts of impostors, fanatics, and pretenders to magic made their appearance; the priesthood was riven by dissensions; the hatreds between the populace and the Roman soldiery (mostly of Græco-Syrian origin), and under the command of cruel procurators, such as Albinus and Gessius Florus, increased; frightful portents (according to Josephus) appeared in the heavens, until, in 66 A.D., in spite of all the precautionary efforts taken by Agrippa, the party of Zealots, also called Sicarii or 'Assassins,' burst into open rebellion, which, after a horrible carnage, was terminated (70 A.D.) by the conquest of Jerusalem by Titus, the destruction of the temple, and the massacre and banishment of hundreds of thousands of the unhappy people, who were scattered among their brethren in all parts of the world.

The defence of Jerusalem as narrated by Josephus is one of the most magnificent and melancholy examples of mingled heroism and insanity that the world affords. Very considerable numbers of Jews were still allowed to remain in their native country, and for the next thirty years, although both hated and treated with rigour, they appear, on the whole, to have flourished. The Emperor Nerva was as lenient to them as to the rest of his subjects; but as soon as they had attained some measure of political vitality, their turbulent and fanatical spirit broke out anew. Their last attempts to throw off the Roman yoke, in Cyrene (115 A.D.), Cyprus (116), Mesopotamia (118), and Palestine, under Bar-Cochba (q.v.), were defeated after enormous and almost incredible butcheries. The suppression of Bar-Cochba's insurrection (135 A.D.) marks the final desolation of Judæa, and the dispersion of its inhabitants. The whole of Judæa was made like a desert, about 985 towns and villages lay in ashes, 50 fortresses were razed to the ground; the name of Jerusalem itself was changed into *Elia Capitolina*, and a heathen colony settled in the city, from entering which every Jew was strictly debarred. The hardships to which the unfortunate race were subjected were again alleviated in the reign of Antoninus Pius; Alexander Severus placed Abraham on the same divine level as he did Christ. Heliogabalus, among his many senseless whims, patronised various Jewish practices, such as circumcision and abstinence from swine's flesh; and, generally speaking, from the close of the 2d century till the establishment of Christianity under Constantine (330 A.D.), when their hopes were once more dashed to the ground, the Jews of the Roman empire appear to have thriven astonishingly. In this period falls the redaction of the chief code and basis of the 'Oral Law,' the Mishna, completed by Jehuda Hannasi ('the Prince'), or Hakkadosh ('the Saint'), president of the great school at Tiberias (220); and upon this code were grafted subsequently the two gigantic commentaries or complements, the Palestinian and the Babylonian Gemaras. The Babylonian Jews were even more fortunate than their western brethren, though they did not perhaps attain the meridian of their prosperity till the revival of the Persian, on the downfall of the Parthian empire. Their leader was called 'The Prince of the Captivity' (*Resh*

Galutha), and was chosen from among those held to be descended from the House of David. He lived in great splendour, assuming among his own people the style and state of a monarch. The reputation for learning of the Babylonian schools, Nehardea, Sura, and Pumbeditha, was very great. What was, at this time, the condition of the Jews farther east we cannot precisely say. The settlements in India (Malabar) must have arisen long before the famous *Sasanam* or copper tablets record the grant of land to Joseph Rabban (c. 750 A.D.), and it seems fairly certain that Jews had obtained a footing in China, if not before the time of Christ, at least during the 1st century.

In Europe the ascendancy of Christianity was baneful to the Jews. Imperial edicts and ecclesiastical decrees vied with each other in the rigour of their intolerance towards this unhappy people. They were prohibited from making converts, and from marrying Christian women; they were burdened with heavy taxes; yet no prosecution apparently could destroy the immortal race. In the 4th century they are found in large numbers in Illyria, Italy, Spain, Minorca, Gaul, and the Roman towns on the Rhine; they are agriculturists, traders, and artisans; they hold land; their services, in fact, cannot be dispensed with; Constantine, during whose reign a fierce revolution broke out among the Arians and Jews (353), terms them 'that most hateful of all people'; yet in spite of this they fill important civil and military situations, have special courts of justice, and exercise the influence that springs from the possession of wealth and knowledge. The brief rule of Julian the Apostate even shed a momentary gleam of splendour over their destinies, and secured for them permission to rebuild the temple of Jerusalem. The death of this emperor, however, frustrated their labours, and the rapid increase of ecclesiastical power was hurtful to them in a variety of ways; although the emperors now began to protect them as far as they could. In 404 they were excluded by Honorius from military service. After the fall of the western empire their fortunes were different in different countries. In Italy, Sicily, and Sardinia they were for a time unmolested; in the Byzantine empire they suffered many oppressions; while in the 6th and 7th centuries the Franks and Spanish Visigoths inflicted on them frightful persecutions.

The sudden volcanic outburst of Mohammedanism in the Arabian peninsula was at first disastrous to the Jews in that part of the world. It is believed that Judaism was not only known in Arabia but that at one time it had held sway there as a state religion. For several centuries a Jewish kingdom is thought to have existed in the south-west of Arabia, called Himyaritis or Homeritis, which was in a flourishing condition in 120 B.C. About the 6th century a prince of the Jewish faith mounted the throne of Yemen; twice, however, the Jewish kings were driven from it, and the Christian religion was introduced in that part in 530.¹ At first Jewish tribes around Mecca and Medina entertained opinions favourable to Mohammed as an Arabian chief, but when Islam began to threaten their own faith they rose in arms against its founder. Mohammed proved the stronger; he subdued the Chaiibar tribes in 627, and the Arabian Jews were finally massacred; some escaped and a few remained in the peninsula, where Yemenite Jews survive to this day. The spread of Mohammedanism through Asiatic Turkey, Persia, Egypt, Africa, and the south of Spain was, nevertheless, on the whole advantageous to the Jews. Except-

ing accidental persecutions, such as those in Mauritania (under the Idrisids in 790) and in Egypt (under al-Hakim in 1010), they enjoyed, under the khalifs and Arabian princes, comparative peace. In Moorish Spain their numbers greatly increased, and they became famous for their learning as well as for trade. They were counsellors, secretaries, astrologers, and physicians to the Moorish rulers; and this period may well be considered the golden age of Jewish literature. Poets, orators, philosophers of highest eminence arose, and in considerable numbers; and it is a well-established fact that to them is chiefly due—through the Arab medium—the preservation and subsequent spreading of ancient classical literature, more especially philosophy, in Europe. But in Christendom few and far between were the monarchs who rose above the barbarism of the churches. Basil I. (867–886) by threats and promises converted many Jews, but they returned to Judaism after his death. In 1044 Constantine IX. expelled the Jews from Constantinople, and other persecutions took place from time to time. In Babylonia, too, the Khalifate had passed into the hands of rulers hostile to the Jews; Hezekiah, the last exilarch, fell a victim to calumny. He was cast into prison and tortured; the schools were closed, the best of the community had fled to Spain, and those that remained were reduced to an abject condition, from which they took long to recover. In Italy their position was made tolerable by considerable pecuniary sacrifices; here and there at intervals a spirit of Christian intolerance might break out, but they enjoyed for the most part the protection of the Popes.

Less favourable was their lot in France. Under the weaker of the Carolingians the church advanced with imperious strides, and a melancholy change ensued: kings, bishops, feudal barons, and even the municipalities, all joined in cruel persecution. From the 11th to the 14th century their history is a series of successive massacres. All manner of wild stories were circulated against them: it was said that they were wont to steal the Host,² and contemptuously to stick it through and through; to inveigle Christian children into their houses, and murder them; to poison wells; and the like. They were also hated for their excessive usury, though there can be no doubt that the principal blame of this is to be attributed to those whose tyranny, by depriving the Jews of the right to possess land, had compressed their activity into the narrower channels of traffic. Occasionally, however, their debtors, high and low, had recourse to a very easy means of getting rid of their obligations. Thus, Philip Augustus, under whose rule the Jews seem to have held mortgages of enormous value, simply confiscated the debts due to them, forced them to surrender the pledges in their possession, seized their goods, and banished them from the *Île de France*. Yet in less than twenty years, in 1198, the same proud but wasteful monarch was glad to let them come back. Louis IX., in 1234, cancelled a third of the claims which the Jews had against his subjects, 'for the benefit of his soul.' An edict was also issued for the seizure and destruction of their sacred books: and we are told that in Paris, in 1242, twenty-four cart-loads of the Talmud and other books were consigned to the flames. In the reign of Philip the Fair the Jews were again expelled from France (1306), with the usual accompaniments of cruelty; but the state of the royal finances rendered it necessary, in 1315, to recall them; and they were allowed to enforce payment

¹ The early relations between Jews and Arabs formed the theme of Professor D. S. Margoliouth's *Schweich Lectures* for 1921 (published in 1924, Oxford); see especially pp. 57 ff.

² The phenomenon known as the 'Bloody' Host was caused by red microscopical infusoria, exactly resembling blood (*Monas prodigiosa* or *Micrococcus prodigiosus*), which settle on bread or wafers if kept in the dark. See the articles Host and Micrococcus in *Jew. Encycl.*

of the debts due to them, on condition that two-thirds of the whole should be given up to the king! But a religious epidemic having seized the common people in Languedoc and the central regions of France (1321), they signalled themselves by horrible massacres of the detested race. In the following year the plague broke out, and the wildest crimes were laid to the charge of the Jews. One shudders to read what followed; in whole provinces every Jew was burned, and at Chinon a hundred and sixty of both sexes were burned together! Christianity never produced more resolute martyrs: they sang hymns in the place of torment. Finally, in 1394, they were banished from the centre of France.

In England they are said to be mentioned in the ecclesiastical constitutions of Egbert, Archbishop of York, in 740; they are also named in a charter to the monks of Crowland, 833, but the evidence relating to these two references is seriously impugned. Joseph Jacobs (*s.v.* England, in *Jew. Encycl.*) maintains that there were no Jews in England before William I. William the Conqueror and William Rufus favoured them; the latter carried his contempt for the religious institutions of his kingdom so far that he actually farmed out the vacant bishoprics to Jews; and at Oxford, even then a seat of learning, they possessed three halls—Lombard Hall, Moses Hall, and Jacob Hall—where Hebrew was taught to Christians as well as to the youths of their own persuasion. As they grew in wealth they grew in unpopularity. On the day of the coronation of Richard the Lion-Heart (1189), some Jews being found present at the spectacle, from which their nation had been strictly excluded, a popular commotion against them broke out in London; their houses were pillaged and burned; and though Ranulf de Glanvill, the chief-judiciary of the realm, partially succeeded in arresting the havoc, and even in bringing some of the mob to justice (three were hanged), yet the barbarous bigotry of priests and people prevented anything like just or salutary punishment. Similar scenes were witnessed at Norwich, Edmundsbury, Stamford, and York; in York most of the Jews preferred death to forced baptism. When Richard returned from Palestine their prospects brightened a little; though they still were treated with great rigour, their lives and wealth were protected—for a consideration! John at first covered them with honour, but suddenly turned round on his protégés, after they had accumulated great wealth, and imprisoned, maltreated, and plundered them in all parts of the country. Under Henry III. they were mulcted enormously. Accused of clipping the coin of the realm, they had, as a penalty, to pay into the royal exchequer (1230) a third of their movable property. To this reign belongs the now exploded story of the crucifixion of the Christian boy, Hugh of Lincoln (*q.v.*). The accession of Edward I. did not mitigate their misery; some efforts were made to induce them to give up their profession of usury, as was also done in France and elsewhere during the same period; but, heavily taxed by the sovereigns or governments of Christendom, and debarred by special decrees or by vulgar prejudice from almost every other trade or occupation, they could not afford to prosecute ordinary callings. The attempt made by the Dominican friars to convert them, of course, failed utterly; and in 1254, the Jews—no longer able to withstand the constant hardships to which they were subjected in person and property—begged of their own accord to be allowed to leave the country. Richard of Cornwall, however, persuaded them to stay. Ultimately, in 1290, they were driven from the shores of England, pursued by the execrations of the infuriated rabble, and leaving

in the hands of the king all their property, debts, obligations, and mortgages.

In Germany they were looked upon as the special property of the sovereign, who bought and sold them, and were designated his *Kammerknechte* ('chamber-servants'). About the 8th century they are found in all the Rhenish towns; in the 10th century, in Saxony and Bohemia; in the 11th, in Swabia, Franconia, and Vienna; and in the 12th, in Brandenburg and Silesia. The same sort of treatment befell them in the empire as elsewhere; they had to pay all manner of iniquitous taxes—body tax, capitation tax, trade taxes, coronation tax—and to present a multitude of gifts to mollify the avarice or supply the necessities of emperors, princes, and barons. A raid against the Jews was a favourite pastime of a bankrupt noble in those days. The Crusades kindled a spirit not in Germany only, however, but through all Christendom, hostile to the 'enemies of Christ.' Trèves, Metz, Cologne, Mainz, Worms, Spire, Strasburg, and other cities were deluged with the blood of the 'unbelievers.' At such epochs the passions of the populace and of the lower clergy could not be restrained. The word *Hep* (said to be the initials of *Hierosolyma est perdita*, 'Jerusalem is fallen')¹ throughout all the cities of the empire became the signal for massacre, and if an insensate monk sounded it along the streets it threw the rabble into paroxysms of murderous rage. Expulsions or persecutions took place at Vienna (1196), Mecklenburg (1325 and 1350), Frankfurt-am-Main (1241), Brandenburg (1243), Nürnberg (1298 and 1349), Prague (1389 and 1745), and Ratisbon (1519). The 'Black Death' occasioned a great and widespread persecution (1348-50). They were murdered and burned by thousands, and the race almost disappeared from Germany; only, however, to return, for their services were indispensable. Here and there they possessed the rights of citizens, or were allowed to hold real estate; in general they were permitted to prosecute only commerce and usury, and the law turned on them its harshest aspect. Repeatedly, too, the emperors gratified at once their piety and their greed by cancelling their pecuniary claims. In many places they were compelled to live in certain parts of the town, known as the *Judenstrasse* ('Jews' Street').

Switzerland commenced to persecute them about the middle of the 14th century; in the 15th century they were expelled from various places. Their treatment was more humane in Poland and Lithuania; and after 1348 their numbers there were swelled by fugitives from Germany and Switzerland. Russia and Hungary received, persecuted, and banished them.

In Spain the condition of the Jews was long highly favourable; but the horrible persecutions by the Gothic princes in the 6th and 7th centuries made it inevitable that the first gleam of a Moorish scimitar on the coast would turn them into allies of the invaders. During the whole of the brilliant period of Moorish rule in the peninsula they enjoyed, indeed, what must have seemed to them, in comparison with their fate elsewhere, a sort of Elysian life. They were almost on terms of equality with their Mohammedan masters, rivalled them in civilisation and letters, and probably surpassed them in wealth. The Spanish Jews were consequently of a much higher type than their brethren in other parts of Europe. They were not reduced to the one degrading occupation of usury, though they followed that too; on the contrary, they were husbandmen, landed proprie-

¹ For various theories about the origin of *Hep* and for its history, see *Jew. Encycl.*, *s.v.*

tors, physicians, financial administrators, and they had courts of justice for themselves. The Christian monarchs of the north and centre also came to appreciate the value of their services, and we find them for a time protected and encouraged by the rulers of Aragon and Castile. But the extravagance of the nobles and the increasing power of the priesthood ultimately brought about a disastrous change. The estates of the nobles were in many cases mortgaged to the Jews; hence it was not difficult for 'conscience' to get up a persecution. Gradually the Jews were deprived of the privilege of living where they pleased; their rights were diminished and their taxes augmented. In Seville, Cordova, Toledo, Valencia, Catalonia, and the island of Majorca outbursts of priestly and popular violence took place (1391-92); immense numbers were murdered, and wholesale theft was perpetrated by the religious rabble. Escape was possible only by flight to Africa, or by accepting baptism at the point of the sword. The number of these enforced converts to Christianity is reckoned at 200,000. The fate of the Jews in Spain during the 15th century, however, beggars description; we read of nothing but persecution, violent conversion, massacre, the tortures of the Inquisition. Thousands were burned alive; and in one year 280 were burned in Seville alone. Sometimes the popes, and even the nobles, shuddered at the fiendish zeal of the inquisitors, and tried to mitigate it, but in vain. At length the hour of final horror came. In 1492 Ferdinand and Isabella issued an edict for the expulsion within four months of all who refused to become Christians, with the strict prohibition to take neither gold nor silver out of the country. The Jews offered an enormous sum for its revocation, and for a moment the sovereigns hesitated; but when Torquemada, the Dominican inquisitor-general, compared them to Judas, they shrank from the awful accusation; and the ruin of the most industrious, the most thriving, the most peaceable, and the most learned of their subjects—and consequently of Spain herself—became irremediable. Not less than 300,000 resolved to abandon the country, which a residence of seven centuries had made almost a second Judea to them. The incidents that marked their departure are heartrending. Almost every land was shut against them. Some, however, ventured into France; others into Italy, Turkey, and Morocco, in the last of which countries they suffered the most frightful privations. Of the 80,000 who obtained an entrance into Portugal for eight months on payment of eight gold pennies a head, many lingered after the expiry of the appointed time, and the poorer were sold as slaves. In 1497 King Emanuel commanded them to quit his territories, but at the same time issued a secret order that all Jewish children under fourteen years of age should be torn from their mothers, retained in Portugal, and brought up as Christians. Agony drove the Jewish mothers into madness: they destroyed their children with their own hands, and threw them into wells and rivers to prevent them from falling into the hands of their persecutors. The miseries of those who embraced Christianity, but who, for the most part, secretly adhered to their old faith (*Onesim, Anusim*, 'yielding to violence, forced ones'), were hardly less dreadful, and it was far on in the 17th century before persecution ceased. *Autos da fé* of suspected converts happened as late as 1655. In fact, the last Judaiser was burnt in 1826.

The wanderers appear to have met with much better treatment in Italy and Turkey than anywhere else. During the 15th and 16th centuries they are to be found in almost every city of Italy, pursuing various kinds of traffic (nearly the whole

trade of the Levant, for instance, was in their hands); but chiefly engaged in money-lending, in which they rivalled the great Lombard bankers. Abarbanel (q.v.), perhaps the most eminent Jewish scholar and divine of his day, rose to be confidential adviser to the king of Naples. In Turkey they were held in higher estimation than the conquered Greeks; they were allowed to reopen their schools, to establish synagogues, and to settle in all the commercial towns of the Levant.

The invention of printing, the revival of learning, and the Reformation are generally asserted to have been beneficial to the Jews, but this is only partially true. When the Jews began to use the presses at their earliest stage for their own literature, sacred and otherwise, the Emperor Maximilian was urged—chiefly by converts—to order all Hebrew writings to be committed to the flames; and, but for the strenuous exertions of Reuchlin (q.v.), ignorance, treachery, and bigotry might have secured a despicable triumph. Luther, in the earlier part of his career, looked with no unfavourable eye on the adoption of violent means for their conversion; on the other hand, Pope Sixtus V. was animated by a far more wise and kindly spirit towards them than any Protestant prince of his time. In 1586 he abolished all the persecuting statutes of his predecessors, allowed them to settle and trade in every city of his dominions, to enjoy the free exercise of their religion, and, in respect to the administration of justice and taxation, placed them on a footing of equality with the rest of his subjects. That the Reformation itself had nothing to do with subsequent ameliorations in the condition of the Jews is only too plain from the fact that in many parts of Germany, Protestant as well as Catholic, their lot became actually harder than before. They were driven out of Bavaria (1442, 1450; 1551-55), out of Brandenburg (1509 and 1573); and during the whole of the 17th and the first part of the 18th century the hardships inflicted on them by the German governments positively became more and more grievous. What really caused the change in their favour was the great uprising of human reason that marked the middle of the 18th century. Among the writers who distinguished themselves in Germany by pleading the cause of the Jews we may specially mention Lessing and Mendelssohn. In Holland the lot of the Jews has been favourable. Refugees from France settled in Hainault and the Rhine provinces in 1321, but in the province of Holland no Jews seem to have lived before 1593. Jews were free to perform their religious duties, and they possessed tacitly the rights of citizens, though it was not until 1796 that their emancipation was legally completed.

In England the edict of Edward I. remained in force for more than 300 years; and the first attempt made by the Jews to obtain a legal recognition in that country was during the Protectorate of Cromwell in 1655. Cromwell himself was favourable to their admission; so were the lawyers; but the nation generally, and particularly the religious portion of it, were strongly hostile to such a proceeding; and the wearisome controversial jangling of the divines appointed to consider the question prevented anything from being done legally. None the less Jews began to settle in England. But it was not till the reign of Charles II., who stood much and frequently in need of their services, that the connivance by which the residence of Jews in London had passed without comment was exchanged for the royal consent, formally accorded. The English legislature first commenced to take special notice of the existence of Jews in the first half of the 18th century. In 1718 the attorney-general decided that a Jew born in England could

purchase and enjoy an estate in fee. He went even further and said that the Jews' position was so satisfactory that it could not be improved by denization. This was almost tantamount to a recognition of Jews as British subjects. In 1723 this decision was confirmed by Act of Parliament, which permitted Jews, when taking an oath in a court of justice, to omit from their oath the words 'On the true faith of a Christian.' In 1753 they obtained the right of naturalisation, but in deference to public clamour it had speedily to be revoked. The remaining civil and political rights of the Jews were accorded them during the last century. Until 1828 the number of Jewish brokers in the city of London—all of whom were heavily taxed—was limited to twelve. A Jew could not be admitted to the freedom of the City, or exercise any retail trade, till 1832. Since 1833 the profession of barrister, since 1836 the shrievalty, and since 1845 the offices of alderman, of lord-mayor, and viceroy have been opened to them. During the reign of Queen Victoria every Jewish disability was removed, so that, in point of law, Jews are now, if natural-born subjects, on practically the same footing as English subjects. By an act of 1845 they were allowed to hold offices in municipal corporations, on condition of signing a declaration (in place of the usual oath) not to exercise their influence so as to injure or weaken the Protestant Church. The privileges of this act were extended by one of 1858, whereby Jews are entitled to be admitted to municipal and other offices on taking the oath, omitting from it the objectionable formula. In 1846 they were placed, as regards their schools and places of worship, of education, and charities, on the same footing as Protestant dissenters. In 1871 the Universities Tests Act was passed, which enabled Jews to graduate at the ancient universities without detriment to their religious principles. Before 1845 doubts had prevailed whether the marriages previously celebrated in England among the Jews, according to their own usages, were valid, and the statute of 1847 put an end to such doubts by declaring all such marriages valid, provided both the parties married had been persons professing the Jewish religion. But now, as then, though it is competent for Jews, like other dissenters, to super-add any religious ceremony they please to their marriages, there must in all cases be notice given to the registrar of the district of such marriage being about to take place, the only exemption being that the marriage may be celebrated in the synagogue or any ordinary dwelling, and not, as with other denominations, in the superintendent registrar's office, or a registered building. A license may also be procured from the superintendent registrar, and the secretaries of the respective synagogues are recognised as the persons to keep the register books of Jewish marriages. In Scotland there is no peculiar legislation affecting Jewish marriages. It was not until 1858 that Jews were admitted to parliament, a statute of that year empowering the House to modify the oath required of members, by omitting in the case of Jews the concluding words of the oath. Baron Rothschild was the first who took his seat in the House of Commons on the passing of this act. But even this statute was only permissive, it being still left in the power of parliament to refuse to modify the oath if it so determined. It was accordingly superseded by an act of 1866, which prescribed a uniform oath to be taken by members of all religious denominations, except Quakers and other Separatists, who might claim to be admitted by affirmation. Jews were first admitted to the Upper House in 1885, when Sir N. M. de Rothschild was elevated to the peerage as Lord

Rothschild, taking the oath, *more Judaico*, with his head covered. The very highest offices of the state are now, with scarcely an exception, within the reach of Jews. Unlike Roman Catholics, Jews may present to livings in the Church of England. But whenever a Jew holds any office in the gift of His Majesty, to which office shall belong the right of presentation to any ecclesiastical benefice, such right of presentation devolves upon the Archbishop of Canterbury for the time being.

Some of the relics of that mighty host of exiles that left Spain and Portugal found their way into France, where they long lingered in a miserable condition. In 1520 and 1550 they were received into Bayonne and Bordeaux. Jews were then to be found in considerable numbers in Avignon, Lorraine, and Alsace. In 1784 the capitation tax was abolished. In 1799, while the French Revolution was still animated by a sincere humanitarianism, the Jews presented a successful petition to the national representatives, Mirabeau being among their advocates. From this time their technical designation in France has been *Israélites*. In 1806 the Emperor Napoleon summoned a 'Sanhedrin' of Jews to meet at Paris, to whom a variety of questions were put, mainly with a view to test their fitness for being French citizens.¹ Since then they have been found not only in the highest offices of the civil administration—very frequently in the ministry (e.g. Crémieux, Goudchaux, Fould)—but they have also filled some of the chief places in the army and navy. We may add here that their bravery in the field has been the subject of frequent remark—although among the vices with which a brutal prejudice loved to brand them, in spite of all historical evidence, was also that of cowardice.

In Denmark since 1814 they have been on a footing of equality as citizens with native Danes. To Sweden they were first invited—the invitation only extending to the rich—in 1718. But references to Jews in Sweden occur before then; thus in 1681, at Stockholm, twenty-eight Jews were baptised in the king's presence. Norway forbade them to touch its soil till 1851. Jews had lived in Russia from the earliest times. Their fortunes had been mixed; they suffered persecutions and expulsions, as well as periods of toleration, when they flourished. Readmitted by the Empress Catherine II., they were further protected by the Emperor Alexander I., who in 1804 and subsequent years issued decrees insuring them full liberty of trade and commerce; Nicholas withdrew these privileges. Their residence was strictly confined to certain parts of the empire. Some 225,000 were driven out by further restrictions in 1892, and many were then and later settled in Argentina and elsewhere by Baron Hirsch. The horrors of Kishineff in 1903, surpassed by those of Odessa and many other Russian towns in 1905, showed the old race-hatred as active as ever. This spirit has survived the war. The most appalling massacres decimated the Ukrainian Jews not only during the years of fighting but after them. Tsarist generals waded in Jewish blood, while the Soviet government has rigorously proscribed the Jewish faith and persecuted its Rabbis. In Poland they are more numerous than in any other part of the world. They owed their first humane reception in the 14th century to the love which King Casimir the Great bore for a Jewish mistress. For many years the whole trade of the country was in their hands. During the 17th and the greater part of the 18th century, however, they were much persecuted, and sank into a state of great ignorance, and even

¹ *Napoleon and the Jews* was the subject of the Arthur Davis Memorial Lecture, delivered by F. Guedalla in 1925 (published by the Jew. Hist. Soc. of Eng.).

poverty; but education—in spite of the severity and barbarism of Russian intolerance—has, since the French Revolution, made progress among them. Frederick the Great, king of Prussia, showed himself singularly harsh towards the Jews; his legislation almost throws us back into the middle ages. All manner of iniquitous and ridiculous taxes were laid upon them; only a certain number were allowed to reside in the country, and these were prohibited from both the most honourable and the most lucrative employments. This shameful state of matters was ended by the Prussian edict of toleration (1812), by which Jews were placed almost in an equal position as citizens with other Prussians. Since then the tendency, on the whole, had been to enlarge their 'liberties'—until the revolution of 1848 gained them their full emancipation, although it was slowly carried out. In the smaller German states their full rights were grudgingly conceded. The Reichstag of the republic, like that of the empire which it succeeded, and like the National Assembly in 1848, now contains many prominent Jewish members. However, the progress of Jewish emancipation in Germany has not, of late years, been continuous. Strange to say, the year 1880 was marked by a remarkable revival of hostility against the Jews, especially in Berlin, which, known as the *Judenhetze*, was encouraged by many persons of standing in society. Since the war the *Hakenkreuzler* or Reactionary Nationalists (so called from their badge, the *Swastika*, *Hakenkreuz*) have consistently adopted anti-Semitism as their programme. But the government has generally managed to crush disorder and protect the Jews. The policy of the extreme Nationalists is repudiated by most Germans. In Austria the Emperor Joseph II. distinguished himself by passing an act of toleration (1782) extraordinarily liberal in its provisions for the Jews. Not till 1860, however (and even then under certain restrictions), did they acquire the right to possess land. But in 1868 they were accorded the complete liberty which they now enjoy, and which is only overclouded occasionally by outbreaks of anti-Semitism. In Hungary and Transylvania they have long enjoyed important privileges, and have been protected by the nobility. The 'White Terror' massacres which followed the war have now abated. In Rumania before the war Jews suffered much ill-usage, being only nominally protected by the treaty of Berlin. But since the war a complete change has been made, and the last vestiges of persecution are disappearing. Spain began to tolerate them again in 1837, and they can follow trade or agriculture like other Spaniards. Of late years they have enjoyed complete freedom, and the same can be stated of Portugal. Switzerland long treated them harshly, and only of late have steps in the right direction been taken. Yet the Jewish mode of slaughter is prohibited in certain cantons, and Jewish inhabitants have to import their meat.

In Turkey they are very numerous, and have thriven in spite of the exactions of pashas, the insolence of Janizaries, and the miseries of war. Their communities in Constantinople, Adrianople, Salonika,¹ Smyrna, Aleppo,¹ and Damascus¹ are considerable; Palestine is progressing wonderfully under the British mandate, and in the development of the country the Zionists are working hard. When the suspicions of Arabs are allayed, co-operation will produce even better results, and there are signs that mutual understanding is growing. Their numbers in Arabia are not very large, yet they enjoy some independence. Those in Persia have sunk into ignorance. They are found in Afghanistan, and carry on a trade between Kabul

¹ No longer in Turkey.

and China; in India the Bene Israel and Jews of Cochin are mainly, but not exclusively, agriculturists and artisans. Jews are to be seen in every walk of life, in the army, in the government services, and in the railways and in municipal employ. The Earl of Reading, Viceroy from 1921, is a British Jew, and so was a recent Secretary of State (the late Mr Edwin S. Montagu). In Bokhara Jews possess equal rights with the other inhabitants, and are skilled in the manufacture of silks and metals, and so in China, where, however, they are very insignificant both in numbers and position. They are also found all along the North African coast, where, indeed, they have had communities for perhaps more than a thousand years, which were largely reinforced in consequence of the great Spanish persecutions. They are numerous in Morocco, though not always secure from the perils of Mohammedan fanaticism. In Egypt and Nubia they are few; in Abyssinia, where they are known as Falashas, more numerous; they exist in the Sudan; and are also found farther south in considerable numbers, the mining industries of the Cape and Transvaal being largely in their hands. America, too, has invited their spirit of enterprise. In the United States, as in Great Britain, they enjoy absolute liberty, and have established some 1900 congregations. They have been in Brazil since 1528, and are also settled in some parts of the West Indies. In Surinam there is a flourishing colony.

The present distribution of Jews throughout the world, as estimated in 1923, is as follows: Austria, 350,000; Belgium, 44,000; British Empire, 800,000; Bulgaria, 44,000; France, 165,000; Germany, 615,000; Great Britain, 295,000; Greece, 88,300; Holland, 106,000; Hungary, 500,000; Irish Free State, 5000; Italy, 57,000; Rumania, 950,000; Russia, 3,760,000; Scandinavia, 14,000; Serb-Croat State, 64,000; Spain and Portugal, 5000; Switzerland, 20,000; Turkey in Europe, 80,000; Turkey in Asia, 70,000—making in all Europe above 10½ millions. To this may be added about 600,000 in Asia, 508,000 in Africa, 3,850,000 in America, and 24,000 in Australasia. This would bring the total number of Jews in the world up to a little over 15½ millions. It should be mentioned, however, that some authorities calculate their number as considerably less than this. The foregoing statistics have been taken from the *American Jewish Yearbook* of 1923. The number assumed in 1904 by those who followed a lower scale in estimating was about 5½ millions for Europe, and 1½ million for the rest of the world.

Religion.—Generally speaking, Jews believe in the inspiration of the Old Testament, the authority of the Law of Moses, the absolute unity and incorporeality of the Godhead, the immortality of the soul, the ability of mankind to work out its own salvation without the help of priest, mediator, or sacrifice, and the ultimate conversion of mankind to Theism. Such are the main points of agreement between almost all Jews, but on many questions they are sharply divided. For some two thousand years there have been at least two religious sections. In the time of Christ they were known as Pharisees and Sadducees; in the middle ages as Rabbinites and Karaites, the Rabbinites being adherents of traditional Judaism, and the Karaites insisting on the literal interpretation of Scripture. Since the early part of the 19th century these differences have to some extent been reproduced in the division of Jews into Orthodox and Reformed. Yet it would not altogether be accurate to regard these two presentations of Judaism as dogmas held by different sects. No doubt extremists on either side may find themselves very far apart, but the bulk of Jews to-day may fairly be described as progressively conserva-

tive. The early reformers aimed theoretically at following the Written Law more closely, and in regarding the Oral Law as superseded. But this standpoint was not, in fact, adopted by them, since they observed some Rabbinic precepts and accepted certain Rabbinic interpretations. Conversely, many of the Orthodox Jews tacitly have continued the progress which the Rabbis began, for Talmudic Judaism was certainly progressive. It follows, therefore, that the difference between Orthodox and Reform Jews is one of degree rather than of principle. To describe Reform Judaism as Karaite or iconoclastic and Orthodox Judaism as reactionary or formal is both superficial and incorrect. Many crucial questions cut across this line; for example, the Higher Criticism of the Bible and Zionism. For concise statements of both interpretations of Judaism, the reader is referred to the two articles on 'Judaism, Orthodox and Reform,' in Hastings's *E.R.E.*

Literature.—For the Hebrew language, see under that head. The extraordinary influence which the religion of the Hebrews has exercised on Christian and Mohammedan nations has given a universal significance to their ancient literature; but of this we possess nothing which, in its original shape, reaches further back than the period of David. The composition of the extant works in Hebrew literature proper would, on this view, extend over a period of nearly 900 years—viz. from the times of David to those of the Maccabees. This period was preceded by a preparatory one of sagas, songs, fragmentary historical notices, inscriptions, laws, and probably also priestly registers. The extant literature may be arranged under the five heads—law, prophecy, history, lyric poetry, and speculation (see BIBLE, and the articles on the separate books of the Old Testament). The same epoch in which took place the transition from Hebraism to Judaism—the epoch of the captivity—was also that which marked the commencement of Jewish literature, properly so called. Founded on the earlier and more creative Hebrew, and for the most part written in the same language, it is yet qualified by the presence of religious conceptions borrowed from the Persians, of Greek wisdom, Roman law, and, at a later period, of Arabic poetry and philosophy, and of European science; though everything is strictly subordinated to the great ideas of the ancient faith. Since the return from exile, the Jewish—also, but erroneously, called the *Rabbinical*—literature has, without the slightest external encouragement, actively taken part in the cultivation of the human mind; and in the results of this activity, which are still far from being duly appreciated, there lie concealed the richest treasures of centuries.

Jewish literature has been divided chronologically into nine periods. The *first* period extends to 143 B.C. After the return from exile the Jewish people naturally enough became animated by an intense nationality of feeling. Expositions and additions to the earlier history (*Midrashim*), as well as Greek translations, were executed, and several of the Hagiographa—such as particular psalms, the so-called Proverbs of Solomon, Ecclesiastes, the Books of Chronicles, portions of Ezra and Nehemiah—were written. To this period also, if to any, must belong the uncertain performances of the *Great Synagogue* (q.v.), to whom the work of completing the canon of the Old Testament is chiefly ascribed. Towards its close (190–170 B.C.) several writers appear *in propria persona*, as, for instance, Sirach and Aristobulus. The doctors of whom the Great Synagogue chiefly consisted were called *Soferim* ('Scribes'). At this time Aramaic finally became the popular dialect of Palestine.

The *second* period extends from 143 B.C. to 135 A.D. The *Midrash* (see EXEGESIS), or the inquiry into the meaning of the sacred writings, was divided into *Halacha* and *Hagada*; the former considered the improvement of the law, with a view to practical results; the latter, the essence of the religious and historical interpretations, generally expressed in parables. At first both were the oral deliverances of the *Soferim*, but gradually written memorials made their appearance. The public interpretation of the Scripture in schools and synagogues, the independence of the Sanhedrin, the strife of sects, and the influences of Alexandrian culture furthered this development. To this period also belong various Greek, but not, as is still erroneously supposed by some, the *written* Targums or Aramaic versions of the Bible (see TARGUMS), which sprang at a much later period from oral translations of the Pentateuch in the synagogues instituted after the return from the exile; further, the whole of the Apocrypha (q.v.), and the earliest Christian writings, which are at least the productions of men nurtured in the principles of Judaism, and which contain many traces of Judaistic culture, feeling, and faith. It was also characterised by the drawing up of prayers, scriptural expositions, songs, and collections of proverbs. The author of the first book of the Maccabees, Jason, Josephus, Philo, Johannes are names specially worthy of mention; so also are the doctors of the oral law—Hillel (q.v.), Shammai, Johanan-ben-Zaccai, Gamaliel, Eleazar-ben-Hyrcanus, Joshua-ben-Chananja, Ishmael, Akiba, and others of like eminence. *Rabbi* ('Master') *Talmid Chacham* ('Disciple of Wisdom') were titles of honour given to those expert in a knowledge of the law. Besides the Maccabean coins, Greek and Latin inscriptions belonging to this period are extant.

The *third* period reaches from 135 to 475 A.D. Instruction in the Halacha and Hagada now became the principal employment of the flourishing schools in Galilee, Syria, Rome, and after 219 A.D. in Babylonia; the most distinguished men were the masters of the *Mishna* (q.v.) and the *Talmud* (q.v.)—viz. Eleazar-ben-Jacob, Jehuda, Jose, Meir, Simeon-ben-Jochai, Jehuda the Holy, Nathan, Chija, Rab, Samuel, Johanan, Hunna, Raba, Rava, Papa, Ashe, and Abina. Besides expositions, additions to Sirach, ethical treatises, stories, fables, and history were also composed; the prayers were enriched, the Targum to the Pentateuch and the Prophets completed, and the calendar fixed by Hillel the second (330–365 A.D.). After the suppression of the academies in Palestine, those of Babylonia—viz. at Sura, Nehardea, and Pumbeditha—became the centre of Jewish literary activity. On Sabbaths and festal days the people heard, in the schools and places for prayer, instructive and edifying discourses. Of the biblical literature of the Greek Jews we have only fragments, such as those of the versions of Aquila and Symmachus. With this period terminates the age of direct tradition.

The *fourth* period (from 475 to 740 A.D.). By this time the Jews had long abandoned the use of Hebrew, and instead had adopted the language of whatever country they happened to dwell in. During the 5th century the Babylonian Talmud was concluded, the Palestinian Talmud having been redacted about 370 A.D. Little remains of the labours of the Jewish *literati* of the 7th century, or of the earliest *Geonim* or presidents of the Babylonian schools, who first appear in 589 A.D. On the other hand, from the 6th to the 8th century the Masorah (q.v.) was developed in Palestine (at Tiberias); and, besides a collection of the earlier Hagadas, independent commentaries were likewise executed, as the *Pesikta*, the *Pirke de R. Eliezer*, which contains early material, but which

cannot in its present form date before 830, since it alludes to events of that year. It is, of course, possible that the 30th chapter, which contains these late references, is an addition.

In the *fifth* period (740-1040) the Arabs, energetic, brilliant, and victorious in literature as in war, had appropriated to themselves the learning of Hindus, Persians, and Greeks, and thus excited the emulation of the oriental Jews, among whom now sprung up physicians, astronomers, grammarians, commentators, and chroniclers. Religious and historical Hagadas, books of morality, and expositions of the Talmud were likewise composed. The oldest Talmudic compends, the *Halakhot Pesuqoth* of Yehudai Gaon, belong to the age of Anan (*circa* 750 A.D.), the earliest writer of the Karaite Jews. The oldest prayer-book was drawn up about 870 by Amram Gaon in Babylon (846-875), and the first Talmudic dictionary by the Gaon Zemah b. Paltai about 900. The most illustrious *Geonim* of a later time were Saadia (892-942), equally famous as a commentator and translator of Scripture into Arabic, a doctor of law, a grammarian, theologian, and poet; Sherira (died 998); and his son Hai (died 1038), who was the author, among other things, of a dictionary. From Palestine came the completion of the Masorah and of the vowel-system; numerous *Midrashim*, the Hagiographical Targums, and the first writings on theological cosmogony were also executed there. From the 9th to the 11th century Kairwan and Fez, in Africa, produced several celebrated Jewish doctors and authors. Learned rabbins are likewise found in Italy after the 8th century, as Julius in Pavia. Bari and Otranto were at this time the great seats of Jewish learning in Italy. After the suppression of the Babylonian academies (1040) Spain became the central seat of Jewish literature. To this period belong the oldest Hebrew codices, which go back to the 9th century. Hebrew rhyme is a product of the 8th, and modern Hebrew prosody of the 10th century.

The *sixth* period (1040-1204) is the most splendid era of Jewish mediæval literature. The Spanish Jews busied themselves about theology, exegetics, grammar, poetry, the science of law, astronomy, mathematics, philosophy, rhetoric, and medicine. They wrote sermons and ethical and historical works. The languages employed were Arabic, Rabbinical Hebrew, and ancient or classical Hebrew. We can mention here only Samuel Hannagid, statesman, grammarian, and poet (died 1055), the famous Jehudah hal-Levi (1085-1140),¹ and the renowned Maimonides (q.v.), whose death closes this epoch. The literature of the French rabbins was more theological in its character, and kept more strictly within the limits of the Halacha and Hagada. The great Rashi (q.v.), the prince of commentators, whose real name was Solomon ben Isaac of Troyes (1040-1105), is one of the greatest names in Jewish literature. In Provence, which combined the literary characteristics of France and Spain, there were celebrated Jewish academies at Lunel, Narbonne, and Nîmes. The fame of the Talmudists of Germany, especially those of Mainz and Ratisbon, was very great. Only a few names belong to Greece and Asia; still the Karaite Jews had a very able writer in Jehuda Hadassi (1075-1160). The greater portion of the prayer-book was completed before Maimonides. Many of the works, however, produced between 740 and the close of this period are lost.

The *seventh* period (1204-1492) bears manifest traces of the influence exercised by Maimonides.

Literary activity showed itself partly in the sphere of theologico-exegetic philosophy, partly in the elaboration of theology. With the growth of a religious mysticism there also sprung up a war of opinions between Talmudists, Philosophers, and Cabbalists. The most celebrated Jews of this period lived in Spain; later, in Portugal, Provence, and Italy. To Spain belongs (in the 12th century) the poet Jehuda Charisi. In the 15th century a decline is noticeable. Books written in Hebrew were first printed in Italy at Reggio (1475), in Spain and Portugal at Ixar (1485), at Zamora (1482), and at Lisbon (1489).² During this epoch the chief ornaments of Jewish literature in Provence were Moses ben Nahman, David Kimhi, Abraham Farissol, Isaac Nathan, the author of the Hebrew Concordance. In Italy Jewish scholars employed themselves with the translation of Arabic and Latin works. While France could show only a few notable authors, such as the collectors of the *Tosafot*, Moses de Coucy, Jehiel ben Joseph (died 1286), and the poet fable-writer and exegete Berahya (who properly belongs to England), Germany produced a multitude of writers on the Law, such as Eliezer b. Joel hal-Levi (1160-1235), Meir of Rothenburg (1215-93), Asher ben Jehiel (1250, died at Toledo 1328), Jacob ben Asher (died before 1340), Eleazer ben Jehudah of Worms (1176-1238). Most of the extant Hebrew MSS. belong to this period; but a great part of mediæval Jewish literature lies unprinted in Cambridge, London, Rome, Florence, Parma, Turin, Paris, Oxford, Leyden, Vienna, and Munich.

The *eighth* period (1492-1755) is not marked by much creative or spiritual force among the Jews. In Italy (1475) and the East (1503), in Germany and Poland (1550), in Holland (1620), Jewish scholars worked printing-presses, while numerous authors wrote in Hebrew, Latin, Spanish, Portuguese, Italian, and Judæo-German. Some of the most eminent theologians, philosophers, jurists, historians, mathematicians, poets, commentators, lexicographers, grammarians, &c., of this period were, besides Spinoza, Isaac Abravanel, Elias Levita, Seferno, Bertinoro, Karo, Norzi, Rossi, Moses Isserles, Manasseh ben Israel, Lipman Heller, B. Musaphia.

The *ninth* period extends from 1755 to the present time. Encouraged by the spirit of the 18th century, Moses Mendelssohn (q.v.) opened to his co-religionists a new era, which, as in the middle ages, first manifested itself in the religious literature. Its character, contents, expression, and even its phraseology, were changed. Poetry, language, philology, criticism, education, history, and literature have been earnestly cultivated. The sacred books have been translated by them into the languages of modern Europe, and foreign works into Hebrew; and many of this once proscribed and detested race have taken an important part in the public and scientific life of Europe. Among the many illustrious names of this last period we can select only a few like Mendelssohn, Maimon, Ben Zeeb, Heidenheim, Rapoport, Krochmal, Zunz, Jost, Geiger, Fürst, Sachs, Z. Frankel, Steinschneider, Graetz, Jellinek, Philippsohn, Munk, Salvador, Reggio, S. D. Luzzatto, Neubauer, Schechter, Schiller-Szinessy, Berliner, Buber, Harkavy, Chwolson, Weiss, Levy, Abrahams, Montefiore—chiefly cultivators of literature with reference to their own creed and race.

To enumerate names of those who were and are illustrious in general literature, in law, philosophy, medicine, philology, mathematics, belles-lettres,

¹ The latest edition of his poems (selections, Hebrew pointed text and English verse translations) is that of N. Salaman and H. Brody (Philadelphia, 1925); his *Usuri* (Khazari) was translated into English by H. Hirschfeld (London, 1905).

² E. N. Adler, *Gazetteer of Hebrew Printing* (London, 1917) gives a complete bibliography of the subject and a list of the first books printed at every known press.

&c., we cannot even attempt, since there is not one country in Europe which does not count Jews among the foremost and most brilliant representatives of its intellectual progress. Of Germany—considered to be in the vanguard of European learning—Bunsen said that the greater part of the professors at its universities and academies were Jews or of Jewish origin (Neander, Gans, Benary, Weil, Benfey, Stahl, Dernberg, Valentin, Lazarus, Herz, Steintal)—certainly a most startling fact. Oppert, Darmesteter, Bernays, Sanders, Karl Marx, Lassalle, Emil Franzos, Crémieux (q.v.), Jessel, Sylvester, Meldola, Emma Lazarus, Einstein, Bergson, Sir Sidney Lee, Sir Israel Gollancz, Lord Reading, Palgrave, Brodetsky, Alexander, P. and N. Hartog, Haffkine, D. S. Margoliouth, Freud, Brandes, are likewise eminent names in literature, law, and science; while in finance, statesmanship, and philanthropy the names of Rothschild (q.v.), D'Israeli, Montefiore (q.v.) are universally familiar. Another extraordinary and well-authenticated fact is that Jews are prominent in European press no less than in European finance, but their influence is often greatly exaggerated in these two spheres; it is certainly not exercised in favour of Jews or Judaism, save perhaps in such rare instances as when the house of Rothschild refused to subscribe to a Russian loan because of the persecution to which Jews in Russia were subjected; while, on the other hand, names like Heine, B. Borne, Berthold Auerbach, Henriette Herz, Jules Janin, Felix Mendelssohn-Bartholdy, Halévy, Meyerbeer, Moscheles, Joachim, Ernst, Rubinstein, Wieniawski, Grisi, Braham, Giuglini, Da Costa, Rachel, Davison, Bendemann, Simeon Solomon, S. J. Solomon, Josef Israels, Schnitzler, Ed. Colonne, Goldmark, Sarah Bernhardt, besides hosts of others less familiar to English ears, who shine in all branches of art—music, sculpture, painting, the drama, &c.—show plainly how unjust is the reproach of their being an 'abstract' people, without sense for the bright side of life and the arts that embellish it. As a typical selection of Jews prominent in public life one may cite the names of Sir Matthew Nathan, General Monash, Sir Alfred Mond, E. S. Montagu, Sir I. Spielmann, Herzl, Weizmann, Ballin, Rathenau, Morgenthau, and Sir Herbert Samuel; S. Gompers was a noted labour leader in America. On the other hand, the allegation that the Jews are the mainstay of the Bolsheviks is quite incorrect: in every country Jews belong to all political parties. There is no Jewish vote. Briefly—they are, by the unanimous verdict of the historians and philosophers of our times, reckoned among the chief promoters of the development of humanity and civilisation. What has been their reward we have seen. Happily the growth of religious toleration, which is the distinctive feature of the present age, has changed all this. In every country to which modern civilisation has penetrated Jews now enjoy, if not the full social recognition which is accorded them in England and France, all ordinary civil and political rights. Russia, under the Soviets, penalises Judaism as it does other faiths. During the war and after, the Jews of the Ukraine and Eastern Europe suffered terribly. Many havens of refuge are now closed, although there are still parts of Europe which maintain towards the Jews an attitude of social ostracism worthy of mediæval barbarism. But so anomalous a condition of affairs cannot long continue, and the time is surely not far distant when even in these countries they will be accorded a fair measure of the rights of humanity.

Jew's Ear (*Hirneola auricula-Juda*), a fungus, one of the Hymenomycetes, which grows on decaying parts of living trees, particularly elders. Dried Jew's Ear was formerly in repute as an astringent.

Jew's-harp, or Jew's-TRUMP, a simple musical instrument, which consists of a flat elastic vibrating steel tongue, running between two parallel ribs of metal, and fastened at one end to the farther side of the curve into which the ribs expand; the free end is narrowed to a thin wire and prolonged at right angles to the vibrating piece. The instrument is held between the teeth or lips, kept apart by the rib-frame, and the free projecting end of the vibrating tongue is struck with the finger. The instrument is used from the Highlands of Scotland to Tibet. The first to attain any notable degree of skill as a performer was a soldier of Frederick the Great's army. But his fame was eclipsed by a Württemberger named Eulenstein, who played sixteen Jew's-harps, tuned to different keys; he performed in London in 1828 (died 1890). The derivation of the word seems to be doubtful. The suggestions that 'Jew's' is a corruption of 'jaws' and of 'jeu,' the French word for 'play,' are untenable; more probably the instrument was called Jew's-harp in derision.

Jex-Blake, SOPHIA (1840-1912), sister of Dr Thomas Jex-Blake (1832-1915), headmaster of Rugby and Dean of Wells, studied medicine, became M.D. of Bern, and secured from Edinburgh University the medical curriculum and degree for women. See WOMEN'S RIGHTS, and Life by Margaret Todd (1918).

Jeypore (*Jaipur*), a protected state in Rajputana (q.v.), with an area of 15,579 sq. m.; pop. (1891) 2,532,276; (1911) 2,636,647; (1921) 2,338,802 (mainly Hindus). The central part of the state is a sandy tableland from 1400 to 1600 feet above the sea; in the east and north-west there are mountains, but in the south-east the soil is rich and fertile. The chief manufactures are enamelled gold-ware, marble sculptures, and fabrics. Large quantities of salt, also, are manufactured at the Sambhar Lake. The normal revenue is believed to be about £500,000, £26,000 a year being paid as tribute to the imperial government. The army numbers about 11,000 men of all arms. Great attention is paid to education. The state irrigation works include some of the finest in Rajputana. Jeypore, after many vicissitudes, came under British protection in 1818. The maharaja was eminently loyal during the Mutiny, and was rewarded with an extension of territory.—The capital, JEYPORE, is a walled city, 850 miles NW. of Calcutta, 699 NE. of Bombay, and 84 NE. of Ajmere by rail. A handsome and regularly-built town, with the maharaja's palace in the centre, it is the most important commercial centre of Rajputana. It was founded as late as 1728. The ancient and now deserted capital, Amber, lies 5 miles to the NE. The commercial business of Jeypore is chiefly banking and exchange. It has a college, museum, school of art, and observatory, the 'Mayo' Hospital, and numerous temples and mosques, besides the beautiful Rām Newās Gardens (76 acres). Pop. (1881) 142,578; (1911) 137,098; (1921) 120,207.

Jeysulmere. See JAISALMER.

Jezeel. See ESDRAELON.

Jezeelites, or the NEW AND LATTER HOUSE OF ISRAEL, a religious sect founded in England by a private soldier, James White (1840–85), who adopted the name of James Jeršom Jezeel, and professed to be a messenger from God, whose revelations to him are recorded in 'The Flying Roll.' The headquarters of the sect were at Gillingham, in Kent, where a temple, a college, &c., were partially built. Christ, they believed, by his death redeemed only souls, and those souls who have lived since Moses. For the salvation of the soul belief in the Gospel was sufficient; the body must be saved by belief in the Law. When Christ comes to reign for his millennium he will be greeted by the 144,000 (Rev. vii. 5–8), who will be endowed with immortal bodies; to this chosen band the members of the New and Latter House of Israel aspire to belong. After the death of Queen Esther, Jezeel's widow, in 1888, the sect decayed.

Jhansi, a city in the Allahabad division of the United Provinces of Agra and Oudh, centre of the Indian Midland Railway system. Once the capital of a Mahratta state, it was given to Gwalior after the Mutiny, but in 1886 was restored to the British in exchange for other territory. Even while Jhansi belonged to Gwalior, there was a British district of Jhansi, of which the headquarters were at Jhansi Naobad, under the walls of the city. Jhansi is now the capital of the district of the same name, the area of which is 3634 sq. m., and pop. (1921) 606,499. Pop. of city, including cantonment (1921), 66,432.

Jhelum, or JEHLAM (Sanskrit name *Vitasta*, whence Greek name Hydaspes), one of the rivers of the Punjab. It rises in the mountains of Kashmir, which country forms its upper basin, and is navigable for about 100 miles within that state. On emerging from the Himalayas through the Baramulla Pass, it again becomes navigable for small craft. About 250 miles from its source it enters the plains, and, after a total course of 450 miles (about 200 in British territory), joins the Chenab

at Timmu. On its banks was fought the battle between Alexander the Great and Porus. The Victoria railway bridge near Meeanee (1887) is 4875 feet long. See DOAB.—**JHELUM** (*Jehlām*), headquarters of Jhelam district (area, 2773 sq. m.; pop. 477,000), in the Punjab, stands on the Jhelam (Jhelum) River; pop. with cantonment, 18,000.

Jiménez, JUAN RAMÓN, Spanish elegiac poet, born in 1881. His *Obras*, collected in 1916–17, include *Platero y yo*, *Sonetos espirituales*, *Estío*, *Diario de un poeta recién casado*.

Jingo appears in 1670 as conjurer's gibberish ('hey jingo,' or 'high jingo,' like 'hey presto'). Later (1694) Motteux translates Rabelais's *par dieu* 'by jingo,' and 'by jingo,' 'by the living jingo,' and in Scotland 'by jing' or 'by jings,' are familiar minced oaths. A music-hall song beginning, 'We don't want to fight, but, by jingo, if we do,' became in 1878 a sort of watchword of the bellicose anti-Russian mobocracy during the Russo-Turkish war; hence jingoes are English (and American) Chauvinists. There is no evidence for the Basque *Jainko* or *Jingo*, meaning 'God,' having been introduced into England by Basque sailors; the derivation from 'St Gengulphus' was a joke of 'Ingoldsby's,' and it was on the Koreans and their neighbours mainly that the warlike (if not mythical) Japanese Empress Jingō imposed the terror of her name.

Joachim, founder and abbot of the monastery of Giovanni del Fiore (or Floris) in Calabria, who died in 1202, was a strenuous critic of abuses in the church, and was even more celebrated as interpreter of the Apocalypse, mystic, and prophet. His principal works, the *Concordia Utriusque Testamenti* and a commentary on the Revelation, arranged the divine governance of the world in three stages corresponding to the Persons of the Trinity—the Old Testament, the New Testament, and an impending final dispensation of the Holy Spirit, to be preceded by fearful judgments and manifestations of Antichrist; then was to come perfect liberty, freedom from the letter, and the spread of the gospel amongst the Jews and throughout the world. He found many followers, especially amongst the Franciscans; one of whom, Gherardo di Borgo San Donnino, in 1254 re-edited Joachim's commentaries as the *Evangelium Aeternum*, and in a preface so dealt with the papacy as to be condemned by the Pope and imprisoned for eighteen years. Joachimism died a natural death when his fateful year of 1260 had come and gone without mishap or portent; and the order that had arisen was ultimately absorbed by the Cistercians. See works by Schneider (1873), Haupt (1885), Döllinger (1890).

Joachim, JOSEPH (1831–1907), born of Jewish parents at Kittsee, near Presburg, became the foremost violinist of his time, a great teacher, and in 1868 director of the Berlin High School of Music. Revered by concert-goers in London and other capitals, he had honorary degrees from Cambridge

and Oxford, medals, and other honours. He excelled as an exponent of 'classical' music. Of his compositions, the Hungarian concerto (for violin and orchestra) is the most famous. See books on him by Moser (trans. 1901) and Maitland (1905).

Joachimsthal, a mining town of Bohemia, at an altitude of 2400 feet, on the southern slopes of the Erzgebirge, 10 miles N. of Carlsbad. In the 16th century the mines yielded large quantities of silver; but the production of this mineral has now dwindled away. Besides silver the mines yield nickel, bismuth, and uranium. There is a national uranium factory. The people manufacture tobacco, gloves, lace, &c. The first German thalers or dollars (see DOLLAR) were coined here. Pop. 8000.

Joan, POPE, a fabulous personage long said to have filled the papal chair as John VIII. for about three years after the death of Leo IV. in 855. According to the latest and accepted form of the story, she was daughter of an English missionary, and was born at Mainz or Ingelheim. Forming an illicit connection with a monk at Fulda, she put on male attire and fled with him to Athens, where her lover soon died. She then came to Rome, where, from her remarkable learning, she became in quick succession notary to the curia, cardinal, and pope, until her sex was discovered by the premature and public birth of a child during a solemn procession. This startling story was universally believed and appealed to in Italy from 1400 to about 1600; it appears in all the chronicles within this period, and even so late as 1550 is found in the popular guide for strangers known as the *Mirabilia Urbis Romæ*. Felix Hemmerlin, Trithemius, Coccius Sabellicus, Raphael of Volterra, Pico di Mirandola, and Adrian of Utrecht (afterwards Pope Adrian IV.) are all unanimous in maintaining it, and indeed Aventine in Germany and Onufrio Panvinio in Italy were the first to shake the general belief in its truth. One of the severest blows delivered to the story was given later by the hand of the learned Calvinist David Blondel, in his *Familiér Éclaircissement* (Amst. 1649). So unquestioned was the story that about the beginning of the 15th century the bust of the female pope was placed in the cathedral of Sienna, along with those of the other popes, and there it remained undisturbed till 1600, when, at the request of Clement VIII., Joan was metamorphosed into Pope Zacharias.

Baronius thought it a satire on John VIII.; Aventine, Heumann, and Schröck, a satire on the Pornocracy; the Jesuit Secchi, a calumny originating with the Greeks, just as Pagi and Eckhart thought it did with the Waldenses; Leo Allatius believed it to be based on the story of Thiota, a false prophetess of the 9th century; Leibniz thought it based on a similar story that might have happened in the case of some foreign bishop; while Blasco and Henke believed it a satirical allegory on the origin and circulation of the false decretals of Isidore—an absurd theory developed still further by Gfrörer. Mosheim, Luden, and Hase were unable to believe that so definite a story could have arisen without some foundation; Kurtz, while saying that the historical evidence is valueless, regarded it as an unsolved riddle. At length Dr Döllinger disproved all preceding theories at once by showing that the myth originated not in the 9th or 10th century, as hitherto believed, but was first put into writing in the middle of the 13th; and advanced the theory that the story was deliberately originated by the Dominicans and Minorites in the time of Benedict VIII., a deadly foe to the two orders.

The story was long supposed to be mentioned by

Marianus Scotus (1028–86), but it does not occur in his most ancient MSS., nor yet in those of Sigbert of Gemblours (1030–1112) or of Otto de Freysingen (died 1158). The first to give it currency is the Dominican Stephen de Bourbon (died 1261), on the authority of the lost or as yet undiscovered MS. of his contemporary, the Dominican Jean de Mailly. Thus the earliest account in writing is discovered to be about the years 1240–50, from which source it was transferred to works of history, like the popular but worthless chronicle of the Dominican Martinus Polonus (died 1278). Yet Pope Joan does not appear in his oldest MSS., and the interpolation must have been made between 1278 and 1312. The main vehicle for circulating the myth in Germany was the chronicle *Flores Temporum*, which, connected with various names, comes down to 1290, and is mainly a compilation from Martinus Polonus. Again, the story was inserted in the so-called *Anastasis*, the most ancient collection known of biographies of the popes, but here again it is a later addition. Soon after we find it in Van Maerlant's *Historical Mirror*, a metrical Dutch chronicle, and in the Dominican Tolomeo of Lucca, and later, in the 14th century, in the Dominicans Bernard Guidonis, Leo of Orvieto, John of Paris, and Jacobo de Acqui, as well as in Occam the Minorite, the Greek Barlaam, the English Benedictine Ranulph Higden, the Augustinian Amalrich Angerii, Boccaccio, and Petrarch. About the close of the 13th century the story spread with great rapidity, and in the 15th hardly any doubt shows itself at all. John Huss, at the Council of Constance, naturally enough employed the pontificate of Joan as an argument without contradiction from either side; and the Chancellor Gerson, in a speech before Benedict XIII. at Tarascon in 1403, uses the circumstance as a proof that the church could err in matters of fact. The scholastic theologians accepted the fact, and we find so redoubtable a defender of papal despotism as Cardinal Torrecremata maintaining it, so that the gibes of some busy compilers at early Protestant writers for making much of so unsavoury a story are but idle and ill informed. The Dominicans, from their numerous libraries, might easily have exposed the fable, but, as we have seen, they were actively instrumental in its diffusion instead. The story reached the Greeks in the second half of the 15th century, and it is to them we owe the revolting detail that the child was born just as the woman was celebrating High Mass. A Greek scholar, Emmanuel Rhodis, in a clever study (Eng. trans. by C. H. Collette, 1886) finds it impossible to believe that so well authenticated a story could be without historical basis; and indeed the chain of authoritative evidence is exceedingly awkward for those disposed to attach high credit to tradition in matters of belief.

Originally the woman is nameless, and there are many discrepancies about her name (Agnes, Gilberta, Joan), about the date, her place of birth and previous abode, and the mode of the catastrophe. Four circumstances, according to Dr Döllinger, contributed especially to the production and elaboration of the fable: (1) the former use of a pierced seat, popularly supposed to be a precautionary means of verifying the sex of a newly-elected pope, but really a practice symbolic of taking possession, the seats being merely bright red *sedes porphyreticae*, from an ancient Roman bath; (2) a stone, with an unintelligible but ingeniously misread inscription, popularly supposed to be a tombstone of the unhappy Joan; (3) a statue found at the same spot, its long robes being gratuitously taken for the dress of a woman; and (4) the custom of making a circuit in papal processions, whereby a street which was directly in

the way was avoided. The woman may have been made of English blood from the odium attaching to England because of the struggle between Innocent III. and King John; and besides, many Englishwomen made the pilgrimage to Rome, while St Boniface, even in his day, complains not only of their number, but their dubious character. Her birth at the German city of Mainz might be due to the inveterate German hostility to Roman claims, together with the fact that Mainz was the leading city of Germany.

See Wensing, *Orer de Pausin Johanna* (Hague, 1845), against a book by Kist (1843; 2d ed. 1866; arguing that Pope Joan was probably the widow of Leo IV.); Bianchi-Giovini, *Papessa Giovanna* (1845); especially Döllinger, *Die Papstfabeln des Mittelalters* (1863; trans. 1871), where the historical evidence is demolished; and the relevant articles in the *Catholic Encyclopædia* (1907-14) and Herzog-Hauck's (1896-1909).

Joannes Damascenus. John Chrysorrohoas ('the golden-flowing') of Damascus, a great theologian and hymn-writer of the Eastern Church, was born at Damascus, it is said, in 676, but certainly before the end of the 7th century, of a Christian family of distinction in that city, known by the Arabic surname of Mansour. He was carefully educated, together with his adopted brother Cosmas, by the learned Italian monk Cosmas, who had been brought a slave to Damascus, and is said to have been called to the office of vizier to the reigning khalif. He replied in quick succession to the iconoclastic measures of Leo the Isaurian with two memorable addresses in which he vigorously defended the practice of image-worship. His biographer John, patriarch of Jerusalem (10th century), tells us that Leo, unable to reach his formidable antagonist by open means, caused a treasonable letter to be forged, in consequence of which John's hand was struck off by order of the khalif, but after a night of prayer to the Virgin miraculously restored. It is certain that his later years were spent in a monastery, that of St Sabas near Jerusalem, where we are told he mortified his flesh with ascetic practices of unusual severity. Here he found leisure and inspiration to write his learned works and his religious poetry, was ordained a priest, and died about 754.

His chief Greek works are *Fons Scientiæ*, a group of three works, together forming an encyclopædia of Christian theology; *De Imaginibus Orationes III.*; *De Recta Sententia Liber*, a formal profession of faith; *Contra Jacobitas*; *Dialogus contra Manichæos*; *Disputatio Christiani et Saraceni*; *De Draconibus et Strigibus*, in which he combats popular superstitions; *De Duabus in Christo Voluntatibus*, an attack on Monophysite and Monothelite heresy; *Adversus Nestorianos*; *Loci Selecti in Epistolas S. Pauli*, mostly from the homilies of St Chrysostom; *Sacra Parallela*, consisting of passages from Holy Writ illustrated by parallel passages from Scripture and the Fathers; *Homilia*, thirteen in number; *Carmina*, including both canons or prose hymns and metrical hymns; and *Vita Barlaam et Josaph*, his most famous work, now known to be a disguised version of the life of Buddha. Of John's *Canons* the noblest is that for Easter, beginning, in Neale's translation, 'Tis the day of Resurrection; Earth, tell it out abroad.' Other hymns known to Englishmen through the same translator are 'Those eternal bowers,' 'Take the last kiss, the last for ever,' and 'Come ye faithful, raise the strain.' The first adequate edition of the works of Joannes Damascenus was that of the Dominican Michael Le Quien (2 vols. folio, Paris, 1712). This was reprinted at Venice in 1748, and is the basis of the edition in Migne's *Patrologia* (3 vols. 1864).

See the articles *BARLAAM* and *JOSAPHAT*, and *HYMNS*; also Dr Neale's *Hymns of the Eastern Church* (1870); Dr Joseph Langen's admirable book, *Johannes von Damaskus* (Gotha, 1879); J. H. Lupton's *St John of Damascus* (1882), in the 'Fathers for English Readers.'

Joannina. See *JANINA*.

Joan of Arc (FR. JEANNE D'ARC), the Maid of Orleans, one of the most striking and, in fact, one of the greatest figures that ever crossed the stage of history, was born of comfortable peasant family in the village of Domremy, near Vaucouleurs, on the borders of Lorraine and Champagne, 6th January 1412. She was taught to sew and spin, not to read and write; and in the quietness of her country-life she grew up tall and handsome in form, sweet and womanly in nature, unlike the other girls around her only in her greater strength of will, powers of visualisation, and devotion. She loved to be alone, and she brooded in her waking dreams over the condition of France and the legends of the saints. The cold abstraction of patriotism she never discovered for herself, but she mourned with passionate prayers and tears over the sorrows of down-trodden France, until these prayers took real shapes, and returned to her with form and sound as messages from heaven. And thus there gradually grew up within her heart the conviction that she had been chosen by God to do a special work of deliverance for her country. At thirteen she first saw a light and heard an audible voice from heaven, and her terror gradually disappeared as these signs were repeatedly vouchsafed, and became dear and familiar to her. St Michael, St Catharine, and St Margaret bent over her and whispered in her ears her heavenly mission, and though calm to outward eyes, henceforward she lived an inward life apart, given to God and her saints. During that unhappy time of national degradation a prophecy, ascribed to Merlin, was current in Lorraine, that the kingdom lost by a woman (Queen Isabella) should be saved by a virgin, and no doubt this, together with her visions, helped to define her mission to the brooding and enthusiastic mind of the young peasant girl. 'I had far rather rest and spin by my mother's side,' she said with simple pathos, 'for this is no work of my choosing, but I must go and do it, for my Lord wills it.' Her story was at first laughed to scorn, but her persistence bore down all opposition, and at last she succeeded in making her way to the Dauphin and convincing him by secret signs of her sincerity. 'There is more in God's book than in yours,' she said to the doubting and hesitating theologians. She put on male dress and a suit of white armour, mounted a war charger, bearing a banner of her own device—white embroidered with lilies, on one side a picture of God enthroned on clouds, on the other the shield of France supported by two angels, together with a pennon on which was represented the Annunciation. Her sword was one that she divined would be found buried behind the altar in the church of St Catherine de Fierbois. Thus equipped she put herself at the head of an army, dictated a letter to the English, and advanced to aid Dunois in the relief of Orleans, which was hard beset by the victorious enemy. She set out on her mission with two aims—aims which show the genius of her character—to raise the siege of Orleans, the key to the military situation; and to crown the Dauphin at Reims, the key to the political situation, as there would then be a legitimate rallying-point for the supporters of France. By sheer force of personality she was not only obeyed by men like the 'Bastard of Orleans' (Comte de Dunois) and 'La Hire,' but by her genius she made them her warmest adherents. Her strength of will and certainty of purpose soon put some enthusiasm into the army. Indeed, so far did her striking personality obtrude itself that she new-modelled the forces, and the voluptuary and the blasphemer had to amend their ways. On the 29th April 1429 she threw herself into the city, and, after a week of fighting, the English were compelled to raise the siege and

retreat (May 8th), carrying with them a tale of terror at the strange witchcraft by which they had been overcome. At once the face of the war was changed, the French spirit again awoke, and the victory of Patay (one of the outstanding battles of history), the capture of Troyes and Châlons, and many other towns in the valley of the Loire, cleared the way for the second of her great aims, the coronation at Reims. Though shrinking from the physical facts of warfare, her splendid courage did not desert her, and even two wounds were not allowed to interfere with her mission of which heaven had given such infallible proofs, and now, with resistless enthusiasm, she urged on the weak-hearted Dauphin to his coronation. At length she was able to persuade him that the road was clear to Reims, and thither she hurried. With the coronation came the end of her career as at first intended. The duties imposed upon her by the voices had been performed, and she wished to return home. 'Would it were God's pleasure,' she said to the archbishop, 'that I might go and keep sheep once more with my sister and my brothers: they would be so glad to see me again.' Persuaded to remain, she was asked by King Charles to name any reward she desired. She asked for freedom from taxation for Domremy, and so it was, at least for many years. Her far-sightedness showed her that if she were to remain with the army her next aim must be the capture of Paris, but not even Joan could infuse spirit into the hesitating coward and his corrupt courtiers, and she wore out her heart with vexation as she saw the work of heaven prevented by the unworthiness of man. She continued, however, to command the French armies, and was present in many conflicts. At length, on the 13th May 1430, she captured Compiègne, then besieged by the forces of England and Burgundy. After going to Crespy for reinforcements she returned to Compiègne; and on the 24th, whilst leading a sortie towards Paris, was captured. After being kept as a prisoner at Beaulieu and Beaufort she was in November of the same year sold by Jean de Luxembourg to the English, and was by them taken to Arras, whence she was brought to Rouen, the headquarters of the English forces. Lest she should escape if tried before either a purely civil or a purely ecclesiastical court she was brought before a 'Court Christian,' which was a mixture of an ecclesiastical and an inquisition court. It was really an international court. Pierre Cauchon, then Bishop of Beauvais and a wretched creature of the English, was the leading judge in the case, which at one time included two judges and sixty-three assessors. Reading the very graphic and detailed proceedings of that court one is forced to conclude that Joan, wronged though she undoubtedly was, had a much fairer trial than has been commonly supposed. Her trial was long, and fell into three distinct divisions: the *cause de l'apprise*, which lasted from the 9th January 1431 to the 26th March; the *trial in ordinary*, which ended in her being sentenced to perpetual imprisonment, till 24th April; and the *cause de relapse*, which brought her to the stake on 30th May. Day after day a host of learned doctors asked her tortuous questions. Her answers show forth the noble simplicity of very truth. Innumerable questions on the nature of her visions were answered with the same calmness and strength, and her judges were for very shame driven to finish the interrogations in private. In the judgment she was found guilty of sacrilege, profanation, disobedience to the church, pride, and idolatry; and the formal condemnation was conveyed in twelve articles. The judges did not disallow the possibility of heavenly visions, but they declared those of Joan to be illusions of the devil. They were now ready to send her to her doom, but

they wished first to force her to an abjuration in order to degrade her in public opinion, and they tortured her by alternate threats and promises, until at last, in the hope, indeed with the promise, of being liberated she recanted, and said that her voices and mission were alike false and not from God. Having obtained her recantation, her judges forgot their promise, and sentenced her to perpetual imprisonment. At this Joan's courage immediately returned, and she withdrew her recantation, saying she preferred death. The fact of her wearing male dress was also used against her, and without delay she was sentenced to be burnt at the stake. This took place on 30th May 1431, when she was only nineteen years of age. She faced her doom with the triumphant courage of the martyr, declaring that she knew her revelations were from God, and that she had only submitted through a momentary fear of the fire. She was permitted to have the consolations of the church, and received the sacrament, while a priest held a crucifix before her till the last. So perished the maid, now recognised as a great warrior saint with one of the finest and most attractive characters of any martyr in the Christian calendar.

But Joan's mission was accomplished, and by the enthusiasm that she awoke the English were driven from the sacred soil of France. Twenty-five years after her death Pope Calixtus III. acceded to the prayer of her mother and her brothers (who had been ennobled under the name De Lys), that the process by which she was condemned should be re-examined. After a careful inquiry the finding was that the twelve articles on which her sentence was based were false, and that therefore the whole proceedings of the Bishop of Beauvais were null and void. The judgment was publicly declared on the spot, in the market-place of Rouen, on which she suffered. But long before this she had been enshrined a saint in the popular imagination, which read the wrath of heaven into the sudden end that was said to have quickly come to every one connected with the trial. Indeed, the people had been slow to accept the fact that the maid was actually dead, and at first readily believed in the impostor who arose in Lorraine five years later. Joan was named Venerable (1902), declared blessed (1908), and canonised (1920).

The national or individual tendencies of such writers as Schiller, Voltaire, Anatole France, Andrew Lang, and Mark Twain have too often led them to portray the Joan they would have liked her to be instead of the Joan she actually was. Few are so clear and unprejudiced as Bernard Shaw in the preface to *St Joan*. Painter and sculptor have spent their genius on the theme, seldom adequately realising its simple grandeur. The head in the Musée Historique at Orleans is commonly supposed to be, if not an actual portrait, at least a work done by some one who had seen Joan of Arc. See Quicherat's elaborate work, *Procès de Condamnation de Jeanne d'Arc* (5 vols. 1841-49, a detailed account of the trial and rehabilitation which threw a new light on Joan's life); Michelet, *Jeanne d'Arc*; Siméon Luce, *Jeanne d'Arc à Domremy* (1906); books by Joseph Fabre, *Le Brun de Charmettes* (1817), H. Wallon (4th ed. 1888); Sorel, *La prise de Jeanne d'Arc devant Compiègne* (1889); Ayrolles, *La vraie Jeanne d'Arc* (1902); T. D. Murray, *Jeanne d'Arc* (a translation of the *Procès de Condamnation et Réhabilitation*; 1902); Anatole France (1908), and Andrew Lang (in reply to him, 1908), G. Hanotaux (1911); Barrès, *Autour de Jeanne d'Arc* (1916); C. Sarolea, *The Maid of Orleans* (1918); and Bernard Shaw's play, *St Joan* (1924).

JOB, THE BOOK OF. No book in the Old Testament has made a greater appeal to the human mind than the Book of Job. Luther spoke of it as 'magnificent and sublime as no other book of Scripture.' Thomas Carlyle could scarcely find words to express his admiration of it. 'I call the Book of Job,' he says, 'one of the grandest things

ever written with pen . . . a noble book, all men's book. There is nothing written, I think, in the Bible or out of it of equal literary merit.' And Tennyson did not hesitate to describe it as 'the greatest poem whether of ancient or modern times.' The appeal of the book is very largely due to the subject with which it deals. Its main theme is the eternal problem of human suffering and pain. Job is the Prometheus of Israel, and the Book of Job occupies the same position in Hebrew literature as the *Prometheus Vinculus* of Æschylus and the *Edipus Rex* of Sophocles do in Greek—only the Book of Job is infinitely superior to its two rivals because its treatment of the subject is far more profound. Part of its popularity, however, is undoubtedly to be ascribed to its own intrinsic artistic merit. In its dramatic character and in the beauty of its poetic style it is absolutely unique in the Old Testament. From the literary point of view it must be regarded as the greatest achievement of the Hebrew mind. In recent times Mr H. G. Wells has attempted to give us a modern version of the Book of Job in his *Undying Fire*. The story is given a present-day setting and the arguments are modernised; but the ground traversed is practically the same, and in the end a similar result is reached.

There has been considerable discussion as to the particular class of literature to which the book belongs. Some writers have described it as a lyrical poem or a series of lyrical poems, but such a description is entirely inadequate. Generally speaking, the book is styled a drama, but there is too little action in it to make that term quite apt. Cheyne calls it a 'germinal character drama,' and compares it with the *Iphigenia* of Goethe. Perhaps Driver's account of it is the best that has yet been given: 'It is of the nature of a drama, and may be termed a dramatic poem. Its principal parts are constructed in the form of a dialogue, and the action which it represents passes through the successive stages of enlargement, development, and solution. The action is, however, largely internal and mental, the successive scenes exhibiting the varying moods of a great soul struggling with the mysteries of fate, rather than with trying external situations.'

Contents.—The book in its present form may be divided into the following parts: (1) The proemium (chaps. i.-iii.); (2) the discussion between Job and his three friends (chaps. iii.-xxxi.); (3) the speeches of Elihu (chaps. xxxii.-xxxvii.); (4) the answer of God from the whirlwind (chaps. xxxviii.-xlii. 6); (5) The epilogue (chaps. xlii. 7-17). The proemium describes the plot of the drama. It depicts the successive calamities which befell Job, who is described as 'perfect and upright, fearing God and eschewing evil.' These disasters come upon Job at the instance of Satan in order to test the reality and disinterestedness of his religious faith. The proemium raises the question as to whether there is any basis of fact behind the description of the tragedy. That Job actually existed and that he was regarded as one of the heroes of faith is proved by the explicit statements in Ezekiel, xiv. 14, 19, where he is ranked with Noah and David. It does not, however, follow from this that the picture in the opening chapters of the book is drawn from life. Much of the story—e.g. the account of the council in heaven—is obviously the creation of the religious imagination. Probably Duhm is right in regarding the narrative as a 'Volksbuch' or popular story which had been handed down from generation to generation. Originally, no doubt, it was based upon fact, but legendary accretions were certainly added to the tale in the process of its transmission. The writer of Job did what most poets and dramatists do, i.e. he took a

traditional story and built up on it his own drama. Duhm thinks, and there is much ground for his conclusion, that the story existed in a literary form long before the Book of Job was written, and that the author used this old material and wove around it the fabric of his drama. While it is not possible, therefore, to go as far as the Talmud, which definitely states that 'Job existed not and was only created to be a parable,' and while it seems necessary to assume a substratum of fact behind the story, it is impossible to deny that there are many elements in it which are due to legendary embellishment and the work of the imagination. The tragedy of Job's sufferings has been intensified in order to form the theme of theological debate. (2) The bulk of the book (chaps. iii.-xxxi.) is occupied with the discussion on the problem of suffering between Job and his three friends, Eliphaz, Bildad, and Zophar. The speeches fall into three cycles: (a) chaps. iv.-xiv.; (b) chaps. xv.-xxi.; (c) chaps. xxii.-xxxi. Each of these cycles consists of six speeches, one by each of the friends and a reply by Job. In the last cycle, however, the third disputant, Zophar, fails to speak. The discussion opens with a bitter complaint from Job, who curses the day on which he was born, since his life has only become a misery to him, and the release of death is denied him. This agonising outburst forms the starting-point of the debate. Job's wild cry of anguish appears to his friends to be an act of impiety. They remonstrate with him in elaborate arguments, which call forth equally elaborate replies from the sufferer. In the first cycle of speeches the disputants lay stress on the goodness and justice of God, whose government of the world is based upon moral principles, and who metes out reward and punishment to men in accordance with their deserts. Job meets the challenge by a fervid assertion of his own innocence and a bitter arraignment of the Divine ordinance. In the second cycle the drama deepens. Job's antagonists dwell upon the lessons taught by experience, and try to show that where suffering exists, it can generally be proved that there was anterior sin, and finally hint that it is in this direction that an explanation must be sought to account for the calamities which have befallen him. Job in reply reiterates his innocence, and refuses to admit that any such explanation exists. In the third cycle the friends become more explicit, and state definitely that, whether he admits it or not, Job must have been guilty of some terrible sin to account for his sufferings. But as the speeches of his friends increase in violence, Job's mind becomes calmer, and his faith grows surer. The bitterness which characterises his opening monologue passes away, and he seems to reach, if not a clearer vision, at any rate a greater trust in God. (3) At this point in the drama Elihu, who has not been previously mentioned, takes up the parable. He charges the three interlocutors who have already spoken with weakness, and says their arguments are unsatisfactory (chaps. xxxii.-xxxvii.). He attempts to vindicate the Divine Providence, and severely condemns Job for attempting to justify himself. Elihu, however, has a larger conception of the problem in some respects than his predecessors in the debate. They had regarded suffering as always penal—a punishment for sin. Elihu, on the other hand, holds that it may also be remedial and corrective. This larger theory does not, however, throw much light upon the discussion, as Job still refuses to admit any consciousness of sin. (4) The Divine theophany (chaps. xxxviii.-xlii. 6). In this section God is represented as answering Job from the whirlwind. These chapters contain a sublime description of the majesty of God in the works of creation. The emphasis is laid upon the infinite

power and inscrutable wisdom which fashioned the universe in all its parts. The omniscience of God is contrasted with the ignorance of man, and the question is asked, How can man, who cannot explain even the simplest facts of nature, hope to master the secret of the mysteries of God? Job is overwhelmed by this Divine manifestation, and replies, 'Now mine eye seeth thee, wherefore I abhor myself and repent in dust and ashes.' (5) The epilogue (chap. xlii. 7-17) contains the *dénouement* of the drama. Job is restored to double his former prosperity. His vindication is complete, and on his petition the Divine mercy is extended to his friends.

The Problem and its Solution.—The problem of the book, as has already been explained, is to account for the presence of suffering in the world. The orthodox position of the time is represented in the speeches of Job's friends that all suffering is to be explained as a punishment for sin. This was the formula by which current Jewish theology attempted to account for the presence of evil in the world; and the Book of Job represents one of the great revolts of Jewish thought against the tyranny of the formula. The persistence of the formula is proved by the existence of other protests—e.g. in the seventy-third Psalm and the Book of Wisdom, and it survived even into New Testament times, as is shown by the question put to Jesus in John ix. 2, 'Who did sin, this man or his parents, that he was born blind?' The formula, however, was constantly open to criticism on the ground that it was false to the facts of life. Virtue does not always carry off the prizes. The greatest sufferers are not always the greatest sinners. Vice sometimes manages to evade the penalty. And in the Book of Job an attempt is made to disprove the formula by taking the case of a man who *ex hypothesi* is 'perfect and upright' and yet is overwhelmed by a perfect deluge of calamity. But what solution has the Book of Job to offer as an explanation for the presence of suffering in the world? What substitute has it to offer for the theory which it shatters by its criticism? To this question it is not easy to find a certain answer. There are some scholars, like Dr G. Buchanan Gray, who maintain that the book 'was not intended to handle the wide question, "Why do the righteous suffer?" but was concentrated on denying the prevalent dogma that suffering and adversity are marks of sin in the individual sufferer and of the Divine displeasure resting upon him.' The purport of the book is, on this theory, negative rather than positive. It destroys the orthodox position, but fails to find a substitute for it. But this seems to be an unsatisfactory explanation of the object of the book. The work of criticism is only half accomplished unless criticism be followed by reconstruction. The majority of scholars accordingly hold that the book succeeds in establishing a positive position, though they are by no means agreed as to what constitutes this position. In fact, there are some who think that it contains contradictory solutions. The following suggestions are made: (1) Some think that the real contribution of the book lies in the preface, which 'suggests,' as Dr Davison puts it, 'that the drama of our earthly life has a significance which earth itself does not exhaust.' . . . 'It may be needful to prove the disinterestedness of goodness to men, to angels, and to devils' . . . 'and on some is conferred the high prerogative of suffering in order to demonstrate to a scoffing world what righteousness really means.' (2) Others, on the contrary, think that the epilogue contains the real solution of the problem. The whole issue has arisen because Job's critics 'have taken short views of life.' They have taken a mere phase in the action of Providence, and

treated it as if it were the last word God had to speak. Judgment ought not to be passed on a mere fraction of life. We must wait till the final chapter before we can pass judgment on the book of life. (3) Others, again, think the real answer is to be found in the Divine theophany, though they are bound to admit that the answer is not very easy to decipher. The point seems to be this: The limitation of man's knowledge makes it impossible for him to understand the inscrutable ways of Providence. If there are mysteries in nature which the mind of man cannot unravel, we must expect that there will be mysteries, too, in the workings of Divine Providence, and we must acquiesce, even though we cannot explain. (4) Others, again, have found the key to the riddle in these passages in which Job expresses his invincible faith in God in spite of the calamities which have overwhelmed him. It is 'the will to believe' that constitutes the main emphasis of the book. 'Though he slay me, yet will I trust him.' 'I know that my Vindicator liveth.' It is in triumphant expressions of faith such as these that the main lesson of the book is to be found. Reason may falter and miss the way, but faith is indestructible, and clings to God in spite of all. (5) Others, again, think that the real gleams of light are to be discovered in the speeches of Elihu. The moral of these speeches is that the old formula is too narrow, and must be enlarged by the introduction of the conception that punishment is remedial as well as penal, and often, too, not merely remedial, but monitory and deterrent in addition.

The Integrity of the Book.—There is a grave doubt as to whether the Book of Job, as it stands, is a unity—the work of a single poet, or whether it may not have been enlarged from time to time by later hands. In the first place, the original LXX version of Job, as we know from the statements of Origen, was considerably shorter than the Hebrew text, and there are some serious omissions, especially in the group of Elihu speeches. It is uncertain, however, whether we are entitled to deduce from this fact with Hatch the conclusion that when the LXX translation was made the Book of Job was much shorter than it is at present, or whether we ought not rather to assume with Dillmann and Driver that the LXX is guilty of arbitrary omissions. There is much to be said for the position of many modern scholars who hold that the Elihu speeches are a later addition to the book. Elihu seems to be introduced as an afterthought. The style of his speeches differs from that of the other three interlocutors. 'It is,' as Dr Peake says, 'strongly marked by Aramaisms and uses words which rarely or never occur elsewhere in the poem.' Then, too, the poem on wisdom (chap. xxviii.) seems irrelevant in its present context and at variance with the speeches containing the Divine theophany. Moreover, the detailed descriptions of leviathan and behemoth (xl. 15-xli. 34) seem out of place in the theophany, and are generally regarded as later insertions. There is some ground, too, for supposing with Duhm that the introduction and epilogue were not the work of the same hand which composed the poems.

Date of the Book.—It used to be assumed that the Book of Job was one of the earliest books in the Old Testament. The strongest argument adduced in favour of this theory was the patriarchal setting of the story. This position has now been almost unanimously abandoned by modern scholars on the following grounds: (1) The first reference to the book is found in a statement of the Greek historian Aristeus, who belonged to the 2d century B.C. If the Book of Job was early, it is difficult to explain the absence of references to it in Jewish literature before Aristeus. (2) The

historical references in xii. 17-23 seem to imply conditions which did not arise before the establishment of the Babylonian empire. (3) The conception of God in the book belongs to a late stage in Israel's religious development. (4) The central problem of the book, the explanation of individual suffering, could not have emerged until the religious value of the individual had been emphasised by Jeremiah and Ezekiel. (5) There is no trace of a belief in Satan in the pre-exilic period. (6) The author of Job seems to have made use of Jeremiah, Isaiah, and Psalm viii. On these grounds the general consensus of modern opinion regards the book as post-exilic. Duhm dates the book in the early part of the 5th century B.C. Other scholars prefer a later date, about the close of the 5th century.

The best modern English commentaries are Peake (*Century Bible*), A. B. Davidson (*Cambridge Bible*), Franks (*Peake's Commentary on the Bible*). The outstanding German commentaries are Duhm, Dillmann, and Budde. See also introductions to the Old Testament by Driver, G. B. Gray, &c., and articles in the Biblical encyclopaedias; Cheyne, *Job and Solomon*; Peake, *The Problem of Suffering in the Old Testament*.

Job's Tears (*Coix Lacryma*), an Indian grass, sometimes rising to the height of 8 feet, with the stout habit of maize, to which also it is botanically allied. The name is derived from the tear-like form of the hard, shining, bluish-white seeds, which are sometimes made into bracelets and necklaces, and are also an article of food. Though one of the worst of the cereals, it has become almost naturalised in Spain and Portugal, and is grown in Italy.

Jocelin de Brakelond, a Benedictine monk at Bury St Edmunds, was abbot's chaplain and almoner, wrote a domestic chronicle of his abbey from 1173 to 1202, and died about 1211. The *Chronica Jocelini de Brakelonda* displays the admiration of the shrewd monk for his superior, Abbot Samson, and gave Carlyle the inspiration out of which grew *Past and Present*, one of the happiest (but least historical) of his works. The chronicle was edited by Rokewode (Camden Society, 1840), by T. Arnold (Rolls Series, 1890), and translated by Tomlinson (1844), Sir E. Clarke (1903), and Jane (1922). Brakelond was a street in Bury St Edmunds.

Jockey Club. See HORSERACING.

Jodeln, a peculiar manner of singing with the falsetto voice in harmonic progressions, practised by the Tyrolean and the Swiss. See VOICE.

Jodhpur, or MARWAR, the largest in area of the Rajputana states, containing 35,000 sq. m.; and second in population, though owing to the famine the numbers fell from 2,521,727 in 1891 to 2,057,553 in 1911, and to 1,841,642 in 1921. Cotton and wheat are grown; iron, zinc, salt, and marble are amongst the mineral wealth. The salt comes from the Sámbar lake, half in Jodhpur and half in Jeypore (q.v.). The climate is remarkably dry, and the difference of temperature between night and day very great. Jodhpur was taken under British protection in 1818, paying tribute, and providing a 'contingent' of native horse. The contingent joined the mutineers in 1857. Since 1873 the administration has been reformed and the state has shown great loyalty. The capital city of the state, Jodhpur, founded in 1459, has fine palaces and temples, gardens and tanks, flour-mills, electric light, tramways, hospitals, and a college; pop. 63,500.

Joel, the second in order of the twelve minor prophets. He is designated in i. 1 as the son of Pethuel, or (as it is given in most of the ancient versions) Bethuel, but of his personal history nothing is told. It can be inferred, however, from

his book that he lived in or near Jerusalem considerably after the exile. The Book of Joel falls into two distinct parts, the separateness of which is obscured for readers of the Authorised English Version by the use of futures instead of preterites in ii. 18, 19a; the passage is correctly given in narrative form in the Revised Version. The first part, addressed by the prophet in his own name to his contemporaries, relates to a present plague of locusts and the calamities caused by it; i. 2-ii. 11 describes with vivid hyperbolic imagery the dire invasion which threatens the destruction of the country and the arrival of the final consuming judgment known as 'the day of Jehovah'; in ii. 12-17, speaking in the name of Jehovah, he summons the people to a solemn fast at the sanctuary and the priests to intercessory prayer. The second part contains Jehovah's answer, prefaced by the passage already referred to (ii. 18, 19a): 'Then was the Lord jealous for his land, and had pity on his people; and the Lord answered and said unto his people.' First, a promise of fruitful seasons to make up for the ravages of the locusts is given (ii. 19-26); this is followed by the promise of the outpouring of the Spirit on all the Jews and even upon their servants and the final coming of the day of the Lord, which is to issue in a divine judgment upon their heathen enemies in the valley of Jehoshaphat ('Jehovah judgeth') and in the final establishment of Jerusalem as a holy city, the centre of fertility to the surrounding land (ii. 27-iii. 21). The style of Joel is regarded by scholars as elegant and pure rather than original; his prophetic conceptions are largely modelled on those of older prophets from Amos to Ezekiel. Until modern study the prevailing inclination of critics was to assign an early date to the book, most of them placing it in the minority of Josiah, king of Judah, because the priests, and not a king, appear as heads of the commonwealth. But this goes better with the post-exilic date, to which other features in the prophecy clearly point. The dispersion of Israel is alluded to in iii. 1, 2; Judah and the people of Jehovah are regarded as synonymous; and the reference to the slave-trade with the Grecians is inconsistent with an early date. Ancient and mediæval interpreters commonly took the locusts in Joel's prophecy figuratively or allegorically, and the same view has been argued for, though by no means convincingly, by some recent scholars. There are commentaries by Merx (1879, with history of interpretation down to Calvin), Driver (1891), and J. A. Bewer (*Internat. Crit. Comm.*, 1912). See also the commentaries mentioned under HOSEA.

Joe Miller's Jest. See JEST-BOOKS.

Joffre, JOSEPH JACQUES CÉSaire, Marshal of France, was born at Rivesaltes (Pyrénées-Orientales) in 1852, of Catalan parentage. He was educated at Perpignan, and after serving in the Franco-Prussian war as a temporary sub-lieutenant was given a commission in the engineers. From 1885 to 1888 he was employed at Formosa and Indo-China on defence work. After four years at home he was seconded once more to the colonial government. In 1894, by a brilliant march to the relief of Timbuktu, he for the first time brought his name before the general public. As secretary of the Military Inventions Committee; at work on the Diego Suarez forts, Madagascar; as general of Division; as governor of Lille; and as commander of the second corps, he passed the years, until in 1911 he was appointed to the *Conseil Supérieur de la guerre*, and nominated generalissimo designate in the event of war. On its outbreak it was his sound common-sense and entirely unexcitable nature which became the immovable props on which a flurried and excited country could rely, and

when after the retreat before the overwhelming force of the German armies he commanded his forces to stand fast, they turned, and the 'miracle of the Marne' raised Joffre's prestige to a height far above that of any of his fellow-generals. Later on, however, criticisms began to be heard, but Joffre went on unperturbed, and in December 1915, although appointed to the command of all the French armies, he managed to retain the immediate governance of the forces on the Western Front. His assurance regarding the strength of the armies at Verdun and the slowness of the Soume offensive were the rocks on which he foundered, and in November 1916 Nivelle was appointed to the supreme command, and Joffre became 'technical adviser to the government.' He was created 'Marshal of France,' a title brought out of abeyance for him, and in 1917 he went on a mission to the United States, and became a member of the Académie Française, but his influence on the course of the war had waned. Able to appeal to the average Frenchman, it was his insensibility to intrigue and his power of listening to all sides of a problem and then fixing on the essentials with a tenacity which nothing could shake, which made Joffre a figure of such prominence and such a suitable personality for the position he was called upon to hold.

Johanna, one of the islands of the Comoro (q.v.) group.

Johannesburg, the chief town and mining centre of the Transvaal goldfields, is situated about 6000 feet above sea-level, 293 miles N.E. of Kimberley, and 350 miles N. of Ladysmith. Railway connection, completed in 1892, brought Johannesburg within 60 hours' journey of Cape Town; and it is now connected also with Port Elizabeth (714 miles), Durban (437 miles), and Lourenço Marquez on Delagoa Bay (396 miles). In 1886 the Transvaal government proclaimed certain farms on the famous Reef of Witwatersrand as public goldfields; and the ground on which Johannesburg now stands was selected as the site of the new station or town. From the time of the foundation (1887) the town and the mining industry grew rapidly. In 1895-96 it became the scene of the struggles of the Uitlanders to extort political and other rights from the Boer government (interrupted by the Jameson (q.v.) raid of January 1896), which eventually resulted in the war of 1899-1902, and the annexation of the Transvaal and Orange Free State as British colonies. A dreadful dynamite explosion wrecked part of the town in 1896. As yet in 1890 (with pop. of 60,000) the streets were not lighted, and only the concession for paving the principal street had been granted. The government buildings consist of the post and telegraph offices, and the mining-commissioner's and the landdrost's (magistrate's) offices, &c. The university college was chartered as the University of the Witwatersrand in 1922. Fine banks, churches, hotels, club-houses, with shops and private houses, and a magnificent stock exchange, law courts, art gallery, and an observatory have been erected. The climate is, or would be, very healthy were not the sanitary conditions so unsatisfactory, and were it not for the frequent terrible dust-storms. The population in 1921 was 288,131, of whom about 152,000 were whites, 136,000 natives and coloured. Johannesburg is by far the largest town in the Union. See TRANSVAAL.

Johannisberg, a village of Prussia, overlooking the Rhine, 13 miles WSW. of Wiesbaden. It has a castle (1722-32), but is noteworthy chiefly for its famous vineyards on the castle hill producing the choice *Johannisberger* white wine.

John, the Apostle, the son of Zebedee and the brother of James, was originally a Galilean fish-

man. A conjecture has been put forward that his mother was Salome, and that she was a sister of Mary the mother of Jesus, but the evidence is inconclusive. There is more probability in the view that he was the unnamed disciple of John the Baptist mentioned in the fourth gospel (i. 35), who, in company with Andrew, transferred his allegiance to Jesus. He became one of the inner circle of the disciples, and with Peter and James was present at the miracle of the raising of the daughter of Jairus and the Transfiguration. The occasions upon which he comes into prominence in the gospel story are few. In Luke, John and James are represented as wishing to call down fire upon a certain Samaritan village which had refused to receive Jesus (Luke, ix. 54). On another occasion John's mother endeavours to induce Jesus to promise a special place of dignity to her sons when the kingdom comes (Mark, x. 35). With Peter he is commissioned to secure a room for the Passover, and make preparations for the feast. Only one instance is recorded where John acts entirely by himself, i.e. the question which he puts to Jesus as to what is to be done to the man who had been found casting out devils in the name of Jesus. These fragmentary references seem to justify the title which Jesus bestowed upon John and his brother James—Boanerges, 'Sons of Thunder.'

John, EPISTLES OF. Three epistles are ascribed to John in the New Testament. The first epistle was probably closely associated with the fourth gospel, of which it may have formed the covering letter. It is a warm and glowing appeal to the Christians of Asia Minor to maintain the faith, to keep in fellowship with Christ and with one another, and to practise the rule of love. It contains a strong protest against a form of heresy—which is identified with Antichrist—and which is usually assumed to be Doketism, i.e. the theory which denied the real humanity of Jesus, and the particular type of Doketism attacked is probably that associated with the name of Cerinthus. The second epistle is a personal note addressed 'to the elect lady and her children,' though this expression has sometimes been regarded as a figurative description of a church. The third epistle is unmistakably personal, and is addressed to Gaius, whom it commends for his hospitality and devotion, to warn him against Diotrephes, 'who loveth to have the pre-eminence,' and to commend to him Demetrius, who was probably the bearer of the letter. Harnack thinks that this epistle marks a crisis in the development of episcopal government in the church. Its author is seeking to exercise episcopal authority over the church, and its own bishop, Diotrephes, is resisting an attempt to interfere with what he regards as the liberty of the church. The first epistle is known to have been in existence as early as the time of Papias (135), and was always recognised as part of the New Testament canon. About the second and third epistles there is more doubt. For some time they were placed among the 'disputed books,' especially by writers belonging to the Eastern division of the church. The fact that the author of the second and third epistles describes himself as 'the presbyter' has led many modern scholars to suppose that not only these two letters but the first epistle and the fourth gospel as well are the work of John the Presbyter. The best modern commentaries are by Westcott (1892), Brooke (*International Critical Commentary*), W. H. Bennett (*Century Bible*), Holtzmann-Bauer (1908), Huther (1880). See also New Testament Introductions by Moffatt, Jülicher, Peake, Holtzmann, &c.

John, THE GOSPEL OF. From the time of Irenæus to the end of the 18th century the fourth gospel was unanimously ascribed to John the

Apostle. In modern times, however, the authorship and value of the gospel have been the subject of keen debate. Modern scholars are divided into no less than six camps. (1) Those who still maintain the traditional view that the fourth gospel was written by the apostle John, e.g. Westcott, Zahn, Lightfoot. One of the best modern expositions of this theory is found in Drummond's book on *The Character and Authorship of the Fourth Gospel*. (2) Those who hold that the fourth gospel in its present form was written by a personal disciple of John, who embodied his master's teaching. This view is very widely adopted to-day as a compromise between modern criticism and the traditional view. (3) Some scholars question the unity of the gospel, and think that, like the synoptics, it is a compilation of different sources. This theory has been very strongly advocated by Wendt, who maintains that the gospel was formed out of two main sources—the one containing the prologue and the speeches of Jesus, the other the historical narratives. Wendt holds that the source containing the discourses is Johannine, but the historical framework the work of a later and less reliable writer. The former source was a collection of the discourses delivered by Jesus at the end of his life, but these have been wrongly distributed by the compiler, who places some of them quite early in the ministry. (4) There is an increasing tendency among scholars to ascribe the gospel to John the Presbyter. This view was first put forward by Delft, and has been accepted by such important authorities as Harnack and Bousset. Harnack, however, still maintains that there is an indirect connection between the gospel and John the Apostle, since John the Presbyter is supposed to have been his disciple. Harnack's formula for describing the fourth gospel is 'The Gospel of John the Presbyter according to John the son of Zebedee.' (5) A modified form of this view is put forward by the American scholar Bacon. According to Bacon the so-called Johannine epistles were written by an elder whose name may possibly have been John, but on the other hand may equally well have been 'Alcibiades or Melchizedek,' or anything else. The gospel was compiled by a later writer, who made use of materials left by this elder. It is quite possible that the elder may have been a disciple of John the Apostle. (6) The most extreme form of modern criticism is that of Schmiedel, who maintains that the fourth gospel cannot have been derived even indirectly from an apostle or from John the Presbyter. It is the work of an entirely unknown author, and was composed about 140.

The case for the Johannine authorship rests chiefly on internal evidence. It is maintained that the Hebraic style in which the fourth gospel is written proves that it must have been the work of a Jew; that the intimate acquaintance which it exhibits with the history and geography of Palestine, the customs of the people, &c., proves that it must have been the work of a Palestinian Jew; that the details which it introduces into the narrative, e.g. the description of the pool of Bethesda, the frequent specification of the exact time at which events happened, &c., prove that it was the work of a contemporary; and, finally, certain specific references prove clearly that it was the work of one who belonged to the inner circle of disciples. These references are as follows: (a) the statement in the prologue, 'We beheld his glory'; (b) the statement in John, xix. 35, 'And he that saw it bare record, and his record is true, and he knoweth that he saith true that ye might believe'; (c) the statement in John, xxi. 24, 'This is the disciple which testifieth these things and wrote these things: and we know that his

testimony is true.' In this passage the disciple in question is identified with 'the disciple whom Jesus loved, who also leaned on his breast at supper.'

The external evidence is not so convincing, since the earliest witness to the Johannine authorship is Theophilus of Antioch (c. 170). Drummond, however, has adduced strong evidence to prove that Justin Martyr used the fourth gospel and included it among 'the memoirs of the apostles,' and Lightfoot thinks that is some proof that the Johannine authorship of the gospel was recognised by Papias.

The case against the Johannine authorship rests upon the following grounds: (1) The weakness of the external evidence. The earliest reference to the Johannine authorship is, as we have seen, in Theophilus of Antioch (170). There can be no doubt that the fourth gospel was much less used by Justin Martyr than the synoptics, and it is difficult to reconcile this fact with its acceptance of the Johannine authorship. (2) The discrepancies between the fourth gospel and the synoptics. Upon points of history there is divergence with regard to the duration of the ministry of Jesus, the numbers of visits to Jerusalem, and the day of the Crucifixion—to say nothing of smaller points, such as the date of the cleansing of the temple, and the account of the call of the disciples. It is quite possible that on most of these points some method of reconciling the two narratives might be found; but in the account of the teaching of Jesus the discrepancy between the two versions is much more vital. In the synoptics the sayings of Jesus are terse, didactic, and aphoristic; in the fourth gospel the speeches are long and discursive, and there is a comparative absence of the compact and clear-cut utterances which we find in the synoptics. The subject-matter, too, is different. In the synoptics the teaching of Jesus is chiefly ethical, and the main thought of his utterances centres in the establishment of the kingdom; in the fourth gospel the ethical teaching falls into the background, and the centre round which all the speeches revolve is, as Sanday says, 'the Speaker Himself, His works, His Person, faith in Him and the Divine Paraclete who was to take His place when He was gone.' Then, again, the prologue, which it is alleged shows unmistakable traces of the influence of Philo, proves that the fourth gospel could only have been written by a man who was steeped in Alexandrian philosophy, and there is an incongruity in supposing that a man with John's antecedents should have become susceptible to Alexandrian influences. On the whole it may be said that the case for and the case against the Johannine authorship just about balance each other. We have one set of arguments which seem to lead us to the inevitable conclusion that the fourth gospel was written by the apostle John; and we have another set of arguments which just as convincingly point in an exactly opposite direction. The only satisfactory conclusion seems to be that the fourth gospel in its present form is the work of a disciple of the apostle who embodied in the book material which he had obtained from his master, but allowed himself perfect freedom in manipulating and arranging his information.

The Purpose and Character of the Gospel.—The fourth gospel is not so much historical in the technical sense of the word as apologetic. This is made perfectly clear by the writer's own statement at the end of chap. xx. 'These things are written that ye might believe that Jesus is the Christ, the Son of God; and that believing ye might have life through his name.' The writer's main purpose, therefore, is to prove the theological proposition that 'Jesus is the Christ, the Son of God.' One of his favourite terms is the word 'witness,' which occurs fifty times in the gospel.

and is used in connection with the general theme of the book. The writer lays the utmost stress upon the witness of the miracles. 'This beginning of miracles did Jesus in Cana of Galilee, and manifested forth his glory' (ii. 11). The word used for miracle throughout the gospel really means 'sign.' In the fourth gospel the miracles are regarded as 'signs' or proofs of the Divinity of Christ. Then the writer appeals frequently to the witness of John the Baptist and the disciples. Of the former he says, 'The same came to bear witness to the Light, that all men through him might believe' (i. 7). The writer, too, bases an argument on the witness of the Father; cf. viii. 18, 'The Father that sent me beareth witness of me.' There is an excellent summary of the line of apologetic adopted by the writer of the gospel in v. 36, 37, 'I have a greater witness than that of John: for the works which the Father hath given me to finish, the same works that I do, bear witness of me, that the Father hath sent me. And the Father himself hath borne witness of me.' There can be little doubt that at the time when the fourth gospel was written the Church had entered upon the period of theological criticism. Ebionitism, which tried to reduce Christ to a human figure, was in the air, and the fourth gospel was written to defend the higher Christology, which had won general acceptance in the Church.

But besides being an apologetic, the fourth gospel is also a theological interpretation of the Christian facts. Christian thought seems to have passed through three stages. In the first stage the synoptic portrait of Christ held the field. In other words, the Church was contented simply with a statement of the Christian facts. Then under the influence of the apostle Paul Christian thought passed into the theological stage, and became interested in the ideas which were involved in the facts—e.g. the idea of justification, the idea of the atonement, the idea of communion and fellowship with the risen and eternal Lord. There was just the possibility that the ideas might become divorced from the facts. There seemed to be a sense of discrepancy between the synoptic picture of Jesus and the Christ of the Pauline theology. The fourth gospel represents the third stage. It was written to prove that the apparent discrepancy between the facts and the ideas was unreal, and that the life and teaching of Jesus, when properly understood, involved all the elements which characterised the later theology. The fourth gospel is the record of the life and teaching of Jesus from the point of view of the higher Christology.

The Historical Value of the Fourth Gospel.—The real problem which confronts us to-day is not so much the question of authorship, but the question of the historical value of the fourth gospel. The narrative portion of the gospel presents many difficult points upon which we have to decide whether we will follow the synoptic or the Johannine tradition, but it is on the theological side—the account of the teaching of Jesus—that the most serious problem arises. There is considerable force in the remark of Renan, 'If Jesus spoke as Matthew makes him speak, he cannot have spoken as John makes him speak.' We are bound to admit that the writer of the gospel has introduced some of his own ideas into the teaching of Jesus. Even a conservative scholar like Luthardt feels himself constrained to acknowledge 'that the subjectivity of the evangelist has been at work in a slight degree.' Sanday goes much further: 'If the evangelist is also the apostle, the discourses must have undergone a sensible modification in his mind before they were written down—a modification such as might naturally result from a strong intellect and personality operating unconsciously upon the

facts stored up in the memory and gradually giving to them a different form, though without altering their essential nature and substance.' The last phrase in this quotation contains the real point at issue among modern scholars. Do the discourses of Jesus in the fourth gospel contain the essential nature and substance of his teaching? It seems perfectly inconceivable that these discourses were a pure invention. There is great force in the judgment of Matthew Arnold: 'These discourses of Jesus cannot in the main be the writer's, because in the main they are clearly beyond his reach.' Moreover, there is one point in the synoptics where Matthew and Luke reach the theological level of the fourth gospel. It is in the well-known passage (Matt. xi. 27; Luke, x. 22) where Jesus is represented as saying, 'All things are delivered unto me of my Father: and no man knoweth the Son, but the Father; neither knoweth any man the Father, save the Son, and he to whomsoever the Son will reveal him.' This statement practically involves all the essential points in the Johannine Christology. In the synoptics, however, Jesus only reaches this level once: in the fourth gospel he invariably speaks from this standpoint. The truth probably lies somewhere half-way between the two representations. It is extremely unlikely that the synoptics are right in assuming that Jesus only spoke in this way on a single occasion, and it is even more unlikely that John is right in making Jesus use this kind of language upon every occasion. Then, again, we can be quite certain that the writer put a certain amount of restraint upon himself. Though the phraseology and style of the prologue resembles that of the discourses, the writer never puts the term 'Logos' into the mouth of Jesus. He recognises the fact that Jesus could never have spoken of himself as the Logos. Then, again, we know from the first epistle that one of the writer's profoundest convictions was that the death of Christ constituted a propitiation for the sins of the world: yet in the gospel he never once ascribes this idea to Jesus. The author of the fourth gospel, therefore, does impose some restrictions upon himself. He does not insert the whole of his theology into the teaching of Jesus, and this fact should give us some confidence in the truth of the essential elements which he does ascribe to Jesus.

Literature.—The question of authorship is discussed in all the Introductions to the New Testament—e.g. Holtzmann, Zahn, Jülicher, Moffatt, Salmon, Bacon, and Peake. The most important modern books on the subject are Drummond, *The Character and Authorship of the Fourth Gospel*; Sandy, *The Criticism of the Fourth Gospel*; Bacon, *The Fourth Gospel in Research and Debate*; Latimer Jackson, *The Problem of the Fourth Gospel*. Schmiedel's theory is expounded in his article in the *Encyclopædia Biblica*. The best discussion of the theological problem will be found in E. F. Scott's *The Fourth Gospel*. The question of historical value is discussed in Askwith's *Historical Value of the Fourth Gospel*. An article on the relation of the prologue to the body of the gospel, by H. T. Andrews, will be found in the *Expositor* of August 1914. The best modern commentaries are those of Westcott, Holtzmann-Bauer, Wellhausen, Zahn, Godet, and Loisy.

John, the name of a long line of popes, the number of whom is variously stated by different historians. John VIII. (872-82) is styled the IX. by some writers, who, accepting the story of Pope Joan (q.v.), reckon her as John VIII.; and John XV. (985-96) is also called XVI. by those who place before him another John who died within a few days of his election. Without entering into this question, it will suffice to say that the last of the line of popes called John is John

XXIII., who filled the papal chair most unworthily in 1410-15. The following popes of this name appear to deserve some special notice.—JOHN XII. was the son of Alberico, and grandson of the notorious Marozia, who, during the pontificate of John X. (913-27), ruled with almost supreme power at Rome. John was originally named Octavianus, and, being elected pope in 956 through the violence of the dominant party when only in his nineteenth year, was the first in the papal line to originate the since familiar practice of changing his name. The Emperor Otho in 963 in a synod of the clergy, overstepping all the ordinary rules of canonical procedure and legal precedent, caused sentence of deposition for scandalous life to be pronounced against John, and Leo VIII. to be elected in his stead. John, however, re-entered Rome in the following year with a strong party and drove out Leo; but his career was cut short by a dishonourable death.—JOHN XXII. is one of the most celebrated of the popes of Avignon. He was born at Cahors in 1244, and was elected pope in 1316, on the death of Clement V. Attempting to carry out in very altered circumstances the vast and comprehensive policy of Gregory VII. and Innocent III., John interposed his authority in the contest for the imperial crown between Louis of Bavaria and Frederick of Austria, by not only espousing the cause of the latter but even excommunicating his rival. The diet of Frankfort refused to obey, and a long contest ensued, not only in Germany but also in Italy, where the Guelph or papal party was represented by Robert, king of Naples, Frederick of Sicily being the chief leader of the Ghibellines. The latter was placed by John under the same ban which had already been proclaimed against Louis; but in 1327 Louis came to Italy in person, and having been crowned at Milan with the iron crown, advanced upon Rome, expelled the papal legate, and was crowned emperor in the church of St Peter's by two Lombard bishops. Immediately on his coronation he proceeded to hold an assembly, in which he caused the pope, under his original name of James de Cahors, to be thrice summoned to answer a charge of heresy and breach of fealty; after which he caused him to be deposed, and Peter de Corvara, a monk, to be elected pope, under the name of Nicholas V. These measures, however, were attended with little result. Louis returned to Germany, and the Guelphic predominance at Rome was restored, the papal representative resuming his authority. But John XXII. never personally visited Rome, having died at Avignon in 1334, when, although without incurring the suspicion of personal aggrandisement, he had accumulated in the papal treasury the enormous sum of 18,000,000 florins of gold.

John, king of England, the youngest of the five sons of Henry II. and Queen Eleanor, was born at Oxford, 24th December 1167. At his birth his father, who had provided for his elder brothers, called him John Lackland, and the name stuck to him. But the boy was Henry's darling, and he betrothed him to his wealthy cousin, Hawisa of Gloucester, made the new feudal tenants of Ireland do homage to John as well as himself in 1177, and sent him to Ireland as governor in 1185. Although John's misconduct and wanton insolence soon compelled his recall, Henry obtained the pope's consent to his being crowned king of Ireland; but the coronation never took place, and in 1189 the announcement that John was among his enemies gave the king his death-blow. Richard on his accession bestowed four English shires and other lands on John, and married him to Hawisa. No sense of gratitude, however, held John from endeavouring to seize the crown during Richard's captivity in Austria; but he was pardoned and

treated with great clemency, and was nominated his successor by his brother on his deathbed. In the 12th century the principle of primogeniture was but imperfectly adopted, and although Arthur, the twelve-year-old son of John's elder brother Geoffrey, appears to modern eyes beyond question the rightful heir to the throne, the general opinion of his own day was in favour of John, who had the nomination of the late king. Moreover, at his coronation at Westminster, which took place on 27th May 1199, the old English doctrine of election to the crown was for the last time formally asserted, nor did any man dissent. On the Continent, however, the barons of Anjou, Maine, and Touraine acknowledged Arthur, whose claims were supported by Philip of France. But Aquitaine was secured to John by the energy of his mother Eleanor, and in May 1200 he succeeded in buying off Philip, married his niece Blanche to Philip's son Louis, and received Arthur's homage for Brittany. But in the same year he persuaded his Aquitanian and Norman bishops to annul his marriage with his cousin, and married Isabel, the child-heiress of Angoulême; by which action he offended both the house of Gloucester and the powerful family of La Marche, one of whom was betrothed to the heiress. In the war that ensued, Arthur, while endeavouring to capture his grandmother Eleanor, at the castle of Mirabeau, was surprised by John and taken prisoner. Before Easter 1203 he was dead; murdered by John's orders, if not by the king's own hand, men said. This crime was used as a weapon against him by Philip, who at once marched against him, captured city after city, and finally, in March 1204, after a seven months' siege, took King Richard's 'saucy castle,' the Château-Gaillard itself, John making scarcely an effort against him. Only a portion of Aquitaine was left to the English king, nor could he recover more by the short campaigns he made in Poitou in 1206 and 1214.

The first period of John's reign thus ends with the separation of Normandy (1204), which compelled those who held lands in both countries to make choice of one: henceforward the barons of England are English. Immediately after, in 1205, John entered on his quarrel with the church, the occasion being a disputed election to the archbishopric of Canterbury. The matter was referred to the pope, Innocent III., and in 1207 he had Stephen Langton, an English cardinal at Rome, a man of great learning and piety, elected, and consecrated him when John had furiously declined to receive him. In 1208 the kingdom was placed under the Interdict (q.v.). John retaliated by confiscating the property of the clergy who obeyed the interdict, and driving the bishops into exile. Otherwise, too, he acted vigorously. He compelled William, king of Scotland, who had joined his enemies, to do him homage (1209), put down a rebellion in Ireland (1210), and subdued Llewellyn, the independent prince of Wales (1212). Meanwhile John had been solemnly excommunicated (1209), and now, in 1212, the pope issued a bull deposing him from his kingdom, and absolved his subjects from their allegiance; a crusade was proclaimed, and to Philip was intrusted the execution of the sentence. John, outlawed by the church, and hated for his cruelty and tyranny by his subjects, found his position untenable, and was compelled to make abject submission to Rome. On 15th May 1213 he resigned his crown to the pope's envoy at Dover, and agreed to hold the kingdoms of England and Ireland henceforth as fiefs of the papacy, and to pay a thousand marks yearly as tribute. This shameful submission closes the second part of John's reign. For Innocent the degrading exac-

tion was a false step. From this period may be dated the hostility to the papacy which culminated in the Reformation.

Philip, wrathful and disappointed, turned his forces against Flanders; but an English fleet surprised the French fleet at anchor and with only the sailors on board, and captured 300 vessels and burned 100 more. This put an end to all talk of invasion, and in 1214 John made a campaign in Poitou. Most of the barons, however, refused to serve abroad, and, Philip having crushed the emperor and his allies at Bouvines (27th July), John returned to enter on the struggle with his subjects which occupied all the remainder of his reign; and now for the first time in English history we see the barons, clergy, and people ranged side by side against the tyranny of the king. A demand that John should keep his oath and restore the laws of Henry I. was scornfully rejected. John relied mainly upon the support of the pope, but he also took the white cross, and endeavoured to detach the clergy with the heavy bribe of free election to bishoprics—but vainly, to their honour be it said. Preparations for war began on both sides. About Easter 'the army of God and Holy Church,' under four great earls and forty barons, assembled at Stamford and marched to London; they met the king at Runnymede, and on the 19th June 1215 Magna Carta (q.v.), the 'great charter' of the English constitution, was finally sealed. In August the pope annulled the charter, and the war broke out again. John had a share of the military talent of his family, and the first successes were all on his side, until the barons called over the dauphin of France to be their leader. Louis landed in May 1216, and John's fortunes became desperate. Yet the English leaders had already begun to distrust their foreign allies, and a number were even preparing to renew their allegiance, when death overtook the king at Newark, on 19th October 1216, in the forty-ninth year of his age.

For John's character, see the excellent accounts of his reign in Green's *Short History*, and Stubbs's preface to *Walter of Coventry* (vol. ii. 1873). See also Stubbs's *Constitutional History* (vol. i.), and *The Early Plantagenets* in 'Epochs of Modern History'; Pauli's *Geschichte von England* (vol. iii. 1858); Sir J. H. Ramsay's *Anglo-Norman Empire* (1903); Miss Norgate's *John Lackland* (1903); Powicke's *Loss of Normandy* (1913).

John II., king of France, surnamed the Good, the son of Philip VI., was born in 1319, and succeeded his father in 1350. In 1356 he was taken prisoner by Edward the Black Prince at Poitiers and carried to England. After the treaty of Bretigny (1360) he returned home, leaving his second son, the Duke of Anjou, as hostage, till he should fulfil the terms of his ransom. But in the meantime the duke escaped back to France. John, however, chivalrously kept his word, and returned to London early in 1364; but he died on 8th April in that same year, without having regained his freedom. His eldest son, Charles V., succeeded him.

John, the blind king of Bohemia, the son of Count Henry III. of Luxemburg (afterwards the Emperor Henry VII.), was born on 10th August 1296, and, having married (1310) the heiress of Bohemia, was crowned king of that country in 1311. In the struggle between the rival houses of Austria and Bavaria for the imperial crown he gained the victory for the latter at Mühldorf in 1322. In 1332-35 he was warring in Italy on behalf of the Guelphic party. In 1334 he married Beatrix of the French Bourbon house, and thenceforward was an active ally of the French king; he went to his assistance against the English in 1346, and fell at Crécy (26th August). He had been blind since 1340. During his reign Silesia was acquired from Poland.

John, AUGUSTUS, British painter, born in 1879. It was as an exhibitor at the New English Art Club that he first came into prominence. He is notable as a draughtsman, and has shown a marked genius for decorative effect, while he has most undoubtedly been influenced by Cézanne and Picasso. In fact he has been known to subordinate, and indeed to distort, form for the decorative effect to be gained. No artist of his time is greater than John in his power of characterisation. In 1921 he permitted himself to be elected A.R.A. 'The Mumpers' (1912) in the Tate Gallery shows the decorative effect he is able to achieve. During the war he was official artist to the Canadian Corps, and at the Peace Conference was commissioned by the imperial authorities to paint the outstanding figures there. 'Lloyd George,' 'Bernard Shaw,' 'Lord Fisher,' the 'Emir Faisal,' and 'Colonel T. E. Laurence' were some of those painted between the years 1916 and 1920. 'Madame Suggia' is a later portrait which exemplifies his amazing power of bringing out character, and at the same time of making a simple design extremely decorative. Although in a sense he has entered the fold of conventional art, he has not lost the powers acquired as a rebel against the flaccidity and supineness he saw around him.

John Dory. See DORY.

John of Austria was a natural son of the Emperor Charles V. and Barbara Blomberg of Ratisbon, and was born 24th February 1547. He was early brought to Spain, and after the death of his father was acknowledged by his half-brother Philip II. Honours and an annual allowance were bestowed upon him, and he was educated along with the Prince of Parma and the Infant Don Carlos. He was intended for the church, but his own bent was towards war, and in 1570 he received the command of an army sent against the rebellious Moors in Granada, whom he completely rooted out of the country—signalling himself at once by valour and by cruelty. On the 7th October 1571, with the united fleets of Spain, the pope, and Venice, he defeated the Turks in the glorious battle of Lepanto. Discord breaking out among the allies, Don John separated himself from the rest, took Tunis, and conceived the scheme of forming a kingdom for himself in the north of Africa. But Philip, jealous of this design, sent him to Milan to observe the Genoese; and afterwards, in 1576, as viceroy to the Netherlands. In this capacity he sought to win the favour of the people by mildness; but being left unsupported by Philip he was hard pressed for a time, till the arrival of the Prince of Parma with troops enabled him to restore the fortunes of Spain by the victory of Gembloux over William the Silent in 1577. But Philip was now apprehensive that he might make himself king of the Netherlands, and Don John's untimely death in his entrenched camp at Namur, on 1st October 1578, was not without suspicion of poison. See Stirling-Maxwell's work (2 vols. 1883).

John of Damascus. See JOANNES DAMASCENUS.

John of Gaunt, Duke of Lancaster, fourth son of Edward III., was born 24th June 1340 at Ghent, during his father's visit to Flanders. In 1359 he married Blanche, heiress of the duchy of Lancaster, and himself was created duke in 1362. Three years after her death he married in 1372 Constance, daughter of Pedro the Cruel of Castile, and assumed the title of king of Castile, though the country and crown were seized and held by Henry of Trastamare. The military expeditions which John organised against his rival all proved unsuccessful. Towards the close of his

aged father's reign John gradually became the most influential personage in the realm. He was an ambitious man, and put himself in opposition to the party of his brother the Black Prince, and is suspected of having entertained the design of succeeding his father as king. He also opposed the party of the clergy, and lent support to Wyclif and his followers. But he was very unpopular with the common people; and during Wat Tyler's revolt they burned his palace of the Savoy, in London. The young king Richard, distrusting him too, contrived to send him away on another expedition for the recovery of his crown in Spain. On this occasion John concluded a definite peace in virtue of which his daughter Catharine should marry Henry, son of John I., and so succeed as queen of Castile. On his return to England after three years' absence he was able to reconcile the young king to his (John's) brother Thomas of Woodstock, Duke of Gloucester. After this Richard II. seems to have reposed more confidence in John, for he made him Duke of Aquitaine, and entrusted him with several embassies to France. But John of Gaunt gradually ceased to be a factor in English politics, and died on 3d February 1399. On the death of his second wife he had married in 1396 his mistress, Catharine Swynford, whose three sons and daughter were legitimated in 1397; from the eldest was descended Henry VII. See the study by S. Armitage Smith (1904).

John of Leyden (properly John Beuckelszoon, Beuckels, or Bockhold) was born at Leyden in 1509. He wandered about for some time as a journeyman tailor, settled in Leyden as merchant and innkeeper, and was noted for his abilities as an orator. Adopting the opinions of the Anabaptists, he became one of their wandering prophets. In 1533 he came to Münster, and, when Matthiasen lost his life in 1534, became his successor. Setting up in Münster 'the kingdom of Zion,' he applied in an extravagant manner the principles of the Old Testament theocracy, and established polygamy and community of goods. In June 1535 the city was taken by the Bishop of Münster. John and his chief accomplices suffered death with circumstances of fearful cruelty (January 26, 1536). See ANABAPTISTS; and Hamerling's *König von Sion*.

John of Nepomuk. See NEPOMUK.

John of Salisbury. See SALISBURY.

John o' Groat's House, in Caithness, 1½ mile W. of Duncansby Head, and 18 miles N. of Wick, was, according to tradition, an octagonal building with eight doors and windows and an eight-sided table within, built by John o' Groat to prevent dissensions as to precedence among the eight different branches of his family. Whatever the origin of the legend, which resembles that of the Round Table, it is certain that between 1496 and 1525 there was one 'John o' Groat of Duncansbay, baillie to the Earl in those parts,' and probably a Hollander. An outline on the turf marks the site of the house; and the neighbouring hotel (1876) has, appropriately enough, an octagonal tower. 'Frae Maidenkirke to John o' Groat's' (Burns) is the Scottish equivalent of 'from Dan to Beersheba,' Maidenkirke being Kirkmaiden in the Moll of Galloway. For 'John o' Groat's buckies,' see COWRY.

John, PRESTER. See PRESTER JOHN.

John the Baptist, the forerunner of Christ, was the son of the priest Zacharias and Elizabeth, the cousin of Mary, the mother of Christ. He was a Nazirite from his birth, and he prepared himself for his mission by years of self-discipline in the desert, until at length he appeared to stifle his hearers with the preaching of repentance. The rite of baptism which he

administered was a token and symbol of repentance and forgiveness of sins, preparatory to that baptism to follow, the distinctive quality of which was to be the gift of regeneration through the power of the Holy Spirit. With the baptism of Jesus the more especial office of the forerunner ceased, and soon after his ministry came to a close. He had fearlessly denounced Herod Antipas for taking Herodias, his brother Philip's wife, and was accordingly flung into prison, where ere long he was executed at the request of Salome, the daughter of the abandoned Herodias. The Mandæans or Zabians (q.v.) still claim to be his disciples. John the Baptist was from an early date regarded in England as the patron saint of the common people, and great masonic festivals continue to be held on St John's Day, the 24th of June. For the Knights of St John, see HOSPITALERS.

John's, EVE OF ST, one of the most joyous festivals of Christendom during the middle ages, celebrated on midsummer eve. From the account given of it by Grimm in his *Deutsche Mythologie* it would appear to have been observed with similar rites in every country of Europe. Fires were kindled chiefly in the streets and market-places of the towns; sometimes they were blessed by the parish priest, but, as a rule, they were secular in their character. The young people leaped over the flames, or threw flowers and garlands into them, with merry shoutings, songs, and dances. In England the people on the Eve of St John's went into the woods and broke down branches of trees, which they brought to their homes and planted over their doors, to make good the prophecy respecting the Baptist, that many should rejoice in his birth. It was a lingering belief of the Irish peasantry that the souls of all people on this night leave their bodies, and wander to their ultimate place of death by land or sea—a notion that may throw light on the widespread custom of watching or sitting up awake on St John's eve. In England it was believed that if any one sat up fasting all night in the church porch he would see the spirits of those who were to die in the parish during the ensuing twelve months come and knock at the church door in the order in which they were to die.

Johns Hopkins. See HOPKINS; and for the university founded by him, BALTIMORE.

Johnson, ANDREW, seventeenth president of the United States, was born at Raleigh, North Carolina, 29th December 1808. His parents were in humble circumstances, and his father was drowned while attempting the rescue of a friend when Andrew was but four years old. At the age of ten he became a tailor's apprentice, and with the help of a fellow-workman learned to read. In 1824 he went to Laurens, South Carolina, to work as a journeyman, and two years later emigrated to Greenville, Tennessee. There he married Eliza M'Cardle, a young girl of education and refinement, who taught him to write, and in other ways helped on his studies. He served as alderman and then as mayor for several years; in 1834 took part in framing the new State constitution; and in 1835 and 1839 was elected a member of the legislature. In 1840 he was chosen presidential elector-at-large, and cast his vote for Martin Van Buren. In 1841 he was elected to the State senate, and in 1843 to congress. Successive re-elections continued him a member of the House of Representatives until 1853, when he was chosen governor of the State of Tennessee, and in 1855 he was re-elected to that office. In 1857 he was sent to the United States senate for six years. There he was an earnest advocate of the Homestead Law and other measures for the benefit of working-men.

He was a sturdy opponent of all secession and dis-union schemes.

When the war broke out in 1861 he found himself in accord with the administration, and during its progress was a leader of the Southern Union men. His efforts and sacrifices in behalf of the Union led to his selection by President Lincoln as military governor of Tennessee (1862), and subsequently to his nomination and election to the vice-presidency (inaugurated 4th March 1865). On the assassination of Lincoln (14th April 1865) he became president. He sought to carry out the policy of his predecessor. He retained all the former cabinet in office, and, when vacancies occurred, filled them with those known to have been Lincoln's personal and political friends. But the assassination had provoked a revulsion of public feeling. Many who had favoured amnesty, leniency, and reconciliation now began to doubt whether the states so recently in rebellion could safely be restored to a share in the government without further guarantees. Congressional sentiment divided on the question of 'reconstruction.' President Johnson's policy was first distrusted, and then denounced as evincing disloyal sympathies. Irritated at the misconstruction of his motives, and resenting the charge of disloyalty as insulting, he retorted by speeches full of bitter and violent invective. This intensified the ill-feeling. Soon a majority of the congress, elected with him, were opposing his policy. While he urged the readmission of Southern representatives to seats, the congressional majority insisted that the Southern states should be kept for a period under military government, until they gave more proof of loyalty. President Johnson vetoed the congressional measures; and the congress passed them over his veto. Extra sessions were held to keep him in check, and laws passed to limit his power. Finally, his removal of Secretary Stanton from the war department precipitated a crisis. He claimed the right to change his 'constitutional advisers' in cabinet, and in return he was charged with violation of the 'Tenure of Office Act,' in doing so without the consent of the senate. Articles of impeachment were presented, and he was formally brought to trial before the senate. The trial resulted in his acquittal—less than the necessary two-thirds of the senators voting for conviction. Practically this ended the contest, as the election of 1868 was close at hand, at which his successor was to be chosen. Retiring from office in March 1869, he returned to Tennessee. He was an unsuccessful candidate for congress in 1872; elected to the United States senate in January 1875, he died 31st July.

See Dewitt on his trial (1903), and for the defence, the *Diary of Gideon Welles* (1912).

Johnson, LIONEL PIGOT (1867-1902), born at Broadstairs, studied at Winchester and New College, Oxford, and became a Roman Catholic in 1890. He was author of two volumes of verse—*Poems* (1895) and *Ireland* (1897)—a study of Thomas Hardy, and a posthumous book of essays, *Post Liminalium* (1911).

Johnson, RICHARD MENTOR, vice-president of the United States, born in Kentucky in 1781, was admitted to the bar, and was a member of congress from 1807 to 1819, of the United States senate till 1829, and a representative again till 1837. He served with great bravery in the war with Britain in 1812-13. In 1837-41 he was vice-president under Van Buren. He died at Frankfort, Kentucky, 19th November 1850.

Johnson, SAMUEL, famous in his own day as a lexicographer, an essayist, and a critic, and still famous, though rather perhaps for personal than for literary reasons, rather as a brilliant con-

versationalist and a sincere and brave man than as a writer of the highest order, was born at Lichfield, September 13 (N.S.), 1709. His father, Michael Johnson, a native of Derbyshire, of obscure extraction, was an old bookseller—what we call a second-hand bookseller—and seems to have been a person of some mark and importance in his neighbourhood, where booksellers of any kind were then scarce. 'He propagates learning all over the diocese,' wrote Lord Gower's chaplain in 1716, 'and advanceth knowledge to its just height; all the clergy here are his pupils, and suck all they have from him.' His municipal position, too, was good. He served the offices of junior bailiff, of sheriff (the city of Lichfield being then styled a county), of mayor. His wife, Sarah Ford, came of a yeoman's family living in Warwickshire, and seems to have been a woman of some capacity. Thus his early circumstances were not so unfriendly to the future lexicographer as they are sometimes represented. On the other hand, he inherited from his father 'a vile melancholy,' a terrible tendency to depression and despair, which never wholly ceased to dominate him, and possibly some tendency to superstition, as he was credulously taken up to London to be 'touched' for the 'king's evil,' being afflicted with scrofula. Moreover, his father did not prove a successful man of business, however notable his knowledge of books; and pecuniary troubles soon began to be felt. Thus in his social rank, and his early experience of comfort followed by adversity, Johnson's early life closely parallels that of Shakespeare. He was sent to a dame's school, and then to the Lichfield grammar-school (1716-26), and for a while to the school of Stourbridge; and then for two years (1727-29) he studied or idled at home. All through life he was of indolent habits; but his quickness of apprehension and his strength of memory were amazing. As some one said of him, he 'tore out the heart of books.' And so during his school-days he became a prodigy of learning. Probably the hours spent at will amidst his father's books did more to make him so than the lessons and the floggings of Messrs Hawkins and Hunter, and Mr Wentford. At last, in 1729, probably through the assistance of his godfather, Dr Swinfen, he went up to Pembroke College, Oxford. His attainments were soon recognised; a Latin translation of Pope's *Messiah* increased his fame; and he became a figure of note and of influence in the 'nest of singing birds' of which he was a member. But he was 'miserably poor;' though then, as always, he bore his poverty without complaining or in any way abating his independent spirit. When some well-intentioned fellow-student placed at his door a pair of new boots, of which he stood sorely in need, he flung them out of the window. In the year 1731 things grew worse and worse; he left Oxford finally in October, without a degree; in December his father died.

The terrible struggle with poverty which began at Oxford, or even earlier, lasted some thirty years more (1731-62), and might never have ceased but for the intervention of the royal bounty. For some years after he left the university his life is obscure. He attempted schoolmastering, as do so many when there is nothing else before them, though he could scarcely have been less well fitted for such work physically or in his habits than in fact he was. He was liable to convulsive starts and facial contortions; and he never learned how to control his temper. 'He has the character,' says an extant letter concerning one of his candidatures, 'of being a very haughty, ill-natured gentleman; and that (*sic*) he has such a way of distorting his face (which though he can't help), the gentlemen think it may affect some young lads.' After a few months at Market Bosworth he relinquished a

situation which all his life long he recollected with 'the strongest aversion and even a degree of horror.' Clearly he liked the pedagogic profession as little as it liked him. He now made approaches towards the career to which he was destined. Visiting Birmingham in search of employment, he began his connection with the press by producing an abridged translation of Lobo's *Voyage to Abyssinia*. Also, he wrote to Cave, the proprietor of the *Gentleman's Magazine*, then recently started, proposing to become a contributor. In 1735, his fortunes being at their lowest ebb, he, aged twenty-five, was bold enough to marry the widow of a Birmingham mercer, aged forty-six. She brought him a portion of £800, part of which seems to have been lost by the insolvency of an attorney. The accounts given of his 'pretty charmer,' as he called her, are not very fascinating; but, as he said in after years to Beauchamp, 'Sir, it was a love match on both sides.' And certainly his attachment, at all events, was deep, and tender, and constant. Once more, and no doubt with the remainder of his wife's portion, he attempted schoolmastering; but it is not surprising that parents did not crowd with their offspring to the boarding-house opened at Edial Hall, near Lichfield. There was now nothing for it but to try the metropolis. In 1737, with a tragedy and twopence-halfpenny in his pocket, he came up, along with his Edial pupil, Garrick, to London, which henceforward was to be his abode. Later in the year he fetched Mrs Johnson. It is certain he had a terrible struggle to make a living. One publisher, noticing his burly frame, advised him to buy a porter's knot; another gave him the task of compiling a catalogue of the Harleian Library, and him Johnson knocked down with a folio Septuagint when he accused him wrongfully of negligence. He was sometimes dinnerless (yours, *impransus*, is his signature to a letter to Cave), occasionally bedless (we hear of his walking round St James's Square with Savage all one night 'for want of a lodging'), always ill fed and shabbily dressed. But he bore all with a splendid courage. He neither whined about hardships he had to endure, nor boasted of the fortitude with which he endured them. There is no more heroic figure in the history of our literature. Meanwhile, in spite of circumstances, he was becoming the foremost writer of his time, and was already obtaining an influence and a power due to something more than his writings—due to the force and the nobility of his character. In 1738 he became a regular contributor to the *Gentleman's Magazine*, and from November 1740 to February 1743 he wrote the debates in parliament published by Cave under the title of *The Senate of Lilliput*, and 'took care that the Whig dogs should not have the best of it.'

In 1738 he attempted to do with Juvenal what Pope had been doing with Horace; he published his *London*, a poem between whose lines may be read the piteous story of the harsh experiences he was undergoing. It is interesting to note that Pope on first reading the poem promised that its unknown author should soon be *déterré*, and got Lord Gower to write to a friend to beg Swift to obtain Johnson a Dublin degree in order to help him to a mastership of £60 a year. A few years later, in 1747, he published his proposal of a new Dictionary of the English Language. It was paradoxical indeed that one in his starving position should undertake a task so gigantic and so unremunerative. But it was not only undertaken, but achieved. Just when this huge labour was nearing completion a nobleman whose help at an earlier period would have been thrice welcome extended towards him a patronising hand; and to this overture Johnson replied in the famous letter of February 7, 1755,

which for its just indignation, and its passion of independence, to say nothing of its fine quality as a piece of writing, would make its author memorable had he no other claim on the admiration of posterity. During the years mainly devoted to the Dictionary he had produced also his *Vanity of Human Wishes*, another and yet more brilliant adaptation of Juvenal, and also the series of essays called *The Rambler*, in which his genius showed to less advantage, though it is frequently perceptible in the acuteness of the observations he records. In 1752, just after he had concluded *The Rambler*, his wife died. His grief was profound and enduring. For some forty days this man who to the world at large seemed, and often in manner was, so rough and savage, buried his face and wept. 'Sir,' he said some years after to an old fellow Oxonian who asked him if he had been married, 'I have known what it was to have a wife, and I have known what it is to lose a wife. It had almost broke my heart.' Indeed, one of the most striking characteristics of Johnson, when he is seen beneath the surface, is the infinite tenderness of his nature to children, to women, to poverty, and to every form of distress. As Garrick put it, he had nothing of the bear but the skin. During nearly all the Dictionary period and three years beyond it—i.e. from 1748 to 1758—he was living in a house in Gough Square, off Fleet Street. In 1759 his mother died; and he wrote *Rasselas* in the evenings of a single week. The novel had lately arisen in our literature; and so this work took the shape of a tale. But Johnson had little talent for that kind of writing; and the value of *Rasselas* lies in far other directions. In respect of its view of life, it has been well described as but a prose edition of the *Vanity of Human Wishes*; and it has much in common, though the differences also are striking, with Voltaire's *Candide*, which was published almost exactly at the same time. In 1758 he again attempted the periodical essay, adopting *The Idler* for his title. During all these years he performed also much hack-work. Yet, for all his efforts, he was more than once arrested for debt.

At last he was relieved from his oppressive and incessant penury by the bestowal upon him by the crown of a well-deserved pension of £300 a year. And for the last twenty-two years of life (1762-84) he lived in what was comparative affluence, finding himself able to accommodate in his house in Johnson's Court, whither he migrated in 1765, and mainly to support two homeless friends—viz. Mrs Williams and Mr Levet, as well as his black servant Francis Barber; and in his house in Bolt Court, which he occupied from 1777 to his death, no less than three others besides—viz. Mrs Desmoulins and her daughter, and a Miss Carmichael, to say nothing of occasional waifs and strays for whom he provided a night's lodging. These strange inmates of what he called his 'seraglio' were far from being always harmonious, but all their petulance could not weary out his benevolence. We read of his carrying home a poor creature he found lying on the streets upon his back, and putting pennies into the hands of the sleeping street Arabs on his way home from the club, that they might have something for breakfast when they awoke in the morning. In the London of that day he filled an almost, if not quite, unique position. He was a sort of literary monarch. 'He seemed to me,' said one of his many friends, 'to be considered as a kind of public oracle, whom everybody thought they had a right to visit and consult.' In 1763 the lion-hunting Boswell became his eager and faithful follower, and treasured up with wonderful skill every roar that was uttered. It is mainly to his

faithful and reverent recollection that we owe our intimate knowledge of the peculiarities of the great man—his insatiable tea-drinking, and love of late hours; his slovenliness in dress and strange gesticulations; his physical strength and courage; his antipathy to Scotchmen, and love of London streets; his insensibility to music and painting; his hearty old Toryism, hatred of Whigs, and honest old-fashioned patriotism; his reverence for the church, and his sincere religion yet strange shrinking from death; his abhorrence of all false sentimentality, and rigid truthfulness; his delight in conversation, his marvellous dexterity in retort, and his frequent browbeating of his antagonists. Even his cat Hodge has become a living personality to posterity from the inspired faithfulness of his chronicler.

In 1764 the famous club known as the Literary Club was formed, having amongst its original members Johnson, Reynolds, Burke, Goldsmith, Langton, Sir John Hawkins. Probably in 1765 Johnson made the acquaintance of Mr Thrale and his sprightly wife, who made a new home for him both in Southwark and at Streatham, and in other ways did much to make his life bright and happy for the long space of more than sixteen years. With them he travelled to Bath, to Brighton, to North Wales, to France. In 1773 Boswell persuaded him to visit Scotland and the Hebrides, which was perhaps the most striking event of his later years. So far as his terrible enemy melancholia permitted, he found life worth living and pleasant to live during this period. He delighted to fold his legs and have out his talk; and there was no lack of appreciative and reverent listeners. But he wrote little. To set himself to write was always an effort; and he shrank from making it. His best thought and wit found an outlet in conversation. His *Journey to the Hebrides* and his *Lives of the Poets* are the only works of any importance belonging to this time of his kingship. Some time in March 1781, he writes, 'I finished the *Lives of the Poets*, which I wrote in my usual way, dilatorily and hastily, unwilling to work and working with vigour and haste.' Meanwhile, his social circle began to be sadly invaded and broken. Goldsmith died in 1774, Garrick in 1779, Beaulieu in 1780, Mr Thrale in 1781, and Levett, whom he commemorated in a touching poem, in 1782. For a while after her husband's death Mrs Thrale kept up the old relationship, but by the autumn of 1782 she had determined to marry Piozzi, an Italian musician and Catholic, and Johnson's displeasure at what he considered a degrading step at length dissolved a friendship which had 'soothed twenty years of a life radically wretched.' The marriage actually took place in June 1784, less than six months before Johnson's death. In 1783 Mrs Williams passed away; and for all her peevishness was sincerely missed. For Johnson, too, the end was approaching. In 1783 he suffered a paralytic stroke. He rallied to some extent, and was once more seen in his old haunts. But in the following year dropsy and asthma attacked him. By November there was but little hope of his recovery. All that medical skill and all that the tenderest affection could do to relieve and to smooth his dying hours was faithfully done. He took solemn leave of Langton, Burke, Reynolds, and other dear friends he had loved with a constant affection, and sent a tender blessing to his young favourite Fanny Burney, who watched weeping at his door. 'I am afraid,' said Burke one day, 'that so many of us must be oppressive to you.'—'No, sir, it is not so,' replied Johnson, 'and I must be in a wretched state indeed when your company would not be a delight to me.'—'My dear sir,' said Burke, with a breaking voice, 'you have been always too

good to me,' as he left him for the last time. The brave-hearted Johnson faced the inevitable with heroic courage, refusing at the last to take his opiates, that he might 'render up his soul to God unclouded.' He died on the evening of December 13, and he was buried in Westminster Abbey near Garrick, Dryden, and Cowley. A monument was raised to him in St Paul's.

The usual estimate of him as a writer is hardly so high now as in his own day. As a writer, it must be said of him that he was rather of an age than for all time. His greatest interest for us is that he so exactly represents the current ideas of his age, such as they were. He never fully expressed himself in literature. And, excellent as are several of his works, or at least passages in them, we should never have known his real greatness but for Boswell's admirable portraiture of him, and his masterly reports of his conversations. Boswell's skill in these respects is beyond praise, and deserves a better acknowledgment than Macaulay and some other critics have vouchsafed him. In Boswell's pages Johnson will live for ever and be better known than anybody that ever lived. And the more he is known, the more readily will be recognised the nobleness of his nature, the vigour of his genius, and the value of his literary services.

Editions of his works have been numberless; the best is that published at Oxford in 11 vols. in 1825. See the article BOSWELL, the Life by Sir J. Hawkins (1787), and the editions of Boswell's *Life of Johnson* by Croker, Napier, Henry Morley, and Birkbeck Hill; the *Essays* by Arthur Murphy, Macaulay, and Carlyle, as well as Macaulay's perfect biography in miniature, contributed to the *Encyclopædia Britannica* (1856); also Birkbeck Hill's *Dr Johnson, his Friends and his Critics* (1878), and his edition of the *Letters* (1892); Leslie Stephen's book ('Men of Letters', 1878), those by Grant (1887) and Bailey (1913); Sir Walter Raleigh's *Six Essays* on him (1910); Courtney's *Bibliography* (1915); A. L. Reade's *Johnsonian Gleanings* (1909 et seq.). Matthew Arnold edited the chief six of the *Lives of the Poets* (1878); a good edition of the whole is that by Mrs Napier (1890). See also Madame D'Arbly's *Diary and Letters*, Mrs Piozzi's *Autobiography*, and Mrs Napier's *Johnsoniana* (1884)—the last made up from the writings of Mrs Piozzi, Richard Cumberland, Bishop Percy, T. Tyers, Dr Campbell, Hannah Moore, Madame D'Arbly, Rev. T. Twining, Miss Reynolds, Sir Joshua Reynolds, and Arthur Murphy.

Johnston, ALBERT SIDNEY, an American general, was born in Kentucky, 3d February 1803, graduated at West Point in 1826, and served in the United States army until 1834. In 1836 he joined the army of Texas as a private soldier, but very shortly became its head; in 1838 he was appointed war secretary of the young state, and in 1839 drove the marauding Indians out of northern Texas. He served in the Mexican war under General Taylor, who in 1849 appointed him a paymaster in the United States army. In 1855 he received a cavalry regiment, and in 1858 he brought the Mormon rebellion to an end without the employment of force. He was then appointed brigadier-general, and commanded in Utah and in the department of the Pacific until 1861, when he resigned and passed over to the South. Appointed to the command of the department of Kentucky and Tennessee, he fortified Bowling Green, and held the Northern army in check until February 1862, when he retreated to Nashville and, on the fall of Fort Donelson, to Corinth, Mississippi. Here he concentrated 50,000 men, with which force he attacked Grant at Shiloh before daybreak on Sunday, 6th April 1862. The National army was surprised, and the advantage in the tremendous battle that ensued lay with the Confederates when, at half-past two, while leading a charge, Johnston was

mortally wounded. The next day Grant's supports came up, and the enemy, now under Beauregard, was driven back to Corinth. There is a *Life of General Johnston* by his son (New York, 1878).

Johnston, ALEXANDER KEITH, cartographer and geographical publisher, was born at Kirkhill, Penicuik, 28th December 1804. His first important work, the *National Atlas* (fol.), occupied him for five years, and was published in 1843. Its merits received immediate recognition, and Johnston was appointed Geographer Royal for Scotland. Acting on a suggestion from Humboldt he visited Germany, and gathered material for his *Physical Atlas* (1848; 2d ed. 1856). Its publication was the signal for a shower of honours from the geographical societies of Europe. In 1850 appeared a very useful *Dictionary of Geography*, better known as 'Johnston's Gazetteer.' In 1851 he constructed the first physical globe, showing the geology, hydrography, &c., of the earth. His *Royal Atlas of Geography* (1861) was famous; and he published atlases of astronomy and geology, besides educational atlases, physical, general, and classical. He died 9th July 1871.—His son, ALEXANDER KEITH (1844-79), trained as a draughtsman in his father's firm, took part in an exploring expedition to Paraguay in 1874, and in 1879 was appointed leader of the Royal Geographical Society's expedition to East Africa, but died of dysentery when scarcely a month on the way. He wrote a *Physical Geography* (1877), extended Hellwald's *Africa* (1879) in Stanford's series, and did other geographical work.

Johnston, ARCHIBALD, LORD WARRISTON (1610-63), assisted in drawing up the Scottish National Covenant, took a prominent part in Scottish public life, became a judge or lord of session in 1641, and in 1646 was made king's advocate by Charles I. A strong remonstrant or extreme Presbyterian, he held office under Cromwell, and sat in his House of Lords; was a member of the council of state on the recall of the Rump parliament, and after its suppression president of the committee of public safety. Arrested in France after the Restoration, he was tried by the Scots parliament and hanged. See his *Diary* (Scottish Hist. Soc., 1911), and a study by Morison (1901).

Johnston, or JONSTON, ARTHUR (1587-1641), physician and humanist, was born at Caskieben, Aberdeenshire, and educated at Marischal College, Aberdeen, and the university of Padua, where he graduated M.D., 11th June 1610. The same year (says Sir T. Urquhart) he was 'laureated poet at Paris and that most deservedly,' and thereafter visited many seats of learning on either side the Alps from Rome to Sedan, in which latter he sojourned long with his compatriot Andrew Melville, professor of Divinity in the university. For many years he practised medicine in France, whence his fame as a Latin poet spread over Europe. In 1625 appeared in London his elegy on James I., and about the same time he was appointed physician to King Charles. His Latin rendering of the Song of Solomon, dedicated to that monarch (Lond. 1633) contained a specimen of his translation of the Psalms of David into Latin verse, a work on which he had long been engaged, and which was published at Aberdeen in 1637. In that year he helped to bring out the *Delitiae Poetarum Scotorum hujus Aevi Illustratum* (Amsterdam, 2 vols. 12mo), a collection in which his own contributions are the most numerous and the best. In 1637 he became rector of King's College, Aberdeen; but his avocations as court physician kept him mainly in England, and he died suddenly on a visit to Oxford in 1641. His translation of the Psalms, often reprinted, divides the

palm with Buchanan's. See the monograph by Geddes (1890), who edited his poems in vols. i. and ii. of *Musa Latina Aberdonensis* (New Spalding Club, 1892-95).

Johnston, SIR HARRY HAMILTON, born in London in 1858, attended King's College, and studied painting at the Royal Academy, but from 1879 became known as a traveller in Africa. A skilled naturalist, he commanded the Royal Society's expedition to Kilimanjaro in 1884; and has held a succession of offices, including, besides posts in the Cameroons and on the Niger coast, the commissioner-ship or consul-generalship in British Central Africa, Tunis, and Uganda. He has written brilliant books on Africa, *British Mammals* (1903); Bantu languages (1919-22); sequels to *Dombey and Son* and *Mrs Warren's Profession*; and *The Story of My Life* (1923).

Johnston, JAMES FINLAY WEIR, chemist, was born at Paisley in 1796. He was of humble parentage, and studied at Glasgow University. Having in 1830 married a lady of considerable fortune, he repaired to Stockholm, and became the pupil of Berzelius, the chemist. In 1833 he was invited to take the readership in chemistry and mineralogy in the newly-established university of Durham. But he resided chiefly in Edinburgh, and there carried on his investigations. It is as an agricultural chemist that he is chiefly known. His *Catechism of Agricultural Chemistry and Geology* went through more than fifty editions, and was translated into almost every European language; and his *Lectures on Agricultural Chemistry and Geology* (1842; 17th ed. 1894) won high esteem. The last of his works, *Chemistry of Common Life* (1854), passed through several editions (one edited by Church in 1879). He died at Durham, 18th September 1855.

Johnston, JOSEPH EGGLESTON, an American general, was born in Virginia, 3d February 1807. His mother was a niece of Patrick Henry. He graduated at West Point in 1829, fought in the Seminole war, became captain of engineers in 1846, served with great gallantry in the war with Mexico, where he was wounded at Cerro Gordo—he received altogether ten wounds in the three wars he was engaged in—and in 1860 was commissioned quartermaster-general, with the rank of brigadier-general. He resigned in 1861 to enter the Confederate service, and was appointed brigadier-general and given the command of the Army of the Shenandoah; in August he was made full general. He came to the assistance of Beauregard at the first battle of Bull Run, but waived his claim to precedence, and left him in command. In 1862 he was for several months disabled by a wound received at Seven Pines, while opposing McClellan. In 1863, with a weak force, he failed in an endeavour to relieve Vicksburg. He commanded the force directed to oppose Sherman's advance towards Atlanta, in 1864, and stubbornly contested his progress; he was steadily driven back, however, and in July was relieved of his command. He was again placed in command by General Lee in February 1865, and ordered to 'drive back Sherman,' but he had only a fourth of the Northern general's strength, and after a last vigorous resistance at Bentonville, in March, and after learning of Lee's surrender, he accepted the same terms on 26th April. General Johnston afterwards engaged in railway and insurance business, and was elected to congress by Richmond in 1877. He was appointed United States commissioner of railroads by President Cleveland. He died 21st March 1891. See his *Narrative of Military Operations* (1874), and Lives of him by Johnson (1891) and R. M. Hughes.

Johnstone, a manufacturing town of Renfrewshire, on the Black Cart, $3\frac{1}{2}$ miles W. by S. of Paisley. Founded in 1781, it contains a large flax-mill, cotton-mill, foundries, and engineering works, and is the Scottish seat of machine-tool making. Pop. 12,500.

Johnstone, FAMILY OF, takes its surname from the lordship of Johnstone in Annandale, Dumfriesshire. In former days it was one of the most powerful and turbulent clans of the west Borders, and was at constant feud with its neighbours, especially the Maxwells. Of three branches, Johnstone of Annandale, Johnstone of Westerhall, and Johnston of Hilton and Caskieben in Aberdeenshire, the first named, which retained the ancient patrimony, was ennobled by Charles I., and became successively Lords Johnstone of Lochwood, Earls of Hartfell, and Earls and Marquises of Annandale. These titles, being limited to heirs-male, became dormant in 1792, and more than once rival claims for their revival by the Annandale and Westerhall branches have been repelled by the House of Lords. A branch of the house of Westerhall was in 1881 raised to the peerage as Baron Derwent.

Johnstown, (1) capital of Fulton county, New York, on Cayadutta Creek, 40 miles WNW. of Albany, has knitting-mills and large glove factories; pop. 11,000. (2) A town of Pennsylvania, on the Conemaugh River, 78 miles E. by S. of Pittsburg by rail, with large iron and steel works, and many other industries. It was overwhelmed by the bursting of a reservoir on 31st May 1889. Pop. (1880) 8380; (1900) 35,936; (1920) 67,327.

Johore, a state, under British protection, at the south end of the Malay Peninsula, with an area of 7500 sq. m. The country is densely covered with timber, and rises into several mountain-peaks, the highest being Mount Ophir (4186 feet). The population numbers about 280,000, one-third Chinese. The Malays live by fishing and wood-cutting; the Chinese are traders and shopkeepers. The chief staples of the country are rubber, copra, tin, areca-nuts, gambier, and black pepper. All kinds of fruit are plentiful. The climate is tropical but healthy. The capital is Johore, 15 miles NE. of Singapore. A causeway (1924) carrying road and railway joins Johore with Singapore.

Joigny (anc. *Jovinacum*), an old walled town in the French department of Yonne, 90 miles by rail SE. of Paris; pop. 6000.

Joinery. See CARPENTRY.

Joint-fir. See SEA-GRAPE.

Joints, in Anatomy. A joint or articulation may be defined to be the union of any two segments of the skeleton of an animal body, through the intervention of a structure or structures of a different nature. The textures which enter into the formation of the more complex joints are bone, cartilage, fibro-cartilage, ligaments, and synovial membrane. Bone forms the fundamental part of all joints; ligament, in various modifications, is employed as the bond of union between the bony segments; while the three remaining textures chiefly occur in those joints in which there is free motion. The joints vary in the degree of motion from almost perfect immobility to the greatest amount and extent of motion that are compatible with the maintenance of the bony segments in their proper relation to each other.

Joints have been divided by anatomists into two great classes—the *Immovable* and the *Movable*. In the immovable or *Synarthroses* the parts are continuous, that is to say the bones are united together by a prolongation of the periosteal fibrous membrane between them. In some cases the uniting medium

is a plate of cartilage. There is no synovial sac intervening between the bones. In movable joints the articular surface of each of the bones is covered with cartilage, and these cartilaginous plates are separated from each other by a synovial sac more or less complete. This sac is lined by a membrane which secretes a viscid fluid for lubricating the articular surfaces—the *synovia* or joint-oil.

In *synarthroses* the articulation is said to be by *suture* when the bones seem to grow somewhat into one another, and to become interlocked and dovetailed together, each bone having a jagged or serrated margin, or when there is a degree of bevelling, so that one bone is overlapped by the other. Both these kinds of suture are at once seen in the human Skull (q.v.).

The movable joints are *Amphiarthroses* and *Diarthroses*. In the former there is partial mobility of one bone upon another, combined with great strength. The contiguous surfaces of the bones are united by a thick and strong layer of fibro-cartilage, the centre of which is usually soft, and may present a cavity lined by a synovial membrane, with which a little elastic tissue is intermixed. As examples of this kind of joint may be mentioned the articulation between the bodies of the vertebrae and that between the two pubic bones at what is termed the symphysis.

Diarthroses are complete joints, the articular surfaces being covered by articular cartilage and separated from each other by a cavity lined by synovial membrane. In these the degree and nature of the motion are very various. There may be merely a little *gliding* motion between the ends of the bones, as, for example, in the articulations between the various bones of the carpus and tarsus. (see HAND, FOOT). In these cases the surfaces are plane, or one is slightly concave and the other slightly convex; and the motion is limited in extent and direction by the ligaments of the joint, or by some projecting point of one of the bones. In some cases, instead of a slight concavity and convexity, one bone presents a cup-like depression, while the termination of the other assumes a hemispherical, or more or less globular shape. Hence the name of *ball and socket* that is applied to such joints. The best example of this variety is the Hip-joint (q.v.), and the next best is the shoulder. In these joints the ball is kept in apposition with the socket by means of what is termed a *capsular* ligament, which may be described as a barrel-shaped expansion of ligamentous structure, attached by its extremities around the margin of the articular surfaces composing the joint, and forming a complete investment of it, but not so tight as materially to restrict its movements. This species of joint is capable of motion of all kinds.

Another important variety of articulation is the *hinge-joint*, in which the contiguous surfaces are marked with elevations and depressions, which exactly fit into each other, so as to restrict motion to one plane. The elbow and ankle joints, and the joints of the fingers and toes, are the best examples of this variety. The knee-joint is a less characteristic example, because in certain positions it is capable of a slight rotation. These hinge-joints are always provided with strong lateral ligaments.

The last kind of joint requiring notice is that which admits only of *rotatory* motion. A pivot and a ring are the essential parts of this joint, the ring being generally formed partly of bone and partly of ligament. The best example of this articulation is that between the atlas (the first vertebra) and the odontoid or tooth-like process of the axis (the second vertebra). See HAND.

Diseases of the Joints.—In diseases of the joints we may have one or more of the following textures

affected: (1) the synovial membrane; (2) the cartilage; and (3) the bones themselves. The synovial membrane may undergo either acute or chronic inflammation, giving rise to the serious affections known as acute and chronic Synovitis (see *SYNOVIAL MEMBRANES*). Loose substances of a fibrous structure, usually resembling a small bean in size and shape, sometimes occur in joints, especially in the knee-joint. They commence as little pendulous growths upon the synovial membrane, which after a time become detached. The cartilage may be affected in various ways. There may be (1) simple destruction of cartilage; (2) tubercular destruction of cartilage; (3) hypertrophy of cartilage; (4) atrophy of cartilage, and other modified forms of disease of this texture, all of which, especially the second, are of a very serious character, but not of a nature that admits of popular explanation. The most important diseases of the osseous structures of the joints are (1) ulcer and (2) caries. These diseases often, but not always, begin with the disorganisation of cartilage, and then extend to the bones. Sometimes, however, they commence in the bones. See *ANKYLOSIS*.

Resection or Excision of Joints 'is on the whole safer than amputation; less violence is done to the body, fewer great arteries and nerves are injured, and, what is of more consequence, fewer large veins are divided, and as the articular end of the bone only is sawn off, and the medullary canal not touched, there is less chance of pyæmia. Lastly, the patient is left with an imperfect limb, it is true, but with one which, in most cases, is highly useful' (Druitt). The operation has been performed on the shoulder, elbow, wrist, hip, knee, and ankle. Few subjects have in recent times excited more discussion among surgeons than the application of this operation to the knee-joint. The operation was first performed in 1762; and up to the year 1830 there are records of 19 cases, out of which 11 died. From 1830 to 1850 the operation was never performed, and was generally condemned; but in the last-named year it was revived by Professor Fergusson, and is now a frequent and most valuable operation. 'The cases,' says Dr Druitt, 'in which it ought to be performed are, generally speaking, such cases of injury or disease as would otherwise be submitted to amputation. The object of the operation is to produce a firm and useful limb, slightly shortened, and with entire bony union, or fibrous union admitting of some small degree of motion at the situation of the joint. But all cases are not suitable for excision; and those cases are unsuitable and better adapted for amputation in which either the *quantity* of the diseased bone is very great, or the *quality* of the disease may be such as experience has shown to be incompatible with the exudation of healthy material of repair.' In at least 50 per cent. of cases the operation results in a good useful leg. It has already saved so many limbs that it must be regarded as one of the greatest triumphs of modern surgery. Further information on this subject may be found in Holmes's *System of Surgery*, or in any surgical text-book—e.g. Erichsen's.

Joints, in Geology, are the natural division-planes or cracks by which rocks of all kinds are traversed. Joints, although very frequently irregular, yet have a tendency to run across rocks in certain directions. Thus, in ordinary bedded aqueous rocks (sandstone, shale, limestone) they are generally developed more or less at right angles to the bedding, so that, if the strata be horizontal, the leading joints will be vertical or approximately so. Two sets of these joints are usually recognisable (*master-joints*), which cut each other at or nearly at right angles. Hence aqueous rocks, by means of joints and

original bedding-planes, are divided into larger or smaller cuboidal blocks. In massive crystalline rocks, such as granite, joints are rarely so regular. Yet even in these two sets of joints, crossing each other, can often be traced: and occasionally another horizontal set may be present—these last simulating the bedding-planes of aqueous strata. Were it not for the presence of such natural division-planes, it is obvious that quarrying would be a much more difficult operation. A peculiar kind of jointing is met with in certain crystalline igneous rocks, as in some fine-grained basalts, in which the division-planes separate the rock into polygonal or more or less perfect hexagonal prisms or columns (see *BASALT*). Joints have been formed in various ways. Many are doubtless due to the strain and tension to which rocks have been subjected during movements of the crust. Others probably owe their origin to contraction on cooling: the prismatic joints of basalt being 'fissures of retreat.' And, in like manner, it seems likely enough that sedimentary strata may sometimes have become jointed during their gradual drying and consolidation.

Joint-stock Company. See *COMPANY*.

Jointure, in English law, meant originally an estate settled on husband and wife jointly for their lives. Such settlements were made as a substitute for dower, which is that portion of property to which, on her husband's death, the widow is entitled for the maintenance of herself and children—one-third and upwards of the estate for life. The term jointure now includes an estate limited to the wife. The requisites of a jointure are: (1) That it must commence and take effect immediately on the husband's death; (2) it must be for the wife's life, at least; (3) it must be given to the wife herself, and not merely to trustees for her; (4) it must be expressed to be made in satisfaction of her whole dower; (5) it must be made before marriage. The mode of giving a jointure in modern marriage settlements is usually by way of a rent-charge on the husband's real estate. If a jointure be created out of an estate before marriage, the husband cannot sell the estate afterwards, so as to defeat the jointure. A jointure is not lost by the treason or felony of the husband, nor by the elopement and adultery of the wife.

In Scotland the word jointure is also frequently used in a similar sense to denote a conventional provision for a widow, consisting either of an annuity to her or of a life-tenure assignment of rents, or of a life-tenure of lands, called a locality. In whatever way the jointure is constituted it also excludes the widow's terce, unless it is otherwise expressed. See *HUSBAND AND WIFE*.

Joinville, a small town of 4000 inhabitants in the French department of Haute-Marne, 22 miles N. of Chaumont by rail, which was formed into a principality by Henry II., and later supplied the title to the third son of Louis-Philippe.

Joinville, JEAN, SIRE DE, the biographer of St Louis of France, was born in 1224, and became sénéchal to Thibaud, Count of Champagne and king of Navarre. He took part in the unfortunate crusade of Louis IX. (1248-54), returned with him to France, and lived thereafter partly at court, partly on his estates. He declined to go on the fatal expedition to Tunis, and survived till 11th July 1319. During his stay at Acre in 1250, at the age of twenty-six, he occupied his leisure in composing a manual of the Christian faith—his *Credo*, which he retouched thirty-seven years later; and there is extant a letter he wrote to Louis X. at the age of ninety-one. During the crusade he took notes of events and wrote down his impressions. At the age of almost eighty, at the entreaty

of Jeanne de Champagne, wife of Philip le Bel, he undertook his *Vie de Saint Louis*, which he finished after the death of his patroness, and presented in 1309 to her son (afterwards Louis X.). The concluding portion of the book bears traces of senility; nothing, on the other hand, is more clear, animated, and real than the part relating to the crusade. Thus the book is obviously a collection of pieces composed at different times. Joinville is an excellent example of the best type of 13th-century cavalier, with all his admirable qualities as well as all his limitations and defects: he is brave, pious, candid, devoted to his king while strictly maintaining against him his feudal rights, considerate for his vassals, a jealous guardian of all traditional privileges; but, on the other hand, his intelligence generally stops short at detail and cannot grasp general causes: he relates unskilful military operations without criticising or apparently even understanding them; he approves intolerance in St Louis, and falls into woeful puerilities in his narration. His style conforms closely to his character: it is veracious, flowing, naive, often singularly expressive, but it has neither the elegance of the best prose-writers of the middle ages nor the vigour and solidity of Villehardouin: it is the tone of an amiable and familiar talker, who sometimes forgets himself a little in his reminiscences, but never fails to charm. The book has the one consummate merit of sympathetically raising up clear before our eyes the breathing image of a romantic figure over whom already there hung the shadow of a tragic destiny.

Unfortunately the text has only come down to us in later MSS. in which the language has been modernised; but the methodical study of competent editors has at length restored with almost complete security both the substance and the form of the book—one of the most precious bequests of the middle ages, holding its place in time between Villehardouin and Froissart. See works by Didot (1870) and Delaborde (1894), and Sir F. Marzials's translation (1908).

Joists. See FLOOR.

Jókai, MAURUS, Hungarian novelist, was born on 19th February 1825 at Komorn. He qualified as an advocate, but never practised; literature and journalism were more to his taste. He was an active partisan of the Hungarian struggle in 1848, and when the Austrians gained the upper hand, it was with difficulty that he escaped imprisonment. After 1849 he devoted himself exclusively to literary pursuits. His works number about 300 volumes, and embrace novels, romances, dramas, humorous essays, poems, &c. Of these the most valuable are the novels and romances, of which *Midst the Wild Carpathians* is perhaps the most popular (1890). His skill as a narrator is enhanced by a lively imagination, humour, and a complete grasp of Hungarian life. His work is sometimes marred by improbability, a straining after effect, and superficial treatment. Most of his novels have been translated into German, and many into English. Jókai also gained fame as a journalist, as editor first of the revolutionary weekly *Pictures of Life*, then of the political daily *Fatherland*, and lastly of the humorous weekly *The Comet* (1858–81), and the government organ *Nemzet* ('The Nation'). Long a powerful debater on the liberal side in the Hungarian parliament, he died 5th May 1904.

Jokjakarta, or DJOKJAKARTA, a residency of central Java, has an area of 1191 sq. m., and a population approaching a million, nearly all Javanese; see JAVA. The capital, Jokjakarta, is a town of some 104,000 inhabitants, with the sultan's palace and ruins of ancient temples.

Joliba. See NIGER.

Joliet, capital of Will county, Illinois, is on Des Plaines River, and a ship-canal, 35 miles SW. of Chicago. It has plentiful water-power. It is the site of the state penitentiary, and has extensive manufactures of flour, steel, rails, machinery, chemicals, wire, stoves, tools, cigars, &c. There are large quarries of limestone at Joliet, and a coal-field in the neighbourhood. Pop. 38,000.

Jolly-boat (Dutch *jolle*, 'yawl'). See BOAT.

Jomini, HENRI, BARON, born 6th March 1779 at Payerne, in the canton of Vand, commanded a Swiss battalion at twenty-one, but going to France was introduced to Ney, and finally rose to be chief of his staff; he was created baron after the peace of Tilsit. In 1804 he attracted the notice of Napoleon by his *Traité des Grandes Opérations Militaires*. He distinguished himself at Jena, in the Spanish campaigns of 1808 and succeeding years, during the retreat from Russia, and at Lützen and Bautzen; but, offended at the treatment which he received from Napoleon, he entered the service of Russia in 1814. In 1828 he took an active part in the war Russia waged against Turkey, particularly in the capture of Varna. His fame as a military writer rests upon *Histoire Critique et Militaire des Campagnes de la Révolution* (5 vols. 1806), *Vie Politique et Militaire de Napoléon* (4 vols. 1827), and *Précis de l'Art de Guerre* (1830; new ed. 1881). Baron Jomini died at Passy, near Paris, 24th March 1869. See the Life by Lecomte (1861), and Sainte-Beuve in *Nouveaux Lundis*, vol. xiii.

Jommelli, NICCOLÒ, Neapolitan composer (1714–74), is known by his operas *Armida* and *Ifigenia*, and by a *Miserere* and a *Requiem*.

Jonah. The Book of Jonah, unlike the other eleven of the series of the minor prophets in which it occurs, is not a prophetic discourse but a narrative, and does not in any sense claim to have been written by the prophet whose name it bears. It belongs to that special kind of literary composition, common among the late Jews, usually known as haggadic; it is obviously not intended to be taken as literal history, but as a parable attached to a historic name. The name in this instance is that of Jonah, the son of Amittai, who is mentioned in 2 Kings, xiv. 25, as having been a native of Gath-hepher in Galilee, and as having prophesied the victories of Jeroboam II. No writing known to belong to him is now extant; and on various grounds the narrative is regarded by modern scholars as being later than the great prophets and the exile. Whether the story now associated with Jonah's name may have had some basis in any word or deed of his, or whether the choice of his name was quite arbitrarily made by the anonymous author, cannot now be determined. The key to the narrative, the details of which are familiar to every one, is to be sought in the closing chapter, where Jehovah asks the prophet whether he does well to be angry because of the sparing of Nineveh, a great city teeming with innocent life for which Jehovah has laboured, and which he has caused to grow. Nowhere in the Old Testament is that particularism, to which the Jews were ever prone, more clearly or emphatically rebuked. As for the earlier part of the story, its explanation is to be sought in the often-recurring Old Testament figures in which the great world-powers are likened to sea-monsters or dragons (see, for example, Jer. li. 44), and deliverance from any overwhelming calamity is spoken of as a bringing back from the depths of the sea (cf. Ps. lxxviii. 22). At the time when the Book of Jonah was written the Jews, who had returned from the Babylonian exile full of bright hopes as to a near and glorious future, had become querulously aware of the failure of these. The object of the writer seems to have been

to suggest to them that their existing troubles, in which they seemed as it were to be swallowed up by the world-powers which oppressed them, were due to their neglect of the missionary vocation which had been urged upon Israel by the later prophets (see especially Isa. xl.-lxvi.); once Israel in penitence and prayer shall have shown that she has again become alive to this duty, she may hope to experience the fulfilment of the prophet's words (Hos. vi. 2): 'After two days he will revive us; on the third day he will raise us up.' The prayer of Jonah, whether a composition of the author of the rest of the book or not, certainly cannot be carried back to a date nearly so early as the time of Jeroboam; it is largely a cento from older compositions, the metaphors in verses 3-6 being common in all periods of Hebrew poetry. See the commentaries on the minor prophets mentioned under HOSEA; also J. A. Bewer (*Internat. Crit. Comm.*, 1912), and Driver's *Literature of the Old Testament* (p. 321 seq.).

Jonas, JUSTUS (1493-1555), a helper of Luther's in the work of reformation and translation of the Bible, was professor at Wittenberg, pastor at Halle and Coburg, and superintendent at Eislefeld. He took part with Luther in many of the great events of the Reformation, as at Worms, Marburg, and Augsburg.

Jonathan, BROTHER, the personification of the United States, especially of its native-born citizens. The original of the name is supposed to be Jonathan Trumbull (1710-85), governor of Connecticut, whose shrewdness, staunch patriotism, and unflinching zeal gained him the esteem and friendship of Washington; and the latter's phrase when perplexed, 'Let us hear what Brother Jonathan says,' passed into a proverb.

Jones, EBENEZER, poet, was born at Islington, 20th January 1820. He was brought up in the strictest sect of the Calvinists, but at thirteen was writing verses, and in secret devouring the Waverley novels. In 1837 he was forced by his father's long illness to turn clerk in a city warehouse: his hours were eight to eight six days a week. Yet he published his *Studies of Sensation and Event* (1843), poems 'full of the very essence of poetry,' and admired by such poets as Browning and Rossetti. But the world rejected them, and he published no more, save a pamphlet on the *Land Monopoly* (1849), which anticipated Henry George by thirty years in proposing to nationalise the land. A Chartist he was not, but a disciple of Carlyle in politics, as of Shelley in poetry. In 1844 he married, miserably, the niece of Edwin Atherstone; and he died at Brentwood, 14th September 1860. See articles by Watts-Dunton in the *Athenæum* (1878); and notices by Sumner Jones (elder brother of the poet, and a poet himself) and W. J. Linton prefixed to a reprint of the *Studies* (1879).

Jones, EDWARD BURNÉ. See BURNÉ-JONES.

Jones, ERNEST, Chartist poet, was the son of Major Jones, equerry to the Duke of Cumberland, afterwards king of Hanover. He was born at Berlin in 1819, was educated in Germany, and came to England in 1838. In 1841 he published his romance, *The Wood Spirit*, was called to the bar of the Middle Temple in 1844, and the year following became the most prominent leader of the Chartist movement. He declined all remuneration for his services, and issued *The Labourer, Notes of the People*, and the Chartist organ, *The People's Paper*. He voluntarily resigned a fortune of nearly £2000 per annum, left to him on condition that he should abandon the Chartist cause. For the part which he took in the Chartist proceedings at Manchester in 1848 he was condemned to two years' solitary confinement. This vindictive sentence

was brought before the House of Commons, but Jones refused to petition for its commutation. While in prison he composed an epic poem, *The Revolt of Hindostan*. The authorities refused him pen, ink, and paper, and the poem was stated to have been written on the leaves of his prayer-book with a bird's feather and blood drawn from his own veins. After his release Jones wrote *The Battle-day* (1855); *The Painter of Florence* and *The Emperor's Vigil* (1856); and *Beldagon Church and Corayda* (1860). He tried for a seat in parliament, but was defeated at Halifax (1847) and Nottingham (1853, 1857). He died 26th January 1869.

Jones, HENRY ARTHUR, playwright, was born at Grandborough, Bucks, 28th September 1851, and was at first in business. *Only Round the Corner* was produced in 1878, but his first hit was *The Silver King* (1882). About forty plays followed.

Jones, INIGO, architect, was the son of a cloth-worker, and was born in London 15th July 1573. A nobleman sent him to Italy to study landscape-painting, but, drawn to architecture by the works of Palladio, he followed in his footsteps, and became known as the 'English Palladio.' On leaving Italy he went to Denmark by invitation of Christian IV., and there he is said by some to have designed the royal palaces of Rosenborg and Frederiksborg. Returning to England in 1604, he was employed by James I. in arranging the scenery, &c. for the masques of Ben Jonson, which were at that time the chief amusement of the court. Jonson afterwards satirised his fellow-labourer in *A Tale of a Tub*. In 1612 Jones revisited Italy, still further to improve his style, and on his return to England was appointed surveyor-general of the royal buildings. He was at this time accounted the first architect of England, and, according to some, the first of the age. He died 21st June 1652. His masterpiece is considered to be the Banqueting House (now the Chapel Royal) at Whitehall. Another representative specimen of his work is the church of St Paul, in Covent Garden, London.

See Walpole's *Anecdotes of Painting* (Dallaway's ed. 1828) for the buildings designed by him; his *Life* by Peter Cunningham (1848); Fergusson's *History of Architecture*; and W. J. Loftie, *Inigo Jones and Wren* (1893).

Jones, OWEN, Welsh antiquary, was born in Denbighshire in 1741, and died in London, 26th September 1814. He was all his life a furrier, but had early developed a taste for Welsh poetry. In 1801-7 he published at his own cost the *Myvyrian Archaeology of Wales*, a collection of poetic pieces dating from the 6th down to the 14th century (new ed. Denbigh, 1870). The MSS. from which he made his selection, running to one hundred volumes, are deposited in the British Museum.—His son, OWEN JONES, born in 1809, made himself a name as an art-decorator. He laid the foundations of his knowledge in an architect's office in London, travelled for four years in southern Europe, and published *Designs for Mosaic and Tesselated Pavements* (1842), *Plans, Elevations, Sections, and Details of the Alhambra* (1845), and *Polychromatic Ornament of Italy* (1845). He was made superintendent of works for the London Exhibition of 1851, and afterwards director of decorations for the Crystal Palace, where he designed the decorations of the Alhambra, Egyptian, Greek, and Roman courts, and wrote guide-books to the first two. In 1853 he published *Principles regulating the Employment of Colour*; in 1856 the *Grammar of Ornament*, still a valuable text-book; in 1864, *One Thousand and One Initial Letters*; and in 1867, *Examples of Chinese Ornament*. He also illustrated several books. He died in London, 19th April 1874.

Jones, PAUL, United States naval commander, by his countrymen styled 'the Pirate,' was born in

Kirkbean parish on the coast of Kirkeudbrightshire, 6th July 1747, the fifth and youngest child of John Paul, head-gardener to Mr Craik of Arbigland. Apprenticed at twelve as sailor-boy to a Whitehaven merchant, he made several voyages to America, where he had an elder brother settled in Virginia. This brother's property he inherited in 1773, having meanwhile for five years been mate on a slaver; and about the same date he changed his name John Paul for that under which he is famous. He embraced the cause of the American colonies; and when congress in 1775 resolved to fit out a naval force he offered his services. In April 1778, visiting the British coast in a brig of eighteen guns, he performed some most daring exploits, and took advantage of his familiarity with the scenes of his boyhood to make a hostile descent on the shores of the Solway Firth. At Whitehaven he fired one ship and spiked thirty-six guns; from St Mary's Isle he carried off Lord Selkirk's plate, but six years later restored it; and next morning in Belfast Lough he captured the *Drake* sloop-of-war—the first naval success of the Americans. The year after, as commodore of a small French squadron displaying the stars and stripes, he threatened Leith, and on 23d September fought close off Flamborough Head a most desperate and bloody engagement, in which he captured two British men-of-war. Louis XVI. created him a Chevalier of the Order of Military Merit, and congress voted him a gold medal. In 1788 he entered the service of the Empress Catharine, and as rear-admiral of the Black Sea fleet served creditably in the war against Turkey; but a twelvemonth later he quitted the Russian service. He died at Paris, 18th July 1792, his funeral being attended by a deputation of the Legislative Assembly.

See Lives by Sherbourne (1825), Janette Taylor (1830), Mackenzie (1841), Simms (1845), James Hamilton (1848), J. C. Abbott (1875), James Barnes (1900), A. C. Buell (2 vols. 1900), and Mrs de Koven (1913); also Sir J. K. Laughton's *Studies in Naval History* (1887).

Jones, Sir William, one of the earliest of English orientalists, was born in London, 28th September 1746, the son of William Jones (1680–1749), a learned mathematician and friend of Newton. He had his schooling at Harrow under Thackeray and Sumner, and entered University College, Oxford, in 1764, where his remarkable attainments quickly attracted attention. In 1765 he left Oxford to become tutor to the eldest son of Earl Spencer, and with him remained five years. He was called to the bar in 1774, and two years later was appointed Commissioner of Bankrupts. In 1770 he published, at the request of the king of Denmark, a *Life of Nadir Shah*, translated into French from the Persian; in 1772 a *Persian Grammar*; in 1774 his Latin Commentaries on Asiatic Poetry; and in 1780 a translation of seven ancient Arabic poems, known as the *Moallakat*, so called from being 'suspended' in the temple at Mecca. In March 1783 he obtained a judgeship in the Supreme Court of Judicature in Bengal, and was knighted. With characteristic ardour he at once devoted himself to the study of Sanskrit with a view to prepare a digest of Hindu and Mohammedan law. He established the Bengal Asiatic Society, 'for investigating the history, antiquities, arts, sciences, and literature of Asia,' and was its first president. He contributed largely to the *Asiatic Researches*. Already in 1789 he had finished his translation of *Sacontala*, or the *Fatal Ring* (1799), when in 1794 he published a translation of the Ordinances of Manu, a preparatory task for the greater work. Soon after he was attacked with an inflammation of the liver, which carried him off on the 27th April 1794. The East India Company erected a

monument to his memory in St Paul's Cathedral, and a statue in Bengal. A collected edition of his works was published by Lord Teignmouth in six quarto volumes in 1799; two supplementary volumes followed in 1801; and a Life in 1804. The impulse that Sir William Jones gave to the study of Sanskrit literature was far more important than the performance his short and busy life enabled him to effect. He was indeed a learned scholar, but his scholarship was of the pre-scientific age, and has long since been superseded. But his noble and generous character and his ardent enthusiasm for learning have done much not only to promote learning, but to elevate the character of the scholar.

Jongleurs (Old Fr. *jogleor*, *juglere*, Ital. *giocolatore*, from the Lat. *joculator*), among Provençals and northern Frenchmen, a class of minstrels during the middle ages who sang and often composed poems, songs, and fabliaux, and who frequented courts, tournaments, castles, and towns for that purpose. They made a trade of song, poetry, and story-telling, and often of jesting and buffoonery, and are distinct from the knightly poets, the Troubadours and Trouvères. They were often for their special gifts retained in the service of particular lords, and we find them also named indifferently *ménestrels* or *ménéstriers*. Two of their number, Jacques Grure and Hugues-le-Lorrain, founded the church of St Julien in 1331. See **PROVENÇAL LANGUAGE AND LITERATURE**.

Jönköping, a town of Sweden, capital of the *lan* or county of Jönköping (area, 4447 sq. m.; pop. 230,000), stands on a beautiful situation at the southern end of Lake Wetter, 115 miles by rail nearly due E. of Gothenburg. It is famous for its safety-matches. Paper, carpets, tobacco, &c., are also made. Pop. 30,000. Here several Swedish parliaments have been held, and peace was signed between Sweden and Denmark in 1809.

Jonquil (Fr. *jonquille*, from Lat. *juncus*, 'a rush'), a name given to certain species of *Narcissus* (q.v.) with rush-like leaves. The Common Jonquil (*N. Jonquilla*), a native of the south of Europe, is one of the commonest bulbous-rooted plants in our flower-borders. It has from two to six yellow flowers at the summit of its scape (leafless stem). The Sweet-scented Jonquil (*N. odoratus*), also a native of the south of Europe, is another species very generally cultivated. Perfumed waters are made from Jonquil flowers.

Jonson, BEN, dramatist, was born at Westminster in 1572, a month after the death of his father, who was a minister. Jonson thought that his grandfather was of Annandale (probably he was a Johnstone). Ben was educated at Westminster School under Camden, whom he held in the highest veneration. Fuller is probably wrong in saying that he spent a few weeks at Cambridge. His mother remarried a master-bricklayer; and for a while Ben followed the craft of his stepfather, but 'could not endure the occupation' (see his *Conversations with William Drummond of Hawthornden*). At some undefined time he went off to serve as a soldier in the Low Countries, where he distinguished himself by killing one of the enemy in single combat 'in the face of both the camps.' After a short stay abroad he returned and 'betook himself to his wonted studies.' He married early (between 1592 and 1595) and had children, whom he survived. Among his poems are two tender elegies on the death of his eldest son and eldest daughter. According to his own account his wife was 'a shrew, yet honest.' On one occasion he stayed five years away from her, as the guest of Sir Robert Townshend and of Lord Aubigny.

We first hear of Jonson's connection with the stage in 1597, but he had doubtless been at work for some time previously both as an actor and dramatist. In 1598 he is mentioned by Meres as one of 'our best for Tragedie.' During these early years he seems to have usually collaborated with other playwrights—Porter, Chettle, Dekker, &c. In 1597 he was imprisoned for completing Nash's *Isle of Dogs*. He had a narrow escape in 1598 from the gallows. An actor in Henslowe's company, Gabriel Spencer, challenged him to a duel in the fields at Shoreditch. Jonson killed his adversary, was tried for homicide, pleaded his clergy, and escaped with the penalty of branding in the thumb of the left hand and the forfeit of his goods and chattels. In his conversations with William Drummond (q.v.), whom he visited at Hawthornden in 1618-19, he declared that the quarrel was not of his seeking, but that he 'had been appealed to the fields,' adding that the challenger's sword was 10 inches longer than his own. During his imprisonment he was visited by a priest who converted him to the Roman Catholic creed, to which he adhered for the space of twelve years.

In 1593 *Every Man in his Humour* was produced. There is a tradition that Shakespeare procured this excellent play to be acted; and we know that Shakespeare himself personated one of the characters. In the original version the scene is laid near Florence; afterwards Jonson gave English names to the characters, and shifted the scene to London. *Every Man in his Humour* is lighter and brisker than the elaborate masterpieces of his maturer years. *The Case is Altered* was played in the same year. The success of *Every Man in his Humour* inspired *Every Man out of his Humour* (1599), a somewhat tedious play, which was followed by *Cynthia's Revels* (1600) and *The Poetaster* (1601). In the last play Jonson made a violent attack on Dekker and Marston, and was in consequence assailed in Dekker's *Satiromastix*. Subsequently Jonson and Marston were reconciled; they worked together on *Eastward Ho*, in company with Chapman; and all three were imprisoned (1605) for a supposed insult to the Scottish nation. Marston dedicated his *Malcontent* to Jonson in handsome terms. But the quarrel broke out again later. *Sejanus*, a solidly constructed but frigid tragedy, was produced in 1603; and *Volpone*, or *the Fox*, a dexterously ingenious but uncomfortably cynical comedy, in 1605. Of *Epicæne*, or *the Silent Woman* (1609), a farcical mirth-provoking piece, Dryden observed, 'I prefer it before all other plays, I think justly, as I do its author, in judgment, above all other poets.' *The Alchemist* (1610) is the most elaborate and most masterly of Jonson's writings, the magnificent extravagance of Sir Epicure Mammon being depicted with keenest spirit and inexhaustible learning. *Catiline* (1611) is a companion piece to *Sejanus*. In 1612 he went to France as tutor to Raleigh's son. *Bartholomew Fair* (1614) hits off the humours of the old London festival with the liveliest gusto. *The Devil is an Ass* (1616) shows the beginnings of decay; yet the masques, which, interrupted by his walk to Edinburgh and back in 1618-19, chiefly occupied him for the rest of the reign, are of singular beauty. He was one of the most learned men of his age, and he lavished all the stores of his knowledge on these entertainments; but his sprightliness of fancy and fertility of invention matched his learning, and his masques are models of elegance and grace. The mechanism was provided by Inigo Jones, with whom he frequently quarrelled. Other poets allowed Jones to take the chief credit for the success of their masques; but Jonson insisted that the poetry was the main thing, and that the mechanic's art was of minor importance. Jones

finally succeeded in ousting Jonson from court favour.

In addition to the masques Jonson wrote many elegies, epistles, love-poems, epigrams, and epitaphs, such as the famous epitaph on Salathiel Pavy. As a song-writer he had few equals. Of his songs the most popular is 'Drink to me only with thine eyes,' but the Hymn to Diana in *Cynthia's Revels*, 'Still to be neat, still to be drest' in *The Silent Woman*, and many of the songs scattered up and down the masques are equally charming. None knew better than Ben Jonson how to write complimentary poems; the best is perhaps the epigram to the Countess of Bedford, 'This morning, timely rapt with holy fire.' To the collected edition (1623) of Shakespeare's works he prefixed a noble memorial poem. His prose *Discoveries* are distinguished by admirable judgment and unaffected purity of diction.

When he was in his forty-sixth year he spoke with humorous complacency of his 'mountain belly' and 'rocky face.' But bodily infirmities came in later years. In 1628 he was paralysed. For the last few years of his life he was unable to leave his room. His sufferings were intensified by poverty. After King James's death few masques were called for. Charles II.'s patronage was fitful, but the Earl (afterwards Duke) of Newcastle was a good friend. From 1628 Jonson was chronologer to the City of London. He returned to comedy with *The Staple of News* (1626). *The New Inn* (probably 1629) was not successful on the stage (as Jonson records in the famous *Ode to Himself*); it has an improbable plot. The latest comedies were *The Magnetic Lady* (1632) and *A Tale of a Tub* (1633; an early work revised). A delightful pastoral play, *The Sad Shepherd*, was left unfinished. He died in August 1637. A collection of poems to his memory by the famous wits of the age was published in 1638 under the title of *Jonsonus Virbius*. His arrogance and asperity had procured him enemies; but he had been liberal in his praise of others' merits, and the younger poets regarded him with reverence and affection. The slab over his grave in Westminster Abbey was inscribed 'O rare Ben Jonson!'

See the *Life* by Gifford as revised in Cunningham's reissue of Gifford's 9 vol. edition of the works (1875); books by Symonds, Swinburne, Koeppe, Castelain (1907), and Gregory Smith (1919); Ward's *Dramatic Poetry*. An edition of the Works, with a *Life*, has been undertaken by Herford and Simpson (1925 *et seq.*) There is also an edition by various editors (Yale Press), and several plays have appeared in Bang's *Materialien*.

Jónsson, EINAR, sculptor, born in Iceland in 1874. He studied at Copenhagen under Sinding and afterwards at the Royal Academy of Fine Arts in the same city. 'The Outlaw,' a composition of stark realism with an intense atmosphere of rugged power, was exhibited in 1901. In 1902-3 he studied in Rome, but in his reaction against what he considered the cramping influences of the antique he determined to go his own way in art, and his productions, 'Evolution,' 'New Life' (one of the most beautiful of his works), 'The King of Atlantis,' and 'Ingolf Arnarson' (dignified and striking but full of romance and charm), show very clearly the trend of his art. His works have been collected and housed at Reykjavík. The bold grandeur of his effects will be taken as a direct result of the influence of the majestic but bleak land from which he sprang.

Jonston, ARTHUR. See JOHNSTON.

Joplin, a city of Missouri, 140 miles S. of Kansas City, in a great zinc and lead mining field, with smelting-works; pop. 30,000.

Joppa. See JAFFA.

Jordaens, JAKOB, born at Antwerp, 19th May 1593, ranks next to Rubens in realistic fidelity and vigour of portraiture, though he is sometimes a little coarse; he excelled in humorous pieces depicting Flemish life, but painted also scriptural and mythological subjects. He died at Antwerp, 18th October 1678. See monograph by Rooses (trans. 1908).

Jordan ('descending'), the principal river of Palestine, the bed of which forms a great valley stretching from north to south, in the eastern part of the country. It is formed by the junction of three streams. The highest source of the Jordan is the Hasbany, which rises near the Druse town of Hasbeiya, on the west side of Mount Hermon. There is another spring on the south side of the same mountain at Baniyas (Paneas or Cæsarea Philippi), and the Leddani at Dan. The Jordan flows south, and after a course of a little over 100 miles, having passed through the small Huleh Lake (The Waters of Merom) and the Lake of Tiberias (Sea of Galilee), 682 feet below the Mediterranean, it falls into the northern extremity of the Dead Sea (q.v.), 1292 feet below the Mediterranean. Besides smaller affluents, it receives four streams, the Wady Far'ah and Wady Kelt from the west, the Hieromax and Jabbok from the east. M'Gregor estimates the Jordan to have 200 miles of channel from the Hasbeiya source to the Dead Sea. The source is 1700 feet above the Mediterranean, making a total fall when it reaches the Dead Sea of 3000 feet. The bed of the river varies much in breadth, from 30 to 50 yards. It flows latterly in a sunken channel, and its banks of white marl are in some places flat, in others steep; in the north partly occupied by fields of barley, but barren below Jericho. There are upwards of forty fords, but the two at Jericho are impassable in flood. The lower course was explored by Molyneux in 1847, by Lynch in 1848; the upper by John M'Gregor in his canoe in 1869. See for geology Blanckenhorn, *Naturwissenschaftliche Studien am Toten Meer und im Jordantal* (1912).

Jordan, MRS DOROTHEA, actress, was born near Waterford in 1762, the daughter of an actress and one Bland, whose father afterwards had the marriage annulled. She appeared first in Dublin, under the name of Miss Frances, as Phoebe in *As You Like It*, but soon became popular in romps and 'breeches' parts. Having had a quarrel with her manager, in 1782 she crossed the channel and obtained an engagement from Tate Wilkinson, of the York circuit, with whom she acted for three years. It was Wilkinson who joked her about 'crossing the Jordan,' and so suggested a new name to her; the 'Mrs' was added to secure a legacy—a theatrical wardrobe—left to her on this condition by an aunt who was a stickler for the proprieties. Mrs Jordan made her début at Drury Lane in *The Country Girl* in October 1785—just seven weeks before Mrs Clive died—and in a few days she had bewitched the town; the benches, formerly empty on the nights when Mrs Siddons was not playing, were now filled, and her joyous, apparently irrepressible laugh—her *swindling* laugh, a friend called it—captivated all hearts. In November she appeared as Viola in *The Twelfth Night*—a performance of which Lamb, long after, wrote with a kind of rapture; and he added, 'Her joyous parts (in which her memory now chiefly lives) in her youth were outdone by her plaintive ones.' Nevertheless, for nearly thirty years, it was in the rôles of romps and boys that she mainly kept her hold on the public; in the part of a youthful and tender heroine she was less successful, as her wonderful voice lost its freshness and sweetness. In 1790 commenced her connection with the Duke of

Clarence, afterwards William IV., which endured until 1811. That she was faithful to him all this time, in spite of her youthful follies, there is no reason to doubt, and her considerable income was placed freely at his service. As some return he was warmly attached to her, and caused all who came to his house to treat her as his duchess. No satisfactory explanation has ever been given of the sudden breaking-off of their relations: Mrs Jordan testified to the Duke's generosity, but there is reason to believe she sacrificed herself in the settlements that followed. At anyrate, after playing in London and in the provinces until 1814, she was compelled to retire to France for a debt of £2000—and this at a time when she was supposed to be in receipt of a pension of £1500 a year, besides her earnings as an actress. She lived in comparative poverty, though not in actual want, at St Cloud, and died there, friendless and alone, 3d July 1816. In 1831 King William raised her eldest son to the peerage, as Earl of Munster, and gave the other Fitz-Clarences the rank and precedence of the younger sons and daughters of a marquis. See *Lives* by Boaden (2 vols. 1831) and Mrs Jerrold (1914).

Jordanes, wrongly JORNANDES, historian of the Goths, was by birth a Goth, or of both Alan and Gothic descent, and flourished in the middle of the 6th century. He was first a notary, as was his grandfather, but afterwards became a monk. He wrote two historical works in Latin—*De Regnorum ac Temporum Successione*, a dry compendium of history from the creation to 550 A.D., and only valuable for events subsequent to 450 A.D., and *De Getarum Origine et Rebus Gestis* (trans. Mierow, 1915), based on a lost work of the Roman Cassiodorus. This last is our only source of information about much connected with the Goths and other barbarian tribes. The work is, however, a mere compilation, and has many inaccuracies and inconsistencies. See Mommsen's introduction to his edition of both works (1882), and Hodgkin's *Italy and her Invaders* (1880).

Jortin, JOHN, miscellaneous writer, was the son of a Huguenot refugee, and was born in London, 23d October 1698, and educated at Charterhouse and Jesus College, Cambridge. Having taken orders, he held in succession the livings of Swavesey in Cambridgeshire (till 1730), Eastwell in Kent, St Dunstan's-in-the-East, London (from 1751), and Kensington. He was also a prebendary of St Paul's and archdeacon of London. He died 5th September 1770. At Cambridge he published a volume of meritorious Latin poems, *Lusus Poetici* (1722). The works for which he was best known are *Miscellaneous Observations upon Authors, Ancient and Modern* (2 vols. 1731–32); *Remarks on Ecclesiastical History* (5 vols. 1751–53); *Life of Erasmus* (2 vols. 1758–60); and *Tracts: Philological, Critical, and Miscellaneous*, edited by his son (2 vols. 1790).

Jorullo, a volcanic mountain in the Mexican state of Michoacan, 4315 feet above sea-level, and 1640 feet above the plain on which it stands, is about 150 miles WSW. of Mexico city, in 19° 9' N. lat. and 103° 51' 48" W. long. It was thrown up during one night, 29th September 1759, after several months of subterranean convulsions. The plain on the northern side is inflated like a gigantic bladder, the surface consisting of lava and cinders—a phenomenon to which the people give the name of *malpays*; it has an elevation of 40 feet above the rest of the plain, and is convex, rising in the centre to 535 feet. The southern slope is covered with luxuriant vegetation from base to summit.

Josaphat. See BARLAAM.

Joseph, the name of four persons in the Bible. (1) **JOSEPH**, the elder of the two sons of Jacob by Rachel, and his father's favourite among all his sons. His envious brothers sold him into Egypt, where, after he had endured imprisonment in consequence of the calumnious charges of the wife of his master Potiphar (a similar story is told of Hippolytus, son of Theseus, and his step-mother Phædra; see also **SEVEN WISE MASTERS**), his conduct and skill in the interpretation of dreams brought him the especial favour of Pharaoh (perhaps one of the Hyksos), and the first place in the kingdom. His prudent foresight enabled him to stave off famine by measures which enormously enhanced the power of the throne, and soon he had the gratification to find his brothers at his feet, driven down into Egypt for lack of bread. The story is told in full detail in Genesis, how at last he made himself known to his trembling brothers, and sent to Canaan for his aged father and the whole family, placing them after their arrival in the land of Goshen. Joseph died at length full of years and honours, and when the Israelites left Egypt they carried with them his bones to be buried in Shechem in the inheritance of his son Ephraim.

(2) **JOSEPH**, the husband of the Virgin Mary, and reputed father of Jesus, a carpenter at Nazareth. The earliest genealogy of Jesus makes Joseph a descendant of David, and would seem to favour the natural birth of Jesus from parents both of royal line; but the notion of the miraculous conception is found in both Matthew and Luke, and was early accepted as a part of Christian belief. Later days developed the idea of the perpetual virginity of Mary, and made Joseph into her protector and merely nominal husband, giving him eighty years and a grown-up family of sons by a former wife at the time of his formal espousal of Mary. These stories first occur in the apocryphal gospels, earliest of which is apparently the *Prot-evangelium of James*, a 2d-century production quoted by Origen, and mentioned by Clement of Alexandria and Justin Martyr. The apocryphal *Historia Josephi fabri lignarii*, which now exists in Arabic, is thought by Tischendorf to have been originally written in Coptic. Joseph appears last in the gospel history when Jesus is twelve years old (Luke, ii. 43); he is never mentioned during his ministry, and may be assumed to have been already dead. The controversy about the 'brethren of the Lord' has engaged the attention of many writers from the time of St Jerome to the present day. The main facts related of them in Scripture itself are their unbelief during the lifetime of the Lord, their distinctness from the Twelve (Acts, i. 13; 1 Cor. ix. 5), and their connection with Joseph and Mary. The two opinions that prevailed until the time of St Jerome about the close of the 4th century were (1) that they were sons of Joseph by a former wife, as held by most orthodox Christians, and by such Fathers as Clement of Alexandria, Origen, Eusebius, Gregory of Nyssa, Epiphanius, Ambrose, and the later Greek writers; (2) that they were sons of both Joseph and Mary, as maintained by Tertullian, Helvidius, Bonosus, the heretical Arabian sect of the Antidicomarianites, and Alford, Farrar, Bungere, Mayor among others. St Jerome about the year 383 wrote a treatise in answer to Helvidius, maintaining that they were cousins after the flesh, being sons of Mary, the wife of Alphæus (identical with Clopas) and sister of the Virgin. In this opinion Jerome was followed by Pelagius, Augustine, Theodoret, and later Latin writers. But as Bishop Lightfoot points out in the Dissertation, 'The Brethren of the Lord,' appended to his Commentary on the Epistle to the Galatians (1865), Jerome claims no traditional support for his theory, and does not himself hold it staunchly

and consistently. The strongest objection against the Helvidian theory is that Jesus on the cross commended his mother to the keeping of St John (John, xix. 26, 27); against the Hieronymian, that it gives a special sense to 'brethren' unsupported by biblical usage, and that it supposes two if not three of the unbelieving 'Lord's brethren' to be in the number of the Twelve. Lightfoot favours the Epiphaniian as traversing less serious scriptural difficulties, and more in accordance with Christian tradition.

(3) **JOSEPH OF ARIMATHEA**, a rich Israelite of high character, who seems to have been a member of the Great Council or Sanhedrim. He opposed the determination of his colleagues to bring about the death of Jesus, but did not openly profess himself a disciple from motives of fear. But the courage of his convictions came to him at the moment of the crucifixion, and on the evening of that day he went boldly to Pilate and begged the body of Jesus, burying it reverently in his own rock-hewn tomb. An ancient tradition makes him carry the Grail (q.v.) to Britain about the year 63 and settle at Glastonbury (q.v.).

(4) **JOSEPH**, called Barsabas and surnamed Justus, one of the two persons chosen as worthy to fill the vacant place of Judas among the Twelve (Acts, i. 23). Papias relates a tradition that he had been miraculously preserved by the Lord from the fatal effects of a cup of poison he had drunk.

Joseph I., German Emperor, the eldest son of Leopold I., born at Vienna, 26th July 1678, was crowned king of Hungary in 1689, and king of the Romans in 1690, became emperor in 1705, and died on 17th April 1711. Holding opinions more liberal than those which have generally prevailed in his family, he granted privileges to the Protestants of his dominions, especially in Silesia. In alliance with Britain, he prosecuted actively and successfully the war of the Spanish Succession against France. Another favourite scheme of his was the appropriation of Bavaria.

Joseph II., German Emperor, son of Francis I. and Maria Theresa (q.v.), was born 13th March 1741. He early gave proof of excellent abilities. In 1764 he was elected king of the Romans, and after the death of his father (1765) German Emperor; but until the death of his mother in 1780 his actual share of power amounted to little more than the chief command of the army and the direction of foreign affairs. Although he failed in his object of adding Bavaria to the Austrian dominions (1777-79 and again in 1785), which he hoped to obtain in exchange for the Low Countries, he acquired Galicia, Lodomeria, and the county of Zips, at the first partition of Poland in 1772; and in 1780 he appropriated great part of the bishoprics of Passau and Salzburg. He was a zealous reformer; but having imbibed, like Frederick the Great, the principles of absolute rule which prevailed in that age, he attempted his reforms too rashly, and too much by the exercise of mere authority. As soon as he found himself in full possession of the government of Austria he proceeded to declare himself independent of the pope, and to prohibit the publication of any new papal bulls in his dominions without his *placet*. The continued publication of the bulls 'Unigenitus' and 'In Coena Domini' was prohibited. Besides this, he suppressed no fewer than 700 convents, reduced the number of the regular clergy from 63,000 to 27,000, prohibited papal dispensations as to marriage, and on 15th October 1781 published the celebrated Edict of Toleration, by which he allowed the free exercise of their religion to the Protestants and Non-united Greeks in his dominions. Pope Pius VI. thought to check this course by a personal interview with the

emperor, and for that purpose made a visit to Vienna in 1782, but was unsuccessful in his object. Joseph's other important reforms were the abolition of serfdom and the reorganisation of the system of taxation on a juster basis. He also curtailed the feudal privileges of the nobles. In 1788 he engaged in a war with Turkey, in which he was unsuccessful; and the vexation caused by this, and by the revolts in his own dominions, in Hungary, Tyrol, and the Netherlands, and the necessity under which he felt himself of revoking many of the edicts by which he had sought to promote the welfare of his people, especially in Hungary, hastened his death, which took place on 20th February 1790. He founded many valuable educational and scientific institutions, and did much to promote the progress of arts, manufactures, and commerce in Austria.

See works by Brunner (1868-85), Lustkandl (1881), Nosinich and Wiener (1885), Bright (1897), and Schlitter (1900); also *The Cambridge Modern History*, vol. vi.

Joseph, king of Naples. See BONAPARTE.

Josephine, MARIE ROSE, empress of the French, was born 23d June 1763, in the island of Martinique, where her father, Tascher de la Pagerie, was captain of the port at St Pierre. She had only an indifferent colonial education; but her qualities of mind and heart, even more than her beauty, won universal regard. When about fifteen years of age she came to France, and in 1779 married Viscount Alexandre Beauharnais (q.v.). A daughter of this marriage, Hortense, queen of Holland, was the mother of the Emperor Napoleon III. Josephine's husband was executed during the Reign of Terror, she herself just escaping. On 9th March 1796 she was married to Napoleon Bonaparte. She accompanied him in his Italian campaign, and exercised a great influence in restraining him from measures of violence and severity. At Malmaison, and afterwards at the Luxembourg and the Tuileries, she attracted round her the most brilliant society of France, and contributed not a little to the establishment of her husband's power. But her marriage with Napoleon proving unfruitful, it was dissolved by law on 16th December 1809. Josephine retained the title of empress, corresponded with Bonaparte, and, if the allied sovereigns had permitted it, would have rejoined him after his fall. She died at Malmaison, 29th May 1814.

See works on her by Aubenas (1859), Ober (hostile but uncritical, 1901), Sergeant (insisting on her unfaithfulness, 1908), Turquan (unfriendly also, 1909), Méneval (insisting on her good qualities and belittling her faults, trans. 1912), Walter Geer (1925).

Josephus, FLAVIUS, a celebrated Jewish historian, was born at Jerusalem in 37 A.D. He was of both royal and sacerdotal lineage, being descended, on the mother's side, from the line of Asmonean princes, while his father, Matthias, officiated as a priest in the first of the twenty-four courses. The careful education he received developed his brilliant faculties at an unusually early age, and his acquirements both in Hebrew and Greek literature soon drew public attention upon him. Having successively attended the lectures at the paramount religious schools of his time—'sects,' as he inaccurately terms them—he withdrew into the desert to sit at the feet of one Banos, who is conjectured to have been either a follower of John the Baptist or an Essene. Three years later he returned to Jerusalem, and henceforth belonged to the body of the 'Pharisees,' which in fact comprised the bulk of the people. So highly was his ability esteemed that at the age of only twenty-six he was chosen delegate to Nero. When the Jews rose in their last and fatal insurrection against the Romans Josephus was ap-

pointed governor of Galilee. Here he displayed the greatest valour and prudence; but the advance of the Roman general Vespasian (67 A.D.) made resistance hopeless. The city of Jotapata into which Josephus had thrown himself was taken after a desperate resistance of forty-seven days. Along with some others he concealed himself in a cavern, but his hiding-place was discovered, and being brought before Vespasian he would have been sent to Nero had he not—according to his own account, for Josephus is his own and his sole biographer—prophesied that his captor would yet become emperor of Rome. Nevertheless he was kept in a sort of easy imprisonment for about three years. Josephus was present in the Roman army at the siege of Jerusalem by Titus; and after the fall of the city (70 A.D.) was instrumental in saving the lives of some of his relatives. After this he appears to have resided at Rome, and to have devoted himself to literary studies. The exact period of his death is not ascertained. All we know is that he survived Agrippa II., who died 97 A.D. He was thrice married, and had children by his second and third wives. His works are the *History of the Jewish War*, in 7 books, written both in Hebrew and Greek (the Hebrew version is no longer extant); *Jewish Antiquities*, in 20 books, containing the history of his countrymen from the earliest times down to the end of the reign of Nero (the fictitious Hebrew *Josippon*, which for a long time was identified with Josephus' *Antiquities*, dates from the 10th century A.D.); a treatise on the *Antiquity of the Jews*, against Apion, in 2 vols., valuable chiefly for its extracts from old historical writers; and an *Autobiography* (37-90 A.D.), in one book, which may be considered supplementary to the *Antiquities*. The other works attributed to him are not believed to be genuine.

The peculiar character of Josephus is not difficult to describe. He was in the main honest and veracious; he had a sincere liking for his countrymen, and rather more pride and enthusiasm in the old national history than he could well justify; but the hopelessness of attempting to withstand the enormous power of the Romans and an aversion to martyrdom caused him to make his terms with the enemy, perhaps in the faint hope of being thus of some use to the national cause. The influence of Greek philosophy and learning is visible in all his writings, and has given to his conception of biblical history a somewhat rationalistic tinge. He speaks of Moses as a human rather than a divinely inspired lawgiver; he doubts the miracle in the crossing of the Red Sea, the swallowing of Jonah by the whale, and, generally speaking, whatever is calculated to teach that there was a special miraculous Providence at work on behalf of the chosen people. The famous passage about Jesus is an interpolation. But since Peter Brinch in 1699 exposed his many errors, his credit as a historian has, as Margoliouth contends, gone steadily down.

The *editio princeps* of the Greek text appeared at Basel (Froben) in 1544. Since then the most important editions (with notes) are those of Hudson (Oxford, 1720), Havercamp (Amst. 1726), Dindorf (Paris, 1845-47), Bekker (6 vols. Leip. 1855-56), and Niese (Berlin, 1886 *et seq.*). Josephus has been frequently translated; the most celebrated versions in English have been those by I'Estrange (1702), Whiston (1737; revised by Shilleto, 5 vols. 1889-90; corrected by Margoliouth, 1906), and Trill and Taylor (1851). See the German books devoted to Josephus by Bärwald (1877), Böttger (1879), Bloch (1879), Destimon (1882), and Olitzki (1886).

Joshua (Heb. *Jehoshua*; Gr. *Iêsous*, from late Heb. *Jêshua*), or HOSHEA (Num. xiii. 16), the son of Nun, of the tribe of Ephraim, is first mentioned in Ex. xvii. 9 as commanding the warriors of Israel

in the battle of Rephidim. He was also one of the twelve spies sent out from Kadesh to collect information about the strength of the Canaanites and the prospects of the intended invasion (Num. xiii.), and when the others returned disheartened he and Caleb alone retained their courage and reported in favour of an armed advance. These two alone, therefore, out of all the grown men of Israel, were exempted from the divine sentence that because of their want of faith they should fall in the wilderness. During the forty years' wanderings Joshua acted as the 'minister' or personal attendant of Moses (Ex. xxiv. 13, &c.), a relation which seems to have marked him out as the favourite disciple and probable successor of the lawgiver. After 'the Lord was angry with Moses' Joshua was expressly designated to lead the people into Canaan (Deut. i. 38), and this designation was solemnly confirmed at the tabernacle (Deut. xxxi. 14 sqq.) before Moses' death. The book that bears his name is a narrative of the conquest and settlement of Canaan under the leadership to which he thus succeeded. It relates with considerable detail the passage of the Jordan, the fall of Jericho and Ai, the submission of the Gibeonites, the defeat of the five kings of the south at Beth-horon and of the four kings of the north at the waters of Merom, gives a large number of geographical and administrative details as to the distribution of the conquered territory among the tribes that had taken part in the conquest, and concludes with two addresses which Joshua delivered shortly before his death. The Jewish rabbis and early Christian writers all supposed this book to have been written by Joshua himself; but this is an impossible assumption, for besides telling of his death it alludes to a number of things that did not happen until long after that event (see, for example, xv. 63 compared with Judges, xix. 10-12; and xix. 47 with Judges, xviii. 7, 27 sqq.). In fact, like the other historical books of the Old Testament, it is an anonymous writing, and when critically examined is seen to have been at some time united to the Pentateuch, and to have been composed in the same manner. It is made up of extracts from various narratives, pieced together by a later hand in the manner of Eastern historians, and in its present form cannot be much earlier than the time of Ezra. Most modern critics are agreed that the sources are mainly three—the Jehovistic (known to critics by the symbol J), the Deuteronomistic (D), and the Priestly (P); these are scarcely earlier than the 9th, 7th, and 5th centuries respectively. To the Jehovistic document are usually ascribed in the main chaps. ii. 1-viii. 29; ix. 1-xi. 9; xxiii., xxiv., and a few short fragments in other chapters. To the Deuteronomist may be assigned chaps. i., viii. 30-35; xi. 10-xiii. 14; xiv. 6-15, and some other small portions; while the remainder, including the greater part of the account of the division of the territory, comes from the priestly writer. Its geographical details are characterised by some vagueness, except as regards the portion of the land which was held by Jews after the exile. See further article PENTATEUCH and Driver's *Literature of The Old Testament*, pp. 103 sqq.

Josiah, one of the kings of Judah, was the son of Amon and Jedidah, and succeeded his father at the age of eight in 641 B.C. He grew up an ardent religious reformer, and purged Judah and Jerusalem from idolatry. It was in his reign that Hilkiah the high-priest is said to have discovered the 'Book of the Torah,' by which some understand Deuteronomy, others Exodus, and others again the whole Pentateuch. The king now vigorously re-established the worship of Jehovah, and instituted the rites in the newly-discovered book. He met his death at Megiddo, in the valley of Esdraelon,

when attempting to check the advance of Pharaoh-Necho against the Assyrians, 609 B.C. Josiah was the last of the good kings of Judah. In his days prophesied Jeremiah and Zephaniah.

Josika. See HUNGARY (*Literature*).

Joss-sticks (pidgin English *joss*, an image of a god; Port. *deos*), cylinders burned in Chinese ceremonial, are made from pounded leaves of *Lindera communis* and other evergreen shrubs of that Lauraceous genus, treated with glutinous rice-water to make the mass adhesive.

Jost, ISAAK MARKUS, a Jewish historian, was born at Bernburg in Anhalt, 22d February 1793. He laboured as a Jewish schoolmaster at Berlin (1826-35) and Frankfurt-on-Main (1835-60), and died at Frankfurt, 20th November 1860. He wrote *Geschichte der Israeliten* (9 vols. 1820-29), to which were added *Neuere Geschichte der Israeliten, 1815-45* (3 vols. 1846-47), and *Geschichte des Judenthums* (3 vols. 1857-59). He also edited a German translation of the *Mishnah*, with text and commentary (6 vols. 1832-34).

Jotunheim. See GIANTS.

Joubert, JOSEPH, was born at Montignac in Périgord, 6th May 1754, and studied and taught till twenty-two at the college of Toulouse, then under the direction of the Fathers of the Christian Doctrine. He then went to Paris, and here made the acquaintance of Diderot, D'Alembert, Marmontel, and La Harpe, and lived through all the fever of the Revolution. He became the bosom friend of Fontanes and Chateaubriand, and he carried both to the famous *salon* of Madame de Beaumont. In 1790 his native townsmen elected him as justice of the peace, and in 1809 he was nominated by Napoleon on the recommendation of Fontanes to a seat in the council of the new university. At Villeneuve and at Paris he lived henceforward, and his years glided quietly away, while he read, dreamed, walked, wrote letters, and discoursed to friends who thronged even to his bedroom, which he seldom left before three o'clock in the afternoon. Despite weak health, he carried his head high all his life, and never ceased to read and re-read his favourite books, and jot down his meditations. Yet he published nothing in his life, although he was the keenest as well as the kindest critic to the writings of all his friends. He died 4th May 1824. Fourteen years after, his widow acceded to the prayers of her friends to allow a small volume to be printed from his papers. Chateaubriand edited it; Sainte-Beuve praised it without stint in the *Revue des Deux Mondes*, and Joubert's fame was from the moment of its appearance assured. And his *Pensées*, alike from their intrinsic value and insight and their faultless form, are worthy of their place in the splendid succession of La Rochefoucauld, Pascal, La Bruyère, and Vauvenargues.

At length in 1842 Joubert's nephew, Paul de Raynal, issued an adequate edition of the *Pensées et Maximes* from the more than 200 small manuscript books, with the addition of a number of letters, and an admirable biographical sketch. Another and enlarged edition by his brother, Arnaud Joubert, followed in 1850; yet another, better arranged, by Louis de Raynal in two volumes in 1862. There are translations by G. H. Calvert (Boston, 1867) and Henry Attwell (1877). See Sainte-Beuve's *Causeries du Lundi* (vol. i.), *Portraits Littéraires* (vol. ii.), and his *Chateaubriand et son Groupe*; Matthew Arnold's *Essays in Criticism* (1865); and the selection from Joubert translated by Miss Lyttelton (1898).

Joubert, PETRUS JACOBUS, born 1834, commandant-general of the Transvaal, was conqueror of Colley in 1881 and of Jameson in 1896, and organised the first Boer successes in the South African war of 1899-1902, but died after a short illness, 27th March 1900.

Jouffroy, THÉODORE SIMON, a French philosopher, was born at Pontets, a village of the Jura, on 7th July 1796. He became a pupil of Cousin, the philosopher, at Paris, and from 1817 onwards taught philosophy at various educational institutions in Paris. Ill-health obliged him in 1838 to exchange his professorial chair for the post of librarian to the university. He died at Paris, 4th February 1842. Jouffroy was not an original thinker, and founded no school. His merit is that he was the lucid interpreter and translator of Reid and Dugald Stewart. His own best books were *Mélanges Philosophiques* (1833; new ed. 1883), *Cours de Droit Naturel* (1835-42), and *Cours d'Esthétique* (1843; new ed. 1883). A prominent feature of his teaching was the sharp separation of psychology from physiology. For some time Jouffroy was an industrious member of the Chamber of Deputies; he was also well known as a journalist. See books by Tissot (1876) and Ollé-Laprune (1899); and his *Correspondance* (ed. Lair, 1901).

Jouffroy d'Abbans, CLAUDE, MARQUIS DE (1751-1832), claimed by the French as the inventor of steam-navigation, served in the army, and did in 1783 make a small paddle-wheel steam-boat sail up the Rhone at Lyons—the connection between piston and paddle-wheel axle being rack-and-pinion. Compelled to emigrate by the Revolution, he failed, on account of financial ruin, to float a company till after Fulton had made his successful experiments on the Seine in 1803. See SHIPBUILDING; and a monograph by J. C. A. Prost (Paris, 1889).

Jougs, JUGGS, or JOGGS, the name given in Scotland to a form of pillory which was used also in Holland and probably in other countries. The jougs were nothing more than an iron ring or collar, fastened by a chain of two or three links to a pillar or wall in some public place, such as a market-cross, a market-tron or weighing post, a prison door, a church door, a churchyard gate, a churchyard tree, a tree beneath whose branches courts were held, and the like. The ring or collar opened by a hinge or joint, so as to enclose the culprit's neck, when it was secured by a loop or staple and a padlock. The jougs were employed as a punishment as well for ecclesiastical as for civil offences. They may be traced as far back as the 16th century, and, although they have not been in use for the last hundred years, they may still be found hanging at a few country churches. The accompanying wood-cut represents the jougs at the picturesque village of Duddingston, in the city of Edinburgh.

Jougs.

Joule, JAMES PRESCOTT, one of the most distinguished experimental philosophers, was born 24th December 1818 at Salford. In his youth he had the good fortune to have for instructor in science the celebrated Dalton, and he soon showed the bent of his genius by constructing for himself electrical machines and other instruments. His earliest notable experiments were made with reference to electro-magnetic engines; from which he passed to quantitative determinations regarding heat, and the transformation of various forms of Energy (q.v.). He is

justly entitled to be considered as the experimental founder of the modern theory of conservation of energy. In 1878 a civil list pension of £200 was conferred upon him. He died 11th October 1889 at Sale, near Manchester. See *Nature* (October 1882), his collected papers (published by the Physical Society, 1884-87), and the *Memoir* by Osborne Reynolds (1893).—The name **JOULE** has been introduced for the unit of work in practical electricity. It is the work done in one second by the ampère or unit current flowing through the ohm or unit resistance, and is therefore, according to Joule's Law (see ELECTRICITY), the heat developed in one second in a conductor having that resistance and carrying that current. It is approximately equal to 10,000,000 ergs; so that 'Joule's Equivalent,' defined as the mechanical equivalent of the heat required to raise the temperature of 1 gramme of water from 0° C. to 1° C., contains to the same approximation 4.16 joules. See THERMODYNAMICS.

Jourdan, JEAN BAPTISTE, COMTE, a French marshal, born 29th April 1762, at Limoges. He entered the army at sixteen, and, after seeing service in North America, rose under the Republic to the rank of a general of division. In September 1793 he obtained the command of the Army of the North, and on 16th October defeated the Austrians at Wattignies. In 1794 and 1795 he commanded the Army of the Meuse and Sambre, and with it gained the victory of Fleurus (26th June 1794), drove the Austrians back across the Rhine, took Luxembourg, and laid siege to Mainz. But on 11th October 1795 he was defeated at Höchst, and thus compelled to retreat over the Rhine. Crossing this river again in 1796, he penetrated as far as Bavaria, but was there beaten by the Archduke Charles at Amberg and Würzburg; this discomfiture made him resign his command. In 1799 the Directory entrusted him with the command of the Army of the Danube; but he was again defeated by the Archduke Charles at Ostrach and at Stockach. Although he took no part in the *coup-d'état* of 18th Brumaire, the First Consul employed him in 1800 in the reorganisation and administration of Piedmont; and on the establishment of the Empire in 1804 he was made a marshal and a member of the Council of State. In 1806 he was nominated governor of Naples, and afterwards accompanied King Joseph Napoleon to Spain as chief of his staff. Louis XVIII. made him a count in 1819. But his republican principles led him to enter heartily into the revolution of 1830. He died at Paris, 23d November 1833.

Joust. See TOURNAMENT.

Jove. See JUPITER.

Jowett, BENJAMIN, the translator of Plato, was born at Camberwell in 1817, and educated at St Paul's School and Balliol College, Oxford, where he had a distinguished career, taking the Hertford scholarship in 1837, a classical first-class in 1839, and the Latin essay in 1841. Already a Fellow in 1838, he was tutor of his college from 1840 till his election as master in 1870. Thus his whole life had been identified with Balliol, and as master his influence is supposed to have permeated the college to a degree almost unexampled. He was a member with Macaulay of the Commission for inquiry into the mode of admission to the Indian Civil Service, and he was appointed in 1855 to the regius professorship of Greek at Oxford. He received the degree of Doctor from Leyden in 1875, Edinburgh in 1884, and Cambridge in 1890, and acted as vice-chancellor from 1882 till 1886. For an article 'On the Interpretation of Scripture' in *Essays and Reviews* (1860) he was tried for heresy by the vice-chancellor's

court, but acquitted. He published commentaries and sermons, but he is best known by his translation of the *Dialogues* of Plato (4 vols. 1871), with its admirably learned and lucid introductions, and his less happy versions of Thucydides (2 vols. 1881) and the *Politics* of Aristotle (1885). He died 1st October 1893.

See the *Life and Letters* by E. Abbott and L. Campbell (1897-99), and a sketch by Lionel Tollemache (1895).

Joyce, JAMES, novelist, born at Dublin, 2d February 1882, was educated at Clongowes Wood and Belvedere Colleges, and the Royal University (Dublin), and lived much on the Continent. In addition to his work in fiction—*Portrait of the Author as a Young Man* (1915), *Dubliners* (1916), *Ulysses* (Paris, 1922)—he wrote a volume of poems, *Chamber Music* (1907), and a play, *Exiles* (1918).

Joyce's Country. See GALWAY.

Juan. See DON JUAN, JOHN OF AUSTRIA.

Juan Fernández, two rocky islands in the Pacific, 420 and 540 miles respectively west of Valparaiso, Chile, to which they belong. The nearer one, called Más-a-Tierra (nearer the mainland) to distinguish it from the other, Más-a-Fuera (farther in the offing), is 13 miles long and 4 broad, and is for the most part a series of rocky peaks of volcanic origin, the highest of which, Yunque, is 3000 feet above sea-level. The island was discovered by the Spaniard whose name it bears in 1563, and was frequently visited by buccaneers down to its occupation by the Spaniards in 1750. Here Alexander Selkirk, a buccaneer, a native of the Scottish fishing-village of Largo, lived in solitude from 1704 to 1709. His story is supposed to have suggested the *Robinson Crusoe* of Defoe; though it should be remembered that Robinson's island was on the other side of South America, near the mouth of the Orinoco.

Juárez, BENITO, president of Mexico, was born of Indian parents in Oaxaca in 1806, became an advocate, and as governor of his native state (1847-52) was distinguished both for his ability and his honesty. Exiled during the dictatorship of Santa-Anna, he returned when the republic was restored, and in 1857 was elected president of the Supreme Court (equivalent to vice-president of the nation). On the overthrow of the Liberal president by the clerical party in 1858 Juárez assumed the executive, but was compelled to retire to Vera Cruz, where his government was recognised by the United States in 1859, and whence he issued decrees abolishing religious orders and confiscating church property. In January 1861 he was able to enter the capital, and in March was elected president for four years. In December of the same year the allied forces of England, France, and Spain occupied Vera Cruz (see MEXICO); in April the British and Spanish withdrew, but the French remained, and declared war against Juárez, who retreated gradually to the northern frontier, and remained for nearly a year at El Paso del Norte. He entered Mexico city again in July 1867, Maximilian (q.v.) having been shot meanwhile by order of court-martial—an ungenerous but not impolitic or perhaps altogether unjustifiable act of reprisal. Juárez was again elected president for four years—years disturbed by repeated revolutionary attempts. In 1871 he was re-elected, and the risings became even fiercer and more frequent; but he faced all his foes with the dogged courage of his race, and was holding his position with unwearied energy when he died, somewhat suddenly, 18th July 1872. See the *Life* by Ulick R. Burke (1894).

Juba, a great river of eastern Africa, flows into the Indian Ocean near the town of Kisumu. The river is formed by the junction of three main head-streams, two of them (not explored

till 1890-1900) rising in southern Abyssinia; the lower course is through arid country; its flow is irregular, and its mouth is blocked by a dangerous bar. Part of Jubaland (W. of the river) was ceded by Britain to Italy in 1925. See KENYA.

Juba. See NUMIDIA.

Jubal, son of Lamech and Adah, in Genesis the inventor of the harp and organ. The name is most likely significant, connected with *yobel*, 'jubilee.'

Jubbulpore. See JABALPUR.

Jubilate, the 100th Psalm, which in the Vulgate begins *Jubilate Deo omnis terra*. It was added to the English Prayer-book in 1552, to be sung after the Second Lesson, instead of the *Benedictus*, when that canticle occurs in the chapter for the day; but it is used at other times as well, and always at thanksgivings.

Jubilee, THE YEAR OF (Heb. *yobel*), a peculiar theocratic, and apparently theoretical much more than practical, institution among the Hebrews (Leviticus, xxv.), by which, every fiftieth (not forty-ninth) year, the land that in the interval had passed out of the possession of those to whom it originally belonged was restored to them, and all who had been reduced to poverty, and obliged to hire themselves out as servants, were released from their bondage; while at the same time all debts were remitted (Jos. *Ant.* iii. 12). The jubilee forms, as it were, an exalted sabbatical year, and the land was completely to be left to rest in the former as in the latter. The design of this institution was chiefly to prevent the growth of an oligarchy of land-owners, and the total impoverishment of some families. It was proclaimed at the end of the harvest-time, like the sabbatical year, on the day of atonement, by the 'yobel' (a kind of horn), hence probably also its name. There is no trace in the whole history of the Hebrews down to the Babylonian exile that the jubilee had ever been observed; after the return, however, it appears to have been rigorously kept, like the sabbatical year, for some time at least; but, from its general impracticability, it must soon have fallen into disuse. Dillmann maintains the 'year of liberty' of Ezek. xlv. 16-18 to be the year of jubilee, while Kuenen and Wellhausen make it the sabbatical year.

The Christian church adopted the term *Jubilee* from the Jewish, and the jubilee in two forms, the 'ordinary' and 'extraordinary,' is still an institution in the Roman Catholic Church, as a period of remission from the penal consequences of sin. The ordinary jubilee is that which is celebrated at stated intervals, the length of which has varied at different times. Its origin is traced to Pope Boniface VIII., who issued, for the year 1300, a bull granting a plenary indulgence to all pilgrim-visitors of Rome during that year, on condition of their penitently confessing their sins, and visiting the church of St Peter and St Paul, fifteen times if strangers, and thirty times if residents of the city. Innumerable troops of pilgrims from every part of the church flocked to Rome. As instituted by Boniface, the jubilee was to have been held every hundredth year. Clement VI., in a bull of 1343, abridged the time to fifty years. The number of pilgrims that year is said to have been no fewer than 1,000,000! The term of interval was still further abridged by Urban VI., and again by Paul II., who in 1470 ordered that thenceforward each twenty-fifth year should be held as jubilee—an arrangement which has continued ever since to regulate the ordinary jubilee. Paul II. extended still more, in another way, the spiritual advantages of the jubilee, by dispensing with the personal pilgrimage to Rome, and granting the indulgence to all who should visit

any church in their own country designated for the purpose, and should, if their means permitted, contribute a sum towards the expenses of the Holy Wars. The substitution by Leo X. of the fund for building St Peter's Church for that of the Holy War, and the abusive and scandalous proceedings of many of those appointed to preach the Indulgence (q.v.), were among the proximate causes of the Reformation. In later jubilee years the pilgrimages to Rome gradually diminished in frequency, the indulgence being, for the most part, obtained by the performance of the prescribed works at home; but the observance itself has been punctually maintained at each recurring period, with rare exceptions. The extraordinary jubilee is ordered by the pope out of the regular period, either on his accession, or on some occasion of public calamity, or in some critical condition of the fortunes of the church; one of the conditions for obtaining the indulgence in such cases being the recitation of certain stated prayers for the particular necessity in which the jubilee originated. See book by H. Thurston, S.J. (1900; abridged, 1924).

Jubilee is also used for the celebration of a fiftieth anniversary—as the jubilee of George III.'s accession (1809), and of Queen Victoria's (1887); and for festivals generally, as the 'Peace Jubilees' celebrated at Boston, United States, in 1869 and 1872. A 'Diamond Jubilee' is a sixtieth anniversary, as that of Queen Victoria in 1897.

Juby, CAPE, on the west coast of Africa, in the Spanish territory of Río de Oro. An English company was established there in 1879-89.

Judæa. See PALESTINE.

Judah (Heb. *Yehuda*, 'the Bepraised One') was the fourth son of Jacob and Leah, and founder of the greatest and most numerous of the twelve tribes, to which belonged the royal house of David. In the march through the wilderness it had the van assigned to it; and tradition narrates that its standard was a lion's whelp, with the words: 'Arise, O Lord, and let thine enemies be scattered!' After the conquest of Canaan its territories stretched from the Dead Sea on the east to the Mediterranean on the west (though the Philistines long held possession of the fertile district west of the mountains of Judah), and from Jerusalem (excluding that city) on the north to the land of the Amalekites on the south. The capital of the tribe was Hebron. For its history, see JEWS.

Judaisers. See EBIONITES.

Judas Iscariot, the betrayer of Jesus. Very few facts apart from the great act of treachery are known about Judas. He was the son of Simon, and bore the surname of Iscariot, which is also (John, vi. 71; xiii. 26) attached to his father. There can be little doubt that Iscariot means 'man of Kerioth,' and indicates that Judas and his father lived in Kerioth, a town in the south of Palestine. He was attracted by the preaching of Jesus, and became one of 'the twelve disciples.' Like the others, he received a commission to preach and heal the sick. Though his name is mentioned last in all the New Testament lists of 'the twelve,' he seems to have taken high rank among them, for he was chosen as their treasurer (Luke, viii. 3), and kept the common purse. He was guilty of dishonest practices, however, and is called 'a thief' in the fourth gospel (John, xii. 4-6). At the final Passover Judas went to the 'chief priests,' and offered to betray Jesus if they would promise him a reward. The price agreed upon was 'thirty pieces of silver.' Judas thereupon revealed the secret haunts of Jesus on the Mount of Olives, and conducted a squadron of the temple police to the spot where the arrest was effected. After the betrayal Judas was filled with remorse, and committed suicide. We have

two accounts of the tragic end of Judas—one written by Matthew (xxvii. 5-8), the other by Luke (Acts, i. 18-19)—and there are many discrepancies between the two narratives. In Luke's account, for instance, Judas used the money which he received to purchase the field of Aceldama. Matthew, however, tells us that in his remorse he flung the silver into the temple, and it was the high priests who bought the field to bury strangers in it. Matthew makes Judas hang himself. Luke says, 'falling headlong, he burst asunder in the midst.' A third and more disgusting story of the end of Judas is found in the fragments of Papias.

The treachery of Judas raised a serious problem for the early Church: 'How was it that Jesus admitted such a man into the company of the disciples?' Did it not reveal lack of insight on his part? How could such a mistake be reconciled with his Messianic claims? The answer to the difficulty was given by Peter in the words: 'It was needful that the scripture should be fulfilled' (Acts, i. 16). A similar answer is given in the fourth gospel: 'Not one of them perished, but the son of perdition; that the scripture might be fulfilled' (John, xvii. 12).

Modern thought, however, is interested in the psychology rather than in the theology of the betrayal, and there have been many attempts to explain the motive of the crime. Some of the radical New Testament critics (headed by Bruno Bauer and Volkmar, and supported by Cheyne in his article in the *Encyclopædia Biblica*) think there is no possibility of giving a psychological explanation of the crime, and maintain that the story was invented, either as a pictorial embodiment of the enmity of the Jewish people, or to account for the ease with which the arrest was effected. In view of the fact that such a theory raises more difficulties than it solves, it has won very little support in modern times. The usual psychological motive assigned to the crime is that it was the result of avarice: Judas was led to betray his master by lust for gold. The great difficulty in this explanation is that the reward hardly seems sufficient to tempt the cupidity of a really avaricious man. It is calculated that 'thirty pieces of silver' represent about four pounds in English coinage, with, perhaps, two or three times the purchasing power of that sum in normal times. A third view sees the main motive of Judas in the disappointment that he felt in the failure of Jesus to proclaim himself as Messiah. It had become evident now that the career of Jesus would end in tragedy; and Judas, in order to save himself from sharing the fate which he saw to be inevitable, turned common informer for the sake of his own personal safety. It is quite possible that Judas may have been actuated by some such feeling as this, but there is absolutely no evidence of it in the narrative. An interesting modern theory—originated by Daub, and strongly supported by Whately and De Quincey—tries to acquit Judas of any base motive, and supposes that he was induced to take the step of betrayal in order to force the hand of Jesus, and compel him to assert himself. 'His hope,' as De Quincey puts it, 'was that when actually arrested by the Jewish authorities, Jesus would no longer vacillate: he would be forced into giving the signal to the populace of Jerusalem, who would then rise for the double purpose of placing Jesus at the head of a revolutionary movement and throwing off the Roman yoke.' All that can be said about such a theory is that it is pure surmise, and rests upon no basis of fact at all. A further theory recently advocated by F. Ménégoz holds that Judas was a Roman spy who obtained a position among the disciples in the interests of the Roman Empire.

See Daub, *Judas Ischarioth* (1816), and the discussions in the Lives of Christ by Keim, Neander, Weiss, Edersheim, Farrar, &c., De Quincey's Essay.

Judas Maccabæus. See MACCABEES.

Judas' Tree (*Cercis*), a genus of trees of the natural order Leguminosæ, sub-order Cæsalpinales. The common Judas' Tree (*C. Siliquastrum*) is a native of the south of Europe and of the warmer temperate parts of Asia. It has almost orbicular, very obtuse leaves. The flowers, which are rose-coloured, appear before the leaves. There is a legend that Judas hanged himself on a tree of this kind. The American Judas' Tree (*C. canadensis*) is very similar, but has acuminate leaves. The flower-buds are frequently used in salads and pickled in vinegar. The wood of both species is very beautiful, veined with black, and takes an excellent polish. The young shoots of the American Judas' tree are used in domestic dyeing, and impart a fine colour to wool.

Judd, JOHN WESLEY (1840-1916), geologist, was born at Portsmouth, and entered the Royal School of Mines. In 1867 he joined the Geological Survey; in 1876 became professor of Geology at the School of Mines, in 1881 at the Royal College of Science. *Volcanoes* (1881) is by him.

Jude, THE EPISTLE OF, one of the Catholic epistles. It claims to have been written by 'Judas, a servant of Jesus Christ, and brother of James.' The latter phrase, however, is possibly a mistranslation of the statements in Luke, vi. 16 and Acts, i. 13, in which there is no word for brother in the original, and the words would more naturally mean 'Judas, the son of James.' It is impossible to identify this Judas with any certainty. Scholars have claimed him as (a) the brother of James, and therefore one of 'the brethren of the Lord,' Mark, vi. 3; (b) the Judas who is mentioned in the lists of the Apostles; (c) Judas Barsabbas, one of the leaders of the early church (Acts, xv. 22). The difficulty about any of these theories lies in the fact that the contents of the epistle seem to point to the second century as the date of its origin; by that time all the three men mentioned must have been dead. Nor can we assume that the epistle is pseudonymously ascribed to any one of them, since neither of them seems to have been of sufficient influence or importance for his name to lend weight and authority to an epistle. If we resist the evidence of the contents and place the epistle in the first century, it is still impossible to decide between the rival claims of the three men who bear the name, though there is probably less to be said against the view that identifies the author with Judas the Apostle than is the case with the other two theories. But this hypothesis is exposed to serious criticism in some directions. Jude would have been unlikely not to take advantage of the authority attaching to his Apostleship in driving home his warnings against the heretics. Moreover, in verse 17, he appears to dissociate himself entirely from the 'Apostles of our Lord Jesus Christ.'

The object of the epistle is to warn Christians against a very serious form of heresy. The author, as he tells us himself, verse 3, was thinking of writing a treatise on 'our common salvation,' when he suddenly felt himself constrained to write this epistle in its place. The epistle is a plea for conservatism in theology and life. The readers are urged 'to contend earnestly for the faith which was once for all delivered to the saints.' The heresy was partly theological, partly moral. The heretics were denying 'our only Master and Lord, Jesus Christ,' and they were 'turning the grace of God into lasciviousness.' Their false teaching is described under such phrases as 'the way of Cain,'

'the error of Balaam,' 'the gainsaying of Korah' (verse 11). The writer points out in lurid phraseology the retribution which has fallen upon sinners in the past, e.g. the wicked angels, the cities of Sodom and Gomorrah; and a similar punishment will overtake the sinners of his own day. The heresy cannot be particularly identified, but it was similar to that of the Nicolaitans mentioned in the Book of Revelation, and to certain phases of gnosticism. One interesting feature in the epistle is the use which the writer makes of Jewish apocalyptic literature, especially the *Book of Enoch* and the *Assumption of Moses*. The most important problem connected with the epistle is the character of the relationship between it and 2 Peter. Practically the whole of Jude is embodied in 2 Peter. There has been much discussion as to which of the two is the original, and even to-day each of the epistles has its champions. On the whole, however, the balance of modern scholarship inclines to Jude. If Jude was the borrower, it is difficult to explain why he restricted himself to one chapter of 2 Peter. Moreover, as Moffatt says, 'Judas has the notes of an original writer. The style is sententious, forcible, and terse as compared with the cloudy and rhetorical language of 2 Peter.' Mayor sums up the discussion in the words, 'The impression which they leave on my mind is that in Jude we have the first thought, in Peter the second thought; and we can generally see a reason why Peter should have altered Jude, but very rarely a reason why what we read in Peter should have been altered to what we find in Jude.' There is a great diversity of opinion on the question of date. Renan puts it as early as 54, and thinks it was directed against Paul; Bigg, Salmon, and Weiss between 60 and 70; Zahn, Mayor, and Bartlett between 70 and 80; Reuss, Spitta, and von Soden, 80-90; Harnack, Jülicher, and McGiffert, 100-125.

The best modern commentaries are those of Mayor, Bigg (*International Critical*), Spitta, von Soden. See also Moffatt, *New Testament Introduction*, and articles in Bible dictionaries.

Judenhetze. See JEWS.

Judge is the generic descriptive name given to those who are invested with the power of judging and deciding causes in the highest courts of common law. In Great Britain—though it is otherwise in America—it is not usual to designate the highest class of judges by the epithet of judge, and British lawyers never do so. Thus, instead of saying Judge Blackstone, Judge Pollock, Judge Eldon, the proper description is Mr Justice Blackstone, Chief-baron Pollock, Lord Chancellor Eldon, &c., according to the particular court in which they presided. In Scotland the usual prefix to the name of a judge is Lord; and the judges there, on their appointment, often assume territorial titles in addition to the prefix 'Lord'; and the courtesy titles of the judges were extended to their wives by King Edward VII. In England the judges of the superior courts are only called lords while they sit in court or in chambers. The practice has long been for the crown to confer the honour of knighthood on all the judges of the superior courts of law and equity in England, but not in Ireland or Scotland. All the superior judges are appointed by the crown, and since the Act of Settlement (1701) have held their offices during good behaviour; since 1 Geo. III. chap. 23, they have also continued to hold their appointments notwithstanding the demise of the crown. They can only be removed from their office on the address of both Houses of parliament. They are disqualified from sitting in the House of Commons. Judges in England may sue and be sued in their own courts, but none may be judge in his own case. No action may be brought against

the judge of a superior court for anything done in his judicial capacity. Judges of inferior courts are liable to be sued, but only when they have acted in bad faith, or beyond the bounds of their jurisdiction. The term judge is the proper title of the judges of the county courts established in England in 1846; in writing to a county court judge it is proper to address him as His Honour Judge Brown. In Scotland the phrase is often applied to all judges, superior and inferior, whenever they have a fixed and determinate jurisdiction, in contradistinction to temporary commissioners.

In the United States the judges of the supreme court are appointed by the president with the consent of the senate; in the courts of the several states they are either appointed by the executive, elected by the legislature, or, as in most states of late years, chosen directly by popular suffrage. A judge is not liable to a civil action for acts performed as part of his official duty, but he may be impeached for any high crime or misdemeanor.

Judge-advocate-general, a judicial officer appointed by letters-patent, is the adviser of the crown in proceedings to confirm or revise the decisions of courts-martial. He is also the adviser, in legal matters, of the Secretary of State for War. Before confirmation, the sentences of all courts-martial, with the evidence adduced, are submitted to him; and it is for him to represent to the commander-in-chief any illegality of procedure, or other circumstance rendering it undesirable that the King should be advised to confirm the court's decision. He does not advise as to the exercise of the prerogative of mercy. The judge-advocate-general formerly received a salary of £2000, and was usually a member of the House of Commons and of the ministry—changing, of course, with the latter. In 1892 the office ceased to be political, and was conferred (without salary) on the President of the Probate Divorce and Admiralty Division. The judge-advocate-general is also the title in the United States for the chief of the bureau of military justice at Washington.

Judges, THE BOOK OF (Heb. *Shōfētim*—compare Carthaginian *Sufetes*; LXX. *Kritai*, but in Philo *Krimata*, 'judgments'), a canonical book of the Old Testament, the second in the series known as the 'former prophets,' relates to the period in the history of Israel from the death of Joshua to the birth of Samuel. Its authorship—or rather the authorship of any part of it, for it is drawn from more than one source—is unknown, and its final redaction, as is shown by the presence of Deuteronomic and other elements, cannot have taken place until after the exile. Its composite character is shown by the fact that it has two beginnings (see i. 1, and ii. 6). The main section of the book, extending from ii. 6 to xvi. 31, consists of an apparently consecutive narrative, grouped round six principal judges—Othniel, Ehud, Deborah, Gideon, Jephthah, and Samson—the intervals being filled with the history of Gideon's son, Abimelech, and references, more or less brief, to six minor heroes—Shamgar, Tola, Jair, Ibzan, Elon, and Abdon. The religious philosophy of this narrative is obvious; the history falls into running cycles, all corresponding to the scheme indicated at the outset by the words: 'After the death of Joshua the children of Israel did evil in the sight of the Lord, and forsook the Lord God of their fathers. . . . And the anger of the Lord was hot against Israel, and he delivered them into the hands of spoilers . . . and they were greatly distressed. Nevertheless, the Lord raised up unto them judges, and was with the judge, and delivered them. . . . And it came to pass when the judge was dead that they returned and corrupted themselves more than their fathers. . . . And the

anger of the Lord was hot against Israel,' &c. The apparently consecutive character of the narrative disappears when its chronological data are carefully analysed; from these we find that the chronology of the section is based on some later scheme, or rather schemes, which, as they stand, cannot be reconciled with the datum in 1 Kings, vi. 1. Probably the narrative of the greater judges was originally separate from that of the minor ones. The religious standpoint of this main section of the Book of Judges, taken along with other points of internal evidence, shows that in the main it was not composed earlier than the 8th century B.C. On the one hand, there are signs of exilic and post-exilic redaction; but, on the other hand, the section contains elements that might appear to be much earlier than the century named—such elements, for example, as the song of Deborah and the history of Abimelech. Of the remaining portions of the Book of Judges, i. 1 to ii. 5 is relatively old, older than the Book of Joshua, which relates to the same subject, the conquest of Canaan, but treats it in a much later manner. The closing section of the book is made up of two unconnected and independent narratives of very different dates. The history of Micah and the Danites (xvii. seq.) reads like a piece of old history; that of the Levite and the Benjamites, on the other hand, is very generally considered to be post-exilic, and in any case must be regarded as comparatively very late.

See G. F. Moore (*Internat. Crit. Comm.*, 1895); G. A. Cooke (*Cambridge Bible*, 1913); and C. F. Burney (1918).

Judgment. See HELL, RESURRECTION.

Judicature Acts (1873-76), THE, constituted the English Supreme Court, comprising the High Court of Justice, with a Chancery division (see CHANCERY) and a Queen's (King's) Bench division (see COMMON LAW); and the Court of Appeal (see APPEAL).

Judicial Committee. See PRIVY-COUNCIL.

Judicial Factor. See FACTOR.

Judicial Separation, in English law, is the separation of two married persons by order of the Court of Divorce. Married persons may, if they please, mutually agree to live separate, and they may enter into a deed of separation for that purpose, which to some extent is recognised as valid by courts of equity. This is called voluntary separation. A deed of separation is always revocable by consent of the parties, though to some extent binding on each, if the other do not consent to renew the cohabitation. When the parties have not mutually consented to separate, one of them can compel a judicial separation for certain grounds of misconduct. Thus, either party may apply on the ground of adultery, or cruelty, or desertion without cause for two years and upwards. When a husband is convicted of an aggravated assault on his wife, the court before which he is tried may make an order which is almost equivalent to a judicial separation.

Married persons separated by deed or judicial order are still married. Not being divorced, they cannot marry again; but there is no longer the duty of cohabiting. The court may award a certain income to the wife after separation, and may also make orders as to the custody and maintenance of children. But, irrespective of this, the wife becomes, to all intents and purposes as regards her future property, in the same position as if she were unmarried. On the other hand, the husband is no longer responsible for maintaining his wife, except so far as he may have been ordered to pay her alimony, and he is not liable for her future debts. In 1857 the law on this head was materially improved, and a new Divorce Court established. See DIVORCE; also MARRIAGE.

In Scotland the law was changed in 1861, and now nearly coincides with the English law in many respects. Whenever a decree of separation *a mensa et thoro* is obtained at the instance of the wife, all property which she may acquire, or which may devolve upon her, is held entirely separate from and independent of her husband; she can bequeath it by will as if he were dead. She can also enter into contracts, and sue and be sued in her own name, and the husband is no longer liable for necessities or her debts, except so far as he is bound by the decree of separation to pay her aliment. The grounds of judicial separation in Scotland also are nearly the same as in England.

In the United States the courts used till 1838 partial divorce *a mensa et thoro*; but since then the marriage contract is either wholly dissolved or the courts refuse to interfere.

Judith, a Jewish heroine, who saved her native town, Bethulia, by a deed of unexampled daring and devotion. She made her way into the hostile camp, and into the very tent of Holofernes, general of Nebuchadnezzar. The general was bewildered by her beauty, and she plied him with wine till he sank overpowered upon his couch. Then she cut off his head, and found her way out carrying it with her. Her townsmen were inspired with a sudden enthusiasm, rushed out upon the enemy, and completely defeated them. The tale is not mentioned by Josephus, and has from an early period been held to be an allegory. It forms the subject of the apocryphal book of *Judith*, the composition of which is put variously between the time of the Maccabees and the time of the second Jewish war under Hadrian. The exploit of Judith has given a frequent subject to art: here we may merely mention the bronze group of Donatello at Florence; the paintings by Botticelli, Cranach, Horace Vernet, and Etty; the poems of an anonymous Old English writer, of Hans Sachs, Opitz, and Hebbel.

Judson, ADONIRAM (1788-1850), American missionary, born in Malden, Massachusetts, studied at Brown University and Andover theological seminary, sailed for India, and joined the Baptists. He worked as a missionary in various parts of Burma, translated the Bible into Burmese, and prepared a Burmese-English dictionary. His first wife, Ann Haseltine (1789-1826), author of a *History of the Burmese Mission*, assisted her husband with his translations. His second was the widow of G. D. Boardman (q.v.). His third, Emily Chubbuck (1817-54), was known in the literary world as Fanny Forrester. See *Lives by Wayland* (Boston, 1853), and Judson's son Edward (New York, 1883).

Juggernaut. See JAGANNATH.

Jugglers. See CONJURING.

Juglans. See WALNUT.

Jugoslavia, or YUGOSLAVIA. See SERBIA.

Jugular Vein. See THROAT, VEIN.

Jugurtha, king of Numidia, son of Mastanabal, who was a natural son of Masinissa, was carefully educated along with Adherbal and Hiempsal, the sons of his uncle Micipsa, who succeeded Masinissa on the throne. After Micipsa's death Jugurtha soon caused Hiempsal to be murdered (118 B.C.), whereupon Adherbal fled to Rome. Jugurtha succeeded in bribing great part of the Roman senate, and obtained a decision in his favour, freeing him from the charge of the murder of Hiempsal, and assigning him a larger share of the kingdom than was given to Adherbal (117 B.C.). But Jugurtha soon invaded Adherbal's dominions, and, notwithstanding injunctions by the Romans to the contrary, besieged him in the town of Cirta (112 B.C.), and caused him and the

Romans who were captured with him to be put to death with horrible tortures. Thereupon war was declared against Jugurtha by the Roman people; but, by bribing the generals, Jugurtha contrived for years to baffle the Roman power. At last the consul, Q. Cæcilius Metellus, proving inaccessible to bribes, defeated him in 109 and 108 B.C., so that he was compelled to flee to the Mauritanian king, Bocchus. Marius, who succeeded Metellus in the command, carried on the war against Jugurtha and Bocchus, till at last Bocchus delivered him up to Sulla, then the quæstor of Marius. He was carried in the triumph of Marius, 1st January 104 B.C., and then flung into a dungeon under the Capitol to die of hunger. Our interest in Jugurtha is entirely due to the masterpiece of history in miniature which Sallust devoted to his story.

Jujube (*Zizyphus*), a genus of spiny and deciduous shrubs and small trees of the natural order Rhamnaceæ. The species are pretty numerous. The Common Jujube (*Z. sativa*) of the south of Europe, Syria, &c., is a low tree, which produces a fruit resembling an olive in shape and size, red or sometimes yellow when ripe. The fruit is dried as a sweetmeat, and forms an article of commerce. *Syrup of jujubes* is used in coughs, fevers, &c.; but the *jujube paste* or *pâte de jujube* of the shops of Britain is made of gum-arabic and sugar, without any of the dried jelly of this fruit.—The jujube of India (*Z. Jujuba*) is a similar small tree, with round or oblong fruit, sometimes of the size of a hen's egg.—A Chinese species of jujube (*Z. nitida*) has a very pleasant yellow fruit about an inch long; and other species not much inferior are found in Africa, South America, and other warm countries.—The Lotus (*Z. Lotus*), a shrub 2 or 3 feet high, a native of Persia, the north of Africa, &c., produces in great abundance a fruit about as large as a sloe, and with a large stone, but having a sweet farinaceous pulp, which the natives of some parts of Africa make into cakes resembling gingerbread. A kind of wine is sometimes made from it. This is believed by many to be the Lotus of the ancient Lotophagi celebrated by Homer.—*Z. Spina-Christi*, another native of the countries near the Mediterranean, is sometimes said to be the plant from the branches of which Christ's crown of thorns was made, and is therefore called Christ's Thorn and Jew's Thorn, names which, for like reason, are also given to *Paliurus Spina-Christi*. The fruit is about the size of a sloe, oblong, and pleasantly acidulous.—*Z. xylopyrus*, a native of the coast of Coromandel, has greenish downy fruit about the size of a cherry, with an edible kernel tasting like a filbert. The tree, which grows 20 feet high, yields a hard, durable, light timber, which assumes a fine orange colour.

Ju-jutsu. See WRESTLING.

Jujuy, the most northerly province of the Argentine Republic, is a mountainous tract, bounded on the W. and N. by Bolivia, and has an area of about 15,000 sq. m. Its minerals are rich, but not worked to any extent. The chief industries are agriculture and cattle-raising; sugar and wheat are the principal crops. The exports (mainly to Bolivia) consist of cattle, mules, fruit, chicha brandy, skins, gold-dust, and salt. Pop. 77,000.—The capital, JUJUY, on the San Francisco River, 44 miles N. of Salta, has a custom-house, colleges, sugar-houses and refineries, and 10,000 inhabitants.

Jukes, JOSEPH BEETE, geologist, was born near Birmingham on 10th October 1811, and graduated from St John's College, Cambridge, in 1836, having studied under Sedgwick. In 1839 he was appointed geological surveyor of Newfoundland, and in 1842 he took part as naturalist in the

exploration and survey of Torres Strait, New Guinea, and the east coast of Australia. He surveyed part of North Wales for the Geological Survey (1846-50), and in 1850 became director of the survey in Ireland. He also lectured in the Museum of Irish Industry and at the Royal College of Science in Dublin. He died 29th July 1869. He wrote many memoirs; but he is best known by his *Student's Manual of Geology* (1857). See his letters, ed. C. A. Browne (1871)

Julamerk, seat of the Nestorian patriarch, on the Great Zab, in eastern Kurdistan, 60 miles S.E. of Lake Van.

Julfa, (1), a town of Azerbaijan on the Persian frontier; pop. 20,000; (2) a suburb of Isfahan.

Jülg, BERNHARD, philologist, was born at Ringelbach, in Baden, 20th August 1825; studied classical and comparative philology at the universities of Heidelberg and Berlin; and after teaching in gymnasia at Heidelberg, Freiburg, and Rastatt, became in 1851 extra-ordinary professor of Classical Philology at Lemberg; in 1853 ordinary professor at the university of Cracow, and in 1863 at Innsbruck, where he died 14th August 1886. Besides his studies in comparative philology, extended to embrace the tongues of eastern Asia, he devoted much attention to the question of comparative folk-tales.

Julia, the only child of the Roman emperor Augustus, was his daughter by his second wife, Scribonia, and was born in 39 B.C. She was distinguished for her beauty and talents, and was married at fourteen to Marcus Claudius Marcellus, the sister's son of Augustus. After his death two years later, she was married to Marcus Vipsanius Agrippa, to whom she bore three sons and two daughters. He in his turn died in the year 12 B.C., whereupon Julia was given in marriage next year to Tiberius; his mother, Livia, the stepmother of Julia, persuading Augustus to this, in order to secure the succession of Tiberius to the throne. The marriage was an unhappy one, and the conduct of Julia herself far from irreproachable; but it was Livia's hatred rather than any lofty regard for virtue that procured the unhappy Julia's banishment to the isle of Pandataria. From Pandataria, whither her divorced mother, Scribonia, accompanied her, she was removed to Rhegium, where she was allowed by Tiberius to remain destitute even of common comforts till her death in 14 A.D. Her son, Agrippa Postumus, was put to death by Tiberius shortly before the death of his mother. Her other sons, C. and L. Cæsar, died in early age. Her daughters survived her. The elder, Julia, inherited her mother's frailty, and died in 28, in the isle of Trimerus, on the coast of Apulia, whither she had been banished by Augustus twenty years before for adultery. The younger, the virtuous Agrippina (q.v.), died in 33, in Pandataria, to which she had been banished by Tiberius.

Julian, surnamed the Apostate, on account of his renunciation of Christianity, Roman emperor from about the end of 361 to the middle of 363 A.D., was born at Constantinople in the later half of the year 331. He was the youngest son of Julius Constantius, the half-brother of Constantine the Great, and his full name was Flavius Claudius Julianus. On the death of the great Constantine in May 337, and the accession of his three sons, there was a general massacre of the male branches of the younger line of the Flavian family descended from Constantius Chlorus and his second wife Theodora. Thus perished the father of Julian, his elder brother, paternal uncle, and cousins, while he himself and his elder half-brother Gallus were alone spared as too young to be dangerous. He lived a

loveless youth, under rigorous espionage, at Maccellum in Cappadocia and at Nicomedia, embittered moreover by the terrible tragedy he had just escaped, which stripped him of all belief in the reigning religion, and drove his ardent temperament for relief into the literary and philosophical studies of his time. His secret apostasy seems to have been begun at Nicomedia and consummated at Ephesus under the influence of the Neoplatonist Maximus. In 355 he spent a few happy months at Athens in the study of Greek philosophy, and among his fellow-students and acquaintances here were the future Bishops Basil and Gregory Nazianzen. Gallus had been put to death the year before, and in November 355 Julian was summoned to Milan to assume the rank of Cæsar, and marry the emperor's sister, Helena.

The shy young student moved awkwardly amid the atmosphere of policy and intrigue at the court, but during the next five years he found more congenial occupation in the camp, and by his skill and vigour showed that he was a soldier as well as a philosopher. He overthrew the stubborn and victorious Alemanni near Strasburg, subdued the Frankish tribes along the Rhine and across the river, and fixed his winter quarters at Paris. He endeared himself to the people by lightening the public burdens, and to the soldiers by his personal courage, his success in war, and the severe simplicity of his private life. In April 360 the emperor, alarmed at his growing popularity, demanded that he should send some of his best troops to serve against the Persians, but his soldiers rose in insurrection and proclaimed him Augustus. He occupied some time in consolidating his power, then sent forward one portion of his army through Rætia and Noricum, another by the northern confines of Italy, while he himself with 3000 chosen soldiers plunged into the gloomy recesses of the Marcian or Black Forest, and sailed down the Danube as far as Sirmium, where he waited to unite his forces. Here he first threw off the mask and openly declared himself a pagan. Here also he learned of the opportune death of his cousin at the foot of Mount Taurus (November 3, 361), which opened up to him the government of the world. The first winter he spent in the imperial city in a course of public reforms, sweeping away a host of corrupt officials who had long battered at will on private bribes and exactions. Towards Christians and Jews alike he ostentatiously adopted a policy of toleration, but none the less he devoted himself with all the enthusiasm of the convert to the task of restoring the dignity of the old religion. He was assiduous in the practice of divination and all other superstitious ceremonies, reopened and rebuilt the deserted temples, and lavished his patronage upon the time-serving reprobates who deluded him into a belief in the reality of their conversion. He stripped the church of its peculiar privileges by every means short of persecution, but was mortified to the heart by the little success of his ardent propagandism alike among the citizens and the soldiers, although the latter were unable to pay their due worship to the person of the emperor without seeming to bow to idols, from the subtle way in which the imperial and the divine symbols were deliberately intermingled. As soon as he had settled affairs in Constantinople he set out on a journey through Asia Minor to Antioch. Here he lived from July 362 to the March of the following year, and found its luxurious citizens as indifferent to his paganism as to Christianity. Yet his zeal in reformation was less hateful than his economic policy in fixing an arbitrary price on corn in order to stave off a threatened famine. The impudent Antiochenes revenged themselves upon the sensitive emperor by lampoons and ridicule;

yet he restrained his resentment, or confined it to the pages of his *Misopogon*, an ironical satire on their effeminate manners, full of the interest of self-revelation. His famous attempt to rebuild the temple at Jerusalem was intended to falsify the cherished prophecies of Christianity no less than to please the Jews.

In March 363 Julian set out on his long meditated expedition against the Persian king Sapor, and after a tedious march crossed the Tigris, and advanced to the walls of Ctesiphon. He was led to advance farther by the false promises of a Persian traitor, and was at length forced to retreat through a barren country, under a burning sun, and harassed by the swarms of the Persian cavalry. The enemy were repeatedly beaten off, but in one of the attacks the emperor was wounded by a spear-thrust in the side and fell fainting from his horse. Theodoret tells us how as his blood spouted from the wound he exclaimed, 'Thou hast conquered, O Galilean!'—a poetical tale that is at least an embodiment of a historic truth. He was carried to his tent, where, after a few words of brave philosophy to his weeping friends, he died about midnight on the evening of 26th June 363.

'Julian's life was an accident,' says Beugnat, 'and at his death events reverted to their natural channel.'

To Gregory Nazianzen, Chrysostom, Sozomen, Theodoret, and all the early Christian writers, the Apostate was a monster of wickedness; to Claudius Mamertinus he was a figure above all taint of human infirmity. The voracious and competent military historian Ammianus Marcellinus and the rhetorical Libanius are alike warm, yet discriminating in praise. Gibbon's account is fairly just, and one of the most splendid passages in historical literature.

Julian's extant writings are a series of *Epistles*, mostly addressed to men of letters; nine *Orations*; *Cæsares*, a series of satires in which past Cæsars are treated to caustic satire from Silenus; and the *Misopogon*. His most important work, *Kata Christianon*, is lost. There are editions by Hertlein (Leip. 1875); Wright (with trans. 1913 et seq.). See the Duc de Broglie's *L'Église et l'Empire Romain au IV^{me} Siècle* (ii. and iv. 1856-69); Neander, *Kaiser Julian und sein Zeitalter* (1813; Eng. trans. 1850); J. F. A. Mücke, *Flavius Claudius Julianus: nach den Quellen* (1867-69); Rendall, *The Emperor Julian* (1879); Negri's *Julian the Apostate* (trans. 1906); Bishop Wordsworth's article in vol. iii. (1882) of Smith and Wace's *Dictionary of Christian Biography*; and Alice Gardner, *Julian, Philosopher and Emperor* (1895). The essay by Strauss, *Der Romantiker auf dem Thron der Cæsaren* (1847), is only a clever pamphlet aimed at Frederick William IV. of Prussia and his religious reaction. Ibsen's splendid drama, *Emperor and Galilean* (1873; Eng. trans. 1876), sketches a new ideal culture for the world to succeed the Christian, as that succeeded the classical.

Julian Calendar, Epoch, Year. See CALENDAR, CHRONOLOGY, YEAR.

Jülich (Fr. *Juliers*), a small town of Rheinland, on the Roer, 16 miles N.E. of Aachen. It is the *Juliacum* of the Romans. Until its fortifications were razed in 1860 it ranked as a fortress of the second class.—From the 12th century Jülich was the capital of an independent countship, created a duchy in 1356. In 1423 Jülich and Berg (q.v.) were united; and Cleves was added in 1521. In 1609 a dispute arose as to the succession, which was not settled till 1666, when a decision was given in favour of the House of Pfalz-Neuburg, the Elector of Brandenburg obtaining Cleves. The Pfalz-Neuburg family becoming extinct in 1742, Jülich passed to the Pfalz-Sulzbach branch, afterwards electors of Bavaria. In 1801 the duchy was annexed to France, in 1814 to Prussia.

Julien, STANISLAS AIGNAN, a great French Sinologue, was born at Orleans, 19th September

1799, and became at twenty-one an assistant-professor at the Collège de France. Ere long, under Abel Rémusat, he gave himself with such zeal to the study of Chinese that he mastered its difficulties in less than a year, and actually executed a Latin translation of the philosopher Mencius (1824-26). From that time his labours were directed with uninterrupted assiduity to the languages and literature of the Far East. Ancient and modern Chinese, Manchu, Sanskrit, and the Mongolian tongues were alike familiar to him; and at the same time he knew almost all the European languages. He succeeded Rémusat in 1832 at the Collège de France, became in 1839 keeper of the Royal Library, and in 1854 head of the Collège de France. He was also conservator of the Bibliothèque Impériale, and was specially charged with the oversight of the Chinese department. He died 14th February 1873. Julien gave admirable French versions of Chinese drama, romances, treatises on silk-culture and porcelain, and of Indian novels. He was the first to make Chinese poetry intelligible. But a more valuable service was his translating the great manuals of Chinese religion and philosophy; and above all, the *Histoire de la Vie d'Houen-Tsang et de ses Voyages* (1852). His splendid *Syntaxe Nouvelle de la Langue Chinoise* appeared 1869-70.

Julius, the name of three popes, of whom the second and third deserve especially to be noticed.—**JULIUS II.**, originally Giuliano della Rovere, a nephew of Sixtus IV., was born at Albizuola, near Savona, in 1443. He was vehemently opposed during his cardinalate to the designs of Alexander VI. for the aggrandisement of his family, and one of his earliest measures on his election to the pontificate, in 1503, was to resume possession of the duchy of the Romagna, which had been bestowed upon Cæsar Borgia. Julius was himself beyond all suspicion of nepotism or selfish designs of aggrandisement; but his public career during his pontificate was almost entirely devoted to political and military enterprises for the complete re-establishment of the papal sovereignty in its ancient territory—Bologna, Ferrara, &c.—and for the extinction of foreign domination and foreign influence in Italy. In pursuing his designs, for the purpose of compelling from the republic of Venice the restitution of the papal provinces on the Adriatic, Julius not only entered into the league of Cambrai with the Emperor Maximilian, Ferdinand of Aragon, and Louis XII. of France, but had recourse to spiritual arms, by placing the republic under the ban of the church; and on the submission of Venice, apprehending the ambitious designs of Louis, he withdrew from the league, and entered into an opposite alliance, the 'Holy League,' to which Spain and England were parties. During this bitter quarrel with Louis XII. the latter attempted, but ineffectually, to enlist the sympathies of the church against the pope. The Council of Pisa, which was convened under Louis's influence, was an utter failure; and the opposing council, fifth of the Lateran, assembled by Julius, but not brought to a close during his lifetime, completely frustrated the designs of the French king. It has been said without grounds that Julius, in his hatred of France, tried to draw even the Turks into the league, but on the contrary one of his most cherished dreams was a holy war under his own command. As an ecclesiastical ruler Julius has little to recommend him in the eyes of churchmen. As a political sovereign he is described by Ranke as 'a noble soul, full of lofty plans for the glory and weal of Italy;' and Professor Leo considers him, with all his defects, as one of the noblest characters of that age in Italy. He was a liberal and judicious patron of art, and a friend of the rising literature of the time. He died in February 1513.

There are Lives by Dumesnil (Paris, 1873) and Brosch (Gotha, 1877).—**JULIUS III.**, born at Rome in 1487, was known before his elevation to the pontificate as Cardinal del Monte. He was one of the three legates of the pope under whom the Council of Trent was opened; and after his election to the papacy in 1550 he himself reopened (in 1551) that council, which had been suspended for upwards of two years. He is connected with English history as having sent Cardinal Pole to organise with Mary the reunion of the kingdom with Rome; but his general government of the church is marked by no very striking events, and his private character is sullied by the taint of nepotism. He died in March 1555.

Jullien (originally JULIEN), LOUIS ANTOINE, was born at Sisteron, in the French department of Basses Alpes, 23d April 1812. He studied at Paris, and became a conductor of concerts there in 1836; but leaving in 1838, made London his headquarters, and did much to popularise music in England by means of large bands, the best available players and singers, and the most attractive pieces, including his own 'Monster Quadrilles.' He became bankrupt in 1857, and retired to Paris, where he was imprisoned for debt. He died in a lunatic asylum, 14th March 1860.

Jullunder (*Jalandhar*), a city of the Punjab, stands in the Doab or rich alluvial plain of the same name between the Sutlej and the Beas, in 31° 21' N. lat. and 75° 31' E. long., on the north-western railway between Umballa and Umritsar. The soil of the neighbourhood is very productive; and the city, though fallen from its former greatness, in 1921 had 71,008 inhabitants. Jullunder is a very ancient city, founded before Alexander's invasion of India, and is referred to in the *Mahabharata*.—It gives its name to an administrative district of 1431 sq. m. area (pop. 822,544), and to a division of 19,394 sq. m. area (pop. 4,181,898).

Julus, or **JULUS**, a genus of Millepedes, in the class Myriapoda (see CENTIPEDE).

July, the seventh month of the year in our calendar, fifth in the Roman Calendar, where it was called Quintilis ('the fifth'). Originally it contained thirty-six days, reduced first to thirty-one, then to thirty, but was restored to thirty-one days by Julius Cæsar, in honour of whom it was named *July* (Lat. *Julius*), his birthday falling on the 12th. In this month the sun leaves Cancer and enters the sign of Leo. According to Dove, the mean temperature of July at London is 64° F.; at Dublin, 61°; at Archangel, 60°; at Berlin, 66°; at Rome, 76°. The average summer temperature at New York is 72°-62; at San Francisco, 58°-04.—The 'July Revolution' is that in France in July 1830, by which Charles X. was set aside, and Louis-Philippe became king.

Jumièges, ROBERT OF, Archbishop of Canterbury, was a Norman by birth, and came to England in the train of Edward the Confessor, over whom he acquired great influence. He was made Bishop of London in 1044, and Archbishop of Canterbury in 1050, and from the first was the head of the anti-English party which gained a temporary triumph in 1051 by the banishment of Earl Godwin and his sons. Their return next year quickly drove him into exile in Normandy. The Witenagemot stripped him of his archbishopric, and he spent the remainder of his life in the monastery of Jumièges, 16 miles SW. of Rouen.

Jumièges, WILLIAM OF, a Norman monk who compiled in Latin a history of the Dukes of Normandy from Rollo down to 1071, which is of some value in the contemporary part—the story of the Conquest and early reign of William I. It is

printed in Migne's *Patrologiæ Cursus Completus* (vol. cxlix.).

Jumilla, a town of Spain, 36 miles N. by W. of Murcia, cultivates the vine and esparto grass, and manufactures salt, jars, silk, &c.; pop. 20,000.

Jumna, or JAMUNA, the principal feeder of the Ganges, has its course wholly in Hindustan. Its source, at a height of 10,849 feet above the sea, is 5 miles N. of Jammotri. After a southerly course of 95 miles it breaks into the plains from the Siwalik Hills at an altitude of only 1276 feet. It continues to flow south as far as Hamirpur, beyond Agra, and then turns to the east, finally joining the Ganges from the right 3 miles below Allahabad, after a total course of 860 miles. As a rule its banks are high and craggy, and it has many tributaries. Area of drainage basin, 118,000 sq. m. Delhi, Agra, Ferozabad, Etawah, and Allahabad stand on its banks. From each bank of the river, where it emerges from the Siwalik Hills, an irrigation canal has been constructed—the Eastern Jumna Canal (1823-30), on the left bank, 160 miles, and the Western (1817-25), 433 miles.

Jumpers, a term given by opponents to the Shakers (q.v.), as also to some Welsh Methodists, assumed to 'jump' as part of divine worship.

Jumping. See ATHLETIC SPORTS.

Jumping Hare (*Pedetes capter*), a South African rodent, *Spring Haas* of the Dutch colonists, belonging to a family (Pedetidae) near to the Jerboas (q.v.). The head much resembles that of a hare, although the ears are shorter; the body is also like that of a hare, but the hind-legs are very long and strong, like those of a kangaroo, and the toes both of fore and hind feet are armed with great claws; and the tail is long and bushy. Its powers of leaping are extraordinary, and at night it makes mischievous inroads on fields and gardens.

Jumping Seed, or BEAN, the seed of a Mexican euphorbiaceous plant, which, if warmed, moves or even jumps on a flat surface, because of the presence within it of the larva of a toxtracid moth (*Carpocapsa saltitans*).

Junagarh, or JUNAGADH, an Indian state (area, 3284 sq. m.; population, 465,493), on the peninsula of Kathiawar. The capital, from which it takes its name, is one of the most picturesque towns in India; it has an old citadel, which contains several Buddhist caves, as does also the ditch surrounding it. Pop. 33,000.

Juncaceæ. See RUSH.

June, the sixth month of the year in our Calendar, but the fourth among the Romans. It consisted originally of twenty-six days, but was finally lengthened to thirty days by Julius Cæsar.

Juneau, the capital of Alaska, stands in the southern district or strip lying between British Columbia and the sea, on Gastineau Channel and opposite Douglas Island. It is the centre of great mining interests, and is a great outfitting place. Its first prosperity it owed to silver and gold mines near by; and it was named from one of its founders, Joseph Juneau. Settled only in 1880, it had in 1920 a pop. of about 3000.

Jung, CARL GUSTAV, Swiss physician and psychologist, born at Kesswyl, Thurgau, 26th July 1875, studied medicine at Basel, and psychopathology at Paris. From 1900 till 1909 he was associated with the psychiatric clinic of Zürich, and in 1905 became, in the university there, lecturer in medical psychology. As a result of experiments in mental association he developed the psychological theory of 'complexes,' a theory which became a fundamental conception of psychoanalysis, and brought him into association with Freud (q.v.), with whose earlier discoveries the

theory was found to harmonise. In 1911 he founded the International Psycho-analytical Society. Then in 1913, denying a unique causative importance to sexuality in human psychology, normal or abnormal, and substituting instead the wider idea of a tension between opposites present in every psychological manifestation, he parted company with Freud and the Viennese school of psycho-analysis, and became leader of the school of Zürich. Among his works are *The Psychology of Dementia Praecox* (1907; trans. 1909); *Wandlungen und Symbole der Libido* (1912; trans. as 'The Psychology of the Unconscious,' 1916); *The Theory of Psychoanalysis* (1915); *Collected Papers on Analytical Psychology* (1916; trans. 1917); *Studies in Word Association* (trans. 1918); *Psychological Types* (1921; trans. 1923). See also DREAMS, EXTROVERT.

Jung, JOHANN HEINRICH, generally called JUNG STILLING, an original German writer, was born at Im-Grund, in Nassau, 12th September 1740. At first he pursued his father's callings—tailor and village schoolmaster; then (1768) he became a student of medicine at Strasburg, where he was intimate with Goethe, who admired his simple, pure, affectionate nature (see *Wahrheit und Dichtung*, ii.). Next he settled (1772) as a medical practitioner at Elberfeld, and won fame as an operator for cataract. Subsequently he held the professorship of Political Economy at Marburg (1787–1804) and Heidelberg. He died at Carlsruhe, 2d April 1817. He was brought up in a pietistic circle, and the effects of his early training clung to him all his life. Although he wrote some semi-mystical, semi-pietistic romances, and later in life works on political economy, he is best remembered for his mystical and charming autobiography, *Heinrich Stillings Leben* (1777–1817; trans. 1835). His *Geisterkunde* and *Theobald* were also translated. See Petersen's monograph (1890).

Jung, SIR SALAR (1829–83), a member of a princely family which since the founding of the Nizam's dynasty in 1713 had furnished Hyderabad with its chief ministers, in 1853 succeeded his uncle in office. He at once began to reorganise the administration of the state, then in a most deplorable condition. The British government had even to pay the troops; and to repay the loan the province of Berar was ceded to the British. Salar Jung's first care was to reduce to obedience the mercenary Arab soldiery. Then the robber chiefs of the hill districts were crushed; courts of justice were established at Hyderabad; the police force was organised; the construction and repair of works of irrigation were attended to; and schools were established. During the Mutiny of 1857 Sir Salar Jung adhered to British interests in face of the opposition of the people. The Nizam Afzul, an apathetic, suspicious, and capricious monarch, had hampered him. But after his death in 1869 Sir Salar Jung was joint regent. In 1876 he visited England in the hope of obtaining the restoration of Berar.

Jung Bahadur, SIR (1816–77), prime-minister of Nepal. His uncle, a high official, was murdered at the instigation of the queen, who appointed the nephew commander-in-chief. When in 1846 the premier was assassinated, Jung Bahadur took vengeance upon the leading chiefs concerned in the crime and made himself prime-minister. A conspiracy against him was quickly quenched in blood, the queen and the witless king were banished; and the heir-apparent was raised to the throne. During the Mutiny of 1857 he sent a body of Gurkhas to help the British.

Jung Breslau. See INOWRACZAW.

Jung Bunzlau. See BUNZLAU.

Jungermannia, a Linnæan genus of cryptogamous plants, containing a great number of

species, which modern botanists have divided into many genera, and formed into an order, Jungermanniales, of Hepaticæ (see LIVERWORTS). The spore-cases open by four valves, and the spores are mixed with elaters. The sporophyte may be thalloid or foliose, dorsiventral or radial. Some species much resemble mosses in appearance. Many are natives of Britain, some of them very common in moist places. The tropical species are very numerous, and some of them are to be found even on the young shoots and leaves of plants. Jungermannia is named in honour of Ludwig Jungermann, who published floras of Altorf (1615) and Giessen (1623).

Jungfrau ('the Maiden'), a magnificent peak of the Bernese Alps, attains a height of 13,671 feet. It received its name either from the unsullied purity and dazzling brightness of the snow by which it is covered, or from the fact that no traveller had ever reached its highest point. Its summit was first ascended by two Meyers in 1811. A railway, mainly continuous tunnel, climbs to the Jungfraujoch (11,340 feet).

Jungle (Sanskrit *jangala*, 'desert'), those thickets of trees, shrubs, and reeds which abound in many parts of India, and particularly in the unhealthy tract called Terai or Tarayani, along the southern base of the Himalaya, and in the Sundarbans (q.v.) at the mouth of the Ganges. The jungles are often impassable, from the thick growth of underwood, tall grasses, and climbing plants. The soil is generally swampy, and fever and other diseases abound. Tigers and other beasts of prey, elephants, boars, deer, and other quadrupeds may be found in great numbers in these thickets, with gigantic snakes, and multitudes of monkeys. The jungle flora and fauna are very peculiar, and the moisture and heat carry a tropical vegetation beyond its usual limits northward to the lower valleys of the Himalaya. See INDIA, BENGAL.

Jungle-fowl, the name given in India to the wild species of Gallinæ (*Gallus ferrugineus*) which is the parent of our domestic barn-door fowl, and to three other closely allied species (see POULTRY).

Juniper (*Juniperus*), a genus of trees and shrubs of the natural order Coniferae, sub-order Cupressineae, having unisexual flowers, the male and female generally on separate plants, and the fruit a fleshy *galbule* (popularly a *berry*), containing

Fig. 1.

a, *Juniperus communis*; b, *J. Sabina*; c, *J. chinensis*.

three small nuts. The species are all evergreen, and have small, narrow, rigid leaves, which are opposite, or in whorls of three or four, or imbricated in four rows. They are natives chiefly

of temperate and cold regions, and are found in Europe, Asia, Africa, and America.—The Common Juniper (*Juniperus communis*) is found in all parts of Europe and the north of Asia, and in the northern parts of North America. Only in favourable circumstances does it become a tree of 15, 20, or at most 30 feet in height, and in general it is only a shrub from 2 to 6 feet high. The fruit takes two years to ripen. It is round, of a bluish-black colour, with a whitish bloom; is of the size of a small currant, and is produced in great abundance. The little nuts or stones of the fruit have on the shell three glands, which abound, before ripening, in an essential oil—*Oil of Juniper*—present also in the young wood. This oil changes to a true turpentine when the fruit reaches maturity, so that to obtain the oil the green fruit must be used. The wood is yellowish red, brownish in the heart, hard, and fragrant. When of sufficient size it is much valued by turners. It is also used for veneering. The berries have a strong and peculiar flavour, and are much used for flavouring gin, which derives its name from them (see GIN). They also enter into several medicinal preparations, being stimulant, sudorific, and diuretic.—Oil of juniper is lighter than water; specific gravity, 0.839. It is limpid and nearly colourless, and is obtained by distilling the unripe fruit, or the twigs, with water.—Spanish Juniper (*J. Oxycedrus*) grows in arid situations in the countries round the Mediterranean Sea. Its fruit is about the size of a hazel-nut; and from its fruit and wood is procured an essential oil of disagree-

Fig. 2.—Branch of *J. communis*, with fruit.

able odour, called *Huile de Cade*.—Virginian Juniper (*J. virginiana*), the Red Cedar of North America, is an evergreen tree, often 30–50 feet high, of conical form, with horizontal branches and very small leaves. The berries are small and bright blue. The heartwood is of a beautiful red colour, valued by turners and makers of cigar boxes and lead-pencils.—The Bermudas Cedar (*J. bermudiana*), with very fragrant reddish-brown wood, covers the uncultivated hills of Bermudas.—The Himalaya Mountains produce several species of juniper trees of considerable size, beautiful appearance, and valuable wood.—The Swedish juniper of British shrubberies is merely a variety of the common juniper.—The Savine, or Savin (*J. Sabina*), a low, much-branched, and widely-spreading shrub, with very small, imbricated, evergreen leaves, grows in Europe, Siberia, Canada, and the northern United States. It bears small black berries, covered with a pale blue bloom. Its foliage has a strong, aromatic, penetrating odour. Being the host for various fungi dangerous to fruit-trees, it is proscribed in several cantons of Switzerland, e.g. Zürich. The fresh and dried tops, and a volatile oil distilled from the former, have been used in medicine. Their odour is strong and terebinthinate, and their taste acrid, bitter, resinous, and disagreeable. The therapeutic properties of savine are due to the volatile oil, of which it contains about 2 per cent., consisting chiefly of a body having the composition $C_{10}H_{16}$, isomeric with oil of turpentine.

Savine exerts a stimulating effect on the pelvic organs, and is employed in cases of amenorrhoea and chlorosis. It is best given in the form of the

oil, 1 or 2 minims of which may be prescribed in a pill, to be taken twice a day. It is sometimes employed to procure abortion; but if given in a sufficiently large dose to produce the desired effect, the life of the mother is placed in the greatest possible peril. Savine in the form of ointment is used as an external application to keep up the discharge from a blistered surface. The ointment cannot, however, be kept long without losing its properties.

JUNIUS, LETTERS OF, a series of seventy letters signed Junius, which appeared in the *Public Advertiser* between the 21st of January 1769 and the 21st of January 1772. They were revised by the author, and reprinted two months later in two small volumes by Henry Sampson Woodfall. An edition which appeared in 1812 contained one hundred and thirteen letters in addition to the seventy in the author's edition; five only of the one hundred and thirteen were signed Junius, and one of the five, dated 21st of November 1768, was the first which appeared with that signature. Soon after Junius began to write he attracted attention owing both to his apparent familiarity with current politics and notable persons, and to his boldness in commenting upon them, the climax being reached by him in his letter to the king on the 16th of December 1769. Woodfall was prosecuted for printing and publishing it in the *Public Advertiser*, and acquitted on a technical point, while Almon, a bookseller, was punished for selling a reprint of it. The audacity of Junius in bidding George III. remember that 'while the crown was acquired by one revolution, it may be lost by another,' stimulated public curiosity as to the writer of that letter and others. Burke was generally supposed to be Junius till his denial was accepted as conclusive. Among the many supposed authors of the letters were Lord Shelburne, Barré, Lord George Sackville, Wilkes, Horne Tooke, and Thomas, Lord Lyttelton. It was not till after the publication of the edition of 1812 that the name of Sir Philip Francis (q.v.) was publicly affirmed to be concealed under that of Junius. John Taylor was the first to advance what is now known as the Franciscan theory. He wrote two books on the subject: the first appeared in 1813, and was entitled *A Discovery of the Author of the Letters of Junius*; the second in 1816, and was entitled *The Identity of Junius with a Distinguished Living Character Established*. In the first Taylor argued that the letters were from the pens of Dr Francis and his son; in the second, that the son was the sole author. De Quincey, Earl Stanhope, Lord Macaulay, and other critics and historians of note have accepted the Franciscan theory. Taylor was led to frame it by reading a letter which had appeared in the *Public Advertiser* on the 23d of March 1772 signed Veteran, in which Lord Barrington is charged with expelling Francis from the War Office. The 'Memoirs' of Sir Philip Francis by Parkes and Merivale appeared in 1867, containing private letters from Francis in which he wrote that he had resigned his clerkship and declined promotion to a higher post in the War Office, and that he was on terms of cordial intimacy with the Lord Barrington whom Veteran vilified. The extant manuscripts of Junius are said to have been written in a disguised hand, and many fancied resemblances have been traced between it and Francis's natural hand. Woodfall, the printer of the *Public Advertiser*, Tomkins, the principal writing-master of his day, and other contemporary authorities considered the handwriting of the manuscripts to be not only natural, but to bear a close resemblance to that of many men and women who lived when Junius wrote. Moreover, it was not till half a century after the publication of Junius's own edition of his

letters that the theory of a disguised handwriting was started in order to get over the difficulty that the natural hand of Francis was unlike that of the Junian manuscripts. No direct or indisputable proof has yet connected Francis with Junius. The authorship of the letters signed Junius remains a mystery. Junius was not the only important political writer of his time, many others being conspicuous and admired, yet the letters of Wilkes and Horne Tooke, to name those of two popular writers, were neither so uniformly brilliant, nor were they so carefully polished, as the letters signed Junius. This great anonymous writer set a pattern for the leading articles, which were unknown in his day, and through which newspapers now influence public opinion.

See *Junius* (2 vols. 1772); *Junius, including Letters by the same Writer under other Signatures* (3 vols. 1812); *Wilke's Papers of a Critic*; articles in the *Athenæum* by Fraser Rae; (Chabot and Twistleton, *The Handwriting of Junius* (1871); H. R. Francis, *Junius Revealed* (1894); and B. Francis and E. Keary's *Francis Letters* (1901).

Junk, a Chinese vessel, clumsy and incapable of much seamanship or speed; yet junks have proved themselves seaworthy on voyages extending even to America and Europe.—*Junk*, in the British navy, is a familiar term for the salt meat supplied to vessels for long voyages—the name being probably derived from the fact that it becomes as hard and tough as old rope, pieces of which are officially styled *junk*.

Junker, WILHELM, traveller, was born of German parents resident in Moscow in 1840, and studied medicine in Göttingen, Berlin, and Prague. Proceeding to Africa in 1874, in the first instance to Tunis and Egypt, he in 1876–78 carried through a series of explorations among the western tributaries of the Upper Nile, going as far south as the Kibbi, a feeder of the Welle. In the year following (1879) Junker started from Cairo on his second and more important journey, his object being to explore the basin and course of the river Welle-Makua, which he followed down to 22° 47' 40" E. long. and 3° 13' 10" N. lat. This river was eventually (end of 1887) proved by Captain Van Gèle to be identical with the Ubangi, a right-hand affluent of the Congo. After spending four years among the Monbuttu and Niam-Niam, Junker prepared to return home, but was prevented from getting back to Egypt by the Mahdi's revolt, and had to remain with Emin Pasha and Casati. But in the end of 1886, a favourable opportunity presenting itself, he managed to find his way to the coast through Karagwe, and reached Cairo again in January 1887. He died at St Petersburg, 13th February 1892. See his *Reisen in Africa, 1875–78* (Vienna, 1889; English trans. by A. H. Keane, 1890).

Junkers, the name commonly given to the younger members of the landed gentry of Prussia and the adjoining states.—*Junkertum*, as a term of reproach, has been used in the middle of the 19th century and since to designate the party of reaction in Prussia, which found its most strenuous supporters amongst the landed gentry.

Juno was to the Roman the abstraction of womanhood as Jupiter was the abstraction of manhood. This is the genuine Roman conception of Juno, and to this we must look and not to any nature-myth for the explanation of this deity. As Mommsen has said (*Hist. of Rome*, i. 28), what distinguishes Roman religion from Greek is that in the former 'to everything existing, to man and to the tree, to the state and to the storeroom, a spirit was assigned, which came into being with it and perished along with it, the counterpart in the spiritual domain of the physical phenomenon; to

the man the male genius, to the woman the female Juno.' This is the first point to notice in analysing this deity; Juno is the counterpart in the spiritual domain of the female principle in the human world. The next step in the analysis is indicated again by Mommsen: 'In occupations even the steps of the process were spiritualised; thus, for example, in the prayers of the husbandman there was invoked the spirit of following, of ploughing, of furrowing, sowing, covering-in, harrowing, and so on, to those of in-bringing, up-storing, and opening of the granaries.' Following the indication thus given us we observe that every step in the life of woman, every function of the female principle, was spiritualised by the Romans, as is shown by the various titles given to Juno—e.g. Virginensis, Matrona, Natalis, Juga, Jugalis, Curitis, Domiduca, Iterduca, Unxia, Pronuba, Cinxia, Fluonia, Ossipaga, Opigena. These spiritual counterparts of the various phases of woman's life were, we may assume, probably not originally all supposed to inhere in one individual deity, but were separate and independent. And here we come to the third step in our analysis; these various spirits—the spirits of marriage, of birth, of travail, &c.—came eventually to be regarded not as separate spirits but as various manifestations of one and the same deity. What, then, was the thread round which these ideas so to speak crystallised? It was in all probability the figure of the Greek Hera. This undoubtedly became known to the Romans through the cities of Magna Græcia at an early period; the 'female Juno' became identified with her; the various attributes of Virginensis, Matrona, &c. were naturally assigned to the new, anthropomorphic Juno; and the other resemblances between Juno and Hera were loans effected at this and later times by the Romans from the Greek. Juno as she appears in Virgil is, of course, a reproduction of the Hera of Homer. See HERA.

Junot, ANDOCHÉ, Duc d'Abrantès, one of the great Napoleon's generals, was born October 23, 1771, at Bussy-le-Grand, in Côte-d'Or, entered the army as a volunteer in 1792, and distinguished himself in the early wars of the republic. His courage at Toulon caught the eye of Napoleon, and he carried him with him to Egypt as adjutant. At Nazareth he covered himself with glory by putting to flight as many as 10,000 Turks with but 300 horse. In 1804 he was made governor of Paris, and, after a short stay as ambassador in Lisbon, was appointed in 1807 to the command of the army for the invasion of Portugal. In a short time by his rapidity and skill he made himself master of all the strong places in the kingdom. For his brilliant success he was created Duc d'Abrantès, and appointed governor of Portugal; but he squandered the fruits of his victory by his absurd prodigality, and was ere long so severely defeated by Wellington at Viméiro that he was obliged to conclude a convention at Cintra and retire from Portugal. He subsequently served in Germany and Russia, and was made one of the scapegoats for the great Russian disaster, and sent to govern Illyria. This, added to the effect of former wounds in the head, brought on mental derangement. He was taken to his father's house at Montbard, near Dijon, and, two hours after his arrival, precipitated himself from a window, July 22, 1813, fracturing his thigh-bone. Amputation was performed, but Junot frantically tore off the bandages, and died seven days afterwards.—His wife, LAURETTE DE SAINT-MARTIN-PERMON (1784–1838), the accomplished and recklessly extravagant Duchesse d'Abrantès, gained a reputation in the literary world by her *Mémoires* (18 vols. 1831–35), and by several minor works.

Junqueiro, ABILIO GUERRA. Portuguese poet, born in 1850, published lyrics and satire almost from childhood to old age. He became a deputy in 1878, was tried for *lese majesté* in 1907 for his attacks on the Braganzas, and after the revolution was minister to Switzerland. Important works are *Finis Patrie* (1890), *Patria* (1891), *Os Simples* (1892).

Junta ('assembly'), the name given in Spain to a body of persons combined for political or administrative purposes, whether summoned by the sovereign or meeting on their own initiative as representatives of the people. The most famous is the central junta of 1808, with its provincial juntas, chosen for the conduct of the war with France.—In English history the Whig *junto* was the name given to the chiefs of that party in the reigns of William III. and Anne. The Junta was also the name of a debating society founded by Benjamin Franklin, which developed into the American Philosophical Society in 1743. Here also may be mentioned the interior committee of the privy-council under Charles I., which was the germ of the modern cabinet, and which Clarendon says was reproachfully called the *Juncto*. Its principal members were Laud, Strafford, and Cottington, the Chancellor of the Exchequer; the others were Juxon, the Lord High Treasurer, the two Secretaries, Vane and Windebank, the Marquis of Hamilton, and the Earl of Northumberland 'for ornament.'

Jupiter, the chief god of the Romans. Etymologically identical with the Sanskrit Dyaus, the Greek Zeus, and the Teutonic Tiu or Zio, Jupiter is one of the few gods that can safely claim to be descended from the Indo-European primeval period, and consequently one of the few exceptions to the rule that, if a deity is common to the Greeks and the Romans, he was borrowed by the latter from the former in historical times. But though Jupiter was known to the Italians from the time when they first became a separate branch of the Indo-European people, it would be an error to imagine that everything that can be predicated of the Greek Zeus holds good of the Roman god, or that the attributes of Jupiter can be ascribed indiscriminately to the Greek deity. We do indeed find that the same tales are told about Jupiter by Virgil and Ovid as had been related about Zeus by the Greek poets whom the Roman writers imitated; but it by no means follows that these tales were known to the Italians before their contact in historical times with the Greeks. On the contrary, it is in some cases perfectly certain that the myths were borrowed by the Romans from the Greeks. For instance, no myth in which Apollo figures along with Jupiter could possibly be an original Italian production, because it was only in historical times that the worship of Apollo was introduced from Greece into Italy. In this article, therefore, we must refer the reader for all that regards the Greek god to the article ZEUS. But, although we propose here to confine ourselves to the Roman deity, it is by no means easy to determine the outlines of this figure in mythology as it appeared to the religious consciousness of the Italians before they came in contact with Greek thought. We have but little direct information as to the Italians of that period. A few of the *indigitamenta* or formulae containing the epithets of the gods which were recited as a sort of litany by the Roman priests have survived to us, but not enough for our purpose. We are therefore reduced to general considerations. And from this point of view there is no reason whatever for assuming that the resemblance between Jupiter and the Greek Zeus was originally any greater than that between Jupiter and the Sanskrit Dyaus or the Gothic Tiu. As long as it was an accepted

theory that the ancestors of the Greeks and Romans dwelt together, and apart from the rest of the Indo-European family, for some time before immigrating into their respective historical abodes, the case was different.

Now, however, this Pelasgian theory no longer has the sanction of either philology or archaeology. We must, therefore, conceive the difference between the original Italian Jupiter and the Greek Zeus to have been determined by the general differences between Greek and Roman religion. In the striking words of Mommsen (*History of Rome*, i. 28), 'As the Greek, when he sacrificed, raised his eyes to heaven, so the Roman veiled his head; for the prayer of the former was vision, that of the latter reflection.' The Greek gods were thoroughly anthropomorphic; they were represented by their poets and their sculptors alike in the image of man. The gods of the Romans were much nearer the earlier stage of animism; they were powers whose good-favour could be propitiated and ill-will averted by the proper ritual and by sacrifice, but they were not subjects for plastic art until the time of Greek influence. This difference will at once account for the fact that no myths whatever attach to the Italian Jupiter—all that are related of him were borrowed in late times from the Greek Zeus. What we do find is that various epithets, such as Lucetius and Elicius, Imbricitor, Prodigialis, Depulsor, &c., are applied to him. And we may conjecture that all such epithets were probably, as some certainly were, originally part of the *indigitamenta*, with the recital of which the Roman priests sought to secure the favour of the god. In the next place it is to be noted that these epithets tend to show that Jupiter was originally to the Roman just as abstract a figure as Janus ('the spirit of opening'), Juventas ('the spirit of youth'), or Forenus ('the spirit of doors'), Limentinus ('the spirit of thresholds'), or Cardea ('the spirit of door-hinges'). We may conjecture that the Romans present to us the original animism of the Indo-Europeans more faithfully than does the anthropomorphism of the Greeks. That Jupiter was to the Italians, as to the Indo-Europeans, the spirit of the sky, is shown by his epithet Lucetius, which occurred in the Salaric Hymns. The same conception is at the bottom of the epithets which designate Jupiter as the spirit of thunder or of lightning—Jupiter Tonans, or Fulgur. As Jupiter Latialis he presided over the Latin alliance. As the supreme spirit apparently he was besought to grant victory in war, and hence the names Stator, Feretrius, Victor. The vintage also stood under the care of Jupiter Liber. The Ides of every month were sacred to him. He was also the spirit of oaths, Dius Fidius. Finally, although many of the epithets applied to him can at once be recognised as appropriate to the original character of Jupiter as spirit of the sky, such as Elicius, Fulminator, Pluvius, Imbricitor, Serenator, Almus, Frugiferus, there are others, such as Stator, Victor, &c., which cannot possibly be derived from his functions as a sky-spirit, and which must therefore be accretions, possibly resulting from the identification of the Roman Jupiter with the chief gods of the various allied states. The epithet Capitolinus is derived from the temple on the Capitol built by Tarquin, and the spirit inhabiting that temple was, compared with the rest, Jupiter Optimus, Maximus.

Jupiter. See PLANETS, and SOLAR SYSTEM.

Jupiter's Beard, a name applied to various plants, including the House-leek (q.v.), *Anthyllis Barba-Jovis* (see KIDNEY VETCH), and *Hydnum Barba-Jovis* (see HYDNUM).

Jura (Scand. *deor-æ*, 'deer-isle'), an Argyllshire island, $\frac{1}{2}$ mile NE. of Islay, and $2\frac{1}{2}$ miles W.

of the nearest point of the mainland. It extends 23 miles north-eastward; varies in width from $\frac{1}{2}$ mile, at Loch Tarbert in the middle, to $8\frac{1}{2}$ miles; and is 143 sq. m. in area. The western side is rugged and desolate, the eastern green and pleasing. The conical Paps of Jura are 2571 and 2412 feet high; and most of the surface is deer-forest. Pop. (1831) 1312; (1921) 461, nearly all Gaelic-speaking. See **HEBRIDES** and **CORRIEVREKIN**.

Jura, a range of mountains of a peculiar limestone formation, oolitic in composition, and generally called Jurassic, which extends from the angle formed by the Rhone and the Ain, in a north-easterly direction (with a gradually declining elevation) for more than 450 miles, to the upper course of the Main. But it is usual to restrict the name to the ranges that lie along the frontier of Switzerland and France—mainly in the departments of Doubs, Jura, and Ain. These constitute a plateau about 155 miles long by 40 wide, with an average height of 2000 to 2500 feet. The loftiest peaks are Reculet (5643 feet), Crêt de la Neige (2633), Mont Tendre (5512), and Dôle (5507). The eastern face is much steeper than the western. The ranges are broken by numerous transverse gorges or 'cluses.' Many roads and railways traverse the chains, some of them of great strategic importance. Limestone caves are numerous, and they abound in magnificent stalactites and in the bones of extinct animals. Some rivers of considerable size sink into the ground and reappear after some distance, as the Orbe, the Doubs, and the Creuse. Fine pine-forests are a characteristic feature of the scenery.

Jura, an eastern French department, bounded on the E. by Switzerland. Area, 1928 sq. m.; pop. (1881) 255,263; (1921) 229,062. The slopes of the Jura Mountains are thickly wooded, but have also many pastures and meadows. At the foot of the Jura come rich vine-lands. The river-valleys are devoted to the cultivation of grain crops of various kinds. The chief rivers are the Doubs, Ain, and Ognon. Water-power is abundant. The principal industries are the working of iron, cheese-making, watch-making, and turnery. Iron, salt, marble, clay (for pottery), are the most important minerals extracted. The department is divided into four *arrondissements*—Lons-le-Saunier, Poligny, Sainte-Claude, and Dôle. Capital, Lons-le-Saunier.

Jurassic System, the name given to that great series of Mesozoic strata which includes the Lias and overlying Oolites. The system receives its name from the Jura Mountains, where strata of that age are well developed. In England Jurassic rocks extend over a large area in Yorkshire between the mouth of the Tees and Filey Bay, and stretch south from the Humber along the western borders of the great flats of Lincoln and Cambridge, from which they sweep south-west as a broad belt across the Midlands to the Bristol Channel and the coasts of the English Channel between Lyme Regis and Durdlestone Head. Only a few patches of Jurassic rocks occur in Scotland, as near Brora on the east coast of Sutherland, and in some of the western islands. In Ireland the system is equally sparingly represented, as near Larne and Portrush in Antrim. On the Continent rocks of the same age are developed over extensive regions. They form a ring or zone-like belt surrounding the Cretaceous and Tertiary deposits of the Paris basin, underneath which the Jurassic strata doubtless continue. Farther south another belt sweeps round the central plateau of France, and stretches south to the Mediterranean. The most continuous areas in Germany occur in Franconia, Swabia, and Upper Silesia. Rocks of the same age occupy a wide region in central and northern Russia, while more

or less isolated areas are met with in the Caucasus, the Crimea, the Carpathians, the Dinaric Alps, the Apennines, &c. One of the most important Jurassic tracts is that of the Jura Mountains, extending between Basel and Geneva. Narrow and broader belts of the same strata occur along the northern and southern flanks of the Alps. The system also occurs in considerable force in the north-east and the south of Spain.

The Jurassic system of Europe has been arranged in the following groups:

PURBECKIAN: mostly of fresh-water origin; they contain traces of old land-surfaces (dirt-beds), with roots and stems of fossil plants.
PORTLANDIAN: chiefly sandstones, marls, and limestone (Portland-stone); marine.
KIMERIDGIAN: dark shales and clay (Kimeridge Clay); marine.
CORALLIAN: limestones with corals (Coral Rag), clays, and calcareous grits; marine.
OXFORDIAN: dark gray or blue clay (Oxford Clay); and calcareous sandstone (Kellaways Rock—Callovian); marine.
BATHONIAN: limestones, clays, and sands (Cornbrash, Bradford Clay, and Forest Marble); shelly limestones (Great or Bath Oolite), Stonesfield Slate; Fuller's Earth; all marine.
BAJOCIAN (or Inferior Oolite): calcareous sandstones and grits (Cheltenham); marine; represented in Yorkshire by estuarine sandstones, shales, and limestones, with seams of coal and ironstone.
LIASSIC: sands and clays (Upper Lias) resting on limestones, sands, clays, and ironstones (Middle Lias, Marlstone); below which come limestones and dark shales (Lower Lias); all marine.

In India (Cutch) Jurassic strata, ranging from the Bajocian up to the Portlandian inclusively, attain a considerable thickness. The system is not largely developed in North America (Sierra Nevada and Rocky Mountains), but is notable in Colorado for its remarkable reptilian remains. Finally it may be added that Jurassic rocks have been detected in Spitzbergen, Siberia, Australia, New Caledonia, and New Zealand.

Life of the Period.—The predominant forms among the land-plants were cycads, conifers, ferns, and equisetums, but with these were associated fruits which are regarded as belonging to an ancient group of true angiosperms of which there are no living representatives. This vegetation was widely spread over the earth's surface, flourishing abundantly in Britain, and extending far into the Arctic Circle.

The lower classes of the animal kingdom were represented by foraminifera and sponges, by a great variety of corals, by crinoids (both stalked and free forms), by starfishes, sea-urchins, &c. Corals are especially numerous, and mostly belong to the reef-building family of star-corals. Many of the limestones of the period, indeed, particularly those of the Corallian, are simply old coral-reefs. Amongst crinoids one of the most characteristic forms was *Pentacrinus*—a genus still living. Many genera of sea-urchins occur (*Acrosalenia*, *Cidaris*, *Diadema*, &c.), and with these were associated numerous starfishes and brittle-stars. The most prominent crustaceans were long-tailed decapods, to which belong our modern lobsters, prawns, &c.; and true crabs were also present. Insects were represented by ancestral forms of cockroach, grasshopper, earwig, ant, dragon-fly, may-fly, beetles, bugs, &c. Brachiopods, which formed so characteristic a feature in the life of the Palaeozoic seas, had now ceased to be dominant forms, although they were still individually numerous. Most of the old Palaeozoic types had disappeared before Jurassic times—one surviving form, *Spiriferina*, ranging from Devonian times to the close of the Liassic stage. We note, however, the presence of the inarticulate types (*Crania*, *Lingula*, *Discina*) which appeared first in Cambrian times and still flourish in our seas. The most important Jurassic brachiopods are *Terebratula* and *Rhynchonella*, of which there were many species. Both genera have

survived to the present, but are represented by only a few species. Amongst the lamellibranch molluscs many forms unknown in Palæozoic times now made their first appearance, the most important types being the oysters (*Ostrea*, *Gryphaea*, and *Exogyra*), together with *Thiгона* and *Pholadomya*. Gasteropods were fairly numerous, and comprised representatives of the whelks, spindle-shells, spider-shells, &c. of existing seas; and it may be noted that the earliest recognisable fresh-water univalves (*Paludina*, *Planorbis*) date from Jurassic times. But the most characteristic molluscs of this period were the cephalopods, both tetrabranchiate and dibranchiate types. The former, or chambered division, were represented by many forms of *Ammonites*, several hundred species having been chronicled; and the latter, or 'cuttle-fish' division, by numerous species of *Belemnite*. Among fishes were ganoids, usually of small size, and representatives of the sharks and rays. But by far the most important of the vertebrates were the reptiles, which flourished in extraordinary abundance during Jurassic times, and may well be said to be the most striking and characteristic life-forms of the period. Chelonians or turtles, lacertilians or lizards, and crocodiles are all represented: but the most characteristic reptiles were the huge sea-saurians, *Ichthyosaurus* (q.v.), *Plesiosaurus* (q.v.), and *Pliosaurus* (q.v.). Another remarkable group of reptiles were the pterosaurs or winged saurians, of which the most noted were the *Pterodactyls*. Contemporaneous with these were great Dinosaurs (q.v.), such as *Ceteosaurus*, *Megalosaurus*, *Atlantosaurus*, &c., while bird-life was represented by the toothed *Archæopteryx* (q.v.), with its lizard-like tail. The highest forms of life were small marsupial mammals, some of which seem to have been insectivorous, while others were herbivorous.

Physical Conditions.—During Jurassic times the area now occupied in the British Islands by the older rocks appears to have been for the most part dry land. The sea covered the north-east corner of Ireland, and extended along the west coast of Scotland over the site of what is now Skye, and it seems in like manner to have occupied the North Sea opposite the east coast, a portion of which in Sutherland was covered by it. What are now the high grounds of northern England and Wales and the heights of Devon and Cornwall, together with a ridge of Palæozoic rocks which extends under London, were the chief land-areas in south Britain, so that nearly all England was under water in the earlier stages of the Jurassic period. The same sea swept over vast areas of what is now the European continent. The older rocks in the north-west and north-east of France and the central plateau of the same country formed dry land—all the rest was submerged. In like manner, wide regions in Spain were under water. In middle Europe the sea covered nearly all the low grounds of north Germany, and extended far east into the heart of Russia, whence it passed north, and was doubtless confluent with the Arctic Ocean. It occupied the site of the Jura Mountains, and passed eastwards into Bohemia, while on the south side of the Alps it spread over a large part of Italy, extending eastwards from the Alps so as to submerge a broad region reaching as far as the Caucasus Mountains. In short, what are now the central and southern portions of our continent formed a great archipelago in which appeared numerous islands large and small. The chief land-areas of the European region, therefore, were confined to the north and north-west. The existence of this northern land is shown by the fact that, while the Bajocian of the south of England consists of purely marine accumulations, the contemporaneous deposits in Yorkshire are largely fresh-water and estuarine.

The Jurassic strata, which attain a thickness of several thousand feet, point to considerable subsidence; the downward movement, however, was not continuous, but seems to have been interrupted by pauses. Taken as a whole the strata of north-western and central Europe are indicative of rather shallow-water conditions; but the waters were often sufficiently clear to favour the abundant growth of coral-reefs. After the deposition of the Portlandian beds the sea disappeared from what are now the low grounds of England. The succeeding Purbeckian beds are for the most part of fresh-water origin, and seem to have been laid down at or near the mouth of some large river, which probably took its rise in the hills of England or Wales, and flowed south across the upraised bed of the Jurassic sea. Similar indications of a more or less abrupt change from sea to fresh water are afforded by the Jurassic of central Europe, as in northern France, Hanover, Westphalia, and the Jura in Switzerland. While the Jurassic of central and north-western Europe would seem to have accumulated in somewhat shallow seas, the contemporaneous strata of the Mediterranean basin have a decidedly more pelagic aspect. This southern development of the Jurassic is sometimes called the Tithonian series. It is recognised in the southern Alps, the southern Tyrol, the Venetian and Dalmatian Alps, and the Carpathians, and extends into northern Africa.

The climatic conditions of the Jurassic period appear to have been extremely genial. Reef-building corals, for example, flourished in latitudes which are now some 3000 miles north of the present range of reef-builders, while cuttle-fishes and *Ammonites* and large sea-reptiles lived far within the Arctic Circle.

Jurieff. See DORPAT.

Jurieu, PIERRE (1637-1713), a French Protestant divine, studied at Sedan and Saumur, received Episcopal ordination in England, and after some years of the pastorate, became professor at Sedan. On the revocation of the Edict of Nantes (1685) he became pastor of the Walloon church at Rotterdam, where till his death he busied himself in interpreting the Apocalypse and in defending the Protestant faith alike against Arnauld, Bossuet, and Bayle.

Jurisdiction, in Law, means the authority which a court or judge has to entertain a particular case and decide it. The general rule is, that if a court which has no jurisdiction to decide a particular case does decide it, the judgment is a mere nullity. Jurisdiction may be limited either locally, as in the case of a county court; or personally, as where a court has a quorum; or as to amount, as when the Court of Session in Scotland takes cognisance only of cases above the value of £50; or as to the nature of the questions to be determined, whether crimes or civil actions. Jurisdiction is said to be concurrent or cumulative when it may be exercised in the same cause by any one of two or more courts at the choice of the suitor. In criminal procedure, to prevent the collision which might arise from each of the courts claiming to exercise the right, it has been established as a rule that the judge who first exercises jurisdiction in the cause acquires a right, *jure preventionis*, to judge in it exclusive of the others. 'This right of prevention plainly appears to be peculiar to criminal jurisdiction. In civil process it is the private pursuer who has the only right of choosing before which of the courts he shall sue' (see INTERNATIONAL LAW). Jurisdiction is said to be privative, on the other hand, when the court having jurisdiction is the only court entitled to adjudicate in such cases. When a judge appoints another person to

act in his place as deputy or substitute he is said to delegate his jurisdiction.

Jurisprudence is the science of law which professes to discuss the principles on which legal rights should be protected and enforced; or it may be called the philosophy of law. In its literal sense the term means merely knowledge of the law, and seems to have been so used in the Roman law, from which it has been borrowed. The word is often used in a popular sense in Britain as synonymous with law, and it is also so used in France; but it is more correctly used in contradistinction to law, as implying the system or supposed methodical scheme embracing the principles on which positive law is founded. The Institutes of Justinian define jurisprudence, with a certain pomposity, as being the knowledge of things divine and human, the science of right and wrong. A distinction is sometimes made between general jurisprudence, which investigates the principles common to various systems of positive law, divesting these of their local, partial, and other accidental peculiarities; and particular jurisprudence, which confines itself to the particular laws of any country, say England, or France, or Scotland, as an independent system taken by itself. Jurisprudence thus embraces a wide range, as treating of all those duties which are enforced between man and man; and yet it may be safely said that lawyers, though dealing with the results of the science every day of their lives, seldom give any attention to the latent and general principles on which these results are founded. The science has been cultivated rather by students of philosophy than by lawyers; and the distinctive colours of the characteristic philosophies of England and Scotland have tinged the jurisprudence of the several countries. The utilitarianism of Locke and Mill has given a practical or empirical character to English jurisprudence, which may be seen in the legal works of Hobbes and Bentham, and at its hardest in the 'cast-iron' system of Austin, whose lectures were long the first English authority on this subject. In Scotland, on the other hand, a constant tradition of another tendency has been maintained among scientific jurists since the time of Lord Stair. Scottish jurisprudence has always had a closer affinity with the systems of the philosophical writers of France and Germany, and bases its conclusions upon the law of nature rather than upon experimental comparisons of varying systems of positive law. It is developed in the works of Ferguson, David Hume, Adam Smith, Dugald Stewart, and Professor Lorimer. The recent tendency of scientific jurists in England has been to abandon the empirical methods of treatment for the historical method (of which the most prominent and successful follower was Sir Henry Maine), tracing the birth and growth of legal conceptions from remote ages and primitive civilisations. And, stimulated by Roman Law and continental jurists, British scholars, notably Professor Holland, have done valuable work from the analytical standpoint.

Jury, a body of private citizens, sworn to try a question of fact, or to assess the amount of a payment legally due. In almost all systems of law the ordinary citizen or freeman is called to take some part in the administration of justice. The *judices* of Roman law are sometimes compared with modern jurymen; and the *juxes* was in fact a private citizen, empowered to try questions of fact and law under the general directions of a superior magistrate. In communities of Teutonic origin, and especially in England, the people—i.e. the qualified freemen, or a selection from their number—performed many important duties in civil disputes

and criminal trials. They acted as accusers, to 'present' offenders against the law; they decided what action should be taken on a proof by witnesses, compurgators, or ordeal; they were themselves witnesses to the acts by which a title to land was established; even sales of goods were, in old time, witnessed by a kind of jury of townsmen. Many persons suppose that trial by jury, in the modern sense, is as old as King Alfred; and a cartoon in the Houses of Parliament embodies this popular belief. Dr Stubbs (see his *Constitutional History*, chap. xiii.) attaches great importance to the popular element in the ancient courts; but he traces the modern jury system to a Frankish origin. Inquiry by sworn recognitors, as described in the Frank Capitularies, may have been adopted in part from the Roman imperial legislation. Introduced into England by the Norman Conqueror, this form of inquiry was developed into trial by jury under the influence of the Plantagenet kings and their legal advisers. In course of time the 'juratores' ceased to be regarded as witnesses, or as judges of law and custom; they acted on proofs laid before them, and they took the law from a presiding judge. The partisans of royal prerogative would have gone further; they would have deprived the jurymen of their independence, and compelled them to find the verdict dictated by the judge or the advisers of the crown. After a long struggle the independence of the jury was vindicated; while at the same time the judges were freed from subservience to the crown; the functions of judge and jury were accurately distinguished; and the rules of evidence were developed into a rational system. Trial by jury is prized as one of the chief safeguards of the liberties of the subject; it is admitted to be the best mode of trial in criminal cases of importance, and in those civil cases where damages may have to be assessed for wrongs which affect the person, family, or reputation of the plaintiff. In ordinary mercantile cases the tendency in England is to dispense with juries; the adjustment of property rights is, also, left, for the most part, to the judges. In political cases special importance attaches to the rules of law which secure the selection of a fairly representative jury. It is not possible under modern law to pack a jury with partisans of the government. In those parts of Ireland where popular feeling is hostile to the government, counsel for the crown have been frequently charged with making an unfair use of their right to order a juror to 'stand by' when his name is called; but it may be well to point out that jurymen are liable to be intimidated by the people, in cases in which party feeling is deeply aroused in Ireland, and that the democratic spirit is not always favourable to an impartial administration of justice. The Sex Disqualification (Removal) Act, 1919, made women eligible as jurors throughout the United Kingdom.

In the modern criminal practice of England and Ireland several forms of jury are in use. The Coroner's Jury consists of twelve men, usually householders, summoned by a peace-officer acting under the coroner's warrant, to inquire in cases of sudden death, &c. If their inquisition, or recorded verdict, charges any person with crime, the person accused must be arrested and brought to trial. The Grand Jury is a body of not less than twelve and not more than twenty-three men, summoned by the sheriff to consider the indictments to be preferred at assizes, quarter sessions, or the Central Criminal Court. They hear only the witnesses for the prosecution; if they think the evidence wholly insufficient, they 'ignore' the indictment, and the foreman indorses it with the words, 'no true bill.' If they think there is a case which the accused ought to answer, they find 'a true bill,' and the

accused is thereupon arraigned before a Petty Jury, who inquire whether he is guilty or not. The petty jury consists of twelve householders or owners of property, whose names are called over from the panel, or parchment list prepared by the sheriff. The prisoner may challenge the array—i.e. he may allege that the panel is unfairly made up. He may challenge peremptorily thirty-five jurors in a case of treason, twenty in a case of felony; and either the crown or the accused may challenge any number of jurors for cause shown. When twelve men have been sworn, counsel and witnesses for the prosecution and defence address themselves to the jury; the judge interposes to decide points of law, or to remind counsel or witnesses of their duty; at the close of the trial he sums up the evidence, and states clearly to the jury the question they have to decide. If the jury retire to consider their verdict an officer is sworn to keep them 'without meat, drink, or fire;' but the judge may allow them to have a fire and reasonable refreshment. The verdict of the jury must be unanimous; and it is, generally speaking, conclusive; the prisoner cannot be tried again on the same charge. Common jurors do not receive any remuneration. On an indictment or criminal information for libel Fox's Act, passed in 1792, empowers the jury to find a general verdict on the whole matter in issue. The judges, in certain political cases, had directed the jury to find the defendants guilty on proof of publication of the paper charged to be a libel; and the act closes the last stage in the struggle for the independence of juries in criminal cases.

Civil cases which come before a judge and jury may be tried by a common jury of twelve men, whose names are called from the sheriff's panel, as in criminal cases. Both parties have the right of challenge to the array, or to the name of an individual juror, for cause shown. Either party may demand a special jury—i.e. a jury chosen from a special list, in which are entered the names of persons possessing a property qualification higher than is required in the case of common jurors. Special jurors are paid; the payment is usually at the rate of one guinea for each case. The jury must be unanimous; but the verdict of a majority may be taken by consent of the parties. If the case is compromised a juror is withdrawn by consent, and the case comes to an end. In the county court small civil cases are sometimes tried by the judge and a jury of five. For the use of the term jury in connection with manorial courts, see MANOR.

In Scotland forty-five jurors are summoned in criminal cases, of whom fifteen are chosen by lot to try the case; the verdict of a majority suffices. The crown and the accused have each five peremptory challenges; and any number of jurors may be challenged on cause shown. In some points the position of the accused is better than in England. He is entitled to have a copy of the indictment, a list of the witnesses to be brought forward against him, and a list of the jurors—advantages which an English prisoner has no legal right to demand, unless he is accused of treason or misprision of treason. Evidence is first given on both sides; the counsel for the prosecution then addresses the jury, and the prisoner's counsel speaks last. In England the prosecuting counsel may reply if evidence is given on behalf of the accused; and the Attorney-general or Solicitor-general claims the right to reply, even if no such evidence is given. Again, the jury in Scotland may find the charge 'not proven;' and this verdict is so far final that the prisoner cannot be put on his trial a second time on the same charge. This rule gives the accused an additional chance of escape; but there is something to be

said against the expediency of permitting a verdict which leaves the question of guilt or innocence undecided, and allows the accused to go free without clearing his character. Trial by jury in civil cases was no part of the ancient practice of the Court of Session—it was introduced in 1815 by an act which adopted most of the English rules. As in England, the jury in civil cases consists of twelve persons; but unanimity is not essential. If, after being kept three hours in deliberation, nine or more of the jury agree on a verdict, their verdict is taken as that of the jury. If, after being inclosed nine hours, the jury cannot agree, the judge is entitled to discharge them, and generally does so. The judge may allow the jury refreshment after they are locked up to deliberate.

In Ireland the jury laws are substantially the same as in England. Until the passing of the Act of 1871 (Lord O'Hagan's Act), 34 and 35 Vict. chap. 65, modified by 39 and 40 Vict. chap. 21, by which the empannelling and summoning of juries is made the subject of more stringent provisions, the law in England and Ireland was precisely similar. But special legislation has from time to time withdrawn from the consideration of juries in Ireland for a limited period certain crimes of an agrarian or 'quasi-political' character in times of great national excitement. By the Crimes Act, 50 and 51 Vict. chap. 20, special power, extending as high as that of imposing sentences of six months' imprisonment, on conviction of certain specified offences, were conferred on specially constituted magisterial courts sitting without a jury. And special juries for the trial of criminal charges may be empannelled in certain cases.

The Grand Jury in Ireland was till 1898 entrusted not only with the ordinary criminal business performed by the grand jury in England, but also with the entire local government of the country, county by county, much as the same was formerly carried on in England by the justices in Quarter Sessions; but the Irish Local Government Act of 1898 withdrew all its administrative functions, and conferred them on County Councils elected triennially. The authority of the Irish grand juries dated from Anglo-Norman times; and laws, custom, and tradition of 700 years were summed up and ascertained only in 1836 by the Irish Grand Jury Act.

In the United States English principles have been adopted; and trial by jury is made part of the constitution in most of the states. There are some states in which the jurors are empowered to decide questions of law in criminal cases, and in some the judge is forbidden to charge the jury on the facts. A verdict can be returned only on the unanimous vote of a jury; and, with a view to securing impartiality, each juror is required to swear that he is free from any preconceived opinion as to the case on trial, and has no information calculated to influence his decision. The law permits the challenging of individual jurors, both peremptorily and for cause; and this right has frequently been grossly abused for the purpose of delaying justice. The British colonies have framed their jury laws, for the most part, on the English model.

Jury trial has been established in France (where the verdict of a majority is sufficient), and in many other continental countries, in most of which the institution will be found to bear a general resemblance to the English jury. There are, of course, endless differences in detail.

See Forsyth, *History of Trial by Jury* (1852); Lesser, *Historical Development of the Jury System* (N.Y. 1893); Stubbs, *Constitutional History of England*; Pollock and Maitland, *History of English Law*; and CRIMINAL LAW.

Jurymast, a temporary spar, used to replace a mast which has been lost from any cause, and

so to enable the vessel to reach some port for more permanent repair.

Jus Devolutum, a phrase of ecclesiastical law used to denote the right of a church to present a minister to a vacant parish if the patron neglect to exercise his right within the legal time. In the Established Church of Scotland, if a cure be vacant by death or otherwise, a fit person must be presented to the presbytery to supply the cure within six months after the occurrence of the vacancy. If no appointment is made in this time by the congregation the right of presentation accrues to the presbytery, and is called *jus devolutum*.

Jus Gentium. See INTERNATIONAL LAW.

Jus Mariti, a phrase used in Roman law, and adopted in Scots law to denote the legal right accruing to a husband *qua* husband over his wife's property. See HUSBAND AND WIFE.

Jus Primæ Noctis, the right of defloration of virgins, granted on the occasion of a marriage to a special person, as a chief or a priest, among many savage races, as the Kinipetu-Eskimo, Caribs, and certain Brazilian tribes. We have accounts by early travellers describing the custom as existing in Nicaragua, Teneriffe, Cambodia, Malabar; and Nugenheim asserts that the French kings Philip VI. and Charles VI. could not, in the 14th century, induce the Bishops of Amiens to give up the ancient right. Among many savages a similar privilege is freely granted to all the guests at a wedding—perhaps a survival of a reward for help in the abduction, although Avebury ingeniously attempted to explain it as originally an act of expiation for individual marriage. Again, a period of privileged and unlimited license just before marriage is not uncommon; while we often meet with the practice of lending a wife or a daughter to a stranger from primitive notions of hospitality. Dr Karl Schmidt in his erudite work, *Jus Primæ Noctis, eine geschichtliche Untersuchung* (Freiburg, 1881), contends that this 'droit du seigneur' never existed in Europe, having left no evidence of its existence in laws, charters, decretals, trials, or glossaries, and that the later belief in it is merely 'ein gelehrter Aberglaube,' which has arisen in various ways, as from reports of individual cases of tyranny and from an unnecessarily gross interpretation being attached to the fine paid by the vassal to his feudal lord for permission to marry. Bachofen, Giraud-Teuloh, and Kulischer regard the *jus primæ noctis* accorded to a special person as a survival from a primitive stage of promiscuity or communal marriage, the ancient communal right being in course of time taken away from the community and transferred to the priest, king, or noble, as its chief representative. It is perhaps more simply to be understood as a mere tribute that may be exacted as a right by savage potentates, or as a supreme mark of loyalty or respect offered to a chief or priest. This alleged ancient seigniorial privilege is the keynote of Beaumont and Fletcher's odious play, *The Custom of the Country*.

Jusserand, JEAN ADRIEN ANTOINE JULES, born at Lyons in 1855, served in the French embassy at London in 1887-90, and in 1902-24 was ambassador to the United States. He has written, in French and in English, on English wayfaring life, on the literary history of the English people, on Shakespeare in France, James I. of Scotland, Bonaparte, Americans, &c.

Jussieu, DE, a family of French botanists. —ANTOINE DE JUSSIEU, born at Lyons, 6th July 1686, died at Paris, 22d April 1758, was professor of Botany and director of the Botanical Garden at Paris, wrote various works on botany, and edited Tournefort's *Institutiones Botanice* (1719).—His brother, BERNARD DE JUSSIEU, born

at Lyons, 17th August 1699, died in Paris, 6th November 1777, contented himself with assisting Antoine and his son without seeking renown by the publication of his own observations. In 1758 he was named superintendent of the gardens at the Petit-Trianon, and there arranged the plants in accordance with a natural system substantially the same as that which his nephew Laurent subsequently elaborated in a more perfect manner. He edited the second edition of Tournefort's *Histoire des Plantes qui naissent dans les Environs de Paris* (2 vols. 1725).—ANTOINE LAURENT DE JUSSIEU, born at Lyons, 12th April 1748, died at Paris, 17th September 1836, the nephew and pupil of Bernard, was appointed professor of Botany at the Paris Botanical Garden in 1770. His *Genera Plantarum* (1789) laid down the principles on which modern botanical classification is based (see BOTANY). On the outbreak of the Revolution the hospitals of Paris were put in his charge. In 1793 he organised the library of the Museum, one of the best in Europe. In 1826 he resigned his professorial chair to his son Adrien. He published numerous papers on botany in *Annales du Museum* (from 1804-20), and in *Dictionnaire des Sciences Naturelles*.—ADRIEN DE JUSSIEU, son of Laurent, born at Paris, December 23, 1797, died in the same city, June 29, 1853, succeeded his father in 1826. On taking the degree of M.D. in 1824, he presented as his thesis a valuable memoir on the Euphorbiaceæ. This was followed by equally useful papers on the Rutaceæ, Meliaceæ, and Maltigeliaceæ, and a memoir on the embryo of the Monocotyledons. His *Cours Élémentaire de Botanique* (1842) reached a 12th edition in 1884. A number of able botanists of all nations owed their training to him.

Juste, THÉODORE, a Belgian historian, was born at Brussels, 11th January 1818, became in 1859 keeper of the Museum of Antiquities there, and in 1870 professor of History, and died 11th August 1888. Juste was a voluminous writer, but many of his works are of considerable value for the history of his country. He is best known by his *Fondateurs de la Monarchie Belge* (27 vols. 1865-81). Many of his earlier works (1830-80) are abridged in *Le Panthéon National* (1881).

Juste Milieu, a French term, signifying the *just mean*, or, according to the common expression, the *golden mean*. After the revolution of 1830 this term acquired a political signification, and came into very frequent use, because of the declaration of the organs of Louis-Philippe, that the *juste milieu* was the only principle of government which could secure the welfare of France.

Justice, HIGH COURT OF, one of the two great sections of the English supreme courts, as arranged by the Judicature Acts (q.v.). For the Scottish College of Justice, see COURT OF SESSION.

Justice, LORD CHIEF, the title given to the chief judge of the King's Bench Division of the High Court of Justice; formerly given also to the chief judge of the Common Pleas. He of the King's Bench was, and still is, Lord Chief-justice of England; and on him were conferred, in 1881, the powers of the Lord Chief-justice of Common Pleas, that division of the court being abolished. Puisne (i.e. lesser or ordinary) judges in all divisions of the High Court bear the title of Justice, and are spoken of as 'Mr Justice Smith,' &c.

Justice-general, LORD, the highest judge in Scotland, also called the Lord President of the Court of Session (q.v.). Next to him ranks the Lord Justice-clerk. See JUSTICIARY COURT.

Justice of the Peace. A justice of the peace is an inferior magistrate appointed by special

commission under the Great Seal to keep the peace within the county, borough, or liberty for which he is appointed. In 1264 the name *custos pacis* appears for the first time in English history. Until the thirty-fourth year of the reign of Edward III. the officers appointed in each county to maintain internal order were invariably described as guardians or conservators of the peace. Originally royal nominees, the conservators of the peace were, after the fifth year of Edward I., chosen (at least occasionally) by the whole community in the county court, under the instructions of the king conveyed by the sheriff. But after the deposition of Edward II. the appointment of special *custodes pacis* was ordained by parliament (1 Edward III. stat. 2, chap. 16, 1327). The right of election thus taken away from the people was soon vested in, and has ever since been exercised by, the sovereign. While the power of appointing justices of the peace now practically belongs to the Lord Chancellor, it must be clearly understood that the commission of the peace is in theory the King's commission, and that the Lord Chancellor has no such authority over justices of the peace as he possesses over judges of the county courts. The functions of the *custodes pacis* appointed in 1327 were rapidly and widely extended by subsequent legislation; and 36 Edward III. stat. 1, chap. 12, gave for the first time to the old *custodes pacis* their familiar modern name. In 1590 a new form of commission was agreed upon, in which all the particulars formerly specified from a number of statutes were comprehended in words of general description. This was presented to the chancellor, accepted, sealed, and with slight variations has continued in use ever since. Under Richard II. justices of the peace attending quarter sessions were entitled to 4s. a day, payable out of the fines and amerancements at such sessions. It appears, however, that these payments were often made out of the emoluments of the sheriff, and they were abolished. The office of justice of the peace has since been entirely gratuitous; but, after the conversion of the constabulary into police, stipendiary magistrates exercising a summary jurisdiction not unlike that of the justices have been appointed in all large cities and in many large towns. The office of justice of the peace seems to have been held on several occasions by a lady.

The statute 11 Henry VII. chap. 3 enabled justices of the peace to determine all offences except treason and felony without a jury upon information in the king's name. But this act was repealed in the first year of the reign of Henry VIII. In 1653, when the Barebones Parliament made marriage a purely civil contract, justices of the peace were empowered to hear the mutual declarations of the contracting parties. They were authorised by their commission, and still have power, to receive information with regard to any indictable offence. They were also invested with important administrative functions, such as the licensing of ale-houses and the appointment of overseers of the poor or surveyors of highways; and as local authority they transacted the chief county business, controlled the county police, and levied the county rates. The summary jurisdiction of justices of the peace has, however, been defined and restricted by recent legislation, and the Local Government Acts of 1888 and 1893 have transferred to elective authorities most of the administrative powers formerly exercised by justices, except their share in the control of the police and their duties as to the grant of licenses for the sale of intoxicating liquors. See COUNTY, and QUARTER SESSIONS.

The following are *ex officio* justices of the peace: (a) In every commission of the peace for a county, the Lord Chancellor, Lord President, Lord Privy

Seal, and other members of the Privy Council, Lord Chief-Justice, Master of the Rolls, Lords Justices of the Court of Appeal, Justices of the High Court, and the Attorney- and Solicitor-General; (b) the chairman of a county council for his county, and the mayor of a borough for his borough, during his year of office and the next succeeding year. Apart from these *ex officio* appointments, there are two main classes of justices of the peace—those exercising jurisdiction within counties, and those appointed for boroughs. Both are appointed by the crown, the former usually on the recommendation of the Lord-lieutenant of the county to the Lord Chancellor, the latter sometimes on the recommendation of the town council to the Lord Chancellor. In many cases, however, the Lord Chancellor acts independently of the town council or its wishes. Under the Municipal Corporation Act, 1882, sect. 158, borough justices have no authority to act at general or quarter sessions for the county. County justices, on the other hand, have *primò facie* concurrent jurisdiction within any borough which forms part of the county, and which has no separate court of quarter sessions. In the case of borough justices no special qualification beyond that of residence in or within 7 miles of the borough is required. In the case of county justices, a qualification by estate was formerly necessary (Justices' Qualification Act, 1744); and the Justices' Qualification Act, 1875, allowed a qualification by occupation. The Justices of the Peace Act, 1906, abolished the qualification by estate; and a person, if in other respects the law allows it, may be appointed a justice of the peace for any county, or any riding or division of a county, notwithstanding that he does not reside in the county, if he resides within 7 miles thereof. A solicitor, if otherwise qualified, may, since the act of 1906, be appointed a justice of the peace for any county; but no solicitor so appointed, nor any partner of his, may practise directly or indirectly before the justices of that county or for any borough within it. No sheriff can act during his shrievalty as justice of the peace for the county in which he is sheriff; and no person can be appointed to act during bankruptcy. Disqualification by sex for the appointment of justice of the peace has ceased since 1919 (9 and 10 Geo. V. chap. 71). Bias or individual interest may also disqualify a justice from acting. The office of justice of the peace, being conferred by the crown, subsists only during the pleasure of the sovereign. The commission appoints all the persons named therein to keep the peace in the county specified, and any two or more of them to inquire of and determine offences committed in such county; in which number some particular justices with legal or special qualifications were formerly directed to be always included, and no business was to be done without their presence. The words of the commission ran: *quorum aliquem vestrum A, B, C, D, &c. unum esse volumus*; and the persons so named were called justices of the *quorum*. It is now, however, the practice to include nearly all of the justices in the *quorum* clause.

The functions of justices of the peace are partly administrative and partly judicial. The former have been referred to above. The latter fall into three classes. (1) The justice of the peace, like the ancient *conservator pacis*, is empowered to preserve the peace, to suppress riots and affrays, to take security for good behaviour, and to order the apprehension and committal of criminals. (2) At *petty sessions* the justices are enabled to try certain minor offences summarily and without a jury. (3) The commission of the peace authorises any two or more justices to hear and determine certain graver and indictable offences at *quarter sessions*. The

statute 34 Edward III. chap. 1, confirming 18 Edward III. stat. 2, chap. 2, enabled justices of the peace to try at quarter sessions all felonies and trespasses whatsoever committed within the county. Comparatively recent legislation has expressly excepted from the jurisdiction of quarter sessions some of the most serious offences in the criminal law, such as murder, perjury, forgery, bigamy, abduction, &c. The orders and convictions of justices out of sessions can be appealed against to quarter sessions; an order made at quarter sessions may as a general rule be removed into the King's Bench Division of the High Court by writ of *certiorari*, and appeals on the facts or the law now lie to the Court of Criminal Appeal.

Where a justice of the peace acts erroneously within his jurisdiction, an action will not lie without an express allegation and proof of malice and want of reasonable or probable cause. Where a justice either has no jurisdiction or exceeds it, no such allegation or proof is required, but no action can be brought in regard to a conviction or order till it has been quashed upon appeal. Justices are further protected by the Public Authorities Protection Act, 1893.

In Scotland, when it was proposed to hold a criminal inquiry, the sheriff, under the authority of a writ issued by the justiciar, summoned the best and most capable men of each burgh, town, and barony within his shire to appear before the justice-clerk and give information of the crimes done within their respective bounds. This being done, it lay with the justice-clerk to digest the materials thus returned to him, and to make up from them a roll of the offenders' names, and a file of dittay, or indictments for bringing those persons to justice. When the Scotch circuit system was reorganised, a more regular and effective method of taking 'dittay' was adopted; the act of 1537 empowered the king, on the advice of his chancellor, treasurer, and justice-clerk, to appoint 'honourable and worthie persons . . . in degree earles, lordes, baronnes, knights, and special gentlemen landed, experimented in the lovable laws and customes of the realme, actual indwellers in the same shires . . . to be constant and continual up-takers of dittay.' This is the first statute dealing with the institution of justices of the peace in Scotland. The office was further regulated by acts in 1609, 1617, 1633, and 1661. The form of commission is practically identical with that which was settled for use in England in 1590. There is no property qualification in Scotland; but under 6 Geo. IV. chap. 48, sect. 27, a solicitor cannot be nominated a justice of the peace for any county in which he is practising. By 19 and 20 Vict. chap. 48, sect. 4, the disqualification does not extend to writers or procurators who may be elected magistrates or deans of guild in any burgh. The functions of justices are partly administrative and partly judicial. The Local Government (Scotland) Act, 1889, sect. 11, has transferred to the new county councils the powers and duties of the justices in relation to the following subjects: (1) the execution as local authority of the acts relating to gas-meters, explosive substances, weights and measures, habitual drunkards, and wild birds; (2) the appointment of visitors of public, private, or district lunatic asylums; and (3) the registration of the rules of scientific societies under 6 and 7 Vict. chap. 36. As in England, the justices have still authority in regard to the licensing of ale-houses, the administration of the poor laws, &c. The jurisdiction of justices of the peace is partly civil and partly criminal. In civil questions between master and servant they have jurisdiction to any amount. The justices can entertain applications for the aliment of bastard children. The civil jurisdiction

of the justices is now practically superseded by that of the sheriff court, unless to the limited extent allowed by the Small Debt Act (12 and 13 Vict. chap. 34). There is no trace in Scotland of trial with a jury before justices of the peace, as in England at quarter sessions. The ordinary criminal jurisdiction of justices is confined to breaches of the peace, petty thefts, and trifling assaults, punishable by a small fine and imprisonment. (See now Summary Jurisdiction (Scotland) Act, 1908.) A variety of penal statutes have conferred upon the justices of the peace jurisdiction in relation to the revenue, highways, fishings, and public-houses. The Sex Disqualification (Removal) Act, 1919, above mentioned, extends to Scotland. In the Irish Free State, the office of justice of the peace has been superseded by the new judiciary arrangements that have been established in that country.

In some of the United States of America justices of the peace are appointed by the executive; in others they are elected by the people and commissioned by the executive. In some cases they hold office during good behaviour, but as a general rule they are appointed for a limited period.

JUSTICES' CLERK.—The justices' clerk is an officer appointed by justices of the peace in England (who, although not themselves trained lawyers, are yet called upon to administer many branches of the law) to assist them in the discharge of their duties, to advise them as to points of law and practice, to take minutes of the proceedings in every case, to receive and transmit fines, &c. Under the Criminal Justice Administration Act, 1914, the appointment of a justices' clerk requires confirmation by a Secretary of State. Every clerk appointed after the passing of the Justices' Clerks Act, 1877, unless he has previously held a similar appointment for a period of not less than fourteen years, is required (a) either to be a barrister of not less than fourteen years' standing, or a solicitor, or (b) to have served for not less than seven years as a clerk to a police or stipendiary magistrate, or to a metropolitan police-court, or to one of the police-courts of the City of London. Under the same statute justices' clerks receive a fixed salary instead of deriving their remuneration, as formerly, from the court fees.

See Stone's (yearly) *Justices' Manual*; Saunders's *Practice of Magistrates' Courts*; Halsbury's *Laws of England*, vol. xix.

Justices, LORDS. Since the Norman Conquest it has been the occasional practice in England for the sovereign to nominate one or more persons to exercise the chief powers of government during his temporary absence from the kingdom. At first this duty was imposed, principally although not perhaps exclusively, upon the justiciar. But when, after the death of Hubert de Burgh, the functions of the justiciar were gradually distributed and his office itself was practically abolished, *custodes regni* or 'lords justices' were appointed to govern the realm during the sovereign's absence. The English sovereigns from Edward VI. to James II. were never, while actually reigning, absent from England at all; and William III. in the early years of his reign invariably left Queen Mary to discharge the duties of viceroy when he went to the Continent. But after the death of Mary lords justices appear to have been appointed under the great seal, on the occasion of the king's absence, five times between 1695 and 1699. The names of the Archbishop of Canterbury and the Lord Chancellor were usually placed at the head of these commissions. The Act of Settlement (12 and 13 Will. III., chap. 2) provided 'that no person who shall hereafter come to the crown shall go out of England, Scotland, or Ireland without consent of parliament;' but this

clause was repealed by 1 Geo. I. chap. 51; and (George I. during five of his absences from England (1719, 1720, 1723, 1725, 1727) left lord-justices to represent him. Similar appointments were made by George II. after the death of Queen Caroline; and George IV. on his visit to Hanover in 1821 delegated his authority to nineteen guardians, of whom the Duke of York, heir-presumptive, was one. During the reign of Victoria the propriety of an appointment of lords justices was twice considered—on occasion of the royal visit to France, and in 1845, when the Queen was preparing to visit Germany; and on the latter occasion an interesting discussion took place in the House of Lords. The view taken by Lord Chancellor Lyndhurst was that, although the great seal could not be used out of the realm, mandates of the sovereign given by sign-manual out of the realm were valid, and that it was 'in the breast of the sovereign,' on going abroad, to appoint representatives or not, as might be deemed for the public good. This debate practically settled the question, and the nomination of lords justices has fallen into desuetude. These appointments were usually made by letters-patent under the great seal, but in one or two cases parliamentary confirmation of the powers conferred by the king's authority was obtained.

The power to create peers has only once been delegated—by Charles I. in favour of Lord Herbert, afterwards Earl of Glamorgan, in 1644.

Lords justices have sometimes been appointed to carry on the government of Ireland in place of a viceroy: but in modern times this has only been done during occasional absences of the lord-lieutenant, or in the interval between the demise of one lord-lieutenant and the appointment of his successor. These lords justices have usually been the Primate, the Lord Chancellor, and the Commander of the Forces.

LORDS JUSTICES OF THE COURT OF APPEAL.—In 1811 it was found that the work devolving on Lord Chancellor Eldon in the Court of Chancery, and at the same time as Supreme Judge of Appeal in the House of Lords, was too severe for his strength. After considerable discussion it was decided to appoint a new judge, under the title of vice-chancellor, to perform part of his duties; and in 1851 Lord John Russell introduced into the House of Commons a bill for the reform of the Court of Chancery. This statute (14 and 15 Vict. chap. 83) transferred the entire jurisdiction of the Lord Chancellor as head of the Court of Chancery to a new tribunal called the Court of Appeal in Chancery. The members of this court were the Lord Chancellor himself, and two other judges who were required to be at the date of their appointment barristers of not less than fifteen years' standing, took rank and precedence next after the Lord Chief-baron of the Exchequer, and were styled Lords Justices of the Court of Appeal in Chancery. Shortly afterwards the lords justices were 'entrusted with the care and custody of lunatics by warrant under the Queen's sign-manual.' The Judicature Acts established a new Court of Appeal (see APPEAL), in which there are four *ex officio* members—the Lord Chancellor, the Lord Chief-justice, the Master of the Rolls, and the President of the Probate, Divorce, and Admiralty Division—and five ordinary members, who are called 'lords justices' after their predecessors in the old Court of Appeal in Chancery. The lords justices are now merely members of the Court of Appeal, and have no original jurisdiction in the Chancery Division. Their jurisdiction in lunacy, however, remains substantially unaltered; and by section 51 of the Judicature Act of 1873 they were appointed additional judges of the High Court

of Justice, so that they might exercise it more effectively, by the aid of all that original jurisdiction in Chancery which was formerly auxiliary to the jurisdiction in lunacy. The lords justices occasionally sit as additional judges of the High Court of Justice. When acting in this capacity they are bound by the judgment of a Divisional Court, even although they may disapprove of it, and would have reversed it in the Court of Appeal.

Justiciary Court, the highest criminal court in Scotland. Its judges are, since 1887, the judges of the Court of Session (q.v.); formerly there used to be but seven justiciary lords, five of them appointed by patent. It sits usually in Edinburgh, but also holds circuit-courts twice a year in a number of towns, four times at Perth, Dundee, and Aberdeen, and six times in Glasgow, the kingdom being divided for that purpose into three divisions or circuits. The jurisdiction embraces all crimes whatever; and it is an appellate court as regards inferior criminal tribunals. Its decisions are final, there being no appeal to the House of Lords.

Justifiable Homicide is the killing of a human being without incurring legal guilt, as in self-defence. See MANSLAUGHTER.

Justification. See FAITH, LUTHER, REFORMATION, TRENT.

Justin, surnamed the Martyr, one of the earliest and most distinguished apologists of the Christian church, was a native of Flavia Neapolis, the ancient Sichem, in Samaria. He was born probably near the year 100 A.D. His father Priscus was a heathen, and Justin was educated in the religion of his father. He became an ardent student of the philosophy of his age, beginning with the school of the Stoics, but finally adhering to that of the Platonists. His conversion to Christianity he ascribes in one place to the firmness of the Christian martyrs, in another to a chance meeting with a venerable stranger, who directed him to the study of the Jewish prophets, and through them to the great Christian teacher whom they foretold. After his conversion he retained the garb of a philosopher, and appears to have wandered from place to place, as we find him disputing at Ephesus and Rome, if not in other cities also. His martyrdom is supposed to have taken place some time between 148 and 165, but the story rests on no sure historical evidence. The works of Justin, although not very voluminous, are highly interesting and important. The only books ascribed to him with certainty are two *Apologies for the Christians*, the first (the date is matter of controversy, but is referred by Harnack to 152–154, by Veil to 153–155) addressed 'to Antoninus Pius,' the second (perhaps an appendix to the first) 'to the Roman senate;' and a *Dialogue with Trypho the Jew* (date perhaps between 155 and 164), which professes to be the record of an actual two days' disputation held at Ephesus. These are extant in two MSS. only, which agree very closely with each other; one is at Paris (date 1364), the other (date 1541) in the Philipps Library at Cheltenham. The *Speech to the Greeks* is possibly Justin's; the other works once ascribed to him are certainly spurious.

The first edition of his works is that of Robert Stephens (Paris, 1551). The Benedictine edition of Justin, by Maran, appeared in 1742; and Otto's—the best—at Jena (3 vols. 1842–47; 3d ed. 1876 *et seq.*). There are good translations of Justin in the *Library of the Fathers* (1861) and Clarke's *Ante-Nicene Library* (1868), and a popular account in *The Christian Fathers*. See also monographs by Semisch (1840–42), Aubé (1875), Engelhardt (1878), and Kaye (new ed. 1912); and books by Purves (1889), Flemming (1893), Baldus (1895), Veil (1900).

Justin, a Roman historian who flourished apparently in the 3d century. His *Historiarum Philippicarum Libri XLIV.* is a selection, rather than an abridgment, from the *Historiae Philippicae* of Tiogus Pompeius, a history (now lost) primarily of the Macedonian monarchy, but really a kind of history of the world down to the Roman conquest of the East.

Justin I. and II. See BYZANTINE EMPIRE.

Justinian I. (Flavius Anicius Justinianus), nephew, on the mother's side, of the Emperor Justin I., was born in 482 or 483 A.D., in the village of Tauresium, in Illyria. His original name was Sabbatius (not Uprauda); 'Justinianus' he took on being adopted by his uncle. Although the son of a Slavonic peasant, he shared his uncle's success, being invited at an early age to Constantinople, where he received a careful education. When his uncle assumed the purple in 518 he appointed Justinian to high office, and ere long made him virtually commander-in-chief of the imperial forces. His tastes, however, inclined him rather to civic than military pursuits, and he remained attached to the court at Constantinople. In 521 he was named consul, and during the remaining years of the reign of his uncle he continued to exercise great influence. In 527 the Emperor Justin, by the advice of the senate, proclaimed him his partner in the empire. Justin survived this step but four months, and in the same year Justinian was proclaimed sole emperor, and crowned along with the famous Theodora, whom, despite of her more than dubious antecedents as an actress, he had raised to the position of his wife. Justinian at his accession was apparently in his forty-fifth year. His reign of nearly thirty-eight years is the most brilliant in the history of the late empire. Although himself without the taste or the capacity for military command, he had the good fortune or the skill to select the ablest generals of the last days of Roman military ascendancy. Under the direction of his generals, and especially of the celebrated Narses (q.v.) and Belisarius (q.v.), his reign may be said to have restored the Roman empire, at least in outward appearance, to its ancient limits, and to have reunited the East and West under a single rule. In his first war—that with Persia—he concluded a treaty by which the crisis that had so long threatened was at least warded off; but the rejoicings which celebrated its termination had, owing to a domestic revolution, almost proved fatal to the authority of Justinian himself. A conflict of the so-called Blue and Green factions in the circus in 532 was but an outburst of political discontent, which went so far as to elect a rival emperor, Hypatius. Justinian himself was struck with dismay, and had made preparations for flight; but the vigour of Theodora arrested the 'Nika Revolt,' Belisarius and Narses with relentless hand repressed the tumults, 35,000 victims having, it is said, fallen in a single day. By the arms of Belisarius, the Vandal kingdom of Africa was re-annexed to the empire; and the same general, conjointly with Narses, restored the imperial authority in Rome, in Northern Italy, and in a large portion of Spain. One of the most extraordinary, though in the end ineffective, works of the reign of Justinian was the vast line of fortifications which he constructed, or renewed and strengthened, along the eastern and south-eastern frontier of his empire. These works of defence, and the construction of many public buildings both in his capital and in other cities of the empire, involved an enormous expenditure, and the fiscal administration of Justinian, in consequence, pressed heavily on the public resources.

It is, however, as a legislator that Justinian has

gained his most enduring renown. His good fortune in obtaining the services of able generals was not greater than that which attended him in the field of law and legislation. Brilliant as were the triumphs of Narses and Belisarius, they were indeed short-lived in comparison with the work done by the celebrated Tribonian (q.v.) and his coadjutors in the way of reforming and codifying the law. Immediately on his accession Justinian set himself to collect and codify the principal imperial *constitutions* or statutes (*leges*) in force at his accession, following the example set by his predecessor, Theodosius II. The code in which these *constitutions* were collected was published in 529, and it contained a general provision by which all previous imperial enactments were repealed (see CODE). But imperial constitutions made up a comparatively small part of the body of the law. The bulk of the common law was contained in the writings of the *jurists*—authoritative writers of commentaries, text-books, and other works (technically *jus* in contrast to *leges*), all prior to the close of the 3d century. There were many hundreds of these volumes, and owing to want of agreement in the various writers, the law was in a state of great uncertainty, not to say confusion. To remedy this evil Justinian resolved upon the publication of a single treatise in which the commentaries and other writings of the jurists might be digested and harmonised, and adapted to the law of his own time. The preparation of this great work was entrusted to Tribonian, with the assistance of Theophilus and Dorotheus, celebrated professors of law, another law and three other professors, one state official, and eleven advocates. Completed in four years, it was published in fifty books under the title *Digesta* or *Pandectæ* on 31st December 533. While the *Digest* was in course of preparation Justinian resolved on the composition of a third legal work—viz. a systematic and elementary treatise on the law which might serve as a text-book for the use of students and as an introduction to the larger work. The preparation of this was also entrusted to Tribonian and his colleagues, and having been completed a few days before the *Digest*, was published in four books on the same day (31st December 533) under the title of *Institutiones*. It is based upon the *Institutes* of Gaius, and is familiar to all modern lawyers under the name of 'Justinian's *Institutes*.' Meantime, while both the *Digest* and the *Institutes* were being prepared, the *Code* of 529 above mentioned was withdrawn from circulation and republished in 534 with some alterations, and especially with the addition of fifty new constitutions (known as the *Quinquaginta Decisiones*) which had in the interim been pronounced by Justinian. This new edition, in twelve books, is known as the *Codex Repetitæ Prælectionis*, and is the one which has come down to us, no copy of the earlier codex being extant. All these works (*Code*, *Digest*, *Institutes*) were in Latin, which was still the official language of the empire, and all of them testify to the great ability of Tribonian and his co-editors. Upon the publication of the *Digest* Justinian declared by a constitution that all previous law books and decisions were to be held as superseded, and it was forbidden to refer to them in the practice of the courts. During the subsequent years of his reign Justinian pronounced from time to time several new constitutions or laws, some of them making very important changes in certain departments of the law. These (mostly in Greek) were collected and published under the title of *Novellæ* ('the Novels' or 'New Constitutions,' apparently some 170 in number). The *Institutes*, *Digest*, *Code*, and *Novels* together make up what is known as the *Corpus Juris Civilis*—a name

first given by Dionysius Gothofredus in the 16th century.

The character of Justinian has been much canvassed, and opinions are not agreed about it. Procopius, in two separate works, has painted him in very different lights. Making allowance, however, for much exaggeration of his abilities by contemporary writers, it may be said that he contrasts favourably with most of the emperors, whether of the earlier or the later empire. If his personal virtues be open to doubt (and certainly vanity, avarice, and inconstancy were in no small degree characteristic of him), he, on the other hand, displayed undoubted ability as a ruler, and in the main, just and upright intentions. He died on 14th November 565 at the age of eighty-three, and in the thirty-eighth year of his reign.

A few words must be said about the legislative reforms carried through by Justinian. He was not only a collector and codifier of the laws; he also introduced in many directions the most fundamental changes into the substantive law itself. The following were the most important changes: (1) He ameliorated the condition of slaves and extended and simplified the modes of their manumission. (2) He formally abolished the classes of freedmen known as *Latini Juniani* and *Peregrini dediticiorum numero*. (3) He greatly revolutionised the law of intestate succession by giving to *cognati* (relatives on the mother's side) an equal share with *agnati* (relatives on the father's side) of the same degree. (4) He formally abrogated a number of old rules on the law of property, which still lingered in theory. He also made considerable changes in the law of divorce and as to the property of spouses, and he reformed civil procedure in the way of making it uniform and free from complexity.

Just Intonation. See TEMPERAMENT.

Jute was utilised for the first time in England about the year 1820, when an attempt was made

Jute (*Corchorus capsularis*):
a, flower; b, fruit.

improvements in preparing and spinning machinery,

the manufacture of this fibre has rapidly extended, and is now carried on at Dundee, the chief seat of the industry, on a gigantic scale. Jute cloth for gunny-bags and for native clothing has long been woven on hand-looms in Bengal, where the plants yielding the fibre are cultivated. Since 1857 a number of large jute-mills, fitted up with textile machinery, driven by steam-power, have been erected in the neighbourhood of Calcutta. The comparatively small cost at which jute can be raised and manufactured will no doubt secure its permanent success as a textile industry; but the fibre is decidedly inferior to flax in strength, and especially in durability.

Jute is obtained from the bark of two closely-allied species of plants belonging to the lime-tree order (Tiliaceæ). One species, *Corchorus capsularis*, is cultivated in central and east Bengal; the other, *C. olitorius*, is grown, but to a more limited extent, in the neighbourhood of Calcutta. The former grows from 5 to 10 feet, sometimes even to 14 feet, in height, but the latter is rather a smaller plant. The chief difference between the two is in the form of the fruit, which in *C. capsularis* is globular, and in *C. olitorius* much elongated. Both are annuals with yellow flowers, and they can be best cultivated on a loamy soil or upon one of clay and sand. The higher lands produce the finest qualities of jute. Such as is grown upon mud-banks or upon submerged lands is mostly larger and coarser. The sowing time, which is regulated by the nature and position of the soil, extends from March to June. When the plants flower, which they do in from three to four months after sowing, the cutting or harvesting of the crops begins, and is continued in the various districts until October. If the plants are allowed to grow until the seeds are ripe the fibre becomes harsh and woody and quite unsuitable for spinning purposes.

The fibre, which is in the bast layer of the plant, is separated from the stem by retting—i.e. steeping in water (see FLAX). Sometimes the jute is placed in rivers, but more generally in tanks or stagnant pools. To prevent any risk of discoloration of the fibre in the process the jute stalks in some districts are first stacked for a few days to allow the leaves to decay. According to the nature of the water used and the character of the crop, the period of retting lasts from two days to fully three weeks. Care must be taken to stop the process as soon as the fibre begins to separate from the stem, otherwise it rapidly deteriorates. It is believed that retting weakens the fibre, and that if it could be separated from the bark by some inexpensive mechanical process a better quality of jute than it is now possible to obtain would be sent into the market.

The best qualities of jute are of a pale clear yellow or buff colour, with a silky lustre, easily spun and comparatively strong. But there are at least half a score of well-known commercial varieties. Some are bright-coloured, soft, and strong, and such are best for textile fabrics—i.e. comparatively soft, for all jute is of a hard and woody nature. Other kinds are coarse and strong, and suited for making ropes. One or two varieties which are of weak fibre are suited for making paper. One kind, which is long, soft, and fine, but of very bad colour, was long used for the cheap classes of goods, but it is now more largely cultivated and used for a class of yarns and cloth where a high colour is not required.

In order to improve the 'spinning' quality of the jute it is subjected to a process of 'batching.' A number of bales with special characteristics are arranged in the batching department, where the heads, or 'stricks,' are uniformly mixed and passed

through the softening-machine, which has 47 to 63 pairs of spirally-fluted rollers. During the passage of the jute through this machine a quantity of oil and water is sprinkled on it, supplied from tanks erected above the machine. The oils used are mixtures of fish-oils and mineral-oils, in the proportion of one-fourth fish-oil to three-fourths of the mineral-oil, the better grades being used for the finest yarns. The softening action is aided by the use of the liquids in a warm condition.

Jute-fibre, owing to its composition and structure, is not suitable for what are termed 'line yarns,' although attempts have often been made to produce these.

The 'tow process,' as in the cheaper classes of flax-yarns, is practically universal. In 'tow' spinning the fibre is first carded on carding-engines, each of which has a peculiar arrangement of revolving cylinders, armed with card points or pins of steel wire. What may be called the carding process of spinning is no longer confined to jute tow, but the whole of the jute is now, as a rule, spun on this system—i.e. it is not heckled at all. Jute-fibre as obtained from the plant being from 6 to 7 feet long, and often considerably more, it requires to be broken into lengths of from 14 to 18 inches. This is done on the machine called the breaker-card, upon which also the jute is cleaned and the fibres laid more or less parallel by the action of the card points. The jute leaves the breaker-card in the form of a continuous lap or sliver, 3 to 4 inches broad, and fifteen of these are drawn out and delivered as a single sliver by the second carding engine, called the finisher-card. This attenuation is accomplished by the doffing-rollers having fifteen times the surface speed of the feed-rollers.

The sliver, or rather slivers, are next taken to the *drawing-frame*, where their fibres are further straightened and equalised. The drawing-frame has feed-rollers, travelling gills with steel teeth, and drawing and delivery rollers. Here four slivers from the finisher-card are caught by the feed or retaining rollers, passed through the travelling gills, and drawn out into one sliver by the drawing-rollers, which, as well as the delivery-rollers, move at 4½ times the speed of the retaining-rollers. The sliver from the drawing-rollers is, besides, usually doubled by passing two of them between the delivery-rollers. The process is repeated on a second drawing-frame with finer and closer teeth than those on the gills of the first. The object of doubling and drawing out the slivers so frequently is that the thick place of one sliver may be corrected by the thin place of another, and also that the different kinds of jute may be thoroughly mixed both as to quality and colour.

Roving is the next operation, and the *roving-frame* in the arrangement of its rollers and gills is similar to the drawing-frame, but in the former the parts are smaller and the gill-teeth finer and more closely set. As the sliver on this machine, after being still further attenuated by drawing-out rollers, requires to be twisted into a loose thread or 'rove,' a spindle and flier are provided, as well as a bobbin upon which to wind it. Finally the bobbins of 'rove' are taken to the *spinning-frame*, and spun into yarn upon the 'throstle' principle. See SPINNING.

Jute fabrics are for the most part woven of yarn retaining its natural colour. But for some purposes it is bleached, and when used for carpets or curtains it is dyed various colours. Although it can only be made pure white with difficulty, it readily bleaches pale enough to admit of its being dyed without injury even to bright colours. Dyes upon jute are, however, fugitive unless they are dyed by a special and expensive process, which is

only carried out to a small extent in practice. At Dundee the ordinary fabrics made of jute are Hessians, sackings, carpets, tarpauling, and backings for linoleums. The last-named are woven on looms of extraordinary width (see FLOOR-CLOTH). Dyed carpets, curtains, table-covers, and the like, of this material, are attractive enough in appearance, and carpets especially are largely made. These are cheap but not very durable. Millions of small, brightly-dyed prayer carpets for Moslems are sent from Dundee to the East. Fabrics made of jute are easily rotted by damp, and cannot be often washed and dried like linen or cotton goods without injuring them. This fault of jute soon betrays itself if it is mixed with flax for towelling. Jute, from its somewhat glossy lustre, is occasionally used to sophisticate silk; and it has been employed to some extent to make wigs and other articles in imitation of those made of human hair, chiefly for theatrical purposes.

Dundee has no monopoly: Indian rivalry is so serious that Dundee must find new products which the Indian mills cannot manufacture, such as the finer classes of goods, or special products which will create a demand, either owing to their novelty or usefulness.

Jüterbog, or JÜTERBOGK, a town in the Prussian province of Brandenburg, 39 miles by rail SSW. of Berlin. Cloth and cigars are manufactured. Pop. 8000. Near Jüterbog is Dennewitz, where the Prussians under Bülow defeated the French under Ney and Oudinot, 6th September 1813.

Jutes, a north German people, who, with the Angles and some of the Saxons, came to Britain in the 5th century. Bede's statement seems to indicate that they came from Jutland, but this has been doubted. They settled in Kent, Hants, and the Isle of Wight. For their traditional leaders, see HENGIST.

Jutland (Dan. *Jylland*), the only considerable peninsula of Europe that points directly north. The greater portion has since early in the 10th century formed a portion of the kingdom of Denmark (q.v.). Area, 10,000 sq. m.; pop. 1,500,000. Jutland is said to have been inhabited in the earliest times by the Cimbr (q.v.); hence it was called the Cimbric Peninsula or Chersonesus. In the 5th century it was apparently inhabited by the Jutes, who took part in the expedition of the Saxons to England. The Jutes were succeeded by the Danes, who, under the name of Normans (Northmen), frequently desolated the coast of Germany and France. The southern part of Jutland forms the Prussian province of Schleswig-Holstein (see HOLSTEIN, SLESWICK). Northern Sleswick decided by plebiscite in 1920 to become Danish, middle Sleswick to remain German. For the battle of Jutland (1916) see TACTICS, WAR (GREAT).

Juvenal. Decimus Junius Juvenalis was born about 55 A.D. at Aquinum, in the Volscian country, where his father, a free Roman citizen, possessed an estate. He received the usual rhetorical education in Rome, and became the friend of Martial, and at least the acquaintance of Statius and Quintilian. Probably under Titus, or early in Domitian's reign, he served as tribune in the army, and in his native town filled the important posts of censor and flamen of the deified Vespasian. We know from an inscription apparently written by himself that he was in Britain and returned home in safety, but there is no evidence that he was there in a military capacity. That he was in Upper Egypt is certain, but that he was banished thither by Hadrian is merely a more plausible conjecture than that he died an octogenarian under Antoninus Pius.

His interest for posterity depends altogether on

his sixteen satires, still extant, which occupy the very first rank in satirical literature, and are of priceless value as pictures of the Roman life of the Empire. The order in which these compositions follow each other in the earliest manuscripts and latest editions seems to have been that in which they were originally published. They were grouped probably by Juvenal himself into five books, and these were given to the world at intervals, during which he seems to have undergone notable changes of mood. The first book contains the first five satires, and saw the light in the early years of Trajan's government. It presents Juvenal's powers at their highest and most sustained pitch, fresh from living experience of Domitian's brutalising sway, the forms and effects of which constitute their main theme. Book second consists of one satire, the sixth, levelled at females in general, of whom, in their degraded, unsexed condition under the empire, he draws a well-nigh savage picture, unrelieved by any touch of that chivalry which belongs to a later and christianised civilisation. By many (chiefly French and Italian) critics it is reckoned his *chef-d'œuvre*. It probably appeared a little before the death of Trajan. The third book was published soon after Hadrian's accession, and comprises the seventh, eighth, and ninth satires. Interwoven with passages of earlier composition than that date, these touch, without uniformly maintaining, the high level of the preceding ones. The fourth book, also published under Hadrian, is made up of the tenth, eleventh, and twelfth satires, and in the best of them, the tenth, on the 'Vanity of Human Wishes,' notwithstanding its fine declamatory swing and its characteristic misogyny, there is a softer spirit, as of the 'years that bring the philosophic mind,' or at least temper the impetuosity of earlier manhood. The fifth book, again given to the world in Hadrian's time, contains satires thirteen, fourteen, fifteen, and sixteen, and even more than its predecessor betrays the softening influence of age, while distinctly the least vigorous and effective of the series.

Juvenal and Horace respectively represent the two schools into which satire has always been divided; and from one or other of them every classical satirist of modern Europe derives his descent. As Horace is the satirist of Ridicule, so Juvenal is the satirist of Indignation. Juvenal is not a man of the world so much as a reformer, and he plays in Roman literature a part corresponding to that of the prophets under the Jewish dispensation. He uses satire not as a branch of comedy, which it was to Horace, but as an engine for attacking the brutalities of tyranny, the corruptions of life and taste, the crimes, the follies, and the frenzies of a degenerate society. He has great humour of a scornful, austere, but singularly pungent kind, and many noble flashes of a high moral poetry. It should be noted that the old Roman genius—as distinct from the more cosmopolitan kind of talent formed by Greek culture—is plainly discernible in Juvenal. He is as national as the English Hogarth, who perhaps gives a better image of his kind and character of faculty than any single English humorist or moralist that we could name. Juvenal has been better translated in our literature than almost any other of the ancients. Dryden's versions of five of his satires

are amongst the best things he ever did. Dr Johnson imitated two of the most famous in his *London* and *Vanity of Human Wishes*; and the version of the whole of them by Gifford is full of power and character.

See editions by Jahn (new ed. 1893), Weidner (1889), J. E. B. Mayor (1878-86), Owen (with translations, 1903), Maclean, Lewis (with literal prose translation), Pearson and Strong, Duff, Ramsay (with translation, 1918). The lately discovered fragments do not add to Juvenal's reputation.

Juvenile Offenders. Under the Probation of Offenders Act, 1907, the court may, having regard to age, antecedents, &c., release an offender on probation instead of convicting or punishing him, and may place him under a 'probation officer' charged with the duty of visiting and assisting him and reporting to the court as to his behaviour. The Prevention of Crime Act, 1908, empowers a court, where a person between sixteen and twenty-one is convicted of an offence punishable by penal servitude or imprisonment, to order him, if so advised, to be detained for instruction and discipline in a Borstal Institution for not less than one nor more than three years. Refractory pupils in a reformatory school, and youthful convicts in prison, may also be placed in such an institution; and the Secretary of State may grant release on licence, and may remove an incorrigible to prison. Children under sixteen are dealt with by the Children Act, 1908. That statute contains a series of provisions with the object of separating, so far as possible, from older criminals all persons under sixteen who are charged with or convicted of crime. Such a person may not be sentenced to penal servitude or imprisonment, but may be committed for a month to a place of detention to be provided by the police authority. Similarly he must not be tried along with older criminals, and if not released on bail, must be detained in a 'place of detention' pending trial. Parents or guardians are required to attend in court, and may be fined for the child's offence unless they prove that their neglect has not concurred to its commission. See REFORMATORY AND INDUSTRIAL SCHOOLS.

Juxon, WILLIAM, one of the figures on the last 'memorable scene' of Charles I., was born at Chichester in 1582. From Merchant Taylors' School he passed to St John's College, Oxford, and succeeded Laud as its president in 1621. Already he had held livings at St Giles, Oxford, and Somerton in Oxfordshire, and through Laud's influence he became successively dean of Worcester, prebendary of Chichester, dean of the Chapel Royal, and Bishop of London. In 1635 also he was made Lord High Treasurer—'a dignity,' Laud writes proudly, 'held by no churchman since Henry VII.'s time.' In Charles's vacillation about the fate of Strafford, Juxon advised him to refuse his assent to the bill, 'seeing that he knew his lordship to be innocent.' He ministered to the king in his last moments, and it was into his hands that Charles delivered his George with the word 'Remember.' During the Commonwealth Juxon amused himself with his pack of hounds at his country-house in Gloucestershire, and four months after the Restoration was appointed Archbishop of Canterbury. He died at Lambeth, 4th June 1663.

K

the eleventh letter of the modern English and the tenth of the ancient Roman alphabet, descends from the eleventh letter of the ancient Semitic alphabet. The Semitic name of the letter, represented by the Hebrew and Syriac *kaf* and adopted by the Greeks as *kappa*, means the hollow of the hand; and it was probably on account of this meaning that in the alphabet the letter was placed next after the letter the name of which meant a hand. The earliest known form is , which was variously modified in the later Semitic alphabets; in the square Hebrew character it is written  when final, and  in other positions. The primitive form may possibly have originated from an outline of a hand. The original sound of the letter, the voiceless back stop, has remained essentially unchanged, though it has slight diversities of articulation in different languages. In late Hebrew and Aramaic *kaf*, like the other letters denoting stopped consonants, had a spirant pronunciation after vowels. The letter was adopted by the Greeks in the form , which became  when the direction of the writing was reversed. In cursive writing the upright stroke was prolonged above the line, as in the modern *k*. In some mediæval handwritings the angular part of the letter was transferred from the lower to the upper part of the stroke; hence the form represented by the German *f*. The other modern forms of the letter are easily seen to be modifications of *K*, *k*.

In the classical period of Latin, *K*, having the same pronunciation as *C*, was used only as an abbreviation for *calendæ* and the rare prænomen *Cæso*. It retained, however, its place in the alphabet, and in late Latin it was found convenient for use before *e*, *i*, *y* in words adopted from Greek, because the pronunciation of *C* before those vowels had changed. (See the article *C*.) In the languages descended from Latin, the *k* sound before front vowels became common, and for a time *K* was often used to render it. Subsequently the sound was expressed in other ways: in Italian by *ch*, and in French, Spanish, and Portuguese by *qu*. In those languages *K* is no longer used except for foreign words adopted with their native spelling. The letter has never formed part of the Irish alphabet; in Welsh it was used until the 16th century, but was then entirely superseded by *C*. In German, Dutch, and the Scandinavian languages *K* has gradually displaced the 'hard' *C*. In recent German orthography it is used even in words adopted from Latin, as *kausal*, *Kombination*; but *ck* is still written instead of *kk*, which is used in Dutch and Scandinavian.

In English from the 12th century *K* has been regular before *e*, *i*, *y* (also before *n*, where it has ceased to be sounded); in other initial positions the sound is normally expressed by *C*. There is no native word (except *kail*, *kale*) beginning with *ka*,

kw, *ku*, *kl*, or *kr*, though these initial combinations occur in many words adopted from foreign languages. At the end of a word, and before derivative endings, the sound is ordinarily rendered by *k* after a long vowel or a consonant, and by *ck* after a short vowel. The most important exceptions are the words in *-ic* and *-ac*, as *physic*, *colic*, *frolic*, *traffic*, *maniac*, *Syriac*, which until the 19th century were commonly written with *ck*. The *k* is still retained in inflexions and derivatives like *physicking*, *colicky*, *trafficker*, where a 'hard *c*' would be abnormal.

The Roman name of *K* would regularly have been *kē*; but as this would have been phonetically identical with *cē* (*C*), the letter was named *kā* (the vowel being probably suggested by the Greek *kappa*). The name has been retained in all the modern languages using the Roman alphabet.

K², a Himalayan peak. See GODWIN-AUSTEN.

Ka. See EGYPT (*Heligion*).

Kāaba (Arab., 'square house'), the name of an oblong stone building within the great mosque of Mecca. See MECCA.

Kaama, a large species of Antelope (q.v.).

Kabbala. See CABBALA.

Kabir, poet, mystic, and religious reformer, born in or near Benares about 1440, and brought up a Mahomedan, discovered early in life that the teaching of one creed could not satisfy his aspirations after God, and became a disciple of the Hindu Rāmānanda. A weaver by trade, and a skilled musician, he wrote in Hindi. His sayings and poems have much beauty of language and of thought. Repudiating asceticism and breaking down the barriers of intolerance, he taught that God is to be found in universal love, kindness to all living things, extension of the self to embrace the whole. The Sikhs and others found upon his teaching. See Wilson, *Religious Sects of the Hindus*; Westcott, *Kabir and the Kabir Panth* (1908); *One Hundred Poems of Kabir* (trans. Rabindranath Tagore, 1915).

Kabul, or CABUL (the Kabura of Ptolemy), is an ancient town which has been intimately connected with the destinies of India throughout modern history. It was taken in 1394 by Tamerlane, and again in 1739 by Nadir Shah, whose son Ahmad Khan founded the Durani dynasty. For two centuries after its conquest by Baber in 1522, it was held by rulers of the Mogul (or Turk) dynasty together with India. More recently it has been made memorable by the events which led to the terrible disaster of 1842 (see AFGHANISTAN). It was retaken by Pollok in September of that year, and its bazaar was destroyed, after which it remained unvisited by Europeans until 1879, when Sir Louis Cavagnari was appointed resident. The story of his murder and the subsequent occupation of the city by a British force under Roberts is historical. After the instalment of Abdur Rahmon on the throne as Amir, the British forces evacuated Afghanistan in 1880. The British bombed the powder-factory and fort in May 1919. The Amir Habibulla Khan, son of Abdur Rahmon and

grandson of Dost Mahomed, extended and improved the city by the erection of public buildings, constructed roads, and maintained the economical development of Afghanistan, adding greatly to the value of the imports and exports from the city of Kabul. In addition to the arms-factory established by his father, there are now a boot-factory, a clothing-factory, and a woollen-factory. A military college is maintained for the sons of Sirdars, who are frequently sent to Japan to study the art of war.

Kabul is charmingly situated at the foot of the Takht-i-Shah and Asmai hills, which separate it from the Chardeh plain. On a spur of these hills south of the city is the fortress of Bala Hissar (or 'upper fort'), once an important stronghold, but now abandoned. The city, which is composed almost entirely of mud-built buildings with flat roofs, is traversed by the main bazaar, the streets of which diverge from the central square and divide the city into four quarters. The Kabul bazaar rivals that of Kandahar, and includes every variety of trade. The cantonment of Sherpur, situated about a mile north of the Bala Hissar, where the British troops were beleaguered in 1880, is maintained in good repair. Close to it are still to be traced the outlines of the old British entrenchment of 1840. At the western extremity of the Bamar ridge, which flanks Sherpur on the north, is the English cemetery, now protected by a high wall, and kept in fairly good order. Kabul is celebrated for its fruit, its grapes and melons being especially famous. The elevation of the plain above sea-level is about 6000 feet, which ensures a delightful temperature and fine climate in summer, but it is sometimes severely cold in winter, when snow occasionally covers the ground to the depth of several feet, and communication is frequently interrupted. The population of the city probably does not exceed 150,000, and it is composed of all the varied elements of Afghan nationality. Duranis (or true Afghans), Ghilzais, Hazaras, Tajiks, and Kizilbashs form the chief Mohammedan part of the population, whilst Hindus are numerous in one quarter of the city, Kaffirs in the south-west, and a few Jews are also to be found. Kabul is now connected with India by telegraph. There is a British resident in Kabul, and an Afghan representative in London.

The KABUL RIVER rises at Sar-i-Chasma, near the source of the Helmund, flows through Kabul city, and, mainly by a long series of precipitous defiles, finally reaches the Indus at Attok. The length of its course (generally south-easterly) is about 270 miles, and for the most part its volume is insignificant, although it sometimes floods the country about Naoshera.

Kabyles, a branch of the great Berber race of North Africa. See BERBERS; also ALGERIA, and TUNIS.

Kadesh, an ancient Semitic city and kingdom on the Orontes, took Thothmes III. many years of warfare to subdue it. Later, it was in the power of the Hittites, from whom Rameses II. attempted to recapture it, apparently in vain (1288 B.C.). See EGYPT, HITTITES; also JEWS (second paragraph).

Kadiak, an island off the S. coast of Alaska, separated from the mainland by Alaska Strait. It is mountainous and heavily wooded, contains good harbours, and has an area of 3465 sq. m. It is inhabited by salmon-fishing Eskimos.

Kæmpeviser. See DENMARK. (LITERATURE).

Kaempfer. See KÄMPFER.

Kaf, the mountain which in Mohammedan legend surrounds the world.

Kaffa, or FEODOSIA, a seaport on a bay on the east side of the Crimea, 62 miles E. by N. of

Simferopol. It is defended by walls and a citadel, and contains the ruined palace of the Khans of the Crimea and a Greek cathedral. Near by is an Armenian monastery (1442). Soap and caviare, camel-hair carpets, and sheepskin rugs are manufactured; and there is an oyster-fishery. The harbour is excellent, and has superseded Sebastopol as a commercial port. Pop. 35,000. The ancient Theodosia was a flourishing colony of the Milesians; in the 13th century the Genoese founded here a successful trade-depôt, which they called Kaffa. It fell to the Turks in 1475, and to the Russians in 1792.

Kaffir Bread, a name given to several South African species of *Encephalartos*, which, like many others of their order (see CYCADS), have much starch in their stems, and afford a kind of sago and a not unnutritious bread.

Kaffir Corn. See DURRA.

Kaffirs (also spelt Kafir and Caffres), a well-marked division of the Bantu family of the Negro race, inhabiting the districts now known as Swaziland, Zululand, the Transvaal, Orange Free State, Natal, the Cape of Good Hope dependencies of Pondoland, Griqualand East, Tembuland, and Transkei. They embrace two main divisions, the Zulus (q.v.) and the Kaffirs proper. The word 'Kaffir' is a corrupt form of the Arab 'Kafir,' meaning 'unbeliever,' and was borrowed from the African Mohammedans by the Portuguese, and from them by the Dutch and English. The Kaffirs proper never at any time formed one united race, but have always been split up into a number of tribes, the most influential of which have been the Ama-Tembu, the Ama-Xosa (represented by the Gcalekas and the Gaikas), and the Ama-Mpondo. Of these the first named are the tribe of royal blood, though the greatest power has always been in the hands of the Gcaleka chief. The Kaffirs are a fine, stalwart race of men, well made, muscular, and tall. Their skin varies in colour from light brown to sepia black. The racial characteristics depart more and more from the strict Negro type the farther the tribe lies to the south. Yet in all the nose is broad, the lips thick, and the hair woolly; but it does not grow in tufts, as is generally asserted. They are fond of decorating their persons with beads, shells, and feathers, and they protect their skins from the sun by rubbing them with fat and red clay, which makes them look like polished bronze. The women, upon whom devolves the hard labour of cultivating the fields, are individually of inferior physique to the men. They live in beehive-shaped huts, grouped in kraals or villages. These huts are formed of strong wicker-work frames thatched with reeds and grass, the largest about 25 feet in diameter and 7 or 8 feet high in the centre. They are a pastoral people, the chief occupations of the men being stock-breeding and hunting. The care of cattle is the most honourable employment, and belongs entirely to men. They formerly worked in both iron and copper, and were not unskilful in pottery and wood-work. The principal articles of food are milk, maize, and millet. Youths are circumcised at fifteen or sixteen, living thereafter for a couple of months by themselves; the entrance into womanhood is marked by the *ntonjane*, a dancing festival closing a period of seclusion. They practise polygamy, but the wives are not of equal rank, and cannot belong to the same tribal name as the husband. The custom known as *ukuhlonipa* prohibits females from pronouncing the names of any of their husband's male relatives in the ascending line, or any words whatever in which the principal syllables of such names occur—a usage which leads to the women using different words from the men almost to the extent of a different dialect. The three

clicks of the Ama-Xosa, usually represented by the letters *c*, *q*, and *z*, are easily sounded separately by Europeans, but are insurmountably difficult to the adult in combination. The religious instinct has never been very strongly developed amongst this people, and their rites consist merely in sacrifices to appease the malignant spirits on every hand. Their supreme being, Qamata, is indifferent to man, and is seldom invoked in prayer. Snakes are treated with great respect, being regarded as a favourite form assumed by ancestral spirits. The belief in witchcraft is deeply rooted, and the witch-doctor is generally a person of great influence in the tribe. The original fine moral qualities of the Kaffirs—hospitality, honesty, and truthfulness—have been greatly contaminated through contact with Europeans. The Kaffirs have ever been noted for their bravery. In war they arm themselves with ox-hide shields, about 5 feet long, wooden clubs with heavy heads, and assegais.

Partly owing to the war-loving propensities of the Kaffirs, and partly to their cattle-lifting raids and disputes with the colonists about cattle, Kaffir wars have been frequent. In 1780 the Great Fish River was declared the boundary of Cape Colony to the east, but the Kaffir incursions became so troublesome that in 1810-11 they had to be driven back behind the Fish River by force of arms. After a similar little war, undertaken for a similar reason, in 1819, during which the Kaffirs made an unsuccessful attack upon Graham's Town, the boundary was advanced eastwards to the Kat River. But peace was constantly being broken. In 1834 the first of the greater Kaffir wars broke out, and lasted until the following year. But, although the enemy were repulsed and their territories up to the Kei River annexed by the colonial government, the annexation was not ratified by the home authorities until the termination of the next war (1846-48). The conquered districts were called British Kaffraria, and from 1853 to 1865 formed a separate crown-colony; but in the latter year British Kaffraria was incorporated in Cape Colony. The power of the chiefs was nevertheless still unbroken: in 1850 the turbulent Gaikas, who had waged most of the former wars, in conjunction with the rest of the Ama-Xosa and the Ama-Tembu tribes, and a large body of revolted Hottentots, once more invaded the Colony, but after a struggle of nearly three years were successfully driven back. In 1856 the frontier districts were settled by the men of the German legion who had fought in the Crimea, nearly 2500 in number. The last war broke out in 1877: the Gaikas took up arms, and were joined by the Zulus, and eventually the Zulus also entered the fray (see ZULUS). The war ended in the overthrow of the power of the Kaffir chiefs, and the gradual incorporation of their territory in the Cape Colony. By 1888 all Kaffraria up to the frontiers of Natal, with the single exception of East Pondo-land—a separate British protectorate till 1894—had been included within the bounds of the Cape Colony. For subsequent history, see SOUTH AFRICA.

The Ama-Fengus, or Fingoes, are the remnants of broken Kaffir tribes; they are despised by the organised Kaffir races, and but for the protection of the British would probably be little better than slaves to them. They have always been loyal to their protectors, and live scattered from Zululand to the Cape.

See G. Fritsch, *Die Eingeborenen Süd-Afrikas* (1872); grammars of the Kaffir language by Bleek (1869) and Colenso (1855); Chase and Wilmot's *History of the Cape of Good Hope* (1869); Theal's works; Brownlee's *Reminiscences of Kaffir Life*; and Dudley Kidd's *Essential Kaffir* (1904).

Kafiristan, a mountainous region of Asia, lying between the Kabul River on the south and the Hindu Kush on the north-west; its eastern and western boundaries are formed by the Chitral and Panjshir rivers respectively, feeders of the Kabul. Area, about 5000 sq. m. This region of wild, narrow, winding glens and impassable mountains (11,000 to 17,000 feet) has been for centuries the last stronghold of primitive Aryan heathenism against the encroachments of Islam. It is on this account that the inhabitants are called by their Mohammedan neighbours Kafir—i.e. 'unbelievers,' and their country Kafiristan. These people, about 200,000 in all, although speaking different dialects, are ethnically of one race. But they do not form a political unity; the tribes into which they are divided are often at war with one another. The only points of union between them politically are their hatred of the Mohammedans and their passionate love of independence. This they successfully maintained at different times against such great conquerors as Mahmud of Ghazni, Timur, and Baber. The mountaineers are fair in complexion, the women often handsome. Contrary to the custom of orientals, they do not sit cross-legged on the ground, but sit on stools; and they shake hands like Englishmen. Their dress is made of goat skin and goat's hair. They are fond of wine and dancing. Cultivable soil exists only in small patches alongside the torrents; consequently the people follow chiefly pastoral pursuits. Since 1893-95 Kafiristan is recognised by Britain as under Afghan control, and it is now garrisoned by the Amir's troops.

Kagoshi'ma, a town of Japan, on a large bay of the same name, at the south end of Kiu-siu Island, with porcelain manufactures; pop. 100,000. It was damaged by the eruption of Sakurashima in January 1914.

Kaiteur Fall. See ESSEQUIBO.

Kai-fung, capital of the Chinese province of Honan, near the southern bank of the Hoang-ho, long the chief settlement of the Jews in China. Among its 200,000 inhabitants are many Mohammedans.

Kailás. See ELLORA, INDUS.

Kain, an old term in Scots law, used to denote rent paid in kind, as in the shape of poultry or other animals, to a landlord.

Kainite, a hydrated compound of the chlorides and sulphates of magnesium and potassium, used as a fertiliser. See MAGNESIUM, MANURE.

Kainozoic. See TERTIARY, GEOLOGY.

Kairwan, a decayed walled town of Tunis, in an open, marshy plain, 80 miles S. of the capital. It contains about fifty ecclesiastical structures, of which the mosque of Okba, who founded Kairwan about 670, is one of the most sacred of Islam. Outside the city, to the north-west, is the mosque of the Companion—i.e. of the Prophet; this and other sacred tombs have rendered Kairwan—i.e. 'caravan or resting-place'—the Mecca of northern Africa. As such, it was from 1270 jealously guarded from defilement by the presence of Jews; and Christian travellers were excluded until it was entered and explored by the French in 1881. Kairwan makes carpets, copper vessels, potash, saltpetre, and articles in leather. Pop. 20,000.

Kaisarieh. See CÆSAREA.

Kaiserin Augusta, or SEPIK, a river of New Guinea (q.v.).

Kaiserslautern, or LAUTERN, a town of the Bavarian Palatinate, 52 miles by rail SW. of Worms, manufactures sewing-machines, cycles, and boilers. Pop. (1875) 22,699; (1919) 55,707. Frederick I. built a castle here in 1152 (destroyed

by the French in 1713); and near by the French republican armies were defeated in 1793 and 1794.

Kaiser-Wilhelmsland. See NEW GUINEA.

Kaithal, an ancient town in the Punjab, India, 93 miles NNW. from Delhi. It is connected traditionally with the monkey-god Hanuman, and is called in Sanskrit *Kapisthala*, the 'abode of monkeys.' It has saltpetre-refineries, and manufactures cotton, lac ornaments, and toys. It became British in 1843. Pop. 15,500.

Kakapo, or OWL PARROT (*Strigops*, or *Stringops*, *habroptilus*), a remarkable New Zealand bird

Kakapo
(*Strigops habroptilus*).

belonging to the Parrot group (Psittaci), but of very owl-like appearance, and, like the owls, nocturnal, or nearly so, concealing itself in holes during the day, except in very gloomy weather. The kakapo takes possession of a hole, where one exists, among stones or the roots of trees, but seems also to have the power of making a burrow for itself. It lives gregariously. The flesh of the kakapo is more pleasant and delicate than that of any other parrot. It has disappeared from the northern island of New Zealand, and it will probably soon be

extinct, unless means are adopted for its protection. It is the only known bird having large wings which does not use them for flight.

Kakodyle. See CACODYL.

Kala-azar, or DUMDUM FEVER, is a chronic disease found in certain parts of the tropics, e.g. in Assam and in various parts of Africa. It resembles malaria in its febrile symptoms and enlargement of the spleen, but in contrast to malaria is a very fatal disease. It is caused by a minute parasite, *Leishmania donovani*, believed to be transmitted to man by the bite of ticks which live in the walls of infested huts, or occasionally perhaps of mosquitoes. The parasite is found in the blood, spleen, liver, and bone marrow. The symptoms are chiefly wasting, dropsy, fluctuating temperature, and enlargement of the spleen and liver, with progressive anæmia. Cases which are recognised at an early stage sometimes recover, the treatment most used being intravenous injection of tartar emetic or of one of the organic arsenic preparations. For prevention, burning down of huts known to be infested with ticks is the most important procedure.

Kalahari Desert is a tract of country, 600 miles by 350, covering the southern portion of the Bechuanaland Protectorate. It reaches north to the borders of Rhodesia and west to the South-West African Protectorate, and is bounded on the east by the Transvaal. The South African Railway crosses the eastern portion. It covers an elevated basin 3000 to 4000 feet high, and, although its borders are a sandy, waterless land where only prickly desert bush grows, the interior is capable of nourishing a fair amount of vegetation. Much game inhabits the northern portion, and native inhabitants are found thinly scattered over the more fertile districts. See S. S. Dornan, *Pygmies and Bushmen of the Kalahari* (1924).

Kalamata, a seaport in the Peloponnesus of Greece, on the Gulf of Koron, is the capital of Messenia and seat of an archbishop. Its exports (currants, figs, olive-oil, silk, and soap) and its silk industry are considerable. Pop. 20,000.

Kalamazoo, capital of Kalamazoo county, Michigan, is finely situated on the river of the same name, 144 miles by rail ENE. of Chicago. It is the seat of the state insane asylum and of Kalamazoo College (Baptist). The city is the meeting-place of three important railways, and has busy manufactories of machinery, paper, flour, carriages, windmills, agricultural tools, furniture, &c. Celery is grown in large quantities near the town. Pop. 48,000.

Kalát (also spelt Khelat and Kelat), the capital of Beluchistan, is seated on the summit of a hill (over 7000 feet), and is a place of great military importance. It was occupied by England (1839-41); and in 1877 a treaty was concluded with the klan, by which a British agent, with military escort, became resident at Kalát. It can only be called a town by courtesy. It consists of the khan's castle and a half-empty bazaar. For the state actually governed by the Khan of Kalát (who is still head of a confederacy of chiefs), see BELUCHISTAN.—KALAT-I-GHILZAI is a fortress of Afghanistan, 75 miles NE. of Kandahar.

Kalbe, a town of Prussian Saxony, on the Saale, 17 miles S. of Magdeburg. It has manufactures of textiles, paper, and sugar. Pop. 15,000.

Kale, or BORECOLE. See GREENS, SEA-KALE.

Kaleidoscope (from Gr. *kalos*, 'beautiful,' *eidos*, 'image,' and *skopeō*, 'I see'), an optical instrument invented by Sir David Brewster in 1817. It consists, in its simplest form, of a tube, through whose whole length pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle which is an aliquot part of 180°, whilst the one end is fitted up with an eyeglass, and the other is closed by two glasses, at a small distance from each other, between which are placed little fragments of glass or other variously-coloured objects. The eye looking into the tube now perceives these objects multiplied as many times as the angle which the reflecting planes make with each other is contained in the whole circumference of a circle, and always symmetrically disposed; and the slightest shaking of the instrument produces new figures. There are various modifications of the kaleidoscope, by some of which its power is much increased; for example, the mirrors may be adjustable at various angles; and to pattern-drawers it supplies endless varieties of figures.

Kalends. See CALENDs.

Kalevala. See FINLAND.

Kalgan, a Chinese town, 110 miles NW. of Peking, built opposite the passage through the Great Wall, is an emporium of the tea trade with Mongolia and Siberia. The railway from Peking (1909) now passes Kalgan, and reaches Pao-t'ou on the northernmost bend of the Yellow River. Pop. 70,000.

Kalgoorlie, a town of Western Australia, 25 miles ENE. of Coolgardie by rail, is the centre of a rich gold-field. The rush hither began in 1893; the water difficulty was for a time formidable. The trans-continental railway connects it with Fremantle and Port Augusta. Pop. 8000.

Kali, an Indian goddess, the wife of Siva (q.v.).

Kálidása, the greatest dramatist, and one of the most celebrated poets of India. He is known especially through his drama *Sákuntala* ('The Lost Ring'), which, first introduced to the notice of the Western world by Sir William Jones (1789),

created a great sensation throughout Europe (trans. Laurence Binyon; abridged, 1920). Another drama of the same poet, and next in renown to *Sākuntala*, is the *Vikramorvasi* ('The Hero and the Nymph'). Besides these works, Hindu tradition ascribes to his authorship a third drama, *Mālavikāgnimitra*; two epics, the *Raghu-vansa* and the *Kumāra-sambhāva*; the *Megha-dūta* and other poems. But it seems incredible that these are all by one author, differing as they do in style; and it has been assumed that there were at least three Kālidāsa. The date of the author of *Sākuntala* is also extremely debatable; it was in the reign of Vikramāditya of Ujjain. But there have been several sovereigns of Ujjain bearing the name from 57 B.C. to 1050 A.D. Most likely the Vikramāditya in question reigned about 450 A.D.

Kalilah wa Dimnah. See BIDPAI.

Kalinjar, a hill-fortress and hill-shrine in the United Provinces of India, stands on an isolated rock (1230 feet high), the termination of a spur of the Vindhya Mountains, overlooking the plains of Bundelkhand. The records of the place go back to a period of great antiquity, the name Kalinjar occurring in the *Mahābhārata* as that of a city even at that time famous. The whole rock is thickly studded with ruins of ancient Hindu edifices and other works, including gateways, temples, tanks, caves, statues, inscriptions, &c., the most celebrated of all being the remains of the superb temple of Nil Kantha Mahadeo.

Kalisz, a town of Poland, lies on the river Proсна and the old Russo-German frontier, 132 miles WSW. of Warsaw, and has manufactures of lace, embroideries, and cloth. The *Kalisia* of Ptolemy, it is one of the oldest towns of Poland; in its vicinity numerous relics of antiquity have been discovered, and many ancient burial-mounds exist. Pop. 45,000. At Kalisz Augustus of Poland routed the Swedes (1706), and the Russians defeated the French and Saxons (1813). Here, too, was signed on 28th February 1813 the treaty of alliance between Prussia and Russia.

Kallima. See BUTTERFLIES.

Kalmar, a town and seaport of Sweden, capital of a län or county (area, 4436 sq. m.; pop. 231,000) of the same name, is situated on an island in Kalmar Sound, opposite the island of Öland. The town has a good harbour, a handsome cathedral, and a fine castle, in which, on the 20th July 1397, the 'Union of Kalmar' was signed, which settled the succession to the three northern kingdoms upon Margaret of Denmark and her heirs (see DENMARK). The commerce of the town is considerable, and it has manufactures of matches, chicory, and tobacco, and some shipbuilding. Pop. 17,500.

Kalmia, a genus of plants of the natural order Ericaceæ, consisting of evergreen shrubs, mostly about 2 or 3 feet high, natives of North America, with red, pink, or white flowers, generally in corymbs. The flowers are very delicate and beautiful, and the corolla is in the shape of a wide and shallow bell. Some of the species are frequent ornaments of gardens in Britain. They delight in a peat soil. *K. latifolia*, the Mountain Laurel, or Calico Bush, occupies large tracts on the Alleghany Mountains. It grows to the height of 10 feet, and the wood is very hard. It is narcotic and dangerous; the leaves are poisonous to many animals, and the honey of the flowers possesses noxious properties. A decoction of the leaves has been used with advantage in cutaneous diseases, but taken internally it is fatal. A decoction of the leaves of *K. angustifolia* is used by the negroes of North Carolina, of which state the plant is a native, as a wash for ulcerations between the toes.

Kalmucks, a Mongolian race of people, scattered throughout central Asia, and extending westwards into southern Russia. The name is not employed by the people themselves, but by some of the Turkic races of Asia, and certainly by the Russians to designate the Durben Oirad or Four Allied tribes of the Zungars or 'Westerners,' to wit the Turgut, the Khoshoit, the Turbet, and the Choros, who mostly live in Zungaria, but others are now to be found around Koko-nor in north-east Tibet; in the district called Ordos, within the great loop of the Yellow River of China; on the western slopes of the Altai (in Kuldja, &c.); and in the steppes between the Don and the Volga and Caspian, that is to say, in the (Tsarist) Russian governments of Astrakhan and Stavropol, in Don-Cossacks, Ural, and Semirechensk territories, and in the Bisk circuit of Tomsk government. These tribes constitute that great division of the Mongol race known as Western Mongols. They are nomads, possessing large herds of horses, cattle, and sheep. Their physical characteristics are those peculiar to the Mongolian race (see MONGOLS). In religion they are nearly all adherents of Lamaism. Their language differs from true or Eastern Mongolian only in being more phonetic; but they have an alphabet of their own. Their literature consists principally of religious books and folk and fairy tales. In recent centuries the most noteworthy events in their history arose out of the emigration of a large band of the Turgut from Zungaria into Russia in 1650. This band was followed by others composed of Turbet in 1673 and of Khoshoit in 1675. Under Ayuka Khan (1670-1724) the Kalmucks figured as an important factor in Russian politics, sometimes as enemies, sometimes as allies. In 1715 an official named Tulishên was despatched as envoy to Russia, charged with the duty of persuading the Kalmucks to come back; he had already in 1712 conducted other negotiations with Prince Gagarin, governor of Irkutsk. But it was not until 1771 that a large body of them, chiefly Turgut and Khoshoit, being dissatisfied with the treatment they received at the hands of Russia, returned to the empire of China; after a march in which they endured terrible sufferings, they settled at Ili among the Altai Mountains. See the brilliant account of the miseries of this march by De Quincey (vol. vii. of *Collected Works*). But, as we have seen, there still remain some 110,000 Kalmucks in European Russia, in Asiatic Russia there are probably 55,000 more; the Russian *Statesman's Handbook* of 1896 puts the total at 200,000. The number in Chinese territory is not known. An autonomous Kalmuck province in southern Russia was erected in 1920; pop. 125,000.

Specimens of Kalmuck fairy-tales can be read in Jülg's edition of the *Siddhi-Kur* (1866), and in vol. i. of Bergmann's *Nomadische Streifereien unter den Kalmücken* (1804). See also Mayers's *Student's Manual*, and H. Cordier's *Histoire Générale de la Chine*.

Kalna, officially KHULNA, a town of Bengal, 47 miles N. of Calcutta and 28 E. of Bardwan, on the Bhagirathi (Hugli). The town contains numerous temples. The river trade, chiefly in rice and other natural products, has declined owing to competition of the East India Railway. The population has decreased from 27,336 in 1871 to about 16,000.

Kalocsa, a town of Hungary, near the left bank of the Danube, 86 miles S. of Budapest by rail. It is the seat of an archbishop (bishop's see from 1000 to 1135), and has a cathedral, an archbishop's palace (with a library), some monasteries, and an observatory. The inhabitants grow flax, wine, &c. Pop. 12,000.

Kalong. See BAT.

Kalpi, a town in the United Provinces of India, stands among rugged ravines near the bank of the Jumna, 50 miles SW. of Cawnpore. It figured prominently in the wars waged against the Mogul empire, came definitively into British hands in 1806, and was one of the principal agencies of the East India Company. Here on 23d May 1858 Sir Hugh Rose defeated 12,000 of the rebels. The town is mean in appearance, the houses being chiefly mud huts. The population, once much larger, is now about 10,000. They manufacture sugar-candy and paper, and export grain to south and west India, and cotton to Cawnpore and Bombay.

Kaluga, a town of Russia, 76 miles by rail NW. of Tula, on the navigable river Oka, it carries on an extensive trade, especially in corn. It manufactures leather, oil, candles, &c.; but its speciality is 'Kaluga cakes.' Population, 40,000. Kaluga has often been a place of banishment for political offenders, among others Shamyl, the Circassian chief.

Kama, the principal affluent of the Volga, rises in the Russian government of Vyatka, and after 1050 miles joins the Volga from the left 43 miles below the town of Kazan. Its chief tributaries are the Vyatka, the Tchussovaya, and the Bielaya, all navigable. The Kama is navigable from Perm, a distance of 930 miles. Area of drainage basin, 177,560 sq. m. The river is free of ice about 200 days in the year, and constitutes one of the most important highways of communication between Siberia and Nijni Novgorod and St Petersburg.

Kāma, or KĀMADEVA, the Hindu god of Love. In later Sanskrit poetry he is the favourite theme of descriptions and allusions, and mythology exalts his power so much that it allows even the god Brahmā to succumb to it. According to some Purānas, he was originally a son of Brahmā.

Kamakura, a coast village of Japan, 12 miles S. of Yokohama. It dates from the 7th century, was the capital of the Shogunate, but is now only of interest to tourists for its beauties and its famous bronze image of the Buddha, the Dai-butsu, 50 feet high.

Kamchatka, a peninsula of eastern Siberia, stretches south into the Pacific between Behring Sea and the Sea of Okhotsk. Area, 100,000 sq. m. Long and narrow, swelling out towards the middle, it terminates in a point only 7 miles distant from the northernmost of the Kurile Islands. A chain of volcanic mountains runs down the centre, and reaches 15,408 feet in Kojerevskaya and 16,988 in Kluchefskaya. The latter was in active eruption at least twice in the 19th century (1854 and 1885). Hot springs abound. The coast on the south-east is formed of rugged, precipitous cliffs. The principal river is the Kamchatka, which flows into the Pacific. The climate is colder than in corresponding latitudes in Europe, and very humid; grass and tree vegetation are consequently luxuriant. The principal occupations are salmon-fishing and hunting. Furs are the most valuable production of the peninsula. The most useful domestic animal is a peculiar kind of dog, which is employed in hunting and sledging. Kamchatka was annexed to Russia at the end of the 17th century, after the expedition of the Cossack chief Atlasof. The inhabitants are Kamchadales, Koryaks, Lamuts, and a few Russians. The Kamchadales, the preponderating race, live mostly in the south. They are a hardy people, who dwell in winter in earth pits and in summer in light huts. Their language has American affinities; but they are now almost completely russified. The fort of Petropavlovsk (pop. 1500), with a

magnificent harbour covered with ice only during a brief season, is picturesquely situated on the east coast. A British and French fleet made an unsuccessful attack upon it in 1854.

Kamehameha. See HAWAII.

Kamenetz-Podolsk (Polish *Kamieniec*), a town of Ukraine, picturesquely situated on a steep rock above the river Smotritza, an affluent of the Dniester, 243 miles NW. of Odessa and 40 NE. of Czernowitz. There are a Roman Catholic cathedral (1361), a Greek cathedral (16th century), and an Armenian and several other churches. The town was destroyed by the Mongol chief Batu in 1240; taken by the Turks in 1672; returned to the Poles in 1699; and annexed by Russia in 1795. Previous to the partition of Poland Kamenetz was one of the strongest bulwarks of that country against the Turks. Pop. 27,000, one-half Jews.

Kamenz, a small manufacturing town of Saxony, 22 miles NE. of Dresden by rail. It was the birthplace of Lessing. Pop. 11,000.

Kamerun. See CAMEROON.

Kames are ridges of gravel, sand, &c., associated with the glacial deposits of Scotland. See ASAR.

Kames, HENRY HOME, LORD, a Scottish philosopher, was born in Berwickshire in 1696, called to the bar in 1723, and by his merits fought his way upwards to a leading position there, being raised to the bench as Lord Kames in 1752, and made lord of justiciary in 1763. He divided his energies between law and philosophy, and was no less noted for his amiability, his conversational powers, his public spirit, and his agricultural enterprise at Blair-Drummond in Perthshire. He died at Edinburgh, 27th December 1782. Besides books on Scots law he published a series of works more ingenious and interesting than well written: *Essay on the Principles of Morality and Natural Religion* (1751), a defence of the doctrine of innate ideas at the expense of the freedom of the will; *An Introduction to the Art of Thinking* (1761), and *Elements of Criticism* (1762), two works much less satisfactory than ingenious; and *Sketches of the History of Man* (1774), a miscellaneous and curious collection of speculations on all manner of subjects.

Kamloops, a city of British Columbia, at the junction of the North and South Thomson Rivers and the Canadian National and Canadian Pacific Railways, has railway shops, and trades in livestock. Pop. 4500.

Kampen, a town of Holland, situated near the mouth of the Yssel, 5½ miles by rail NW. of Zwolle. It was formerly a Hanse town and had a considerable trade, which gradually left it as the mouth of the Yssel sanded up. But since the middle of the 19th century the river approaches have been improved, and the trade of the town is reviving. The Church of St Nicholas is one of the finest mediæval churches in the country. The inhabitants, only 7760 in 1840, now number 20,000, and are engaged in shipbuilding, commerce, fishing, and tobacco manufacture. Kampen is the Gotham of the Dutch.

Kämpfer, ENGELBERT, German traveller, was born at Lemgo, in Lippe, on 16th September 1651, studied medicine at Königsberg, and travelled (1683-94) in India, Java, Siam, and Japan, during which time he spent two years (1692-94) in the last-named country. He died on 2d November 1716. He published *Amenitates Exotice* (1712), and after his death appeared his *History of Japan and Siam* (1727, trans. Scheuchzer; new ed. 1906). Most of his writings exist in MS. in the British Museum.

Kamptulicon. See FLOORCLOTH.

Kamthi, or **KAMPTI**, a town and cantonment of the Central Provinces, India, lying 9 miles NE. by rail from Nagpur, on the Kanhan River, here crossed by a fine stone bridge, has a trade in grain, timber, cattle, salt, and piece-goods. The population is about 20,000. The town dates from the establishment of the cantonment in 1821.

Kanagawa. See YOKOHAMA.

Kanakas (Hawaiianfer, 'man'). See COOLIES.

Kanara, NORTH, a coast district of Bombay, the most southerly in the Konkan (q.v.), lies south-east of Goa, and has an area of 3946 sq. m.; pop. 400,000, mostly Hindus, speaking Kanarese (see INDIA). For the most part it is a wild forest-country.—SOUTH KANARA, immediately south of North Kanara, belongs to Madras. Its area is 4021 sq. m.; pop. a million and a quarter, four-fifths Hindus. This district also contains a great extent of forest-land, and numerous wild animals. The capital is Mangalore. Both North and South Kanara are partly occupied by the Western Ghâts, contain numerous rivers, and have a heavy rainfall. In both, also, malaria is very prevalent, especially during the monsoon.

Kanaris, CONSTANTINE, a hero of the Greek war of independence, was born in the Isle of Ipsara in 1785, and was master of a small merchant-vessel before the commencement of the war. In 1822 he blew up the Turkish admiral's ship in the Strait of Chios, and later in the same year repeated his feat in the harbour of Tenedos. In August 1824 he avenged the ravaging of Ipsara by burning a large Turkish frigate and some transport-ships which were carrying troops to Samos, and next year was only prevented from burning the Egyptian fleet in the harbour of Alexandria by an unfavourable wind springing up. He was appointed to important commands by the Greek president, Capo d'Istrias, was made senator in 1847, and was minister of marine (1854-55). He took part in the revolution of 1862, and held office repeatedly under the new king. He died 15th September 1877.

Kanauj, one of the great legendary centres of Aryan civilisation in India, to which the Hinduism of Lower Bengal attributes its origin, stood originally on the Ganges, 65 miles NW. of Lucknow. At present the site consists of a vast number of ruins, extending over the area of five villages, about 4 miles from the Ganges, the river having slightly altered its bed. The most remarkable buildings are Mohammedan mausoleums. Its most prosperous era was the 6th century; early in the 11th it fell before the sultans of Ghazni. Among the ruins there is a modern town of some 18,000 inhabitants.

Kanawha. See CHARLESTON, GREAT KANAWHA.

Kanazawa, a town of Japan, on the west coast of the main island, NW. from Tokyo, manufactures porcelain and silk. Pop. 130,000.

Kanchinjanga. See KINCHINJINGA.

Kandahar, or CANDAHAR, the capital of central or southern Afghanistan, about 200 miles to the SW. of Kabul. At the intersection of the two main streets there is a large dome (*Charsu*). Kandahar is well watered by two canals drawn from a neighbouring river, which send to almost every street its own adequate supply; and the same means of irrigation have covered the immediate vicinity with gardens and orchards. Kandahar is a place of great commerce, trading with Bombay, Herat, Bokhara, and Samarkand. Among its permanent residents it has a larger proportion of Afghans, chiefly of the Durani tribe, than any other city of Afghanistan. There are numerous Hindu, Tajik, and Persian merchants. Population

variously estimated from 25,000 to 100,000. About 2 miles to the northward rises a precipitous rock, crowned by a fortress impregnable to everything but heavy artillery. Here, amid all the disasters of the war in 1839-41, the British maintained their ground under Rawlinson. Kandahar has been a pivot for the history of that part of Asia during more than 2000 years. It is supposed to have been founded by Alexander the Great, although the name is Persian. A comparative blank of upwards of thirteen centuries in the history reaches to the famous Mahmud of Ghazni, who wrested the stronghold from the Afghans. From that epoch down to 1747, when the native rule was permanently established, Kandahar, with brief and precarious intervals of independence, was held by Genghis Khan, Tamerlane, and by various rulers of Tartary, India, and Persia in turn. In the war of 1878-80 the British entered Kandahar unopposed, and they held the city till 1881, some months after they had evacuated the rest of Afghanistan (q.v.).

Kandavu, one of the Fiji Islands (q.v.).

Kandersteg, a village of the Bernese Oberland, just below the mouth of the Loetschberg tunnel, is a skiing and curling resort.

Kandinsky, WASSILY, expressionist painter, born at Moscow in 1866.

Kandy, an inland town of Ceylon, on a beautiful little lake among the mountains, 74 miles by rail NE. of Colombo. It is 1665 feet above the sea, and has a mean annual temperature of 76° F. Here are ruins of the palace of the former kings, and a temple in which a reputed tooth of Buddha is jealously preserved (see CEYLON). Pop. 32,000. Peradeniya (q.v.) is near by.

Kane, ELISHA KENT, Arctic explorer, was born in Philadelphia, 3d February 1820, graduated in medicine at the University of Pennsylvania in 1842, and entering the navy as a surgeon, visited China, the East Indies, Arabia, Egypt, western Europe, West Africa, and Mexico; in this last country he did duty on the coast survey. In May 1850 he commenced his career of Arctic discovery as surgeon, naturalist, and historian to the first Grinnell expedition. His account of it appeared at New York in 1854. In 1853 he again set out, this time as commander of an expedition; the results of it are fully detailed in his *Second Grinnell Expedition in Search of Sir John Franklin* (2 vols. Phila. 1856). He died at Havana, 16th February 1857. See Life by W. Elder (Phila. 1858), and the briefer one of M. Jones (Lond. 1890).

Kane, SIR ROBERT (1809-90), chemist, born in Dublin, projected the *Dublin Journal of Medical Science* (1832), received the gold medal of the Royal Society of London for researches into the colouring matter of lichens, and in 1847 the Cunningham gold medal of the Royal Irish Academy for discoveries in chemistry. He originated the Museum of Industry in Ireland, was its first director, and president of the Queen's College, Cork.

Kanem, formerly a vassal state of Wadai, NE. of Lake Chad, French since 1903.

Kangaroo (*Macropus*), a genus of marsupial quadrupeds, of which there are many species, almost all Australian, although a few are found in New Guinea and neighbouring islands. The genus, as now restricted, contains, according to the most reliable estimate, twenty-three species. The kangaroos are of different sizes; some of the Wallabies, which really belong to the same genus, being comparatively small, while the Great Kangaroo (*M. giganteus*) attains a length of 8 feet, counting the long tail. They are entirely herbivorous—mainly grass feeders—and the two lower incisors, which are elongated, play upon each other like the blades of scissors and

crop the grass. The tail is very thick and strong, and the animal uses it as a third leg when moving slowly. The hind-legs are very strong, while the fore-limbs are short. They are very powerful animals, and the hind-limb forms a very effectual weapon for ripping open the bodies of dogs, with the aid of which they are sometimes hunted. They make enormous bounds, and get over the ground very swiftly and gracefully. Some kangaroos can jump a fence 11 feet high; most can jump one of 9 feet. In the districts where they are still numerous they are formidable consumers of pasture; two kangaroos eat as much grass as three sheep. They are treated as vermin, being hunted, shot, poisoned, or killed by means of extensive battues—'yarding' or 'driving'—when parties of horsemen chase them into enclosures and kill them there, many hundreds at a time. The skin is valuable

The Great Kangaroo (*Macropus giganteus*).

for leather, both for shoes and gloves. The flesh is good eating, the tail being a delicacy, and producing excellent soup. The Great Kangaroo was discovered in 1770 on the coast of New South Wales during Cook's first voyage. One of the most remarkable types of kangaroo is the Tree Kangaroo (*Dendrolagus*), in which the hind-limbs have become proportionately shorter in accordance with its arboreal life. The kangaroos and wallabies breed freely in the Zoological Gardens at London, and the young, as in all Marsupials (q.v.), are born in a very imperfect condition. They remain within the pouch of the mother, or retreat there in case of danger, long after they have ceased to be nourished by the maternal milk.

Kangaroo Apple, a species of *Solanum* (q.v.) (*S. laciniatum*), with a somewhat shrubby succulent stem, smooth pinnatifid or entire leaves, and lateral racemes of flowers; a native of Peru, New Zealand, Australia, and Tasmania, in which latter countries its fruit is eaten. When unripe it is acrid, and produces a burning sensation in the throat; but when perfectly ripe it is wholesome.

Kangaroo Grass (*Anthistiria ciliata*), one of the most esteemed fodder-grasses of Australia and India, grows to a height much above that of the fodder-grasses of Britain, affords abundant herbage, and is much relished by cattle. The genus is allied to *Andropogon*, and has clusters of flowers with an involucre. The awns are very long, and twisted.

Kangaroo Island, an island of South Australia, at the mouth of the Gulf of St Vincent, 87 miles by 34 broad, has a nature reserve, fine climate, poor sandy soil, and few inhabitants—all white.

Kangaroo Rat, or **POTOROO** (*Potorous*), a genus of marsupials related to kangaroos. None of the species are larger than rabbits. They feed on roots, which they dig with their fore-feet. The genera *Caloprymnus*, *Bettongia*, and *Epiprymnus* are near akin.

Kanizsa, (1) Nagy (or Great) Kanizsa, a town in Hungary, 136 miles by rail SW. of Budapest, has an active trade in agricultural products, and manufactures bricks, beer, and spirits. Pop. 30,000.—(2) Old Kanizsa (Ó-Kanizsa) in Yugoslavia, stands on the Theiss, 15 miles SSW. of Szegedin. It grows corn and tobacco, and rears cattle and sheep. Pop. 25,000.

Kano, town in the north of Nigeria, has a great market, and with Sokoto forms the chief base for the caravan trade of the interior. Cotton cloth, Hausa gowns, embroidered shoes, and saddles are made and exported. It is famous on account of its walls built of clay, which are between 30 and 50 feet in height, with a thickness at the base of 40 feet. They measure 11 miles round, and are pierced by thirteen gates. It was taken by the British in 1903, and is connected by rail with Lagos on the coast. The place is the chief town of the Hausa (q.v.) race, and is a great Mohammedan centre, with many schools. Pop. estimated at over 100,000.

Kansas, popularly known as the 'Sunflower State,' is the central state of the American Union and the thirteenth in area, and is bounded N. by Nebraska, E. by Missouri, S. by Oklahoma, and W. by Colorado. It is about 400 miles from east to west, and 200 miles from north to south, and contains an area of 82,080 sq. m. The surface is for the most part a rolling prairie, rising in the north-west to between 3000 and 4000 feet. Along the eastern boundary the average elevation is 800 feet, and the rise is so gradual as to be imperceptible; there are no mountains in the state. The bottoms along the larger streams are commonly called valleys, and vary from $\frac{1}{4}$ mile to 5 miles in width; in eastern Kansas they are deeply depressed, and are skirted by bold bluffs rising to 300 feet, but in the west the line between valley and upland can hardly be distinguished. Kansas has no navigable river except the Missouri, which forms a portion of its eastern boundary. The Kansas or Kaw drains nearly half the state, and the Arkansas drains another large portion; the Neosho and Marais des Cygnes furnish the water system of south-eastern Kansas. The larger streams, as the Kansas and Arkansas, are rivers of the plains, with light banks and sandy bottoms; but many of the smaller rivers have rock bottoms, and supply abundant water-power. The timber of the state is found in a narrow belt along the watercourses, principally in the east.

Kansas has a climate subject to extremes of temperature, but neither excessive cold nor heat prevails for long periods. There is a great proportion of bright clear weather in all seasons of the year. While 106° F. has been observed, cases of fatal sunstroke are unknown, and men pursue their ordinary outdoor vocations with scarcely an interruption throughout the year. The mercury rarely falls below zero, and in many seasons the farmers plough during every month of winter. The mean annual rainfall is 37.10 inches; but in the west the supply is much more scanty, and in the upper Arkansas valley irrigation by means of

ditches has been introduced. The average annual temperature is 53° F.

The minerals of Kansas include lead and zinc in abundance on the south-east; coal of excellent quality, the coalfield occupying all the eastern portion of the state; lignite in the west; immense beds of rock-salt; petroleum, natural gas, mineral paint, gypsum, brick-clay, and material for hydraulic cement.

Kansas is an agricultural and pastoral state. The soil throughout is uniformly fertile, but there is a considerable difference in actual productiveness owing to the difference in the rainfall. The area under wheat and maize is over 15,000,000 acres. Other important crops are hay, oats, barley, rye, alfalfa, potatoes, beet, sorghum, and flax. Much fruit is raised, especially apples and peaches. The state is especially suitable for cattle-raising, large stocks of cattle and swine (as well as horses, sheep, &c.) are kept, and meat-packing is a great industry in Kansas City. Creameries are numerous, and more and more attention is given to the raising of blooded stock. Forestry also has engaged the attention of the farmers, and thousands of acres of planted timber now break the surface of the prairie.

The manufacturing industries are chiefly those connected with agriculture and stock-raising. Of these the most important is beef and pork packing, the principal establishments being at Kansas City. Flour-milling is next in importance, and petroleum-refining, butter-making, and the manufacture of glass and beet sugar are worthy of mention. The building of railways began in Kansas in 1860; the mileage in operation (steam and electric) is now about 10,000 miles, and there is now direct connection with the Gulf ports.

Kansas is divided into 105 counties, and sends two senators and eight representatives to congress. State officers and representatives are elected every two years, senators every four. There are insane asylums at Topeka and Osawatomie, a boys' reformatory at Topeka, an asylum for the blind at Kansas City, an institution for the education of the deaf and dumb at Olathe, and an asylum for idiotic and imbecile youths at Winfield; and the state in 1889 adopted also the industrial school for girls at Beloit. In each township two sections (1280 acres) have been given to the common schools, and the sale of these lands forms the basis of the permanent school fund. The state maintains a university at Lawrence; an agricultural college at Manhattan; and a normal school at Emporia. There are also a number of denominational and other colleges in the state. Co-education prevails, with hardly an exception.

History.—Kansas when first known to white explorers was occupied by several tribes of Indians, from one of which, the Kaw or Kansas Indians, the river and the state derive their names. The state, save a small fraction, was acquired in the Louisiana Purchase, and was organised as a territory by the passage of the Kansas-Nebraska Act in 1854. The act provided that the question of the existence of slavery as a permanent institution in the territory should be decided by its people. Kansas at once became the battle-ground between the partisans of slavery and freedom. Large parties from the bordering slave-state of Missouri repeatedly invaded the territory; and armed colonists from South Carolina and other southern states came to take possession. These were met by immigrants from the northern states. Both parties started towns and settlements. Elections were attempted, but resulted in the seizure of the polls by the Pro-Slavery party and the refusal of the Free State party to abide by the declared results. Collisions became numerous, and robberies and murders were

committed. The Federal administration sided with the pro-slavery party, and used the government of the territory and the United States troops against the Free State party. John Brown (q.v.) took part in the civil war which prevailed, and many fights that were almost battles took place. The Free State party were steadily reinforced from the north, and by the year 1857 seemed everywhere in the ascendant; but as late as May 1858 occurred what is known in Kansas history as the 'Marais des Cygnes massacre,' in which six Free State settlers were killed and four badly wounded by a party from Missouri. After several futile endeavours to organise, however, the Wyandotte constitution was finally adopted in 1859, and on the 29th of January 1861 Kansas was admitted as a state of the Union. The civil war immediately followed. Out of a population of 100,000 Kansas sent 20,000 soldiers to the field. Kansas suffered greatly throughout the war, but the building of railroads, begun during its continuance, was pushed with energy at its close; immigration poured in on a scale before unknown in America, and the career of the state has since been one of almost uninterrupted prosperity. The population of Kansas in 1860 was 107,206; in 1900 it was 1,470,495; in 1920 it was 1,769,257. The principal cities are Kansas City, Wichita, Topeka (the capital), Hutchinson, Pittsburg, and Leavenworth.

Kansas City, Kansas, the largest city of the state and seat of justice of Wyandotte county, is situated at the junction of the Kansas and Missouri rivers (adjacent to Kansas City, Mo.), 67 miles by rail E. of Topeka. This city was created in 1886 by the consolidation of several towns, and has since achieved a prodigious growth, due largely to its situation as the converging point of numerous important railway lines. Here are immense stock and meat-packing concerns, and a very extensive grain and flour trade, besides many other industries. Pop. (1890) 38,316; (1920) 101,177.

Kansas City, Missouri, the second city of the state, and one of the great towns of the west, is situated on the Missouri River, 283 miles by rail W. by N. of St Louis. The notable part of the city is built upon a series of steep hills. Large sums have been spent in grading, in laying sewers, and in water and gas pipes; and tramways extend in all directions. The state frontier-line bounds the city on the west, separating it from Kansas City, Kansas. Kansas City, Missouri, possesses numerous fine streets, and handsome residences on the hills. Its public buildings include many well-designed churches, a fine United States court-house, the imposing building of the Board of Trade, and several hospitals; there are two medical colleges, and excellent public schools. The city is the terminus of a number of important railways, and is a principal distributing centre for the rich agricultural region to the south and west. It is one of the leading pork-packing centres and winter-wheat markets in the United States; its stock-yards rank second in the country; and its trade in live-stock is very great. Lumber, provisions, agricultural implements, and coal are largely handled. There are large manufactures of car-wheels, furniture, flour, and many others. Pop. (1860) 4418; (1880) 55,785; (1900) 163,752; (1910) 248,381; (1920) 324,410.

Kansas River is formed by the junction of the Smoky Hill Fork and the Solomon River, in Kansas, at about 97° 25' W. long., and flows generally eastward to the Missouri, which it enters just above Kansas City. Length, nearly 300 miles, or including its forks, 900 miles. Its chief tributary, the Republican River, has a length estimated at 550 miles. The importance of the Kansas River for navigation is, however, not great.

Kan-su', the most north-western province of China (q.v.).

Kant, IMMANUEL, probably reputed at present the greatest of all modern philosophers, was born 22d April 1724 at Königsberg, in East Prussia, where, 12th February 1804, in the eightieth year of his age, as professor of Philosophy in the university, he died. His life, as that only of a student and a teacher, offers few vicissitudes. His father was a saddler, or, more properly, a strap-maker. The tradition is that the family was of Scottish descent, and that the name was originally spelt Cant; but even Kant's grandfather is found to have had his name already spelt Kand or Kant. The Lithuanians also lay claim to his ancestry. So far as school and college are concerned Kant may be considered as thoroughly educated; but during the whole course of these, up to his twenty-third year, he must, as regards comfort, have had but a poor and struggling time of it. For the following nine years Kant supported himself as a family tutor, the usual resource of the ordinary German student, or indeed of the poor ambitious student anywhere. Becoming doctor of philosophy in 1755, he qualified himself in the same year as a *privatim docens*, and, as such, he remained for fifteen years what we would call a private lecturer, though in connection with the university. Not till 1770, when he was forty-six years of age, did Kant become an ordinary professor there (about four years before that he had been promoted to a sub-librarianship, with an annual dole of some eleven pounds sterling). For nearly fifty years, then, we may say that Kant was a teacher of philosophy at Königsberg—a very general one, for he had to embrace in his lectures mathematics, physics, logic, metaphysics, natural theology, anthropology, physical geography, and, more still, *Philosophical Encyclopædia*, to say nothing of pyrotechnics and the art of fortification! There can be no doubt that Kant was acceptable as a teacher, and that his lectures were well attended. We have an interesting testimony from Herder to that effect. His most popular course, however, was, probably, his shallowest—that, namely, on physical geography—though not without features, as well curious in Kant's regard, as, in themselves, interesting and instructive. Only during the last twenty years of his life can it be said that Kant was famous. Before that, even the correspondence with Lambert and Mendelssohn is insufficient to show that his excellent reputation locally had ever been sensibly more general. With or without name, he was the author of a separate work or two that had made no mark; and he had occasionally written creditable papers in the public journals, principally of his own neighbourhood. He was a small, thin, somewhat rickety, bundle of bones; scarcely 5 feet high; as the Scots say, an *auld-farrant* little body; honest, truth-speaking, perfectly well conducted, though not remarkable for his attendance in church; kindly and gracious, and, in his own slender, pedantic-easy way, sufficiently hospitable; but, as evinced by the modest request he refused to the sorely-straitened Fichte, with a tight enough grip on his own little savings.

The writings of Kant can be respectively assigned to three periods, according as they precede, follow, or belong to the dates of his three great *Kritiken* (Critiques). Of these the first is the critical date, 1781; and of the whole period that precedes it the writings are, letters included, some thirty in number. Now, let them be as they may, it is not perhaps improbable that, had Kant died the author of these writings only, both he and they would have been long ago forgotten. Neither his *Thoughts on the True Estimate of Living Forces*,

nor his *General Natural History and Theory of the Heavens*, nor his *Dreams of a Visionary illustrated by Dreams of Metaphysics*, nor even his Latin dissertation *De Mundi Sensibilis atque Intelligibilis Forma et Principiis*, would have availed, it may be, to operate a diversion whether for works or workman. There is, of course, in one of the smaller papers, the hint on Kant's part that the opposing course of the tides is possibly acting in retardation of the rotatory motion of the earth; but, otherwise, the four essays named form all that is of any veritable importance in the first literary period of Kant. Not but that, generally, all through this period, there is evidence of much information and much intelligent curiosity on the part of an earnestly-thinking nature that has already attained to a certain largeness and freedom of scope. The *Thoughts on the True Estimate of Living Forces* was Kant's first publication, and is sufficiently creditable to a young man of twenty-three, though on a question that at that moment had been for some time already authoritatively settled. It is, however, difficult to find in it either the comprehensive inaugural programme of his idolaters, or even the prophetic excellences of his more moderate admirers. The *Theory of the Heavens* was published in 1755; and as regards the suggestion of a nebular hypothesis in that reference Kant deservedly claimed for himself the priority whether we look to Herschel or Laplace. Here, too, nevertheless, Kant only met with his usual bad luck for long. The little anonymous booklet of two hundred pages attracted no attention, not even that of the king, to whom it was dedicated. It may be attributed to Kant as a merit that, at this early date, he speaks of the possibility of there being planets in existence beyond Saturn, as there is to be found in the *Physical Geography* a similar conjecture as regards the existence of what are now called the asteroids. But in the latter reference Kant was not the first; while his suggestion in the former was an inspiration from an idea of his own in regard to comets. What, he asked himself, if, out and beyond Saturn, there were planets in paths increasingly eccentric which, as it were, would tend on the whole to make comets of planets! It is but just to note that, a year before its publication, the *Theory of the Heavens* had been already announced in the essay that concerns the earth's rotation. When one thinks of what speculations must have occupied at this time the mind of Kant, one must acknowledge that all this speaks volumes for the industrious inquiries and the ardent and original reflections of this young man of thirty.

Published in 1766, Kant's *Dreams of a Visionary* is a rather remarkable paper. Kant, all his life, at least longed to believe in the immortality of the soul and the actuality in existence of a world of spirits. He was very much impressed, accordingly, by all those stories in regard to the supernatural intuitions of Swedenborg, so much so, indeed, that he had actually bought, at the enormous expense of seven pounds sterling, the eight quarto volumes of the *Arcana Celestia*. And it is in consequence of his reading in these volumes that he is led to write, half-seriously and half-ashamed, this little, for him exceptional, paper, that is, however, only in the air. Not but that there are, in all probability, signs to be detected in it of that study of Hume at last that led in the end to what has determined itself as his proper work and as his proper worth. These, however, are but obscure and semi-articulate hints, and can hardly be regarded as sufficient to justify the editors of Kant in characterising this writing as 'announcement of his greater enterprises.' The *Dissertation de Mundi Sensibilis atque Intelligibilis Forma et Principiis*, published in

1770, is really the first of these, his *critical* endeavours. It professes to speak of the form and principles of both of the worlds to which we may be said to belong; and it certainly succeeds to its own wish in regard to one of them. For the world of the senses, namely, it does find, before experience, and in anticipation of experience, actual elements of experience that are not due to experience at all, perceptions of things that are not due to the perception of things, but only to the mind itself, only, as it were, to projections from within that throw themselves without, and stand around without. These are Time and Space, which, original or native to the faculty itself, are the *a priori* forms of perceptive sense. That, at least, is the conclusion of Kant; and, in that regard, he is now about as complete in the *Dissertation* as he was eleven years afterwards in the *Critique*. A similar completeness does not follow him at present, however, in respect to the other or *intelligible* world, the world of ideas, of the intellect, the name of which also runs in the title. Probably no one reads this Latin work in these days; but if any one attempts it, most assuredly he will find himself, in regard to what of the *intelligible* world he is to understand he has learned from it, only exasperated. It is only possible to suppose of Kant here, that, having succeeded to his mind in the discovery of *a priori* forms of sense, he can as yet only search and search, and find himself vaguely and variously *bogged*, in a similar attempt with reference to the *a priori* principles of the understanding, the intellect. For success in that respect he had still to wait for the coming into his mind of the idea of school-logic and the forms of the syllogism.

That was the triumph of the great work of 1781, the *Critique of Pure Reason*. We know that what led to the whole work of Kant was the endeavour on his part to find in the proposition of causality that apodictic necessity, and that rationale of it, which Hume, as against his own solution of custom, habit, challenged from philosophy and the world at large. *Every change must have a cause*. Yes, said Hume, but such an affair as change can only be known by experience; without experience it would be unknown. 'Consequently, then, it is but a fact of experience, and, like every other such fact, we know that it *is*, but not that it *must* be. The necessity we attribute to its appearance is only a necessity of custom. On the contrary, says Kant, we really do attribute to any appearance of change a perfect certainty of necessity, a necessity absolute, a necessity, not a dot or a jot, not one iota less apodictic than we attribute to any proposition, to any axiom of the mathematics. That the shortest line is the straight line—our conviction in that respect is not more fixed, assured, immovable, than our conviction that every effect, every change, *must* have a cause. And so far, no doubt, Kant was right. But what, then, further, of the reason of this necessity, the rationale of it, the explanation of it? Seeing that the proposition of causality is really an inferential proposition—a proposition with a conclusion, as it were, from premises—one would have thought it natural on the part of Kant to turn, in the first place, to the consideration of reason and reasoning rather than to the consideration of actual perception and sense. But, probably, as has just been named, it was the suggestion of mathematics that led to this. To explain the necessity of mathematics might be to explain also the necessity of causality. We can leave Kant's consequent proceedings to be pictured here; it is not difficult to realise how he came to his conclusion and to his belief in it. A mathematical truth depended just on the fact of perception; but, inasmuch, again, as a mathematical truth was an

apodictic truth, the perception on which it depended could not be a perception of experience. Such perception could not be *a posteriori*; it must be a perception absolutely independent of experience; a perception, consequently, then, special, proper, and peculiar; a perception *sui generis*—a perception *a priori*! But how could that be? Why, only by space, which was the source and the seat, and, so to speak, the blackboard and tablet of mathematics, being itself *a priori*. But if space were *a priori*, so would time be. As we have seen from the *Dissertation*, this of *a priori* perception, was probably Kant's first acquisition and conquest—towards the rationale he sought. Evidently, however, it was still inadequate to the want. Time and space might be *a priori*, but change, a mere experience of special sense, could not lie there. Could we not add from the intellect an inferential *a priori* form, which, availing itself of the *a priori* perceptive form, might, in combination with it, give birth to an *a priori* schema in supply of the entire virtue of necessity to every actual instance of causality that could possibly emerge? It was here now that the suggestion of logic gave to Kant his whole tree of *Categories* as *syntheses* in correspondence with the *analyses* of the functions of Judgment. Judgments, propositions, were universal, particular, singular; affirmative, negative, infinite; categorical, hypothetical, disjunctive; problematic, assertoric, apodictic. So far, what was concerned was in its nature analytic; but if we supposed an equal number of synthetic functions, then under the same four general rubrics of Quantity, Quality, Relation, and Modality, we should have the twelve correspondent categories of unity, multitude, allness; reality, negation, limitation; substance, causality, reciprocity; possibility, actuality, necessity. It is impossible to follow Kant here in the working-out of all that; but it is really enough to understand as much.

These categories now were *constitutive*: they actually entered into the composition and constitution of things as these presented themselves for the perception of sense. That is, as acting on the *a priori* perceptive matter, or manifold of space and time, they (the categories) gave rise to a pure or *a priori* perceptive-intellectual *schema* that, combining with the sensations of sense as these came into consciousness (from whence they might), produced, in projection around us, this ruled and regulated, orderly, intelligible universe, in which the necessity due to the categories was the very source of law. To these constitutive materials there were added, *regulatively*, the three *Ideas*. Determined by the Category of Relation in the three forms which are found under it, there are, generically, three forms also of the logical syllogism, applicable respectively to the unconditioned of the *categorical* synthesis in a subject, of the *hypothetical* synthesis of the terms of a series, and of the *disjunctive* synthesis of parts in a system. And these results, otherwise named, are the objects of psychology, cosmology, and theology, or the soul, the world, and God. These, however, are but ideas—only centres, as it were, for further simplification and regulation among the categories themselves. It is for the *Critique of Practical Reason* now to come in and extend at least the *conviction* of existence to these transcendental objects of soul, world, God; and what supplies authority and fulcrum to this critique in this is the *categorical imperative*—the fact of the practical ego possessing a categorical imperative in determination of its own will. Considering that the ego, *theoretically*, was declared to be no more than an idea—no more, so to speak, than a mere logical dot on a mere logical *i*—it is hard to understand how, *practically*, it can rise at once into

such throne of an autocrat. But this is certain: it is for his practical critique that Kant deserves all our heartiest praise. So much has Kant what he writes at heart here that all seems to issue at once from within him in a single breath. No purer, no more living morality, has ever been professionally produced by philosopher than glows in the *Ethics* of Kant.

It would appear that when Kant had accomplished as much as this, he turned back to look upon it and reflect. I have found, he seems to have said to himself, my *Categories* in the *a priori* of the understanding, and my *Ideas* in the *a priori* of the reason. That is enough for our theoretical and practical interests; but what of our only other generic interest that remains—what of our interest that we call *aesthetic*? That refers to a function on our part that seems intermediate between the other two—the theoretical and practical functions. But these depending respectively on the Understanding and Reason, is there nothing similarly intermediate between these two again? Yes, there is Judgment. And so it was that Kant was led to his third great critique, the subjects of which were generally, to say so, the products of Art—i.e. Beauty, Sublimity, Design. Beauty originated in the harmony of our own two constitutive elements—sense on the one side and intellect on the other. Sublimity was the feeling of the exaltation in mind above every menace and magnitude of sense. Since design, so to speak, meant evident arrangement by another hand as though from without, it was impossible to give it place, on such terms, in our world; which, in the contributions of special sense (mere sensations), in time and space, in the categories, the ideas, and all else, was only a world within—a world, indeed, all but wholly of our own construction within. We could only say of it (design), in such circumstances, that we ourselves were so fashioned that we could only see into our world *as though* it were the product of an understanding.

Among the remaining works of Kant there are some of considerable bulk and some interest, but little value—at least so far as originality is concerned. Such are the *Anthropologie* and the *Logik*. The *Streit der Facultäten*, *Rechtslehre*, *Tugendlehre*, *Religion innerhalb der Grenzen der blossen Vernunft*—all are well worth reading, and will greatly help to a general understanding of their author. In that latter respect the *Prolegomena*, the criticism of Eberhard, and the essay on the Progress of Metaphysics since Leibniz and Wolff, are specially to be signalled, and may even be named indispensable. The essay in the philosophy of nature, *Metaphysische Anfangsgründe der Naturwissenschaft*, cannot well be neglected, and still less, perhaps, various little essays in natural history. Even the critique of Herder will be found good, and, just on the whole, it may be said that no work on Kant's part, however small, should, if belonging to the middle or concluding period, fail to be read. The little essays that bear on natural history, for example, however unimportant they may appear, contain more than one declaration that is of interest, in so far as Kant, though averse, probably, to the dogma of direct creation, has yet, in his perception of the existence of ideas, and of actual concert on ideas, in nature, never a thought of even the suggestion of a mechanical evolution through chance.

It is impossible to overrate the enormous impulse which Kant has been the means of giving to the study of philosophy, both in Germany and everywhere else (as well in America and the East as in Europe). Quite a host of names, besides those of Jacobi, Fichte, Schelling, Hegel, Herbart, Krause, Schopenhauer, Schleiermacher, might be mentioned

in this connection. It is not quite certain, however, that Kant's work will prove to have been more in the end than one principally of suggestion. We know not but that, if all that monstrous gaunt machinery—*aesthetic*, *analytic*, what not—had been offered precisely as the machinery proper for the production of the necessity in causality—we know not but that, if all that monstrous gaunt machinery (time and space themselves shut up within it) had been seriously offered, *for that purpose, from Germany, and in the time of Hume*—we know not but that it might have been received with something more unequivocal than a smile! But be that as it may, and assuming the constructions of Kant to prove in themselves neither a solution for the problem of the universe, nor yet for the problem of causality, we have still to bear in mind what *suggestion* in his regard means. Apart all consideration of his followers, the truth is that it is to Kant we owe—with discount only of all necessary historical addition—our entire metaphysical material at present. Really, whatever metal of speculation is anywhere turned now, the ore of it was Kant's. The *Critique of Pure Reason*, if not precisely to be named a liberal education, very certainly is, has been, and will remain, an education in philosophy.

BIBLIOGRAPHY.—A complete bibliography of Kant would cover pages, and is beyond the proportions of this publication. We name only what will probably be found most useful. Of the whole works four editions may be mentioned, those of Rosenkranz and Schubert (Leip. 1838-42); of Hartenstein (Leip. 1838-39); again of Hartenstein (Leip. 1867-69); of V. Kirchmann (Leip. 1868, and further). Benno Erdmann (Leip. 1880) edits a notable edition of the *Critique of Pure Reason*, and Reclam, of Leipzig, publishes a very useful small edition of the same work, edited by Kehrbach. Of translations of the *Critique of Pure Reason* into English there are those of Meiklejohn and Max Müller, and the text-book to Kant of Stirling. Abbott and Bax also translate into English important works of Kant, the one the *Ethics* and the other the *Prolegomena*.

Of writers generally in regard to the philosophy of Kant the following may be mentioned—German: Hegel, Michelet, Erdmann, Ueberweg, Schwegler, Kuno Fischer, I. H. Fichte, Chalybaeus, Ulrici, Biedermann, Weigelt, Fortlage, Ritter, Kirchner, Drechsler, Liebmann, Hayn, Oischinger, Schaarschmidt, Zeller, Drobisch, Steffen, Windelband, V. Hartmann, Krause, Volkelt, Hölder, Vaihinger, Staudinger, Lesswitz, Spicker, Paulsen, Thiele, Cohen, Riehl, Stadler, Thilo, Dühring, Sigwart, Falkenberg. French: Ott, Willm, Wocquier, Foucher de Careil, Barchou de Penhoen, Saintes, Maurial, Saisset, Villers, Vacherot, Cousin. Italian: Galuppi, Testa, Spaventa, Lilla, Cesca. English: Nitsch, Willich, Hodgson, Laurie, Montgomery, Bolton, Ingleby, Adamson, Seth, Hastie, Bowen, Morris, Porter, Caird, Watson, Mahaffy, Maguire, Monck, Green, Wallace, Mansel, Lewes, Nakashima, Balfour, Macmillan, Kemp Smith, Ward, Ewing.

Kaolin, or CHINA CLAY, is fine white clay used in making porcelain. Like less pure clays, it is essentially a hydrous silicate of alumina, but it is a comparatively rare substance. The clays found in most localities contain iron in sufficient quantity to colour them red or buff when burned in a kiln, but China clay is of a pure, or nearly pure white both before and after it is fired. This, together with its refractory nature, makes it of great value in the manufacture of porcelain, of which it forms the chief ingredient. It is also used to a considerable extent by paper-makers, and in less quantity in the making of some chemical products. Kaolin is a product of the decomposition of the felspar of a granitic rock. The name Kaolin is derived from the Chinese *Kao-ling*, 'high ridge,' the name of hills near King-tih-chin in Chiang-hsi, a chief seat of the porcelain manufacture in China. Clay from this district was sent to Europe early in the 18th century by Jesuit missionaries; similar clay

was discovered in Saxony; and about 1755 it was discovered in Cornwall, whence the chief English supplies are obtained, some being also obtained in Devonshire. Kaolin is found in France, and many of the eastern states of the American Union. See CORNWALL, FELSPAR, POTTERY.

Kapellmeister (German), the director of an orchestra or choir, more especially (formerly) the band of a ruling prince in Germany.

Kapila, the founder of the Sāṅkhya philosophy, one of the philosophical systems of the Hindus. He is usually reputed to have been a son of Brahmā; but he is otherwise described as an incarnation of Vishnu.

Kapilavastu, birthplace of the Buddha. See BUDDHISM.

Kapok. See SILK-COTTON.

Kapp, WOLFGANG, born at New York in 1868, became an official in Germany, attacked Bethmann-Hollweg, and sat as a Conservative in the Reichstag. In 1920, with the help of General von Lüttwitz's troops, he contrived a *Putsch* in Berlin. The government fled; but a general strike ensued, and Kapp's reactionary administration crumbled away in four days.

Kappel, or CAPPEL, a village of Switzerland, in the canton of Zurich, $4\frac{1}{2}$ miles N. of Zug. Here the reformer Zwingli was killed in a conflict with troops of the Catholic cantons 11th October 1531. A monument has been erected to his memory.

Kapteyn, JACOBUS CORNELIUS (1851-1922), astronomer, born at Barneveldt, in Holland, studied at Utrecht, was an observer at Leiden for two years, and in 1878 became professor of Astronomy at Groningen. There he conducted measurements and reductions for the southern photographic *Durchmusterung*. He worked also at parallax and proper motion, and discovered the two star-drifts. See STARS.

Kara, the name of a gold-mining district, in a dreary valley in eastern Siberia, about 300 miles from Chita.

Karabel. See HITTITES.

Karachi (*Kurrachee*), a city of India, the capital of Sind and the chief port of entry for the Punjab and the north-west, stands at the northern end of the great Indus delta close to the border of Baluchistan, and is 1170 miles by rail SW. of Delhi. It has excellent and ever-growing harbour accommodation, and ships are loaded at up-to-date docks from the large grain elevators supplied from the grainlands of the Punjab. Iron-founding is also carried on, and cotton-presses add to its wealth. The city is modern and uninteresting, the most attractive buildings being the town-hall, museum, and club. Karachi is connected with Bombay and the Persian Gulf by a good service of steamships. It has been selected as terminus of the air route from England to India. The heat is great, though not so excessive as the interior. In 1922-23 the trade of Karachi in private merchandise ranked fifth among the cities of India. Pop. (1921) 216,883.

Karadjordje (Turkish, 'Black George'), leader of the Serbs in their struggles for independence, was born of poor parents, 21st December 1766, near Kragujevac. He took part in a rising against the Turks in 1787, and was subsequently a cattle-dealer. In 1801 a band of janizaries plundered his dwelling, and he fled vowing vengeance. He soon collected a guerilla band, which gradually increased, and in 1804 he captured the fortress of Sabac. Later he invested Belgrade, and in the beginning of 1806 routed the Turks at the rivers Drina and Morava. With secret help from Russia, he took Belgrade in December 1806. After the

treaty of Slobosic (8th July 1808) he was elected governor of the people, and recognised as prince of Serbia by the Sultan. The French invasion of 1812 compelled Russia to let Serbia shift for itself. Fighting broke out again: the Turks were successful, and Karadjordje had to flee to Austria, where he lived for some time. Meanwhile the freedom of Serbia was secured under the leadership of Miloš Obrenović, at whose instigation George was murdered on his return in July 1817. Karadjordje was the founder of the Karageorgević dynasty, rivals of the Obrenovići. See SERBIA.

Karafuto. See SAKHALIN.

Karagatch, a south-western suburb of Adrianople, on the right bank of the Maritza. In accordance with the Treaty of Lausanne the territory was handed over to Turkey by Greece in 1923. The Greeks leaving it deserted and derelict founded a new city near-by.

Kara-hissar. See AFIUM-KARA-HISSAR.

Karakalpaks ('black-caps'), a Turkish people scattered over southern and eastern Russia.

Karakirghiz, a Turkish people akin to the Kirghiz (q.v.), living mostly in the mountains between Issik-kul and the Kuen Lun. An autonomous Karakirghiz province has been set up in the east of the Kirghiz republic.

Kara-köl. See BOKHARA.

Karakorum, (1) a name given, but according to the best geographers erroneously, to the Muztagh range, in the western Himalayas; sometimes also it is given, again erroneously, to the Kuen-Lun range on the north of Tibet. The Muztagh or Muztagh range is that part of the Himalayas which lies to the west of the Indus and extends as far as the head of the Gilgit Valley. It embraces some of the loftiest peaks of the Himalayan system, including K. 2 (Goodwin-Austen, 28,230 feet).—(2) The name is properly appropriate to a pass (18,550 feet) in these mountains, the culminating point of the route between India and East Turkistan.—(3) The same name, often spelt Karakoram, is also given to two cities in Mongolia (q.v.)—the old Uigur capital of the 8th and 9th centuries, on the Orkhon River, in the north of the Gobi Desert; and the capital of Genghis Khan's Mongol state in the 13th, 25 miles S. by E. of the other. For the mountains, see HIMALAYA; ASIA; and books by Conway, Workman, and De Filippi.

Kara-kum ('black sands'), a desert between Khiva and the Amu Darya on the north, and Persia and Afghanistan on the south, crossed by the Transcaspian railway. To the north lies the Kizil-kum ('red sands').

Karaman. See CARAMANIA.

Karamnasa, a river of India, divides Bihar from the United Provinces, and, after a course of 146 miles, enters the Ganges from the right. The Hindus hold it to be the greatest abhorrence, and will neither drink nor touch its waters, although they are of crystal clearness and abound in fish.

Karamzin, NIKOLAI MIKHAILOVICH, the greatest of Russian historians, was born on 12th December 1765 at Mikhailovka, in Orenburg. His father, an officer of Tatar descent, placed him in the army, but he soon left it to devote himself to literary pursuits, and, after a tour in Germany, Switzerland, and France, established the *Moscow Journal*, and published volumes of tales, critical papers, translations, &c. The work which first gained him a high reputation was his *Letters of a Russian Traveller* (6 vols. 1797-1801). In 1803 he was appointed imperial historiographer, and thenceforward laboured uninterruptedly at his *History*

of *Russia* (11 vols. 1816-29); but he only brought it down to 1613, dying on 3d June 1826 in the midst of his labours. In this great work, the first really critical history of Russia, Karamzin manifests so much enthusiastic admiration for men like Ivan the Terrible that it has been called the 'Epic of Despotism.'

Kara Sea is the portion of the Arctic Ocean lying between Nova Zembla and the Yalmal Peninsula, off the Siberian coast. The rivers Obi and Yenisei discharge their waters into its north-eastern corner. After Nordenskjöld's famous voyage in the *Vega* (1875) the English navigator, Captain Wiggins (who first demonstrated the navigability of the sea in the previous year), more than once succeeded in carrying a cargo of merchandise to the mouth of the Yenisei, and getting back the same summer. From 1911 annual trips were for some years conducted by Jonas Lied and others. Wireless reports of ice conditions at the straits greatly facilitated the Kara Sea route to and from Obi and Yenesei ports for an important trade with Siberia.

Karategin (*Karateghin*), a mountainous eastern province of Bokhara, south of Ferghana. It is traversed from east to west by a tributary of the Amu-Daria, the Surkhob, Waksh or Kizil-Su, with the Hissar mountains to the north and Peter the Great mountains (rising over 20,000 feet) to the south; area about 8000 sq. m. During the long, severe winter it is isolated. Fruit and corn are grown. The population (in part nomadic) is 350,000 to 400,000—Tajiks and some Uzbeks in the west, Karakirghiz in the east. The capital is Garm. Its native rulers lost their independence in 1863. It has been included in the autonomous Tajik province.

Karauli (*Kerowlee*), a native state in Rajputana, separated by the river Chambal from Gwalior. Area, 1242 sq. m.; population, 134,000, nearly all Hindus. It is a hilly country, especially rich in timber.—The capital, Karauli, 75 miles NW. of Gwalior, is defended by a sandstone wall, 2 miles in extent; pop. 20,000.

Karczag, a town of Hungary, formerly capital of Great Cumania, is situated 99 miles by rail E. by S. of Budapest; pop. 23,000.

Kardi. See SAFFLOWER.

Karelia, a region partly in eastern Finland, partly in Russia, inhabited by speakers of the Karelian language, closely related to Finnish. The Russian portion of the area, East Karelia, extends from the Finnish border to Lake Onega and the White Sea, with a Russian-speaking fringe along the coast. Karelian is also spoken to some extent in parts of Ingermanland, and of the governments of Novgorod and Tver. Russia, by help of schools and church, sought to russify the Karelians, whose aspirations for independence or union with Finland complicated the relations of Finland and Russia at the revolution. After some fighting, the peace treaty of 1920 left East Karelia to Russia. It was made an autonomous commune, and in 1923 an autonomous republic of the Russian Soviet federation. Area, 28,600 sq. m.; pop. 144,000; capital, Petrosavodsk (19,000). See *East Karelia and Kola Lapmark*, ed. T. Homén (trans. 1921).

Karens'. See BURMA.

Karikal, the second in importance of the French possessions in India, is on the Coromandel coast, 12 miles N. of Negapatam, in the Kaveri delta; area, 53 sq. m. It is a fertile tract, well supplied with rivers and canals, and largely given up to rice-cultivation. The pleasant little capital (pop. 16,500), about a mile from the sea, has been four times taken by the British. Karikal exports rice, bricks, and tiles, and is a receiving port for

adjoining British districts—South Arcot, Tanjore, Trichinopoly, and Madura. Pop. 55,000.

Karli, a Chaitya temple-cave in Bombay Presidency, on the road between Bombay and Poona. In front stands a lion-pillar, supporting four lions, and bearing an inscription which ascribes its date to the 1st century B.C. The outer porch, 52 feet wide, is closed by the remains of a screen. The dimensions of the interior are 126 feet by 45 feet 7 inches, the height being not over 45 feet. The building consists of 'a nave and two side-aisles, terminating in an apse or semi-dome, round which the aisle is carried.' All the pillars are octagonal, the seven behind the dagoba or Tope (q.v.) being plain, but the fifteen on either side of the nave having richly ornamented capitals bearing elephants and human figures, all admirably executed. Over the entrance is one great window in the form of a horseshoe directing the light mainly on the dagoba. See Fergusson, *History of Indian Architecture*.

Karlings. See CARLOVINGIANS.

Karlovac. See CARLSTADT.

Karloveci. See CARLOVITZ.

Karlsbad, Karlskrona, Karlsruhe, &c. See CARLSBAD, &c.

Karlsburg (Rum. *Alba Iulia*; Magyar, *Gyula-Fehérvár*), a town and fortress of Transylvania, near the Maros, 170 miles E. of Szegedin by rail. There the union of Transylvania with Rumania was proclaimed in 1918; and there in a Romanesque church, built for the purpose, the king of Rumania was recrowned in 1922. Pop. 10,000.

Karma. See BUDDHISM, THEOSOPHY.

Karmathians, a religious and communistic sect into which the Isma'is (q.v.) developed in Asia under the lead of Hamdan Karmat, a peasant-prophet in the region of Kufa. The secret society soon organised itself and began a formidable peasant war. Bahrein was overrun; Damascus had to ransom itself; Baalbec was taken and its inhabitants put to the sword. Abu Said's son, Abu Taher, succeeded him. In 923 he took and plundered Basra; next year he plundered a caravan of 20,000 pilgrims returning from Mecca; and in 925 captured and plundered Kufa, killing or enslaving the inhabitants. In 930 during the Hajj he took Mecca, killing 30,000 persons, choked the well Zem Zem with corpses, and carried away the black stone. Then he threatened Bagdad with only 500 horse from among his 107,000 armed zealots. During the next eight years there was no Hajj, but it was resumed on a payment of 25,000 dinars by the khalif to Abu Taher. This leader died in peace in 943, leaving the control of religion and politics to a council of seven. After a twenty-two years' absence the black stone was brought back to Mecca by the Karmathians and ransomed. During the next hundred years the sect gradually succumbed to the sword and to natural causes, but not until it had acted as a powerful dissolvent on the khalifate.

Karnak. See THEBES.

Karnal, capital of a district in the Punjab, India, 7 miles W. of the present course of the Jumna, and on the Western Jumna Canal. The population, nearly 30,000 in 1865, is now 23,000.

Kärnthen. See CARINTHIA.

Karnul (*Kurnool*), a town in Madras Presidency, India, 110 miles S. by W. from Haidarabad, manufactures carpets and coarse cotton-cloths; pop. 28,000.—The district—separated on the north by the Krishna from the Nizam's Dominions—contains 7580 sq. m., and has a population of 915,000. The Cumbum tank (15 sq. m. in extent) is important for the irrigation of the district, and the canal of

the Madras Irrigation Company traverses it for 140 miles.

Károlyi, COUNT MICHAEL, born 4th March 1875 at Budapest, from extreme Chauvinist conservative developed through radicalism into a pacifist in alliance with the socialists. He opposed Count Stephen Tisza, headed the revolution as prime minister (1918) and president of the Hungarian People's Republic (January-March 1919), but was swept aside by Bela Kun, and withdrew from Hungary.

Karr, JEAN BAPTISTE ALPHONSE (1808-90), a French novelist who long survived his popularity, was born at Paris, was educated at the Collège Bourbon, and early devoted himself to journalism. His *Sous les Tilleuls* (1832) found an audience for a long series of novels, including *Geneviève* (1838). In 1839 he became editor of *Figaro*, and started *Les Guêpes*, the gay and brilliant but sometimes bitter satire of which brought him many readers, no little ill-will, and attempted assassination. These papers he collected in seven volumes (1853-57)—an attempted revival of the series after 1870 proved a miserable failure. His *Voyage autour du monde* (1845) is one of his best-known books.—His daughter, THÉRÈSE KARR (1835-87), published tales and historical books.

Karoo, or KAROO, a generic name of Hottentot derivation given to the inland plains of the Cape Province, South Africa. The Great or Central Karoo is the elevated basin (2000 to 4000 feet above sea-level, and 350 miles long by 70 to 80 wide) lying between the Nieuwveld range on the north and the Zwartbergen on the south. During most of the year it has a parched, barren appearance, but in spring after rains its fertile soil is covered with a thick, bright carpet of flowers and herbage. Karoo bush—fleshy, succulent-leaved shrubs and deep-rooted bulbous plants—afford excellent pasturage for huge herds of sheep and goats (Angora); ostriches, cattle, and horses are also reared. Game, which once swarmed, has not quite disappeared. The climate is dry and healthy, the winter nights being cold. The annual rainfall averages 10 to 18 inches. Windmills and wells procure water from below the surface; storage-dams and irrigation schemes work wonders in some parts. The Little or Southern Karoo (1000 to 2000 feet) lies between the Hex River mountains and the Zwartbergen. The Northern or Upper Karoo (3000 to 6000 feet) stretches north of the Nieuwveld Range towards the Orange River.

Kars, a fortress of Turkish Armenia, lies about 110 miles NE. of Erzerum. It is situated on a tableland of upwards of 6000 feet in elevation; the climate is therefore rather severe. Pop. 35,000, mostly Armenians, who carry on an active transit trade. In 1828 Kars was taken from the Turks by the Russians under Paskevitch. It was brilliantly defended by the Turks under General Williams for six months in 1855. In 1877 it was invested by the Russians, and carried by storm on 18th November. Long a bulwark of the Ottoman empire in Asia, Kars was one of the Armenian fortresses whose cession to Russia was agreed to by the Berlin Congress in 1878. It was taken by the Turks in April 1918. A railway from Tiflis through Kars province was in 1913 extended from Kars to Sarikamish (then 20 miles from the Turkish frontier), the scene of a great Russian victory, 3d January 1915. The Russian province, with that of Erivan, became a republic in 1918, the nucleus of the republic of Armenia, but Kars became Turkish in 1921.

Karshi (anc. *Nakhsheb*), the second largest town of Bokhara, stands in a plain 95 miles SE. of

Bokhara city and 80 SW. of Samarkand. It is surrounded by well-cultivated land and numerous gardens. Commercially it is of great importance in the transit trade between Bokhara, Kabul, and India. Its knives and firearms are exported to all parts of central Asia, Persia, Arabia, and Turkey. The inhabitants, estimated at 25,000, are for the most part Uzbeks, with a mixture of Tajiks, Indians, Afghans, and Jews. It has been included in the Uzbek republic.

Karst. See CROATIA.

Kartells. See ASSOCIATIONS, TRUSTS, AND CARTELS.

Kārttikeya, the Hindu Mars, or god of war, a being represented by the Purānic legends as sprung from Siva, after a miraculous fashion.

Kārun River (Persian *Kūran*; the *Ulai* of Daniel, viii. 2), the sole navigable river of Persia. Rising in the Zardah Koh Mountains, near Ispahan, it flows west through gorges of the Bakhtiāri Range and joins the Shat-el-Arab at Mohammerah, 40 miles from the Persian Gulf. The pipe-line of the Anglo-Persian Oil Company, which supplies the British Admiralty, runs from a refinery on Abadan Islands, near Mohammerah, past Ahwāz to the oil-fields at Māmātāin and Masjid-i-Sulaimān. The Kārun has been open to commerce since 1888, and is navigable to Ahwāz (117 miles from Mohammerah), where rapids interrupt navigation. Above that other steamers connect with Shuster. It is an important trade route to the interior, and in connection with it an improved caravan road was opened to Isfahān by an English company in 1900.

Karur, a town of Madras, British India, in the district, and 70 miles E. of the town of Coimbatore; pop. 18,000.

Karwar, a seaport of Bombay, British India, capital of North Kanara district, 45 miles S. of Goa. It was formerly a place of considerable importance. Pop. 15,000.

Karwin, a town of Czechoslovak Silesia, 8 miles E. of Ostrau. It is an important coal-mining centre, and has a large brewing industry. It contains a fine castle. Pop. 15,000.

Karyokinesis. See CELL.

Kasai, or KASSAI, the great southern tributary of the Congo (q.v.).

Kaschau (Slovak *Košice*, Magyar *Kassa*), an old and handsome town of Czechoslovakia, is situated in the beautiful valley of the Hernád, surrounded by vineclad mountains, 130 miles by rail NE. of Budapest. The cathedral of St Elizabeth (built 1270-1468) is an exceedingly fine Gothic edifice. Kaschau, which ranks as the principal town of Slovakia, is the seat of a Roman Catholic bishop. Of the Jesuit university founded here in 1659 all that now remains is the library of the law academy. It is celebrated for its hams, and has sandstone quarries, paper-mills, and sugar refineries. Pop. 53,000. Kaschau figured prominently during the Hungarian revolution of 1848.

Kashan, one of the most flourishing towns of Persia, is situated in a well-peopled, well-cultivated district, 3690 feet above sea-level, and 92 miles N. of Ispahan. The vicinity is celebrated for its fruit, particularly melons and pears, and the town for its extensive manufactures of silk-stuffs, gold brocade, glazed tiles (called all over Mohammedan Asia *Kashi*), carpets, and copper-ware. Pop. 40,000.

Kashgar, the political capital of eastern or Chinese Turkestan, and, next to Yarkand, the second place of importance, is divided into Kūhna Shehir ('old city') and Yengni Shehir ('new city'). The town and district of Kashgar have a population of 120,000 souls. The old city is a small fortified place overlooking the Kizil River, by which it

is separated from the new city, said to have been built in 1838. In this last-mentioned part of the town stands the Orda—i.e. the palace of the Chinese governor of the whole province, as well as the Friday Mosque (Juma Mesjid). The people, mostly Turks, intermixed with Tajiks, Kashgaris, Hindus, and Andijanis, excel in certain branches of industry, as the making of cottons, silks, carpets, saddlery, &c. Kashgar, the centre of Mohammedan learning in eastern Turkestan, is besides a famous pilgrimage place to the shrine of Hazreti Appak Khodja, who died here in 1693. The capital and the country round it are noted for great fertility and for a variety of excellent fruits, owing to a rich irrigation derived from several rivers and canals flowing from the north and the west. Its most flourishing period embraces the time from the conquest of Arabs under Kuteiba until the appearance of Genghis Khan, from which time it experienced all the revolutions and wars raging on the confines of Islam and Chinese Buddhism. In 1758 the Chinese took possession of Kashgar, and with short interruption it has remained in their power. The last successful rebellion was that of Yakub Kushbeghi in 1864-77.

Kashkar. See CHITRAL.

Kashmir, or CASHMERE, an Indian state embracing an irregular-shaped mountainous region, part of the Himalayan system, between 32° 30' and 36° N. lat., and 73° 30' to 76° E. long. Within its borders are included the valleys of many snow-fed streams, but chief among them is the valley of the Upper Jhelum at Srinagar—'the Vale of Kashmir'—celebrated in literature and history for the beauty of its scenery and the charm of its climate. It extends for about 120 miles from NW. to SE., with a mean breadth of 75 miles, at a distance of about 130 miles by road from Rawal Pindi, in the Punjab. The flat part of the valley is not more than 80 miles long by 20 wide, with a variable elevation above sea-level of from 5000 to 7000 feet. In it are situated two lakes, the Dul, a little to the north of the winding course of the river at Srinagar, and the Wulur, through which the river flows ere changing its course to the westward and passing through the mountains to the Punjab plain. The two best-known routes to Srinagar are from Rawal Pindi, *via* Murree and the narrow valley of the Jhelum, which is now an open and well-made road, but occasionally very hot; and the route from Bhimbur (north of Gujrat) across the lofty range of the Pir Panjal, rising to 11,000 feet above sea-level. The former is the more convenient, whilst the latter passes through mountain scenery of singular beauty, and possesses the advantage of being cool as well as beautiful. Nothing can well exceed the fertile beauty of the Kashmir valley. It is almost surrounded by snow-capped mountains, the lower spurs of which descend gently in terraced slopes to the level of the valley. These terraces are abundantly irrigated for the purpose of rice cultivation, rice being the staple crop throughout Kashmir. On the margins of the lakes, and scattered through the whole extent of the valley, are magnificent groves of chinar or plane-trees, here and there laid out with great regularity and taste to form gardens and country-seats, which used to be the favourite resorts of the Mogul emperors two centuries ago. Avenues of poplars line the banks of the river and the canals, and lend to the scenery a peculiar grace which is quite distinctive of Kashmir. On the surface of the lakes are floating-gardens composed of masses of vegetation from two or three feet thick—intertwined blocks of aquatic plants. Srinagar (pop. 141,735), a quaint and picturesque old town, built almost entirely of wood, was founded at the beginning of the 6th century. It occupies both banks of the river,

which is spanned by seven log-built bridges, and like all Eastern towns is most unclean. The industries of Srinagar are chiefly shawl-weaving and lacquer work, but Kashmir silver and copper work is rapidly acquiring a distinctive character and rising in importance amongst oriental arts. The peculiar design which marks all Kashmir art is said to be derived from the graceful curves of the river as viewed from the summit of the Takht-i-Suliman, a well-known hill overlooking the city of Srinagar.

The natural productiveness of the country is remarkable. Fruit of almost every description is found nearly wild in the lower valleys, and it is now largely cultivated for the manufacture of wine, for which purpose a great variety is utilised. Flowers, especially roses, are abundant, and excellent attar of roses is manufactured. Large crops of grain are raised. Butter is exported. Notwithstanding this fertility and the general cheapness of food-supply, Kashmir is occasionally subject to the scourge of famine. The famine of 1878, together with earthquakes, and the draining of the country by emigration, reduced the population of the valley by a half. There has been great progress in road-making and in developing the mineral wealth of the country.

Kashmir was conquered by Akbar in 1586, and became part of the Mogul empire. It was overrun by the Sikhs in 1819. Ghulab Singh, the feudatory of the Sikhs, made a treaty with Britain in 1846, by which he was confirmed in possession of Kashmir, and recognised British supremacy. There is a British 'resident' at Srinagar. The ruler has the title of Maharaja of Jammu and Kashmir, and his country includes, besides these two divisions, Bultistan, Ladakh, Gilgit, and Punch. The population in 1921 was 3,320,518, well over half being in Kashmir proper. Three-fourths of the population were Mohammedans, while the remainder, except a few thousand Sikhs and Buddhists, were nearly all Hindus. Thirteen dialects are spoken, Hindustani and Punjabi included; Kashmiri is very closely related to Sanskrit.

See works by Bellew (1875), Drew (1875), Wakefield (1879), Knowles (on Folk-tales, &c., 1885-88), E. F. Knight (1893), Laurence (1895), Miss Cotter Morrison (1904), Younghusband (1909), and Neve (1913).

Kashmir Goat, a variety of the common goat (*Capra hircus*, var. *laniger*), remarkable for its very long, fine, and silky hair, from which the famous Kashmir shawls are made. It is found in Tibet and Bokhara, whence the finest goat-hair is imported into Kashmir. The hair is even longer (18 inches) than that of the Angora goat, and is straight, not curled. A single goat does not yield more than three ounces, and the fleeces of ten goats are needed to make a shawl a yard and a half square. A cross between the Kashmir and the Angora goat has longer, finer, and more abundant hair than either. See SHAWL.

Kashubish, a Slavonic dialect spoken near Danzig. It has been debated whether it should be regarded as a dialect of Polish, or as a form of the extinct Polabian.

Kaskaskia, a river of Illinois, rises in the east centre of the state, flows south-west, and enters the Mississippi at Chester. Length, nearly 300 miles. On its right bank, a few miles from the mouth, was Kaskaskia, now under water, the first capital of Illinois.

Kassa. See KASCHAU.

Kassai. See KASAI.

Kassala, a fortified town of Anglo-Egyptian Sudan, 260 miles S. of Suakin, connected in 1924 with the Athara-Suakin-Port Sudan railway. The district is irrigated for cotton-growing.

Kassel. See CASSEL.

Kassites, or KOSSEANS, a people of Elam, which for five and three-quarter centuries imposed a dynasty upon Babylonia (q.v.). See R. Campbell Thompson in the *Cambridge Ancient History*, I. chap. xv. (1923).

Kastamuni, capital of a province of the same name in Asia Minor, stands 76 miles SW. of Sinope. It manufactures cotton goods and leather; pop. 20,000. Here is the ancestral castle of the Comneni; 'Kastamuni' is perhaps for 'Castra Comneni.'

Kasvin. See KAZVIN.

Kât, KATT or KHÂT (Arabic *qat*). See CATHA.

Katabolism. See METABOLISM; also ANALYSIS, PHYSIOLOGY, PROTOPLASM.

Katahdin, the highest mountain in the state of Maine (q.v.), 5385 feet high.

Katanga, a south-eastern district of Belgian Congo, bordering on Rhodesia, with which it has railway connection. It is rich in copper, radium, and other metals.

Kater, HENRY (1777-1835), an English physicist, was born at Bristol. Entering the army in 1799, he went out to India, and was actively engaged in the great trigonometrical survey. Ill-health compelled him to return home in 1808; then, after labouring for six years in the Royal Military College, Sandhurst, he retired on half-pay. His contributions to science are chiefly to be found in the *Philosophical Transactions* between 1813 and 1832. The most important of his memoirs relate to the determination of the length of the seconds pendulum in the latitude of London; the 'floating collimator'; the British standards of length and mass; and compass needles. Conjointly with Dr Lardner, he was the author of 'A Treatise on Mechanics' in the *Cabinet Cyclopædia*. For the emperor of Russia he verified the Russian standards of length.

Katharine. See CATHARINE.

Kathiawar, a peninsula on the west coast of India, lying between the Gulf of Cambay and the Gulf of Cutch; the Brahman and native name for it is *Surashtra*. Politically, the name Kathiawar Agency (formed in 1822) is given to a collection of 187 states, which between them embrace the greater part of the Kathiawar Peninsula. Area of Agency, 20,911 sq. m.; pop. (1921) 2,538,497. The resident of the Agency lives at Rajkot.

Katkov, MIKHAIL NIKIFOROVICH (1818-87), Russian journalist, born at Moscow, studied at Moscow, Königsberg, and Berlin, and was professor of Philosophy at Moscow. In 1861 he became editor of the *Moscow Gazette*, which he made the most influential journal in Russia. At first an advocate of parliamentary government and reform, Katkov was converted by the Polish rising of 1863 into a Pan Slavist and Chauvinist, and is said to have been mainly instrumental in determining Alexander III. to his conservative and reactionary policy. As the champion of the idea 'Russia for the Russians,' he urged the complete russification, by force if need be, of Poland, Lithuania, and the Baltic provinces.

Katmandhu. See KHATMANDU.

Katrine, LOCH, one of the most celebrated of Scottish lakes, in Stirling and Perth shires, 5 miles E. of Loch Lomond and 1½ W. of Callander. Lying 364 feet above sea-level, it curves 8 miles east-south-eastward, is nowhere quite a mile broad, and has a maximum depth of 495 feet, and an area of 4·78 sq. m. It discharges through Lochs Achray and Vennachar, to the Teith; and since 1859 has supplied Glasgow (q.v.) with water. Benvenue

(2393 feet) and Ben A'an (1500) rise steeply at its lower end, whose shores are beautifully wooded, with the mountain defile of the Trossachs beyond. Here, too, are the now much narrowed 'Silver Strand' and Ellen's Isle, the chief scene of the *Lady of the Lake*. Scott was often here during 1790-1809, as also in 1805 was Wordsworth with his sister Dorothy. See her *Tour in Scotland*, Sir G. Airy's *Topography of the Lady of the Lake* (1873), and Murray and Pullar's *Lochs of Scotland*.

Kat River, a branch of the Great Fish River, in the Cape Province, rising in the Didimaberg, in the fertile valley of which a Hottentot settlement was formed in 1829. It was broken up after the rebellion of 1851-52, and the valley now forms the district of Stockenström.

Katt, KÂT, or KHÂT. See CATHA.

Kattimundoo, a substance somewhat resembling gutta-percha, is the milky juice of the East Indian plant, *Euphorbia trigona*, used in India as a cement.

Kattowitz (Polish *Katowice*), capital of Polish Silesia, 10 miles SE. of Beuthen, has coal, iron, and zinc mines, and kindred industries. The inhabitants are mainly German; but though over four-fifths voted for inclusion in Germany, the town was in 1921 awarded to Poland. Pop. 43,000.

Katydid, a name applied to numerous American insects, nearly related to grasshoppers. They are arboreal in habit, and are well concealed in the foliage by the green colour. The true katydid, abundant in the central and western states, is *Cyrtophyllus concavus*, but *Microcentrum retinervis* is yet commoner, and there are several other species belonging to these and other genera. In their general habit, e.g. in the 'song' to which the syllables kat-y-did refer, and in the egg-laying accomplished by the long ovipositors of the females, these lively insects resemble Grasshoppers (q.v.).

Katzbach, a river in Prussian Silesia, falls into the Oder at Parchwitz. On its banks, near Liegnitz, on 26th August 1813, the French under MacDonald, 80,000 strong, were defeated by Prussian and Russian troops under Blücher. The French lost 12,000 killed and wounded, and 18,000 prisoners, with 103 cannon.

Kaub. See CAUB.

Kauffmann, ANGELICA, painter, was born 30th October 1741 at Coire in the Grisons, Switzerland. Whilst still a child she painted the portraits of notabilities in Italy, and in Rome fell under the good influence of Winckelmann. In 1766 Lady Wentworth, wife of the British resident in Venice, persuaded her to go to London. There she soon became famous as a painter of classic and mythological pictures, and as a portrait-painter. She was befriended by Reynolds, and was nominated one of the very first batch of Royal Academicians. But her life was for a while embittered by a marriage (1767) into which she had been tricked by a mere adventurer. It cost her a large part of her fortune to get the marriage dissolved. In 1781 she married the Italian painter Zucchi (1729-95), and, returning to Rome, lived for her art in a circle of distinguished artists, poets, and scholars. She died 5th November 1807. Her numerous paintings are well known from engravings by Bartolozzi and others. As a painter she fails to attain to the first rank. Grace and harmonious colouring do not atone for faulty drawing and lack of originality. Angelica was also an accomplished singer. Her beauty and talents were sung by such poets as Goldsmith, Klopstock, and Gessner, and her story furnished a theme to Lady Ritchie. See Wessely's *Life of her in Dohme's Kunst und Künstler* (1877); *Dublin Univ. Mag.*,

1873; *Art Journal*, 1890; and the life by F. A. Gerard (1892).

Kaufmann, CONSTANTINE VON (1818-82), a Russian general of German (Holstein) descent, was born near Ivangorod in Russian Poland. He fought against the Circassians, and especially distinguished himself at the siege of Kars in 1855. In 1867 he was appointed governor-general of Turkestan, and at once set himself to organise the newly conquered province; in 1868 he occupied Samarkand, and in 1873 conducted a successful campaign against Khiva. Through his energetic policy Russia became the predominating power in central Asia.

Kaulbach, WILHELM VON, German painter, was born at Arolsen, 15th October 1805, and in his seventeenth year entered the Academy of Arts at Düsseldorf. He was one of Cornelius's best pupils, and followed him to Munich; from 1849 down to the year of his death he was director of the Academy of Painting in that city. Although painting in the severely ideal and allegorical spirit of his master, Kaulbach displayed from the first no lack of individual genius. Among his first important productions were sixteen mural paintings illustrating the myth of Amor and Psyche, in the palace of Duke Maximilian, and Apollo amongst the Muses, for a ceiling in the Odeon. Then he executed a number of designs from the works of Klopstock, Wieland, and Goethe in various royal apartments in Munich. In 1834 Kaulbach completed his grandiose 'Battle of the Huns,' representing the legend of the struggle, continued in mid-air, between the souls of the Huns and Romans who had fallen before the walls of Rome, which was regarded as the culmination of the new German school. Nevertheless, the realistic tendencies of his genius came out in his illustrations of Schiller, Goethe's *Faust*, and *Reineke Fuchs*, and in his 'Mad-house.' In 1846 Kaulbach completed, on the heroic scale, the 'Destruction of Jerusalem by Titus.' For several years from 1847 onwards he was occupied painting the walls of the vestibule of the new museum at Berlin with a colossal cycle illustrating the progress of civilisation. His last gigantic painting is the 'Sea-fight of Salamis' in the Maximilianeum at Munich. In his later years he composed illustrations to Goethe and Shakespeare, and painted many portraits. He died of cholera at Munich, 7th April 1874.

Kaunas, Lithuanian name of Kovno (q.v.).

Kaunitz, WENZEL ANTON, REICHSFÜRST VON, Count of Reithberg, Austrian statesman, was born at Vienna on 2d February 1711, and began his public career under Charles VI. Maria Theresa employed him on diplomatic missions to the courts of Rome, Florence, and Turin, and then appointed him minister to the governor of the Austrian Netherlands. He laid the foundations of his permanent fame as a diplomatist in 1748 at the congress of Aix-la-Chapelle. As Austrian ambassador at the French court in 1750-52 he succeeded in converting the century-long enmity of the two states into relations of amity and goodwill. In 1753 Kaunitz was appointed state chancellor, and in 1756 chancellor for the Netherlands and Italy, and for almost forty years continued to have the principal direction of Austrian politics. On account of the part he played in the affairs of Europe he was jocularly called the European coach-driver. As a man he was very vain and confident of his own abilities, narrow in his political views, regarding exclusively the supposed interests of Austria, yet sincere and upright according to his notions of duty. He took a very active part in the ecclesiastical reforms of Joseph II., and was always an earnest

and liberal patron of the arts and sciences: he founded the art school of Vienna, and several academies in Lombardy and the Low Countries. He retired from public life when Francis II. ascended the throne, and died 27th June 1794. See Lives by Hormayr (in *Der österreichische Plutarch*, vol. vi.) and Beer (1872).

Kauri Pine (*Agathis australis*), a species of Dammar (q.v.), a native of New Zealand. It is a tree of great size and beauty, attaining a height of 140 feet or more. The timber is white, close-grained, durable, flexible, and very valuable for masts, yards, and planks. *A. loranthifolia* of the Moluccas is a similar tree. The Fiji Islands, New Hebrides, and Australia produce other species. All of them are trees of dark, dense foliage, and produce a resin called Kauri Gum. It is sometimes found in pieces as large as a child's head, of a dull amber colour. It is dug up from the ground or dredged from swamps, where forests of these trees have formerly grown; and even lies mingled with coal strata of Tertiary age. It is also collected from the trees from which it has newly exuded, and is then of a whitish colour. The kauri forests had been mostly destroyed when the New Zealand government, in 1921, established a National Kauri Park (900 acres) near Dargaville. The chief uses of the gum are for making varnish and linoleum; the finest quality is used as a substitute for amber. Kauri-gum oil, distilled from the peat of kauri swamps, resembles petrol. See NEW ZEALAND, TIMBER.

Kautsky, KARL, German Socialist leader and writer, born at Prague in 1854, was associated with Engels in London, but lived mostly in Germany. He sided with the Minority Socialists in 1918, and was removed from the editorship of *Die Neue Zeit*, of which he was a founder. A Marxian and editor of Marx's works, he wrote against Bolshevism (*Dictatorship of the Proletariat*, Eng. trans. 1918; *Terrorism and Communism*, trans. 1920; &c.), as well as against William II. (trans. 1920), and collected documents on the Outbreak of the World War (trans. 1924). He wrote also on Christian origins.

Kava. See AVA.

Kavalla, a Greek town, in the nome of Drama, on the Gulf of Kavalla, opposite Thasos, was acquired from Turkey in 1913. It has a great tobacco trade. Pop. 23,000.

Kavanagh, JULIA (1824-77), novelist, born at Thurles, in County Tipperary, lived much in Normandy and Paris. The scenes of almost all her stories are laid in France.

Kaveri (*Cauvery*), a river of southern India, rises in the Western Ghâts, and flows south-east, across Mysore and Madras, to the Bay of Bengal, which it enters through two principal mouths. Length, 475 miles; drainage, 28,000 sq. m. The Kaveri is of no value for navigation, its bed being rocky, with many rapids and falls. The fall at the island of Sivasamudram is famous for its beauty. Other islands in the river are Seringapatam and Srirangam. The river is of importance for irrigation in Mysore and in Madras. For this purpose the main stream has been dammed since the 4th century A.D., the Coleroon (the northern branch) since 1838. The Krishnaraja Sagara reservoir, above Seringapatam, for irrigation and electric power, was begun in 1911. Its enlargement, delayed by disputes till 1924, will make it one of the world's greatest. Others are projected.

Kawi, a language of Java (q.v.).

Kay, JOHN, a famous Scottish caricaturist, was born near Dalkeith in 1742, and from an early age practised prosperously as a barber in Edinburgh,

until in 1785 he opened a print-shop for the sale of miniatures and sketches of local celebrities etched by himself. He died February 21, 1826. Kay's portraits have but little artistic merit beyond a genuine humour, yet he possessed somehow the trick of catching the likenesses of his subjects, and the series forms a unique and invaluable record of the social life of the Edinburgh of his time. His portraits were collected and published as *A Series of Original Portraits and Caricature Etchings by the late John Kay, with Biographical Sketches and Illustrative Anecdotes* (2 vols. quarto, 1838; new ed. with additional plates, 2 vols. 1877).

Kayak. See ESKIMO.

Kaye, SIR JOHN WILLIAM, the historian of English India, was born in 1814, and educated at Eton and Addiscombe Military College. He served for some years in the Bengal Artillery, but retired in 1841 to devote himself to literature. In 1856 he entered the service of the East India Company in England, and, on the transfer of the government of India to the crown, was appointed to succeed John Stuart Mill as secretary in the Political and Secret Department of the India Office, a post which he retained until failing health obliged him to retire in 1874. Three years before he had been knighted, and two years later he died, July 24, 1876. Kaye's works are *The History of the War in Afghanistan* (4 vols. 1851-53); *History of the Administration of the East India Company* (1853); *The Life and Correspondence of Sir John Malcolm* (1856); *Christianity in India* (1859); *History of the Sepoy War in India in 1857-58* (2 vols. 1866-71); and *Essays of an Optimist* (1870).

Kayes, or KHAYES, a town of French Sudan, on the river Senegal, has railway communication with the Niger, Dakar, and St Louis; pop. 12,000.

Kaye-Smith, SHEILA, an exponent of 'Earthy' fiction. The soil of England, and in particular Sussex, is the store from which her characters obtain the power which animates them. She published her first book in 1908; but it is in later works, such as *Sussex Gorse* (1916), *Little England* (1918), *Tamarisk Town* (1919), *Green Apple Harvest* (1920), *Joanna Godden* (1920), *The End of the House of Alard* (1923), and *St George and the Dragon* (1925), that her particular gifts are best seen. A strange feeling of the inevitability of fate pervades her writing, which reaches a high standard of excellence.

Kazan, capital of the Russian Tatar republic, and anciently capital of the Mongol kingdom of the Golden Horde, stands 3 miles from the north bank of the Volga, and 200 miles E. by S. from Nijni-Novgorod. The Mongol kingdom was founded in the middle of the 15th century on the ruins of the still more ancient Bulgarian empire (see KIPCHAKS). At the same time the modern city of Kazan was built 28 miles SW. of the former city. In 1552 the Russians, under Ivan the Terrible, carried the town after a bloody siege, and put an end to the Mongol kingdom. The Kremlin or fortress embraces within its walls the cathedral (1562), a magnificent monastery (1555), an arsenal, &c. The houses are in general one-storied, and stand in the midst of gardens. The town has many churches and mosques, and the Sunbek Tower, an object of veneration to the Tatars. Kazan is the chief intellectual centre of eastern Russia, and a home of oriental study. The university was founded by Alexander I. in 1804; connected with it are a library, an observatory, a botanical garden, an antiquarian museum, &c. Kazan is the seat of an archbishop. The principal objects of industry are leather, soap (made from mare's milk), candles, lace, bells,

books, hempen goods, cotton, sacred pictures, &c. Close to the town are the shipbuilding yards in which Peter the Great built his Caspian Sea fleet. The Tatar merchants of Kazan trade as far as Bokhara and Persia on the one side and to Asia Minor on the other. The central parts of the town are occupied by Russians; the Tatars dwell for the most part in the suburbs. The town was destroyed by fire during Pugatcheff's rebellion (1774), and has suffered severely from the same cause more than a dozen times, especially in 1815, 1825, and 1917. Pop. 146,000.

Kazanlik, a town of Bulgaria, at the foot of the Balkans, 5 miles from the south end of the Shipka Pass, and 87 miles NW. of Adrianople, manufactures attar of roses. Its capture by the Russians on 7th January 1878 led to the surrender of the Turkish defenders of the pass. Pop. 10,000.

Kazbek, or CASBECK. See CAUCASUS.

Kazvin, a town of Persia, 95 miles NW. of Teheran, on the road to Resht, manufactures brocade, velvet, cotton, and iron-ware, and breeds camels and horses; pop. 40,000.

Kea is the native New Zealand name for a species of parrot (*Nestor notabilis*). *N. meridionalis* is known as the Kaka; and *N. productus*, from Norfolk Island, has just become extinct. *N. notabilis* is a mountain species, confined to the South Island; it was originally a vegetable and insect feeding bird, but on the introduction of sheep it began to frequent the stations and to feed on offal; later on the parrot acquired the more objectionable habit of destroying live sheep. The kea selects the woollier sheep as easiest to hold on to; the kidneys and adjoining parts are first attacked, because that region is most easily wounded by the bird planted in the wool of the sheep's back. There are many papers in the *Trans. New Zeal. Inst.* upon these remarkable changes of habits.

Kean, EDMUND, actor, was born in London, in Gray's Inn, 4th Nov. (some authorities say 17th Mar.) 1787. His parentage also is doubtful, for, though it is tolerably certain that Nance Carey, daughter of George Savile Carey, was his mother, it is quite uncertain who his father was. Kean is said to have declared himself to be an illegitimate son of the Duke of Norfolk, but common tradition assigns to him as parent either a tailor named Aaron Kean or a builder named Edmund Kean. Nance Carey being an actress, Kean from his infancy made occasional appearances upon the stage, and when about sixteen years old became a regular 'stroller,' playing in Richardson's show and other temples of the itinerant drama. After ten years' painful experience in various provincial circuits he succeeded in obtaining an engagement at Drury Lane Theatre, where he made his famous first appearance as Shylock on 26th January 1814. His success was immediate, and he at once took rank as the first actor of the day, displacing even John Philip Kemble, whose powers were by this time declining. A period of wonderful success followed; but unhappily Kean's irregularities were as great as his genius, and he gradually forfeited the public approval, his reputation being finally ruined by the *cause célèbre* of Cox v. Kean (January 1825). In this wretched case Kean was found guilty of misconduct with the wife of one Alderman Cox; and, a strange outburst of popular morality drove him off the stage, Edinburgh particularly distinguishing itself in vigorous denunciation of the unfortunate actor. Kean then paid a long visit to America, where he had on a previous visit been very popular. He remained in America till the end of 1826, and on his return home was cordially received; but both mind and body had

given way in his wild career, and he was the mere wreck of his former self. At last, on 25th March 1833, he broke down hopelessly while playing Othello to the Iago of his son Charles, and never acted again. He died at Richmond on 15th May 1833. Regarding Kean's genius as an actor there can be no question. He was a master of passionate expression, and excelled in characters where the emotions are kept at highest tension. In level passages he was absolutely bad, and had no power to represent calm dignity; but in the mental agony of Othello, the wild passion of Shylock, or the cynical devilry of Richard he was unapproachable. No better idea of the irregular grandeur of his playing can be given than is contained in Coleridge's saying, that 'seeing Kean act was reading Shakespeare by flashes of lightning.' Kean's life has been written by Barry Cornwall (1835), F. W. Hawkins (1869), and J. F. Molloy (2 vols. 1888).

CHARLES JOHN, son of the foregoing, was born at Waterford, 18th January 1811. He was educated at Eton for one of the learned professions; but his father's extravagances and dissipations rendered it necessary that he should leave school and do something to support his mother and himself. He accordingly became an actor, in spite of the bitter opposition of his father, who swore that he himself would be the first and last tragedian of his name. Charles Kean made his first appearance, at Drury Lane, on 1st October 1827, in the character of Young Norval, and was received by the critics with almost universal condemnation. But he worked assiduously in the provinces, and studied hard, until in time he attained a fair position in his profession, his efforts being greatly aided by the genius of Ellen Tree (1805-80), whom in 1842 he married. In 1850 Kean became joint-lessee with Keeley of the Princess's Theatre in Oxford Street, London, and there he produced a long series of gorgeous 'revivals.' In 1859 he retired from management, and virtually from the London stage, though he played in America and the provinces till shortly before his death, 22d January 1868. A third-rate tragic actor, he was admirable in melodrama. See his Life by Cole (1860).

Keane, JOHN, LORD KEANE (1781-1844), born in County Waterford, served in Egypt and Spain, at New Orleans, and in India, as commander-in-chief; and earned a baron's title for storming the well-nigh impregnable fortress of Ghazni in 1839.

Kearsley, a town of Lancashire, 3 miles SE. of Bolton; pop. 10,000. In the neighbourhood are coal-mines, cotton-mills, and paper-mills.

Keats, JOHN: Oct. 1795—Feb. 1821. Youngest to rise and earliest to set in that brilliant constellation of poets who ennobled England during the first half of the Nineteenth century, John Keats, both in himself and in his work, is one of the most profoundly interesting and attractive figures in literature. In character, true, magnanimous, modest, and tender; much tried and rarely failing: throughout training himself sedulously for the highest achievement in poetry—his life, as man and as artist, was one of persistent growth onward and upward. It is to trace this development, under both aspects, that the following narrowly limited sketch will be mainly devoted.

John Keats was born in Finsbury, London, son of a respectable livery-stable keeper; sent early to school at Enfield, where an elder boy, Cowden Clarke, turned his boyish energies at thirteen towards literature. Henceforward Keats read much and widely. Greek, like Shakespeare, he never learned, but eagerly studied manuals of classical mythology; in Latin he began and (after leaving school) finished a prose version of the

Aeneid; and we cannot doubt that his passion for melody, felicity of phrase, tenderness and beauty in style, was developed or inspired by Vergil's unequalled magical art. Quitting school in 1811, Keats was first apprenticed to an Edmonton surgeon; then, 1815-17, walked the London hospitals and pursued his medical studies. But poetry had now become paramount; and his high sense of duty withdrew him from a profession demanding imperiously a man's entire devotion.

By 1816-17 Keats had found many friends and associates; notably Leigh Hunt, Haydon, Hazlitt:—men of early promise, and (Hunt and Hazlitt at least) of real ability, though sadly marred or blighted by bad taste, vanity, and weakness. His youth naturally led Keats at first to accept their self-estimate and hence overrate their worth and powers. Morally and intellectually he could gain little, except some genial literary impulse, from natures so inferior to his own: yet though familiarity in time cooled, he remained loyal to their better qualities. His friendship was also sought by Shelley. Their names have been united through *Adonais*; but the wild eloquence, the chill Auroral splendour of that great Elegy display no truth in the portraiture of Keats, no touch of human pathos. The two men were in fact, (generally speaking), antagonistic in nature, principles, conduct, and ruling ideas upon that art in which both were so richly gifted: and hence familiarity, on the part of Keats, now and later, was impossible. Others of less note, Reynolds, Dilke, Armitage Brown, were more to Keats: but above all his intense unwavering affectionateness, (one of several points in which he resembles Catullus), placed his two brothers and sister by far highest in value.

This was the poet's student-period. Vergil was his first—perhaps his most influential—love. Clarke led him to Spenser at the close of 1813. Homer in the fine extravagance of Chapman's version, Chaucer, Shakespeare, Milton, Wordsworth,—'the best sort of poetry' as he said, *color che sanno*, became his bosom-friends. Yet, except in early years, he imitated none: Literature has no poet more decisively original.

Thus far Enfield and Hampstead (then unspoiled) were the landscape, the free nature, whence visions of beauty had been created by the young poet's observant eye, ever 'on the object,' and his vivid imagination. But having (March, 1817) published his first book, Keats found 'pastures new' at Carisbrooke, in the island, afterwards for many years a home of a great modern poet in whose genius we may trace a certain congenital likeness to his own. Here Keats worked at *Endymion*; but solitude was fever to that tropically developing nature; financial anxiety also, (so badly was his slender fortune handled by a guardian), which never wholly left him, threw the first cloud of dejection over his sensitive spirit; and he returned to Hampstead and his friends. Eminent among these was now Bailey, then studying at Oxford, where Keats visited him during Long Vacation, continuing *Endymion* upon the Isis. This may have been the sunniest moment of his life. Bailey was apparently the friend who called out what was best and deepest in Keats: It is he also who has left us the most charming sketch of his conversation: (*Colvin*, p. 76).

In 1818 Keats frequently saw Lamb and Wordsworth, whose poetry, (the *Excursion* especially), amongst that of his contemporaries, most deeply affected him. To nurse his much-loved brother Tom, rapidly failing under consumption, he now moved to Teignmouth; *Endymion* was finished; *Isabella*, for his third volume, begun.

These were the last good days allotted to Keats. His character and his aims as Poet were now

formed; both have been much misinterpreted; let us here attempt to summarize them. Manliness, magnanimity, unselfishness, force of human affection, chivalry to woman,—are the dominant notes of his nature: Hatred of wrong and meanness, insight and generosity in act and judgment:—and all guided by eminent good sense: Personally proud;—as to his abilities and work, almost pathetically humble-minded. Keats was no sensualist, as has been erroneously reported; no vague idealist; for the first too unselfish,—too clear-headed for the latter: and from perversity, instability, and self-conceit singularly free.

A man's art is inevitably conditioned by his nature. From that of Keats, sensitive yet strong, modest yet aspiring, when we add a freshness and fullness of genius which recalls Chaucer and Shakespeare, we might justly anticipate that he would not fail to grasp the true idea of poetry under its main heads, the interpretation of nature and of humanity,—both always subordinate to beauty in sound, words, and form. And we find that it was in such wise that Keats, like Sophocles and Pindar, Vergil and Milton, consciously or not, regarded poetry. He was an artist in the rarest and truest sense; this makes him so noteworthy; it is this, not *Endymion* or *Hyperion*, which ranks him with the Greeks. Pursuing Beauty always as his goal, its sensuous charm, in melody and in wealth of description,—an impulse natural to a youth so gifted—often largely over-dominates his verse to 1818. Yet this style from the first he felt was but the prelude to the higher Muses; the transit from Euphrosyne to Urania. Keats was in truth as exquisitely human as Shakespeare; already in the final piece of his first book he is hoping to quit the mere joys of poetry

for a nobler life,
Where I may find the agonies, the strife
Of human hearts.

By 1818, in an admirable letter comparing Life to a many-chambered house, he notes how he has passed from Maiden-thought,—the bower of youth, pure yet pleasure-devoted,—to a place of darkness: 'We feel the *Burden of the Mystery*.' Hence, though he dares not yet 'philosophise,' he finds that the only worthy pursuit is the 'idea of doing some good to the world:' that he 'can have no enjoyment . . . but continual drinking of knowledge:' he rejoices that he has kept his old medical books. This feeling gradually masters him: 'Scenery is fine, but human nature is finer:' his longing is, not for vain praise, but for 'the glory of making, by any means, a country happier.' That these were not mere words, the details of his life prove: whilst some realization of his hopes in poetry is given by the volume of 1820. And if, by twenty-four, he was only beginning to handle the higher human interests; yet may we not truly say that his country has been made lastingly happier by what Keats did thus leave us?

Returning to the story: Henceforth, in quick sequence, the shadows deepen. George Keats departed for America: John to the Lakes and Western Scotland, where what was to prove consumption, developed by overfatigue, claimed him. Then, (Dec. 1818) came the death of his brother Tom: Last, the passion of first-love for Miss Fanny Brawne. They became engaged; but it was too late:—Poverty, bodily decline, and above all his own intensely loving heart, morbidly anxious, gradually changed what should have been support and comfort to agony. Yet Keats struggled bravely. As if purified by the trial, his genius now rapidly bore its ripest fruit: almost all that his third volume contains—the 'treasures for ever' he bequeathed us—were written between Hampstead, Shanklin and Winchester before Autumn, 1819.

Even yet he hoped to live by literature; but, on his return to Hampstead, health of mind and body began unmistakably to fail: the fatal sign of lung-bleeding appeared in February 1820. Henceforth it is in letters only—letters which throughout his life often rival his poetry itself in loveliness and surpass it in depth of thought—that the sorely-charged heart finds expression. The so-called last sonnet seems to have been written in spring 1819.

In September Keats sailed for Italy; the sad and honourable care of nursing him taken by a young artist and friend, Severn. From Naples they moved to Rome. There even the faint delusive sun-gleams of consumption were soon overclouded. It is a relief to the gloom that the generous wounded spirit now found meet reward from Severn's devotedness. Nearing death, the vague 'sentimental optimism' which formed Hunt's substitute, and perhaps his, for religious faith, proved unavailing: Keats 'contrasting now the behaviour of the believer Severn with his own, acknowledged anew the power of the Christian teaching and example, and bidding Severn read to him from Jeremy Taylor's *Holy Living and Dying*, strove to pass the remainder of his days in a temper of more peace and constancy:' (*Colvin*.)

So, though the bodily suffering and agony of remembered love were intense, calm came at last. 'He lay quiet, with his hand clasped on a white cornelian, one of the little tokens' his Fanny 'had given him at starting.' Thus, 'loveable and considerate to the last,—humbly, after his wont, not (as misinterpreted) bitterly, he spoke of his own work and name as 'writ in water':—until with a 'Thank God, it has come,' his soul resigned itself to Him in peace: (23 Feb. 1821.)

Keats lies within the Aurelian Wall of Rome on its southern side, where the faithful Severn was also buried in 1879.

As 'Maker,' Keats presents two main aspects: he is far more an artist in the highest sense than most modern poets: He has also left us masterpieces in that style of art which his few years allowed him finally to reach. The development of his character and general aims in poetry has been traced; the parallel advance in his writing will be now briefly noticed.

The earliest volume (1817) is frankly experimental. Spenser apparently unsealed the spring of poetry for Keats: yet his three imitative pieces, although Spenserian in musical flow and wealth of imagery, are coloured everywhere (in common with a few short lyrics) by the sentimental tone of the later Eighteenth century, and by slipshod mannerisms caught from Hunt. The tender chivalry of his nature glows through the technical inexperience of the Ode to Woman: Some trochaic lines prelude to his later success in that rare and difficult metre. Several among the sonnets rise much higher: that on Chapman's Homer alone in the volume shows his final mastery. Most interesting however are five poems in the free, lovely, heroic metre of Chaucer and the Elizabethan dramatists. Here, dashed with youthful extravagance, bad taste, and confused metaphor, we find that 'fascinating felicity,' that 'perfection of loveliness' in the interpretation of Nature—(yet Nature externally viewed, without reference to her inner or human meanings)—which, in Matthew Arnold's estimate, is not less than Shakespearian. 'Delight in beauty for its own sake only is the leading note; yet while he wrote Keats had before him the image of Poetry by Raphael (in the Vatican fresco),—with her outstretched wings and eager glance over *Things that he scarce could tell—things that lift the thoughts of men*; and acknowledges with candour that these spiritual depths and heights of the art are as yet beyond him.

Endymion, (1818), that 'feverish attempt, rather than a deed accomplished' (so, with his delightful union of modesty and clear judgment, Keats named it), in its main features of style carries on the work of 1815-17. We have the over-sensuous pictures, the fanciful and even tasteless coinage of words: but also the myriad felicities of touch; the 'morning freshness' of Chaucer; many passages of splendid vividness. Though the subject be Greek, the treatment lacks Greek sobriety, finish, unity: It is Elizabethan-Romantic. The ground-legend is hardly traceable: a vague allegory may underlie the whole—but the serious purpose of the mediaeval allegorists and Spenser, but moral beauty, are wanting.

Two years only separate *Endymion* from the concluding, the treasure-volume of 1820. Keats in this is not yet wholly disengaged from youthful exuberance; Even *Lamia*, his last and strongest poem, is too Asiatic: *Hyperion*, with pictures of unsurpassed magnificence, fails in Epic unity and interest. That supreme beauty, never attained except when it interprets human life in its misery and its greatness, is rarely touched. Yet the growth everyway is tropical: and praise would be idle for the dignity and tenderness of the Odes, the pictorial splendour, the affluence of charm diffused throughout this little volume. One of Pindar's noblest lyrics, we read, was written in gold upon the walls of a Grecian temple. And not a few of the poems now before us might deserve a like honour.

Keats published only the three volumes of 1817, 1818, 1820, and in one edition each. An absolutely literal reproduction of them (the reprints to 1883 teeming with errors), with notes, was edited by F. T. Palgrave; including a few first-rate pieces from the great mass of incomplete and inferior work, withheld by Keats himself, but made public by the cruel kindness of admirers.

See *Lives* by Houghton (1848), Colvin (1886, 1917), Amy Lowell (1925); the *Letters*, ed. Colvin (1891) and Forman; the *Poems*, ed. Drury (1896), Forman, de Selincourt (1921), and Colvin (1915).

Keble, JOHN, son of the Rev. John Keble of Coln St Alwyns, Gloucestershire, and Sarah Maule, a lady of Scottish descent, was born at Fairford, near his father's living, on April 25, 1792. His father, a divine of the school of Ken, educated his son at home, and with such success that at the unusually early age of fifteen he was elected to an open scholarship at Corpus Christi College, Oxford, then a small college, but numbering among its scholars many who rose to eminence in after-life, such as Sir J. T. Coleridge and Dr Arnold of Rugby. His university career was unusually brilliant, for in 1810 he gained a first-class both in classics and mathematics; in 1811 was elected Fellow of Oriel College; and in 1812 gained both the Latin and English prize essays. In 1815 he was ordained deacon, and priest in the following year, beginning active work as the curate of East Leach, near his father's living, while still continuing to reside in Oxford, taking pupils and examining. From 1818 to 1823 he was tutor of his college; but his heart was mainly in parish work, and his mother's death was the occasion which made him leave Oxford and return to assist his father. There in the country he did a work for Oxford and the church which was of the most vital importance. Three points need specially to be singled out in this work. (1) First in time comes the influence of his poetry. In 1827 he published with much diffidence, and only in deference to the wishes of his friends, *The Christian Year, or Thoughts in Verse for the Sundays and Holydays throughout the Year*. The influence of this volume

was not very great at first, but its excellence was recognised by true critics, and later on, when the Tractarian movement had made its writer well known, and had stirred a deeper interest in its theme, it had an influence which can scarcely be overrated. For, though some of the poems are rather obscure and somewhat constrained and artificial, as though written to complete the series, yet the greater number have a genuine ring of inspiration in them: the love of home life and of nature, a calming, soothing sense of the ever-present love of God, a sobriety of religious feeling, and a sad undertone of grief for the moral and spiritual degeneracy of the church are its most striking characteristics. His own theory of poetry—that it is the vehicle for the expression of the poet's deepest feelings, controlled by a certain reserve—was explained in an interesting article in the *British Critic* in 1838 on Lockhart's *Life of Sir Walter Scott*. It was worked out at length and illustrated by an examination of the chief Greek and Latin poets in his Latin lectures delivered as professor of Poetry at Oxford, an office which he held from 1831 till 1841.

(2) His intercourse with Oxford was thus kept up, and at the end of 1827 many of his friends wished to see him elected to the vacant provostship of Oriel, and he himself would willingly have accepted such a recall to Oxford. It became, however, clear that a majority was in favour of Dr Hawkins, and Keble withdrew his candidature. But meanwhile a movement was in progress which was to affect Oxford to its centre. Keble had gathered round him in his curacy a small knot of pupils, of whom the most striking was Hurrell Froude. In that knot was formed the impulse which generated the Tractarian movement. Starting from the desire for a moral and spiritual revival of the English Church, revolting from the defects of learning and of taste which characterised the Evangelicals, and much more from the secular Erastianism of the dominant Whig party, these friends fell back upon the primitive ideal of the church, emphasising its essentially spiritual character, laying stress on the reality of the apostolical succession, of the prerogatives of the priesthood, of the grace conferred in the sacraments, and insisting on a high spiritual ideal of life. In his sermon on National Apostasy (1833) Keble gave the signal for active movement, and for the next few years was busily engaged with Newman, Pusey, I. Williams, T. Keble, and others in the issue of the *Tracts for the Times*, until the series was brought to an end by the publication of Tract No. 90 in 1841. Meanwhile Keble had in 1835 married Miss Charlotte Clarke, the daughter of an old friend of his father, and had removed to the living of Hursley, where he remained until his death.

(3) Keble had not only been one of the originators of the movement; he was also, with Dr Pusey, the steady influence which supported it under the shock caused by Newman's secession to Rome. For the last twenty years of his life he was the trusted correspondent and confessor of many who were in intellectual and spiritual anxiety. He was the constant champion of the church at each critical moment, taking a prominent part by his pamphlets, especially on questions connected with marriage and divorce, with the nature of Christ's presence in the eucharist, and with the independence of the church tribunals. He also contributed much to the cause of theological knowledge by his careful edition of Hooker's works, his life of Bishop Wilson, and his translation of St Irenæus. Perhaps even more than in any of his writings he has influenced the church by his character. The type of dutifulness, whether to parents or to his church, full

of affection for home life and of reverence for children, generous to his friends, chivalrous and almost Quixotic in his desire to sacrifice himself for the cause of the truth, indignant against injustice or disloyalty, with an indignation tempered by severe self-restraint, and ever striving after a deep humility, he created an impression of saintliness, and won for himself a rare mixture of love and reverence. He died at Bournemouth on March 29, 1866. Besides the works mentioned, he published the *Lyra Innocentium: Thoughts in Verse on Christian Children* (1846), a poetical translation of the Psalter, and many theological pamphlets. Since his death have been published a most valuable volume of *Letters of Spiritual Counsel*, twelve volumes of parochial sermons, occasional papers, reviews, *Studia Sacra*, &c. A permanent memorial to him exists in Keble College, Oxford, erected by subscription after his death, and incorporated on June 6, 1870. This was founded on the lines of the report of a committee, in which he himself had been much interested, for extending the university by the building of a new college on more economical principles; and it aims at providing an academical education, at a less cost than the older colleges, for members of the Church of England.

See *Memoir of Keble*, by Sir J. Coleridge (1869); J. C. Shairp, *Essay* (1866), and his *Studies in Poetry and Philosophy* (1872); also a collection of memorials by J. F. Moor (1866); and a short *Life* by the Rev. W. Lock in 'English Leaders of Religion' (1893).

Kecskemet, a Hungarian town on a plain 55 miles by rail SE. of Budapest; pop. 73,000.

Kedah. See MALAY STATES, QUEDAH.

Kedron, or KIDRON, spoken of as a 'brook' in the English Bible, should rather be called (as in John, xviii. 1, new version, margin) 'ravine' or 'winter-torrent.' See JERUSALEM.

Keelhauling, a punishment in use in the navy during the 17th and 18th centuries. The culprit was suspended from one yard-arm, then suddenly dropped into the water, and hauled beneath the keel up to the yard-arm on the other side. This was the mode adopted on large square-rigged vessels. On small fore-and-aft vessels the delinquent was let down over the bows, and was drawn aft underneath and along the keelson by a hauling-line, and brought up at the rudder-chains. (Cf. Marryat's *Dog Fiend*.) Keelhauling was practised on an Egyptian corvette so recently as August 1882.

Keeling (or KOKOS KEELING) **Islands**, a group of more than a dozen coral atolls in the Indian Ocean, 12° S. lat., and about 500 miles SW. of Java, are attached to the Straits Settlements, are covered with coconut palms, whence oil is extracted, and are inhabited by about 800 Malays, but owned by a descendant of J. Ross. Pigs and rats are the only mammals; there are no land-birds but poultry; crabs, large and small, abound. These islands were discovered by Captain Keeling in 1609, and were visited by Darwin in 1836; it was upon his study of them that he based his subsidence theory of the formation of coral-reefs (see CORAL). Guppy found here confirmation of Murray's view, and Wood-Jones evidence for his own theory. These islands saw the last fight and burning of the *Emden* (November 1914). For Ross see Sir Hugh Clifford, *Heroes of Exile* (1906).

Keene, capital of Cheshire county, New Hampshire, 92 miles NW. of Boston; pop. 11,000.

Keene, CHARLES SAMUEL (1823-91), an imitable artist in black and white, born of Ipswich ancestry at Hornsey, was the son of a solicitor. He was educated at Ipswich; and having tried law in his father's London office, and architecture under Mr Pilkington, found more congenial work when

apprenticed to the Whympers as a wood-engraver. Otherwise he had no regular art training. After his apprenticeship was over he worked for the *Illustrated London News* and other periodicals; and in 1851 began to work for *Punch*, with which his name was identified till a few months before his death. He illustrated *Robinson Crusoe*, *The Cloister and the Hearth*, *Evan Harrington*, and *Mrs Caudle's Curtain Lectures*, and did some admirable work as an etcher. During his lifetime his work was never appreciated at its full value save by artists. He was a keen observer, an uncompromising realist, and though humorous himself, was not above drawing to illustrate other people's jokes, sternly avoiding artificial or exaggerated funniness. He had an absolute command of his medium, and an exceptional economy of line. Many of his characters have become types and models for all time, not as new creations, but as actual individuals truly observed.

See *Life* by G. S. Layard (1893), and *The Work of John Keene*, by Pennell and Chesson (1897).

Keep. See CASTLE.

Keeper, or LORD KEEPER OF THE GREAT SEAL, one of the great offices of state, practically merged since 1757 in that of Lord Chancellor (see SEAL). An act was passed at the instance of Sir Nicholas Bacon, lord keeper, assigning or confirming to the holder of that office rank and precedence equal to that of Lord High Chancellor. From 1558 to 1700 there were eleven lord chancellors and twenty-one lord keepers; from 1700 to 1757, six chancellors and four keepers. The last lord keeper, appointed in 1757, was Lord Henley.

Keepsake. See ANNUALS.

Keewatin, named from an Indian word, *keewaydin*, for the north-west wind, is a provisional district (1920) of the North-West Territories of Canada, between 60° N. lat. and the north coast, and between 102° W. long. and Hudson Bay, including Southampton Island and others within the Bay, but excluding Melville Peninsula. The northern parts of Ontario and Manitoba were till 1912 in Keewatin.

Kef, EL, a walled town of Tunis, 95 miles SW. of the capital, perched on the side of a steep hill, was noted in Carthaginian times for its temple to Astarte. There exist a ruined temple, thermae, and cisterns of Roman construction. Pop. 6500. A picture of early Christian life at this place is given in Cardinal Newman's *Callista*.

Keftiu. See CRETE (*History*).

Kehl. See STRASBURG.

Keighley (pronounced *Keethley*), a municipal borough (1882), in the West Riding of Yorkshire, on the Aire, amid the moorland scenery of the Brontës' country, 9 miles NW. of Bradford and 17 WNW. of Leeds. The manufactures of worsted and woollen goods, worsted-spinning machinery, and sewing and washing machines are important. Pop. (1851) 13,050; (1881) 25,245; (1921) 41,942.

Keightley, THOMAS (1789-1872), a busy writer, was born in Dublin, was educated at Trinity College, settled in England to a life of letters in 1824. His histories of Rome, Greece, and England held their place as school manuals until superseded by better books. His *Fairy Mythology* (1850) largely retains its value, as do to a less extent his *Life, Writings, and Opinions of Milton* (1855), and his annotated edition of Milton (1859).

Kei Islands, a small group in the East Indies, lying S. of Dutch New Guinea and NE. of Timor, consists of Great Kei, Little Kei, and some smaller islets; total area, 680 sq. m. Great Kei is a long narrow island, stretching north to south, volcanic in origin, with a rocky, hilly surface that rises to nearly

3000 feet. Little Kei, situated to the west of Great Kei, is of coral formation, and lies low; it is said to have made its appearance in the middle of the 19th century during an earthquake disturbance. All the islands are covered with dense jungle. Valuable timber is the chief product. Fishing is the chief occupation; and *bêche-de-mer* is gathered. The group has been Dutch since 1645. The people are Malays and Alfuros.

Keim, THEODOR, a distinguished theologian, was born at Stuttgart, 17th December 1825, studied under F. C. Baur at Tübingen; and was in turns *repetent* at Tübingen, vicar in Stuttgart, deacon and archdeacon at Esslingen, professor of Theology at Zürich (1860), and at Giessen (1873), where he died, 17th November 1878. He published valuable monographs on the religious history of Ulm, Esslingen, and Swabia; sermons (1861-62); *Celsus' wahres Wort* (1873); *Aus dem Urchristentum* (1878); but his name will best be remembered for his works on the Life of Christ, especially the great *Geschichte Jesu von Nazara* (3 vols. 1867-72; Eng. trans. 6 vols. 1873-83), a truly epoch-making work, unequalled in learning, acuteness, and insight. Keim eliminates the miraculous element, regarding the person itself as the real miracle, the divinity of Jesus as depending on the elevation of his humanity attained through a sinlessness which of itself evidenced the miracle of God and his presence on earth. A popular abridgment appeared in 1873.

Kei River, GREAT, a river of South Africa, which in 1848 was made the boundary between Cape Colony and Kaffraria. Transkei is a magistracy of Kaffraria, comprising Fingoland, the Idutwya Reserve, and Gcalekaland, and lying between the Great Kei River and the western boundary of Pondoland. The magistracy forms, administratively, a dependency of the Cape Province. Pop. 2300 Europeans and 196,000 natives.

Keith, ADMIRAL LORD. George Keith Elphinstone, Viscount Keith, was the son of the tenth Lord Elphinstone, and was named after his grandfather the tenth Earl Marischal Keith. Born at Elphinstone Tower, near Stirling, 7th January 1746, he entered the navy, saw service in most parts of the world, and distinguished himself in numerous engagements in the American war and the French wars. He commanded the expedition in 1795-97 which took Cape Town, and was made Baron Keith; and having had the command of the fleet which landed Abercromby's army in Aboukir Bay (1801) he was in 1814 made viscount. He died 10th March 1823. There is a Life by Allardyce (1882).

Keith, JAMES, best known as Marshal Keith, was born at the castle of Inverugie, near Peterhead, 11th June 1696. He came of a family, represented now by the Earl of Kintore, which from the 12th century had held the hereditary office of Great Marischal of Scotland, and whose principal seat was Dunnottar Castle (q.v.). Sir William Keith, the tenth in descent from the founder of the line, was created Earl Marischal in 1458; and George, fifth earl, his sixth descendant, in 1593 founded the Marischal College in Aberdeen. His fourth descendant, William, ninth earl (d. 1712), married Lady Maria Drummond, a Catholic and strong Jacobite, daughter of the fourth Earl of Perth, and by her was the father of Marshal Keith and of his elder brother, George, tenth Earl Marischal (1693-1778). James was destined for the law, and had studied at Aberdeen and Edinburgh, when in 1715 he engaged with his brother in the Jacobite rising, and in 1719 in Alberoni's expedition to the West Highlands, which ended in the 'battle' of Glenshiel (q.v.). Both times the brothers escaped to the Continent; and James held for nine years

a Spanish colonelcy, and took part in the siege of Gibraltar (1726-27). But his creed, the Episcopal, was against him; and in 1728 he entered the Russian service as a major-general. He distinguished himself in the wars with Turkey and Sweden, particularly at the siege of Otchakoff (1737) and the reduction of the Åland Islands (1743). To be healed of a wound received on the former occasion he visited Paris, and thence crossed over to London, where he made his peace with the Hanoverian government, and had more than one interview with George II. In 1747, finding the Russian service in various respects disagreeable, he exchanged it for that of Prussia. Frederick the Great knew his merits, and gave him at once the rank of field-marshal. From this time his name is associated with that of the king of Prussia, who relied as much on Keith's military genius as he did on the diplomatic ability of his brother, the Earl Marischal, whom he despatched on embassies to Paris and Madrid. Keith's talents became still more conspicuous upon the breaking out of the Seven Years' War (1756). He shared Frederick's doubtful fortunes before Prague, was present at the victories of Lobositz and Rossbach, and conducted the masterly retreat from Olmütz. His last battle was not far distant. On 14th October 1758 at Hochkirch (q.v.) Keith, who commanded the Prussian right wing, was shot down while for the third time charging the enemy. The Austrians buried him honourably in the church at Hochkirch, whence Frederick next year translated his remains to the garrison church at Berlin. There, too, in the Wilhelmsplatz, Frederick in 1786 erected a statue of the marshal, a replica of which in bronze was gifted by King William to Peterhead in 1868. Keith died poor and unmarried, but he left children by his mistress, Eva Merthens, a Swedish prisoner of war in 1743. The Earl Marischal, who took no part in the '45, was pardoned in 1760; he was Prussian Governor of Neuchâtel, and from 1764 till his death lived at Potsdam in close intimacy with Frederick the Great.

See the Marshal's fragmentary *Memoir*, 1714-34 (Spalding Club, 1843); an anonymous memoir (Peterhead, 1869); Carlyle's *Frederick*; and German Lives by Varnhagen von Ense (1844; new ed. 1888) and Paczynski-Tenczyn (1889); and for the Earl Marischal a life by Mrs Cuthell (1915).

Kekulé, FRIEDRICH AUGUST (1829-96), chemist, born at Darmstadt, and ennobled as Von Stradowitz in 1895, became professor at Ghent and at Bonn (1865). He made important researches in the chemistry of organic substances, and published a famous handbook of organic chemistry (1861-67).

Kelantan. See MALAY STATES.

Kelat. See KALÁT.

Kelati Nadiri, one of the strongest natural fortresses in the world, in Persia, close to the frontier of Transcaspia. It was raised by Nadir Shah as a defence against the Turkomans.

Kelce. See KIELCE.

Kellaways Rock, highly fossiliferous beds of sand and calcareous sandstones near the base of the Oxford Clay. See CALLOVIAN, JURASSIC SYSTEM.

Keller, GOTTFRIED (1819-90), German poet and novelist, was born at Glattfelden, near Zurich. He studied at first landscape-painting at Vienna (1840-42), but shortly afterwards abandoned painting for literature. From 1861 to 1876 he was state secretary of his native canton. The works on which Keller's fame rest are the romance, *Der grüne Heinrich* (1854; revised ed. 1879-80); *Die Leute von Seldwyla* (1856), a collection of short tales; *Sieben Legenden* (1872); *Zürcher Novellen* (1878); *Gesammelte Gedichte* (1883); and the romance *Martin Salander* (1886). See books by

Bächtold, Ricarda Huch, Ermatinger, Maync; and in English, Marie Hay (1920).

Keller, HELEN ADAMS, born in 1880 at Tusculum in Alabama, lost her sight and hearing from scarlet fever when under two years of age. She learnt the finger alphabet, to read and write, and later to speak, becoming a student at Radcliffe College, and, in 1904, B.A. She published *The Story of my Life* in 1903, *The World I Live In* in 1908, &c.

Kellermann, FRANÇOIS CHRISTOPHE, Duke of Valmy, born 28th May 1735 at Wolfsbuchweiler, in Alsace, entered a French regiment of hussars at seventeen, and had risen to the rank of major-general before the Revolution broke out. In 1792 he received the command of the Army of the Centre on the Moselle, repelled the Duke of Brunswick, and by his daring promptitude delivered France, by the famous cannonade of Valmy. Yet on allegation of treason against the republic he was imprisoned for a year, and only liberated on Robespierre's fall. He afterwards rendered important services in Italy, and on the erection of the Empire he was made a marshal and a duke. In the campaigns of 1809 and 1812 he commanded the reserves on the Rhine. At the Restoration he attached himself to the Bourbons. He was moderate and constitutional in his views. He died 12th September 1820. It was his son (1770-1835) whose charge turned Marengo (q.v.) into a victory.

Kellgren, JOHAN HENRIK (1751-95), Swedish satirist and lyric poet, born at Floby, West Gothland, studied and taught at Åbo, and was librarian and secretary to Gustavus III. at Stockholm. See SWEDEN (*Literature*).

Kells, an ancient town of County Meath, Leinster, Ireland, on the Blackwater, 26 miles W. of Drogheda; pop. 2400. A manuscript copy of the gospels, called the Book of Kells, is beautifully executed with coloured Celtic ornamentation, and is believed to be the work of the 9th century. It is now preserved in the library of Trinity College, Dublin. See ILLUMINATION OF MANUSCRIPTS, and a book by Sir E. Sullivan.

Kelly, NED. See BUSHRANGERS.

Kelp (Fr. *varèch*) is the crude alkaline matter produced by the combustion of seaweeds, of which the most valued for this purpose are *Fucus vesiculosus*, *F. nodosus*, *F. serratus*, *Laminaria digitata*, *L. bulbosa*, *Himanthalia lorea*, and *Chorda Filum*. These are dried in the sun, and then burned in shallow excavations at a low heat. About 20 or 24 tons of seaweed yield 1 ton of kelp. The kelp met with in commerce consists of hard, dark-gray or bluish masses, which have an acrid, caustic taste, and are composed of chloride of sodium, of carbonate of sodium, sulphates of sodium and potassium, chloride of potassium, iodide of potassium or sodium, insoluble salts, and colouring matter. It used to be the great source of soda (the crude carbonate); but this can now be got cheaper and better from the decomposition of sea-salt. A ton of good kelp will yield about 8 lb. of iodine, large quantities of chloride of potassium, and additionally, by destructive distillation, a large quantity of volatile oil, from 4 to 15 gallons of paraffin oil, 3 or 4 gallons of naphtha, and from $\frac{1}{2}$ to 4 cwt. of sulphate of ammonia. Till 1825, before the remission of the duty on salt and on Spanish barilla, the kelp manufacture (introduced into Tyree in 1746) was carried on to a very large extent in the north and west of Scotland, and the value of many estates in the Highlands and Hebrides greatly increased. See SODA, IODINE, SEAWEEDES.

Kelpie. See DEMONOLOGY.

Kelso, a pleasant burgh of Roxburghshire, 23 miles by rail WSW. of Berwick-on-Tweed and 52 (by road 42) SE. of Edinburgh. It stands on the north bank of the Tweed, here joined by the Teviot, and spanned by Rennie's noble five-arch bridge (1803), 165 yards long. In 1126 David I. translated to 'Calchou' a Tironensian abbey, founded by him at Selkirk seven years before. This, wrecked by the English under Hertford in 1545, is now represented by the stately ruin of its cruciform church, Romanesque and First Pointed in style, with a massive central tower 91 feet high. Across the river, on the peninsula formed by the Teviot, stood the royal castle and town of Roxburgh, demolished in 1460; and 1 mile W. is Floors Castle (1718-1849), the seat of the Duke of Roxburghe. Kelso itself has a town-hall, corn exchange, racecourse, and memories of Scott, the Ballantynes, and Sir William Fairbairn. Pop. 3500.

Kelts. See CELTS.

Kelvin, WILLIAM THOMSON, BARON, one of the most brilliant natural philosophers of the 19th century, was born in Belfast 26th June 1824. At Cambridge he highly distinguished himself as an original thinker even in his undergraduate days. He was second wrangler and first Smith's prizeman of 1845, and shortly after was elected to a fellowship in St Peter's College. In 1846 he became professor of Natural Philosophy in the university of Glasgow, where his father had been professor of mathematics. All his numerous writings have the stamp of originality in a marked degree. Perhaps the most remarkable of his earlier papers, published in 1842, is the one in which he solves by an analogy derived from the conduction of heat important problems in electrostatics. To him also we owe the solution of the problem of the transmission of electric currents in submarine cables. It was in this connection that he first came prominently before the public, for it was largely through his refined researches that the Atlantic cable was so soon a realised idea. On the successful completion of the cable in 1866 he was knighted. In 1892 he was created Baron Kelvin. As an inventor of accurate and delicate scientific instruments Lord Kelvin was *facile princeps*. His electrometers of various design—absolute, portable, quadrant, &c.—embody the perfection of mechanical and geometrical adjustment, and his ampere-meters, volt-meters, and watt-meters proved suitable alike for the electrical workshop and laboratory. His sounding apparatus and Compass (q.v.) were adopted by the Admiralty and principal mercantile lines. In pure science Lord Kelvin did incomparable work. Specially may be mentioned his thermodynamic researches from 1848 onwards, including the doctrine of the dissipation or degradation of Energy (q.v.); his magnetic and electric discoveries, including general theorems of great value and the beautiful method of electric images, which has proved a power in all similar investigations; and his work in hydrodynamics, more especially in wave-motion and in vortex-motion. Basing upon the phenomena of gyrostatic motion (see GYROSCOPE), he imagined a kinetic theory of inertia of high interest; and his dynamical theory of dispersion, and indeed all his views on the nature of the Ether (q.v.), are full of suggestiveness. In 1872 his electrostatic and magnetic papers were reprinted in collected form (2d ed. 1884); and his other papers have been similarly published under the title *Mathematical and Physical Papers* (ed. Larmor, 6 vols. 1882-1911), besides *Popular Lectures* (3 vols. 1889-94). He was joint

author with Tait of the famous *Treatise on Natural Philosophy* (vol. i. 1867; 2d ed. in two parts, 1879; never completed), which had incalculable influence on the progress of physics. President of the British Association (1871), of the Royal Societies of London (1890-95) and Edinburgh, he resigned his professorship in 1899, was made Chancellor of Glasgow University in 1904, and dying 17th December 1907, was buried in Westminster Abbey.

JAMES THOMSON (1822-92), his brother, was professor of Engineering in the university of Glasgow from 1872 to 1889. He was an authority on hydraulics, and invented the inward flow vortex turbine. In pure science he is best known as the discoverer of the effect of pressure upon the freezing-point of water. His papers on elastic fatigue, on under-currents, on trade-winds, &c., are all marked by a distinct originality.

For both brothers, see *Lord Kelvin's Early Home*, by their sister, Mrs King (1909); for Kelvin's Life, *Kelvin the Man* (1925), by his niece, Miss A. G. King; for his achievements, his Life by Professor Sylvanus Thompson (1910). James Thomson's *Collected Papers in Physics and Engineering* were edited in 1912 by Sir Joseph Larmor and James Thomson (a son), with a Life.

Kemal Pasha, GHAZI MUSTAFA, Turkish general and first president of the Turkish republic, was born at Salonika about 1881. As a Young Turk he was imprisoned and had a part in the 1908-9 revolution. In the Great War he commanded in Gallipoli and Palestine, and became inspector-general in Anatolia. Head of the movement which set up a National Assembly in Angora (1920), abolished the monarchy and the khalifate, and by the Treaty of Lausanne recovered much that had been lost by the Treaty of Sèvres, Kemal was declared president in October 1923.

Kemble, JOHN MITCHELL, Anglo-Saxon scholar, was the son of Charles Kemble, the actor, and was born in London in 1807. He had his education partly under Dr Richardson, author of the *English Dictionary*, and partly at Bury St Edmunds grammar-school, whence in 1826 he passed to Trinity College, Cambridge, graduating B.A. in 1830. While an undergraduate he spent some time at Göttingen, under the brothers Grimm, who seem to have finally determined his natural bent towards Teutonic studies. The first fruit of these was an edition of the poem of Beowulf (1833-37), to a second edition of which he added a translation, with a glossary and notes. Not to mention several minor publications, he edited for the English Historical Society a valuable collection of charters of the Anglo-Saxon period, entitled *Codex Diplomaticus Aevi Saxonici* (6 vols. 1839-48). But his most important work, which contains the chief results of all his researches, is his unfinished *History of the Saxons in England* (2 vols. 1849; new ed. by W. de G. Birch, 1876). Further work was interrupted by sudden death at Dublin, March 26, 1857. Kemble was for a good many years editor of the *British and Foreign Review*; and also held the office of Licensor of Plays.

Kemble, JOHN PHILIP, eldest son of Roger Kemble, a well-known country manager, was born at Prescott, in Lancashire, on 1st February 1757. His father intended him for the Roman Catholic priesthood, and with this view he was sent to a seminary at Sedgley Park in Staffordshire, and afterwards to the English College at Douai; but the stage mania was on him, and he became, despite his father's earnest prohibition, an actor. His first professional appearance was made at Wolverhampton on 8th January 1776; he afterwards joined the famous York circuit under the command of Tate Wilkinson; and he played also

in Ireland. The success of his great sister, Mrs Siddons (q.v.), gave him the eagerly-coveted chance of a London appearance, and on 30th September 1783 he played Hamlet at Drury Lane. His reading of the character was original and striking, and, though his acting was not then what it afterwards became, it aroused the keenest interest. He continued to play leading tragic characters at Drury Lane for many years, until, indeed, the shiftlessness of Sheridan forced him to leave the theatre. In 1788 Sheridan appointed Kemble manager, and his control of the theatre was notable for the care and completeness with which Shakespeare and the legitimate drama were produced. When driven from Drury Lane in 1802 he purchased a share (one-sixth) in Covent Garden Theatre, for which he paid £23,000. He became manager of that theatre, and made his first appearance there on 24th September 1803 as Hamlet. On 20th September 1808 the theatre was burned to the ground, and on the opening of the new building (18th September 1809) the notorious O. P. (i.e. 'Old Price') Riots broke out, in which the Kemble family were the special objects of public execration. Kemble retired in 1817. He took a formal farewell of the Edinburgh public on 29th March of that year, speaking a farewell epilogue written by his warm friend, Sir Walter Scott. His London farewell was taken on 23d June in his great character of Coriolanus. He afterwards settled down at Lausanne, where he died of apoplexy on 26th February 1823. As an actor Kemble probably has had no superior in the dignified, stately characters of tragedy—he was 'the noblest Roman of them all'—and his Coriolanus, his Brutus, and his Cato were perfect impersonations. He was a magnificently handsome man; stately, if rather stiff, in bearing; a thoroughly intelligent and educated speaker, though labouring under the disadvantage of a weak voice; and, above all, a man of remarkable intellectual power. He was also emphatically a gentleman.—STEPHEN, brother of the foregoing, was born in Herefordshire, 3d May 1758. As an actor he was chiefly remarkable for his enormous bulk, which enabled him to play Falstaff without stuffing. He was for some eight years (1792-1800) manager of the Edinburgh theatre, where he was in continual hot water through lawsuits and other troubles. He died in 1822.—CHARLES, younger brother of John and Stephen, was born at Brecon on 27th November 1775. In 1792 he made his first appearance on the stage at Sheffield as Orlando in *As You Like It*, and on 21st April 1794 made his début in London, playing Malcolm to John Kemble's Macbeth. He continued on the stage till 1840, when, being appointed Examiner of Plays, he retired from the active exercise of his profession. He died on 12th November 1854. As an actor Kemble chiefly excelled in characters of the second rank, and his Laertes, Cassio, and Macduff were scarcely less interesting than his greater brother's Hamlet, Othello, and Macbeth. In comedy he specially distinguished himself, and his name is even yet a tradition for grace, delicacy, and joyous brightness. The wives of Stephen and Charles were both notable actresses.—For Charles's son, see preceding article; two of Charles's daughters complete the list. FRANCES ANNE (Fanny Kemble), born in London, 27th November 1809, made her début in 1829, when her tragic acting created a great sensation. In 1832 she went with her father to America, where two years later she married Pierce Butler, a Southern planter. They were divorced in 1848; and, resuming her maiden name, she gave Shakespearian readings for twenty years. She published dramas, poems, autobiography, &c., and died in London, 15th January 1893. ADELAIDE (1814-79) was distinguished as

an opera singer, but retired before her marriage with F. Sartoris. She was author of *A Week in a French Country House* (1867) and *Medusa and Other Tales* (1868). See Percy Fitzgerald, *The Kembles* (2 vols. 1871).

Kemp, GEORGE MICKLE, architect, was born near Biggar, in Lanarkshire, 26th May 1795, and up to the age of fourteen assisted his father, who was a shepherd. Becoming a carpenter and millwright, he afterwards sought work in England and France, everywhere settling in towns where he could study Gothic architecture; but his tour of Europe was checked by news of his mother's death, and he returned to Scotland in 1826. He ultimately became a draughtsman in Edinburgh, and executed drawings of Scottish cathedrals for a projected Glasgow publication. This was abandoned, however, as was also a project to complete Glasgow cathedral, for which Kemp had prepared a model; but in 1838 his design for the Scott Monument at Edinburgh was accepted. It is on this work alone that Kemp's fame rests, for before the completion of his fairy-like structure the architect was drowned in the canal at Edinburgh on the night of 6th March 1844. See *Life* by T. Bonnar (1892).

Kempen, a town of Rheinland, 7 miles NW. of Krefeld. It manufactures silk, &c. Thomas à Kempis was a native. Pop. 7000. There is another Kempen in Polish Posen, 48 miles by rail NE. of Breslau; pop. 7000.

Kempis, THOMAS A, was so called from Kempen, where he was born about 1379. His family name was Hämerken (Latinised, *Malleolus*, 'Little-hammer'). He was educated at Deventer, and in 1400 entered the Augustinian convent of Agnetenberg near Zwolle, of which his brother John was prior. Here he took the vows in 1406. He entered into priest's orders in 1413, and was chosen sub-prior in 1429, to which office he was re-elected in 1448. His whole life appears to have been spent in the seclusion of this convent. His death took place in 1471. The character of Kempis for sanctity and ascetic learning stood very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which consist of sermons, ascetical treatises, pious biographies, letters, and hymns. Of these, however, the only one which deserves special notice is the celebrated ascetical treatise *On the Following (or Imitation) of Christ*, the authorship of which is popularly ascribed to him. In its pages, says Dean Milman, 'is gathered and concentrated all that is elevating, passionate, profoundly pious in all the older mystics. No book, after the Holy Scripture, has been so often reprinted, none translated into so many languages, ancient and modern,' or so often retranslated. At least eighty editions were printed between 1470 and 1500; and the total number of editions enumerated by Fr. Aug. de Backer (*Essai Bibliog.*, Liège, 1864) was about 3000. Before his death in 1873 he had collected evidence of more than 3000 additional editions. The earliest known English translation (books i.-iii.) was edited by Dr J. K. Ingram for the Early English Text Society in 1893, along with that printed by Wynkyn de Worde in 1504, of which books i.-iii. are by Dr Atkinson, canon of Windsor, and book iv. (from the French) by the Lady Margaret, mother of Henry VII. It is strange that the authorship of a book so popular, and of a date comparatively so recent, should still be the subject of one of the most curious controversies in literary history. The book, up to the beginning of the 17th century, had been ascribed either to Thomas à Kempis or to the celebrated John Gerson (q.v.), chancellor of the university of Paris, except in one MS., which, by a palpable anachronism, attributes it to St

Bernard; but from that time another claimant has been put forward, Gersen, the so-called abbot of Vercelli, whose very existence has not been satisfactorily proved. His claim was strongly argued by Cajetan and many Benedictine writers, and later by M. de Grégory (*Mémoire sur le véritable Auteur de l'Imit.*, 1830) and Renan, but the arguments against it of Father Eusebius Amort and Mgr. Malou (*Recherches histor.*, Tournay, 3d ed. 1858) remain unanswered. These three competitors have divided the voices of the learned, not alone individuals, but public bodies, universities, religious orders, the Congregation of the Index, the Parliament of Paris, and even the French Academy; and the assertors of their respective claims have carried into the controversy no small amount of polemical acrimony. Hilton, an English monk, has also been proposed as author; but the learned have now generally come to concede the honour to Kempis. The theology of the *Imitation* is almost purely ascetical, and (excepting the 4th book, which regards the eucharist, and is based on the doctrine of the real presence) the work has been used indiscriminately by Christians of all denominations. An ancient perfect MS., written by Thomas's own hand, is in the Bourgogne Library at Brussels, and bears the date 1441, but we know that this was not the protograph MS., and indeed MS. copies exist of 1424, 1427, and 1431. We may therefore date the completion of the work between 1415 and 1424. An exact fac-simile was published at London in 1879, with an introduction by Charles Ruelens. The style of the *Imitatio* is characterised by rhythmical periods, cadenced sentences, and frequent (perhaps sometimes accidental) rhymes—a manner not uncommon among mystical writers.

See Kettlewell, *Authorship of the De Imitatione* (1877) and his *Thomas à Kempis and the Brothers of the Common Life* (1882); Victor Becker, *L'Auteur de l'Imitation* (1883); Hirsche, *Prolegomena zu der Imitatio* (1873-94), and his edition (1874); Sir F. R. Cruise, *Thomas à Kempis* (1887), and other works; L. Wheatley, *The Story of the Imitatio Christi* (1891); Montmorency, *Thomas à Kempis* (1906). The first edition (printed at Augsburg by Günther Zainer, 1471 or 1472) was reprinted by Dr Adrian Fortescue. The translation, with introduction, &c., by Dr Bigg (1897), is based, like other English translations, on that of Anthony Hoskins the Jesuit (1568-1615), itself a modernisation of the older one by Richard Whytford (ed. 1520). See the bibliography in Wolfsgruber's *Gerson* (1880).

Kempton, a town of Bavaria, 54 miles S. by E. of Ulm. The upper town grew up around a monastery (8th century) founded by disciples of St Gall; the abbot became a prince of the empire (1360), and the place a free town of the empire (1289). There are some manufactures. Pop. 20,000.

Kempton Park, in Middlesex, 4 miles W. of Kingston-on-Thames, once a royal residence, is now noted for its race-meetings. See HORSE-RACING.

Ken, THOMAS, an English bishop of saintly memory, was born at Little Berkhamstead, Herts, in July 1637. His half-sister, Anne Ken, twenty-seven years his senior, was the second wife of Izaak Walton. He had his education at Winchester, and at Hart Hall and New College, Oxford, obtained a fellowship in the last-named in 1657, and proceeded B.A. in 1661 and M.A. in 1664. He took orders at twenty-five, and held in succession the country livings of Little Easton in Essex, Brixton in the Isle of Wight, and East Woodhay in Hants. Already he had been elected a Fellow of Winchester College, and he now became also chaplain to the bishop, Dr George Morley. Here it was that he prepared his *Manual of Prayers for the use of the Scholars of Winchester College* (1674), and

wrote his famous morning, evening, and midnight hymns, the first two of which, 'Awake, my soul, and with the sun,' and 'Glory to Thee, my God, this night,' are perhaps more widely known than any other English hymns. In 1674 Ken visited Rome, and five years later was appointed by Charles II. chaplain to the Princess Mary, wife of William of Orange, but offended William by insisting that a relative's promise of marriage should be kept, and returned home in 1680, when he was appointed one of the chaplains of the king. It was in March 1683, on the king's visit to Winchester, that Ken refused to give up his house for the accommodation of Nell Gwynne. Later in the same year he sailed to Tangiers as chaplain to Lord Dartmouth, and seven months after his return (in April 1684) was appointed Bishop of Bath and Wells. It is said that as soon as the king heard of the vacancy he remembered Ken's fearless honesty at Winchester, and asked, 'Where is the little man who wouldn't give poor Nelly a lodging? Give it to him.' He was consecrated in January 1685, and one of his first duties was to attend the death-bed of Charles. The chief public event of his bishopric was his trial and acquittal among the 'Seven Bishops' in 1688, for refusing to read the *Declaration of Indulgence*. At the Revolution he found himself unable in conscience to take the oath to William, having already sworn allegiance to King James, and was therefore superseded in his bishopric by Dr Kidder in 1691. He spent the remainder of his days in quiet retirement at Lord Weymouth's seat of Longleat, refusing to perpetuate the schism by consecrating non-juring bishops. On account of his growing weakness he declined to resume the duties of his diocese on Kidder's death in 1703, and gladly recognised his successor, ceasing to sign himself 'Bath and Wells' from that time. He died at Longleat, 19th March 1711. He was esteemed a great preacher in his day, but his name survives now only from his hymns, and from his saintly personal character and the intensity of his devotion. His *Practice of Divine Love* (1685) is his most important work in prose.

Ken's poetical works were collected by Hawkins in 1721; his prose works by Round in 1838. Benham edited the prose works in 1889. There are Lives by Bowles (1830-31), Anderdon (1851), Plumptre (1890), and F. A. Clarke (1896).

Kendal, or KIRBY KENDAL, a market-town of Westmorland, on the Kent, 22 miles N. of Lancaster, with an ancient Gothic church, a ruined castle, a town-hall (1828), and a grammar-school (rebuilt in 1887). Flemings settled here in 1337, and the town became famous for its woollens and 'Kendal-green' buckram; nowadays the industries include heavy textiles, boots, agricultural machinery, paper, &c. Incorporated as a municipal borough in 1875, Kendal returned one member to parliament from 1832 till 1885. Pop. 14,000.

Kendall, HENRY CLARENCE (1841-82), the earliest noteworthy native-born poet of Australia (q.v.), was born in New South Wales, sang of Australian mountains, streams, forest, and life, and held minor government offices.

Keng Tung, or KIANG TUNG, the largest of the southern Shan States (q.v.) in south-east Burma.

Kenia. See KENYA.

Kenilworth, a market-town of Warwickshire, 5 miles N. of Warwick. The castle, founded about 1120 by Geoffrey de Clinton, was defended for six months (1265-68) by Simon de Montfort's son, and passed by marriage (1359) to John of Gaunt, and so to his son, Henry IV. It continued a crown possession till in 1563 Elizabeth conferred it on Robert Dudley, Earl of Leicester, who here in July 1575 entertained her for eighteen days at a

daily cost of £1000—as described in Scott's *Kenilworth*. Dismantled by the Roundheads, the castle has belonged since the Restoration to the Earls of Clarendon. Its noble ruins comprise Caesar's Tower, the original Norman keep, with walls 16 feet thick; Mervyn's Tower and the Great Hall, both built by John of Gaunt; and the more recent but more dilapidated Leicester's Buildings. There is a fragment also of an Augustinian priory (c. 1122), the ruins of which have been excavated; and the parish church has a good Norman doorway. Tanning is the chief industry. Pop. of urban district (1921) 6752.

Kenmure, LORD. See GORDON.

Kennebec, a river of Maine, rises in Moosehead Lake, in the west of the state, and, passing Augusta, runs generally south to the Atlantic Ocean. Its length is over 150 miles. It is navigable for large vessels to Bath, 12 miles, and for steamers beyond Augusta. In its course it falls 1000 feet, affording abundant water-power. Except for a few miles from its mouth, the river is closed by ice for from three to four months in the year; and many companies are engaged in harvesting and storing the ice.

Kennedy, BENJAMIN HALL, one of the greatest of modern schoolmasters, was born in 1804, son of the Rev. Rann Kennedy, second master of King Edward's School, Birmingham, and had his education there and at Shrewsbury under Dr Butler, whence he passed to St John's College, Cambridge. His course was unusually distinguished; he carried off the Porson prize thrice, the medal for the Latin ode twice, and for the Greek ode once, and graduated in 1827 as senior classic, senior Chancellor's medalist, and senior optime. Next year he became Fellow and classical lecturer of his college, in 1830 an assistant-master at Harrow, and in 1836 was appointed to succeed his old master, Dr Butler, at Shrewsbury. Here for thirty years he laboured with assiduous vigour and conspicuous success, forming for almost a generation a series of brilliant scholars, of whom need only here be named the greatest, H. A. J. Munro, the editor of Lucretius. The famous *Sabrinæ Corolla* (1850; 4th ed. 1890) is an imperishable memorial at once of his own brilliant scholarship and of the spirit he could inspire. There never was perhaps a more dexterous and clever versifier in both Greek and Latin. In 1867 Dr Kennedy was appointed professor of Greek at Cambridge and canon of Ely. He died 6th April 1889.

Besides classical school books he edited Virgil, the *Birds* of Aristophanes (with verse translation), the *Agamemnon* of Æschylus, and the *Œdipus Tyrannus* of Sophocles; *Between Whales* contains verses in Greek, Latin, and English.

Kennedy, WALTER (1460?-1508?), Scottish poet, was a son of Lord Kennedy, and wrote in *Praise of Age* and *Praise of our Lady*, but is best known from his share in the *Flyting* or poetical contest with Dunbar (q.v.). His poems were edited by Schipper (Vienna, 1902).

Kennedy, or BEAN FLOWER, a genus of Australian and Tasmanian Phaseolæ, with showy red and purple flowers.

Kenneth Macalpine. See SCOTLAND.

Kennicott, BENJAMIN, was born at Totnes, in Devonshire, 4th April 1718, son of the parish clerk and master of a charity school, was sent to Wadham College, Oxford, and in 1747 was elected Fellow of Exeter. In 1767 he was appointed Radcliffe librarian, and in 1770 canon of Christ Church, Oxford, where he died, 18th August 1783. The great work by which Kennicott's name will be

remembered is his *Vetus Testamentum Hebraicum cum Variis Lectionibus* (2 vols. folio, 1776-80). Already in 1753 and further in 1759 he had published a work entitled *The State of the Printed Hebrew Text of the Old Testament considered*. This contained, among other things, observations on 70 Hebrew MSS., and strongly enforced the necessity for a much more extensive collation. He undertook to execute the work thus projected in the course of ten years, and laboured, until his health broke down, from ten to fourteen hours a day. Ultimately 615 Hebrew MSS. and 16 MSS. of the Samaritan Pentateuch were collated.

Kennington, a division of Lambeth parliamentary borough, London. Kennington Oval, a little to the south of Vauxhall Bridge, is a famous cricket ground.

Kenosha, a city of Wisconsin, on Lake Michigan, and 50 miles N. of Chicago, manufactures leather, machinery, carriages, furniture, &c.; pop. 40,000.

Kenosis. See CHRIST, JESUS.

Kenrick, FRANCIS PATRICK (1797-1863), born in Dublin, became Bishop of Philadelphia and Archbishop of Baltimore. He was a learned theologian and critic.

Kensal Green, a cemetery on the north-west of London, was consecrated in November 1832; here many persons of note have been buried.

Kensington, a straggling borough in the west of London adjoining Westminster. Kensington Palace, till 1899 in Westminster, was transferred to Kensington in that year. Given to the nation in 1899, and built of red brick, it was the seat of Heneage Finch, Earl of Nottingham and Lord Chancellor, from whose successor William III. bought it in 1689; he and his wife Mary, Queen Anne and her consort Prince George of Denmark, and George II. all died within its walls, and it was also the birthplace of Queen Victoria. Kensington Gardens, which at first only consisted of the grounds of 26 acres attached to the palace, are now 2½ miles in circuit, and mainly in Westminster; they are connected with the northern part of Hyde Park by a stone bridge over the Serpentine built by Rennie in 1826. At their southern extremity is the Albert Memorial (1872), designed by Sir Gilbert Scott, and consisting of a bronze-gilt statue (by Foley) of the prince seated, placed beneath a gorgeous canopy 180 feet high, and surrounded by works of sculpture illustrating the various arts and sciences. Opposite, in Kensington Gore, on the site of Gore House, is the Albert Hall (1867-71), a huge circular building in the modern Italian style, of red brick with yellow dressings, used principally as a concert-room, and holding 10,000 persons; its cost was £200,000, and the interior measures 200 feet by 180 feet and is 140 feet high. Other buildings in the vicinity are the Victoria and Albert Museum, Natural History Museum (see BRITISH MUSEUM), Royal School of Art Needlework, Royal College of Music (1883), City and Guilds Engineering College (with new buildings erected by the Goldsmiths' Company), and Imperial Institute. The last-mentioned, founded as a Jubilee Memorial of Queen Victoria, and opened in 1893, is under the Colonial Office, but the central portion is occupied by London University. The parish church of St Mary Abbots—so called from the Abbots of Abingdon, to whom in 1107 a large part of the manor was granted—is a fine Gothic building by Sir Gilbert Scott (1869). Close by is the town-hall (1880). The Oratory of St Philip Neri is in Brompton Road. Next to Kensington Palace, the most interesting building from a historical point of view is Holland House, a quaint Elizabethan mansion erected (1607) by Sir

Walter Cope, and the great resort of the Whig politicians at the commencement of the 19th century. Amongst its occupants have been Fairfax, the Parliamentary general; Addison, who died in it; Shippen, the famous Jacobite; William Penn, the founder of Pennsylvania; and Charles James Fox, the statesman. Campden House, rebuilt in 1862, and lately pulled down, is noteworthy from the former house, erected in 1612, having been the residence, before her accession, of Queen Anne. Of the residences occupied by Swift, Sir Isaac Newton, Jack Wilkes, Wilberforce, George Canning and his son, Dr Dibdin, Sir David Wilkie, William Cobbett, Mrs Inchbald, Count D'Orsay, Talleyrand, Lord Macaulay, Thackeray, and John Leech but few traces now remain. Leighton House, for some time the residence of the late Lord Leighton, P.R.A., has a collection of his paintings, &c. The borough returns two members to parliament. In 1899 Kensington became one of the metropolitan boroughs of the county of London; and it is a suffragan bishopric under London. Pop. (1921) 175,686. See Leigh Hunt's *An Old Court Suburb* (1855), Loftie's *Picturesque Kensington* (1888), Lloyd Sanders's *Old Kew, Chiswick and Kensington* (1910), and Florence Gladstone's *Notting Hill in Bygone Days* (1924).

At South Kensington are several educational establishments maintained by the Board of Education. The Victoria and Albert Museum was established in 1857 as the South Kensington Museum, but was given its present title at the extension in 1899. The science collection has been separated, and now forms the Science Museum. It illustrates the progress and development of the various branches of science, and consists of instruments and apparatus used in scientific education and research, models illustrating the application of scientific principles to industrial purposes, and a library of works on science, reports of scientific societies, and a complete series of patent specifications. Part of the Science Museum has been taken (1924) for the Imperial War Museum. The Victoria and Albert Museum illustrates the application of art to industries of all kinds and periods, with collections of original works of art in every kind of material, and a gallery of paintings of the British school in oil and water-colour. A special section is devoted to the Indian Empire. The library contains books, drawings and prints, and photographs relating to the ornamental and fine arts; the Dyce and Forster libraries, bequeathed by the Rev. A. Dyce and John Forster, illustrate the history of literature and the drama. There is a branch at Bethnal Green, open free every day, with a large collection of objects of science and art. The museum grants loans of selected objects to provincial museums, schools of art or science, and educational exhibitions.

The Royal College of Science is an amalgamation of the Royal School of Mines (founded in 1851) and the younger institution, the Normal School of Science, and is supported by the state to supply systematic instruction in the various branches of physical science to students of all classes, but primarily intended for the instruction of teachers of science. Associateships are given in Mechanics, Physics, Chemistry, Biology, Geology, Metallurgy, and Mining. In 1907 it was united with the City and Guilds Engineering College to form the Imperial College of Science and Technology, a school of London University. The Royal College of Art (formerly the National Art Training School) is established primarily for the training of art masters and mistresses for the United Kingdom, but admits other students, so far as accommodation permits, on payment of fees. The branches taught

are architecture, modelling, design, painting, anatomy, etching, illumination, embroidery, stained glass, and marble-cutting. Some of the institutions here mentioned were started by the government out of the proceeds of the Great International Exhibition (1851) in Hyde Park, close to Kensington.

Kent, a maritime county in the SE. of England, is bounded by the Thames estuary, the Strait of Dover, the English Channel, Sussex, Surrey, and London. Area, 971,849 acres; greatest length, 64 miles; breadth, 38 miles. The surface is for the most part hilly, except in the south-east, where lies a marshy tract, some 14 miles long by 8 broad, and in the north, where a line of marshes skirts the banks of the Thames and Medway; these last are backed by a succession of wooded hills, stretching inland and gradually increasing in height until they culminate in the North Downs (see **Downs**), a chalk range which traverses the middle of the county from west to east, attaining at Knockholt Beeches, near Sevenoaks, a height of 800 feet above the sea-level. Below these downs lies the Weald of Kent, a district abounding in beautiful scenery, and occupying nearly the whole southern side of the county. Of rivers in Kent, besides that which forms its northern boundary, the principal are the Medway, Stour, and Darent. The climate is in general mild and healthy, and the soil, which consists principally of chalk, gravel, and clay, is fertile, particularly in the south-east, where the rich meadows of Romney Marsh afford excellent pasturage for vast flocks of sheep. All branches of agriculture are extensively carried on, especially market-gardening and the growth of Hops (q.v.) and fruit of various kinds. Of other industries the principal are the manufacture of paper, bricks, and cement. In 1890 coal of good quality was found in a heading adjoining the Channel Tunnel (q.v.) at a depth of 1180 feet. Large numbers of hands are employed in the dockyards of Chatham and Sheerness; whilst at Ashford are locomotive and carriage works, and at Whitstable and Faversham are important oyster-fisheries. Kent is divided into five lathes, and comprises the Cinque Ports (q.v.) of Dover, Hythe, Romney, and Sandwich, the cities of Canterbury and Rochester, and a score of other municipal boroughs, almost wholly in the dioceses of Canterbury and Rochester. Pop. (1801) 307,624; (1841) 549,353; (1881) 977,706; (1911) 1,021,033; (1921) 1,141,867. The county includes eleven parliamentary divisions, and the parliamentary boroughs of Bromley, Hythe, and Rochester (with two divisions, Chatham and Gillingham). The chief towns, in addition to those mentioned above, and Gravesend, Maidstone, and Beckenham, are Ramsgate, Margate, Folkestone, and Tunbridge Wells, all popular watering-places. A peculiarity in the tenure of land in Kent is that of Gavelkind (q.v.).

In historical associations the county is unusually rich. The earlier incidents are noticed at **ENGLAND**. Subsequent to the successive occupations of the Danes and Normans, during which the county was the scene of many a battle, the principal events in its history (including those parts which were cut off on the formation of the County of London in 1888) are—the murder of Archbishop Becket at Canterbury (1170); the submission of King John to the Pope's Legate at Dover (1215); the invasions by Louis, Dauphin of France (1216); the insurrections of Wat Tyler (1381), Jack Cade (1450), and Sir Thomas Wyatt (1554); the encampment at Blackheath of the Cornish insurgents under Lord Audley (1497); the rising of royalists at Maidstone (1648), and its subsequent suppression by Fairfax; and the destruction of shipping in the Medway by the Dutch fleet under De Ruyter (1667). Dover was the scene of the death of King Stephen,

and Faversham of his burial; at Greenwich Henry VIII. and Queens Mary and Elizabeth were born, and Edward VI. died; Eltham Palace (now in ruins) was for a long time a royal residence; at Sayes Court, Deptford, which occupied a portion of the site of the royal victualling yard, lived Peter the Great whilst learning the trade of a shipwright; and at Chislehurst Napoleon III. died. Of its early inhabitants Kent has numerous traces in the shape of Roman roads, and many camps and barrows; at Dover, Aylesford, and Hartlip Roman villas and baths have been discovered; near Aylesford are a curious dolmen known as Kits Coty House and the megalithic monument at Coldrum; the river valleys have yielded objects of middle and lower Palaeolithic cultures; and from the plateau of the North Downs Mr Benjamin Harrison gathered his famous eoliths. Of edifices of a historical or antiquarian interest it will suffice to specify here the cathedrals of Canterbury and Rochester, the Norman fortress of the latter place, with those of Chilham and Dover, Penshurst Place, rich in literary associations, and the moated mansions of Hever (the home of Anne Boleyn), Ightham Mote (dating back to the 14th century), and Leeds Castle (where Richard II. and Joan of Navarre were imprisoned). Amongst Kentish worthies are included Caxton, Elizabeth Barton the 'nun of Kent,' Sir Nicholas Bacon, Sir Francis Walsingham, Marlowe, Camden, Sir Philip Sidney, William Harvey, the 'judicious' Hooker, the Earl of Chatham and his son William Pitt, General Wolfe, Richard Barham, Hallam, Grote, Dickens, Gordon Pasha, Cameron the African explorer, and Walter de la Mare.

See the county histories of Hasted (4 vols. 1778-99; enlarged 1886, &c.) and Dunkin (1856-58), and 'The Victoria History' (1908 *et seq.*).

Kent, DUKE OF (1767-1820), fourth son of George III., and father of Victoria (q.v.).

Kent, JAMES, an American jurist, was born in New York State, 31st July 1763, graduated at Yale in 1781, and was admitted to the bar in 1787. After serving two terms in the legislature he was professor of Law in Columbia College from 1794 to 1798, when he was appointed a justice of the supreme court of New York; and in 1804 he became chief-justice, and in 1814 chancellor of the state. In 1823 he retired from the bench, but he continued his chamber practice for many years after. Kent's principal publication was his famous *Commentaries on American Law* (4 vols. 1826-30), which passed through numerous editions and is a legal classic. He died 12th December 1847.

Kent, WILLIAM. See **LANDSCAPE GARDENING**.

Kentigern, ST, the apostle of Cumbria, was son of the Princess Thenew, who, being found to be with child, was first cast from Dunpender or Traprain Law, and next exposed on the Firth of Forth in a coracle. It carried her out to the Isle of May and then back to Culross, where she bore a son (about the year 518). Mother and child were brought by shepherds to St Serf, who baptised them both, and reared the boy in his monastery, where he was so beloved that his baptismal name Kentigern ('chief lord') was often exchanged for Mungo ('dear friend'). Arrived at manhood, he planted a monastery at Cathures (now Glasgow), whither he had been led by two untamed bulls; and in 543 he was consecrated Bishop of Cumbria. In 553 the accession of a tyrannous prince drove him to seek refuge in Wales, where he visited St David, and where, on the banks of another Clyde, he founded another monastery and a bishopric, which still bears the name of his disciple, St Asaph. In 573 he was recalled by a new king, Rederech Hael ('Roderick the Bountiful'); and first at Hoddam in Dumfriesshire, then at Glasgow; he renewed his missionary

labours. About 584 he was cheered by a visit from Columba. He died 13th January 603 ('when he was 185 years old'), and was buried at the right-hand side of the high altar in Glasgow Cathedral. A fragment of a Life, composed at the desire of Herbert, Bishop of Glasgow, and the longer *Vita Kentigerni* by Joceline of Furness, both belong to the later half of the 12th century. Bishop Forbes gives translations of them, and we have adopted his rationalising chronology. Joceline's Life teems with miracles, which were rooted so deeply in the popular fancy, that some of them sprung up again in the 18th century to grace the legends of the Cameronian martyrs. Others are still commemorated by the armorial bearings of the city of Glasgow—a frozen hazel branch which his breath kindled into flame, St Serf's pet robin which he restored to life, a hand-bell which he brought from Rome, and a salmon which rescued from the depths of the Clyde the lost ring of Rederech's frail queen. Nor is it St Mungo only whose memory survives at Glasgow; 'St Enoch's Church' commemorates his mother, St Thewew. To the saint himself there are eight dedications in Cumberland, and fourteen in Scotland.

See Bishop Forbes's *Lives of SS. Ninian and Kentigern* (1874); Skene's *Celtic Scotland* (vol. ii. 1877); and Beveridge's *Culross and Tulliallan* (1885).

Kentish Fire, a form of applause at public dinners or meetings of a political character, consisting in clapping the hands in unison in a peculiar rhythm or cadence, thus: u-u-u-, intensified occasionally by the cry of 'ráh at certain intervals. The effect is very striking if the clapping is well led and kept together, and may be taken to bear some resemblance to the rattle of musketry fire. Hence the name. The origin is more obscure, but the 'volleys' were probably first organised at the great Kentish meetings in 1828-29 to protest against Roman Catholic emancipation. In 1834 at a great Protestant meeting in Dublin (August 15) Lord Winchelsea introduced 'his Kentish artillery' as a novel and stirring feature, and Kentish Fire has ever since been a favourite mode of applause at Protestant, Conservative, or 'Orange' meetings especially in the north of Ireland.

Kentish Rag is the local name given to a grayish-blue and occasionally arenaceous and cherty limestone, which occurs at Hythe and other places on the coast of Kent, in the Lower Greensand Measures. It alternates with sandy beds known as 'hassock.'

Kentish Town, a district in St Pancras parish, in the north of London.

Kent's Cavern, or KENT'S HOLE, is notable for the evidence which it has furnished as to the contemporaneity of man in Britain with various extinct or no longer indigenous mammals. It is situated in a small wooded limestone hill in the immediate neighbourhood of Torquay, and appears to have been known from time immemorial, although it did not attract the attention of scientific men until 1825. The early explorers of the cave, Northmore, Trevelyan, MacEnery, Godwin-Austen, and (in 1846) a committee of the Torquay Natural History Society, all succeeded in finding flint implements mixed up with the remains of extinct animals. But these discoveries received little attention until 1853, when the results of the systematic exploration of Briham Cave by a committee of the Royal Society led to the appointment in 1864 of a similar committee by the British Association for the examination of the deposits in Kent's Cave. The results of this exploration, carried on under William Pengelley (1812-94), from March 1865 to June 1880, at a cost of £1963, are of the highest importance. They show that the

bottom of the cave is paved with a succession of sheets of stalagmite, red earth, and breccia—all of which have yielded relics of man and various extinct or no longer indigenous mammals. Amongst the former are palæolithic flint tools and implements of bone, such as a needle with a well-formed eye, an awl, a harpoon, &c., also perforated badger's teeth, which were probably used for ornamental purposes. The animal remains comprise those of lion, bear, mammoth, machairodus latidens, rhinoceros, hyæna, reindeer, Irish elk, red-deer, wolf, fox, badger, glutton, beaver, &c. In one part of the cave there occurred underneath stalagmite a dark layer some 4 inches thick, which consisted mainly of small fragments of charred wood. This doubtless was an old hearth, round which the palæolithic cave-dwellers gathered to roast bones for the sake of their savoury marrow. The sheets of stalagmite are of inconstant thickness—the lower one attaining in places a thickness of 12 feet, while the upper one does not seem to have exceeded 5 feet, and was frequently very much thinner. The general character and structure of the cave-deposits show that a prolonged time was required for their accumulation. See M. W. Pengelley's address to the British Association (1883), and the Life of him by his daughter (1897).

Kentucky, a river of Kentucky, is formed by two forks which rise in the Cumberland Mountains, and, after a winding north-west course of about 250 miles, enters the Ohio, 12 miles above Madison, Indiana. The river runs through part of its course between perpendicular limestone walls. It is navigable by steamboats to beyond Frankfort.

Kentucky, one of the south-central states of the American Union, lies in the great Mississippi Valley, west of the Appalachian slope, and is enclosed between 36° 30' and 39° 6' N. lat. and between 82° 3' and 89° 30' W. long. Its greatest length from east to west is about 350 miles, its breadth from north to south about 175 miles; its area is 40,400 sq. m. The eastern and south-eastern parts of the state are mountainous, broken by the Cumberland Mountains (2000-3000 feet) and their offshoots. Westward from this region is a plateau sloping gradually toward the Ohio and the Mississippi rivers, which bound the state on the north and west. Large cypress-swamps still exist in some parts, especially in the south-west. Kentucky has a river boundary of more than 800 miles in length, including a stretch of nearly 650 miles along the Ohio, 50 miles on the Mississippi, and 120 on the Big Sandy. The Cumberland, Tennessee, Licking, and Kentucky rivers rise among the mountains in the east, and cross the state to the Ohio, whose other large tributaries, the Green and the Trade-water, rise in the west. The considerable extent of water thus available for navigation has lately been increased by a system of river improvements. Besides these natural highways of commerce Kentucky has 4500 miles of railroad. Southward from the Ohio River extends a semicircular tract of land of Silurian formation; here the soil is produced by the disintegration of the fossiliferous blue limestone, and its fertility is unrivalled. This section is the famous Blue Grass (q.v.) country, in which the most exhausting crops, such as tobacco and hemp, may be raised continuously for a series of years without materially impairing the productive value of the soil, the constant crumbling of the fossiliferous shales restoring those constituents which have been withdrawn by the rich growth of vegetation. Surrounding the blue-grass country is a somewhat narrow belt of Devonian shale; its soil is also very fertile, and the lower strata contain petroleum. In the southern and south-eastern parts of the state there are other tracts of Devonian

deposits, some of which yield heavy lubricating oils. The eastern, the western, and the southern portions of Kentucky belong mainly to the Carboniferous age, and the structure consists of sub-carboniferous limestone, or of true carboniferous deposits, with extensive coalfields. The coal-measures are the result of several alternate exposures and submersions, and average at least ten good beds of coal. Through the central part of the state is a strip of land which appears to have remained permanently raised above the sea during the Carboniferous period, and thus forms a divide between the eastern and the western coal-areas. The eastern coalfield is a prolongation of the Appalachian deposits, and is about 10,000 sq. m. in extent. The western belongs to the Illinois tract, and measures about 4000 sq. m. The coal is bituminous, and some excellent cannel occurs. Next in importance to coal are the iron ores, which are of excellent quality, and are found throughout a district of 20,000 sq. m. in extent. Neither the coal nor the iron deposits are worked as thoroughly as their quality and their abundance would seem to justify, but the output has increased. Galena is found in some sections; valuable building-stones occur almost everywhere; and salt is obtained by boring in the coal and petroleum regions.

Through the limestone formations the streams have cut deep gorges, and within a region of about 6000 sq. m. in the sub-Carboniferous structure much of the drainage is subterranean. The surface topography is peculiar, as there are many round or oval-shaped 'sinks' through which the water reaches the underground streams. The long-continued erosive action of the water has undermined a large part of this region, and produced the numerous and often extensive caverns which form one of the remarkable physical features of this state. Of these the best known, though possibly not the largest, is the Mammoth Cave (q.v.).

Kentucky is densely wooded, except in those places that are under cultivation; a small part of the state is covered with virgin forests. Among the prevailing species of trees are the blue ash, the black walnut, various oaks, pine, maple, tulip-tree, and sweet-gum. Notwithstanding its large proportion of forest land, Kentucky has always been one of the leading agricultural states, and its cereal products are of fine quality. It is the principal tobacco-producing state in the Union. Owing to the excellent quality of the grass, the mild salubrious climate, and other advantages, it has always been a centre for rearing domestic animals, and for breeding the finest grades of stock. A very large percentage of the successful racehorses of the United States have been bred in Kentucky. Kentucky's leading industry is the manufacture of tobacco. The smelting and working of iron are other manufacturing industries of considerable importance, and all wood manufactures flourish.

Kentucky is divided into 120 counties, and contains a large urban population. The most important cities are Louisville (234,391), Covington (57,121), Lexington, and Newport. Frankfort is the capital. The governor and the 38 state senators serve for four years, the 100 representatives for two. Besides two senators, Kentucky sends eleven representatives to congress. The enrolment of pupils in the common schools exceeds half a million. There are several important colleges and schools of higher education, some of them affiliated with the Kentucky University at Lexington. Pop. of the state (1880) 1,648,690; (1900) 2,147,174; (1910) 2,289,905; (1920) 2,416,630.

History.—Numerous remains indicate that the mound-builders lived here in considerable numbers; but at the time of its first occupation by the whites this region seems to have been a hunting-ground

visited by both the northern and the southern tribes of Indians, and not permanently occupied by settlements. The name Kentucky, signifying 'the dark and bloody ground,' is supposed to commemorate the conflicts between the various warlike tribes. One of the earliest pioneers was Daniel Boone (q.v.). This whole territory was included in the original grant to the colony of Virginia, and in 1776 received the name of Kentucky county. In 1790 it was made a separate territory of the United States, and in 1792 was admitted as a state. Kentucky did not secede during the civil war, and several campaigns were waged within its borders.

Kenya (till 1920 the East Africa Protectorate), a British colony and protectorate, bounded by Italian Somaliland, Abyssinia, Lake Rudolf, Uganda, Lake Victoria, Tanganyika Territory, and the Indian Ocean. The protectorate consists of the Lamu islands and a 10-mile coast strip from the river Uмба to Kipini, subject to the Sultan of Zanzibar, whose other dominions remain a separate protectorate (see ZANZIBAR). The cession to Italy, in accordance with a treaty signed in 1924, of a strip west of the Juba (including Kismayu), leaves the Tana (navigable for 400 miles) and the Athi the only considerable rivers. Kenya has a wonderful range of climate, from the humid tropical coast to the high plains (3000–7000 feet) of the interior, where Europeans can live, the unhealthy forest-land of Lake Victoria, the steppes of the north, pastoral or arid, and the great glaciers of Mount Kenya (q.v.). The minerals, not yet of great value, include natron, gold, graphite, copper, manganese, and mica. Lake Magadi, a soda lake in the Masai reserve, is abundantly productive. In the low-lying areas, rice, coconuts, cotton (of ever-growing importance, more especially on the Tana River), cassava, and sugar-cane are produced; while in the highlands, coffee, maize, wheat, and sisal are the main products. Cattle and live-stock also thrive well in the highlands. The forests, of great and ever-increasing value, extend over 3600 sq. m., and contain, amongst other trees, iron-wood, olive, pencil cedar (*Juniperus procera*), pillar wood and m'tandamsi (a substitute for ebony). The exports are cotton, skins, carbonate of soda, coffee, copra, ivory, and rubber. Kenya has an area of 245,000 sq. m., and a population of about 2,500,000, including some 10,000 Europeans, 22,000 Indians, and 10,000 Arabs. On the coast Arabs and Swahilis are the chief races; in the interior the once-dreaded Masai, the Gallas, Kikuyu, and Kavirondo (a fine, primitive race living near the Great Lakes) prevail. The rights of Europeans, Indians, and natives have proved difficult to reconcile. There is a very grave land question. Under the 1924 constitution Europeans elect eleven, Indians five, and Arabs one member to the legislative council, in which there is a nominated majority (including one Arab). The greatest reason for the growth of the colony is the Uganda railway, which, starting at Mombasa (q.v.; with its port Kilindini, 3 miles distant), rises gradually for over 100 miles through tropical forests, only broken occasionally by open spaces, where native cultivation is carried on. From Makindu the country opens out, and on the Athi plateau the railway crosses many miles of open, grassy plains, over which wanders big game of all descriptions in herds of thousands. It passes through Nairobi (q.v.), the capital, drops a couple of thousand feet over the edge of the Kikuyu escarpment into the Rift Valley; then skirting Lakes Naivasha and Nakuru, it climbs the Mau escarpment, and from 8200 feet descends rapidly to Kisumu (Port Florence), its terminus on Lake Victoria. Branches run from Voi to Kahe, from Magadi to the lake of

the same name, and from Nakuru to Eldoret (to be continued so as to open up the Uasin Gishu plateau and important cotton-lands in Uganda). See Norman Leys, *Kenya* (1924).

Kenya, MOUNT, a mountain in East Africa, after which the colony is named. Situated just south of the equator, in $37^{\circ} 50' E.$, it is one of the wonder mountains of Africa, and is in fact the most prominent feature of the country. An ancient volcano, its highest peak 17,000 feet above sea-level, its lower slopes are covered with dense, tropical forests, which give place by way of bamboo forests to an Alpine zone, wherein are to be found some fifteen glaciers. First seen by Krapf in 1849, it was explored by Count Teleki (1889) and J. W. Gregory (1893), and its summit was first reached by H. J. Mackinder in 1899.

Ke'okuk, a city of Iowa, is situated almost at the south-east extremity of the state, on the Mississippi River (here crossed by a railroad bridge), 161 miles by rail ESE. of Des Moines. Numerous railways touch the town. The 'Des Moines rapids,' immediately above it, are passed by canal (11 miles). There is a great hydro-electric installation. The town contains law, medical, and commercial colleges, and has several foundries, saw and flour mills, and factories. Pop. 14,400.

Kepler, or **KEPLER, JOHANN**, one of the very greatest astronomers, was born at Weil die Stadt, in Württemberg, 10 miles from Stuttgart, 27th December 1571. He was left to his own resources when a mere child, his education depending on his admission into the convent of Maulbronn. He afterwards studied at the university of Tübingen, applying himself chiefly to mathematics and astronomy. In 1593 he was appointed professor of Mathematics at Gratz, and about 1596 began a correspondence with Tycho Brahé (q.v.), which resulted in his going to Prague in 1600 to aid Tycho in his work. Tycho obtained for him a government appointment, but the salary was not paid, and Kepler lived for eleven years there in great poverty. He then obtained a mathematical appointment at Linz, and fifteen years afterwards became astrologer to Wallenstein, poverty still pursuing him. He died shortly afterwards at Ratisbon, 15th November 1630.

In character he was intensely enthusiastic, imaginative, laborious, and persevering, all qualities fitting him for the great task of transforming astronomy from a merely *formal* into a true *physical* science. Though Copernicus (q.v.) had transferred the centre of the planets' movements to the sun, these were still considered as compounded of various circles, the only curve thought fit for celestial bodies to pursue. No cause was assigned for their movements, and no unity observed among them, except in the one fact of the sun being their centre. Kepler says, 'I brooded with the whole energy of my mind' on this subject, asking 'why they are not other than they are—the number, the size, and the motion of the orbits.' In fact he had first to determine what the orbits were before answering some of these questions. But one question lay open before him. The periods of the planets were fairly well known, so were their proportionate distances from the sun. Was there any invariable relation between these? In his *Mysterium*, published in 1596, he triumphantly proclaims that five kinds of regular polyhedral bodies govern the five planetary orbits. Yet after publication he still continued to 'brood,' becoming at length convinced that this theory was only an error, until after twenty-two years of patient study and numberless speculative failures, he was able at last to announce (in his *Harmonice Mundi*, 1619) that the 'square of a planet's periodic time is pro-

portional to the cube of its mean distance from the sun.' This rule is known as Kepler's Third Law. He saw clearly enough that it implies that the planets are moved by a force greater near the sun, and lessening with distance, but he did not grasp, as Newton after him did, the truth that this is an *attractive* force constantly acting towards the sun, nor could he therefore guess the law of its action. Finding the theory of epicycles unable to bear the strain of Tycho Brahé's accurate observations, especially in the case of the planet Mars, he endeavoured to find a law for the planet's movements which would be simple and satisfactory. After enormous labour, and by a process of trial and error, he found that (1) *the planet's orbit was an ellipse, of which the sun is in one focus*, and (2) *that, as the planet describes its orbit, its radius vector traverses equal areas in equal times*. These rules (published in 1609 in his work on *The Motions of Murs*) are known as Kepler's First and Second Laws respectively. These laws formed the groundwork of Newton's discoveries, and are the starting-point of modern astronomy. Besides, we owe to Kepler many discoveries in optics, general physics, and geometry. A collected edition of his works was published by Frisch (1858-71).

See Brewster's *Lives of Galileo, Tycho Brahé, and Kepler* (1841); Reitlinger, Neumann, and Gruner, *Johannes Kepler* (1868); Adolf Müller's *Johann Kepler* (1903); and a small book by Bryant (1921).

Keppel, AUGUSTUS, VISCOUNT, English admiral, was the son of William, second earl of Albemarle, and was born on 25th April 1725. Entering the navy, he served under Hawke in 1757, captured Goree in 1758, took part in the battle of Quiberon Bay in 1759, and in the capture of Belleisle in 1761, and commanded at the capture of Havana in 1762. In 1778 he encountered the French fleet off Ushant on 27th July; a sharp but indecisive action ensued; but owing to a disagreement between Keppel and Sir Hugh Palliser, his second in command, the French were suffered to escape without a renewal of the combat. Both admirals were brought before a court-martial, but both were acquitted. The affair made a great stir in the country, the popular verdict being on the side of Keppel. In 1782, in which year he was created Viscount Keppel of Elveden in Suffolk, he became First Lord of the Admiralty, but resigned on Pitt's accession to government. Keppel died, unmarried, on 3d October 1786. See Life by T. Keppel (1842).

Keppel, SIR HENRY, British admiral, a younger son of the fourth Earl of Albemarle, was born 14th June 1809. He saw service as captain during the war against China in 1842, and in the campaign against the pirates of the East Indian Archipelago shortly afterwards. During the Crimean war he commanded a vessel in the Baltic and Black Seas, and finally the operations of the naval brigade before Sebastopol. In 1857 he took an important part in the destruction of the Chinese fleet in Fatshan Bay. Vice-admiral in 1867, full admiral in 1869, G.C.B. in 1871, admiral of the fleet in 1877, he died 17th January 1904. He published an *Expedition to Borneo* (3d ed. 1847), *Visit to the Indian Archipelago* (1853), and *A Sailor's Life under Four Sovereigns* (1899). See a memoir by West (1905).

Ker, THE FAMILY OF, supposed to be of Anglo-Norman extraction, is found in Scotland in the end of the 12th century. The present representatives derive their descent from John Ker of Altonburn in 1357, whose great-grandson Andrew acquired Cessford about 1440, and gave origin in his three sons to the families of Cessford, Linton, and Gateshaw, and in a grandson to that of Fernihirst. Sir Andrew Ker of Cessford (died 1526), whose younger brother, George, was

ancestor of the Kers of Faudonside, had two sons—Sir Walter, whose grandson, Robert, was created Earl of Roxburghe in 1616, and Mark, commendator of Newbattle, whose son, Mark, was created Earl of Lothian in 1606. The second Earl of Roxburghe was only a Ker by his mother. He assumed the surname of Ker, and his grandson, the fifth Earl of Roxburghe, was created duke in 1707. John, third Duke of Roxburghe (1740–1804), was the famous book-collector. Robert Carr, the favourite of James VI., created Viscount Rochester in 1611 and Earl of Somerset in 1613, belonged to the family of Fernihirst.

Ker, WILLIAM PATON (1855–1923), a littérateur who, after a brilliant career at Glasgow and Oxford, which ended in a fellowship, was appointed in 1883 to the Professorship of English Literature at Cardiff. There he remained for six years till his election to the chair of English Literature at New College, London. Although he resigned this position in 1922 he kept control of certain departments; and he held the Professorship of Poetry at Oxford, to which he had been appointed in 1920. A man of great personal charm, and a scholar of quite extraordinary learning, he published many books from 1897 onwards. *Epic and Romance* (1897), *The Dark Ages* (1904), *Essays on Medieval Literature* (1905), *English Medieval Literature* (1912), and *The Art of Poetry* (1923) are works of great merit and interest. Two volumes of *Collected Essays*, edited by C. Whibley, appeared in 1925.

Kerak, or TRANSJORDANIA, an Arab emirate under British mandate along with Palestine, from which the Jordan separates it. Its eastern limits are undefined. Of its 400,000 inhabitants about half wander in the desert east of the Hejaz railway. The other half, town-dwellers and villagers, shepherds and husbandmen, are settled in the thirty-mile fertile strip between the railway and the Jordan. The capital is Amman (pop. 3000), once capital of the Ammonites (q.v.); later, as Philadelphia, one of the Greek cities of the Decapolis. Other towns are Kerak (the ancient Kir el-Moab; see MOABITES), Madeba, Es Salt (10,000), Ma'an, El Hasa. The league of the Decapolis, founded about 64 B.C. against nomad marauders, embraced, according to most authorities (see *Pliny*, v. 18), Damascus, Philadelphia, Raphana, Scythopolis (Beisan in Palestine), Gadara, Hippos, Dios, Pella, Gerasa (Jerash), Kanatha. Some of these have yielded important results to excavation, notably Gerasa. Amman has a fine theatre. In the Great War Faisal and the British wrested the country from the Turks, and when Faisal became king of Iraq, his brother Abdullah was made Emir of Kerak. To Abdullah in 1924 his father, the king of the Hejaz, transferred 'Aqaba (Akaba) and Tebuk, including the ruins of the ancient Nabatean town of Petra (q.v.)—the poet's 'rose-red city half as old as time.' See Mrs Stuart Erskine, *Vanished Cities of Arabia* (1924).

Keratin. See HORN.

Kerbela (*Karbala*), a town and holy place of the Shiites in Iraq, 60 miles SW. of Baghdad, with which it has railway connection (1923) by Hindiya Barrage. The pilgrims number at least 200,000 annually. The sanctity of Kerbela arises from the fact that it is built on the site of the battlefield on which Hasan, son of Ali and Fatima, lost his life (680) in attempting to maintain his right of succession to the khalifate (see KHALIF). Every Shiite Moslem throughout the world who can afford it seeks sepulture in the holy ground there or at Najaf. On the occasion of the Arab rising in 1916 the Turks fired on the holy buildings, but were driven off. Pop. 65,000. See Stevens, *By Tigris and Euphrates* (1923).

Kerch. See KERTCH.

Kerensky, ALEXANDER FEODOROVICH, Russian revolutionary statesman, born at Simbirsk in 1881, son of a local high school principal, studied law at Petrograd. A member of the Socialist Revolutionary party ('Group of Toil'), and its leader in the Duma, he acted as counsel for various victims of reactionary governments, and had himself some experience of imprisonment. At the revolution of March 1917 he became a member of the Duma Committee and minister of justice in the provisional government that it set up. Later he was minister for war, and on Prince George Lvoff's resignation he became premier (July 1917). General Korniloff's insurrection was unsuccessful; but Kerensky's policy of compromise with the bourgeois parties was opposed on the other side by the uncompromising Bolsheviks. He was driven from office by the Bolshevik revolution of November, and fled.

Kerguelen, or DESOLATION ISLAND, of volcanic origin, situated in the Southern Indian Ocean, between 48° 39' and 49° 44' S. lat. and 68° 42' and 70° 35' E. long., being 85 miles long by 79 wide. The surface is mountainous (Mount Ross, 6120 feet), and most of the interior is covered with an ice-sheet and its glaciers. Numerous islands and rocks encircle the coasts. The shores are very irregular, long fjords penetrating far inland and forming good harbours. The climate is raw, and storms are nearly constant. The island was discovered in 1772 by a Breton explorer, Yves de Kerguelen-Trémarec (1745–97), and was visited by Captain Cook (who christened it Desolation Island) in 1776, and by the *Challenger* and other expeditions. It was annexed by France in 1893.

Kerguelen Cabbage (*Pringlea antiscorbutica*), the only known species of a very curious genus of Cruciferae, found only in Kerguelen. It has a long, stout, perennial root-stock, and a bolled head of leaves very similar to those of the common garden cabbage. The root-stocks have the flavour of horse-radish. The dense white heart of the cluster of leaves tastes like mustard and cress, but is coarser. The whole foliage abounds in a very pungent pale-yellow essential oil, which is confined in vessels that run parallel to the veins of the leaf. The flowers are without petals, except in sheltered places. The Kerguelen cabbage was used by voyagers, boiled either by itself, or with beef, pork, &c., chiefly on account of its antiscorbutic qualities. It has been enormously reduced by rabbits unfortunately set free on the island. It is now restricted to localities inaccessible to these pests.

Kerkyra. See CORFU.

Kermadec Islands, a group of volcanic islands in the Pacific Ocean, 700 miles NE. from Auckland in New Zealand. It consists of Raoul or Sunday Island (7200 acres), Macaulay Island (764 acres), Curtis Islands, L'Esperance, and several smaller islands. Attempts at settlement have not succeeded. The climate resembles that of New Zealand. The group was discovered in 1788, annexed by Great Britain in 1886, and in 1887 declared part of New Zealand.

Kerman, or KARMAN (anc. *Carmania*), one of the eastern provinces of Persia, lying south from Khorassan, and having an area of about 60,000 sq. m. Much of the north and north-east is occupied by the *Desert of Kerman* (parts of it salt swamps), which forms a part of the great central desert of Iran. The southern portion, although mountainous, is equally arid and barren with the north, except the small tract of Nûrmanshir, towards the east, which is fertile and well watered. Roses are cultivated for the manufacture of attar of roses; silk and various gums are exported. The

inhabitants, who number perhaps 500,000, are chiefly Persians proper; the rest are Guebres (Gabrs) or Parsees, Balûchis, and other wandering tribes. —**KERMAN**, the chief town, is situated near the middle of the province, in the central mountain-range, and contains a population estimated at 70,000. Kerman was the great emporium for the trade by the Persian Gulf and the Indian Ocean. In 1722 the town was destroyed by the Afghans; in 1794 it was taken and pillaged by Aga Mohammed, and 30,000 of the inhabitants made slaves. But the chief cause of the decline of its trade was the fall of Gombur, its port, before the rising prosperity of Bushire. At present Kerman is mainly noted for the manufacture of the famous Kerman carpets (a sort of woollen rugs), shawls, and felts.

Kermanshah (also KARMANSHAH and KIRMANSHAHAN), a flourishing town of Persia, capital of Persian Kurdistan, near the right bank of the river Kerkhah. It is the centre of converging routes from Bagdad, Teheran, and Isfahan. Its commerce is considerable, and there are manufactures of carpets and weapons. It was occupied alternately by Turks and Russians in 1916-17. A railway has been projected from Bagdad (and built to the Persian frontier), the intervening country presenting no engineering difficulties. But between Kermanshah and Teheran the country is mountainous. Pop. 65,000.

Kermes, a crimson dyestuff got from *Coccus ilicis* (see COCCUS), found in Mediterranean countries on a small oak, *Quercus coccifera*. The name is also given to a cherry-red mineral (see ANTIMONY), usually in tufts of capillary crystals; a mixture of sesquioxide and sesquisulphide of antimony; approximate composition $(Sb_2S_3)_2Sb_2O_3$. It was formerly much used for the same purposes as James's Powder.

Kerner, ANDREAS JUSTINUS, one of the leading members of the 'Swabian School' of poets, was born at Ludwigsburg, in Württemberg, 18th September 1786. He studied at Maulbronn, and afterwards medicine at Tübingen, and settled in 1818 as a physician at Wildbad, and finally at Weinsberg. Here he died, 21st February 1862. Along with his friends Uhland and G. Schwab he published *Poetischer Almanach* (1812) and *Deutscher Dichtervald* (1813). But his chief poetical works are *Reisesshatten von dem Schattenspieler Lux* (1811), *Romanische Dichtungen* (1817), and *Der letzte Blütenstrauss* (1852). His poetry approaches closely to the *Volkslieder* in freshness and simplicity, and is lit up with gleams of humour; but it sometimes drops to the lower levels of romanticism. He took a keen interest in the phenomena of animal magnetism, and wrote several books on the subject, one of which, *Die Scherin von Prevorst* (1829), excited great attention. See Lives by Niethammer (1877) and Reinhard (1886), and Du Prel's *Kerner und Die Scherin von Prevorst* (1886).

Kerosene. See PETROLEUM, PARAFFIN.

Kéroualle, LOUISE DE (1649-1734), a mistress of Charles II. (q.v.), worked in the interests of France, and was made Duchess of Portsmouth. See a monograph by H. Fomeron (1886).

Kerowie. See KARAUJI.

Kerr. See KER.

Kerry, a maritime county in the south-west of Ireland, in the province of Munster, is bounded on the N. by the estuary of the Shannon, and on the W. by the Atlantic Ocean; area, 1853 sq. m. One-fourth is barren mountain-land, and more than one-tenth bog and marsh. Maximum length, north to south, 67 miles; maximum width, 55 miles. Its coast-line is about 220 miles in length; is fringed with islands,

of which the chief are Valentia, the Blasquets, and the Skelligs; and is deeply indented by Kenmare, Dingle, and Tralee bays. Between these and the smaller bays are extensions of the mountain-system which stretches westward from the county of Waterford. The principal group is Macgillicuddy's Reeks, the chief summit of which, Carran Tual, 3414 feet, is the highest in Ireland. The rivers are short and of little consequence. The county contains numerous lakes, some of them, especially the Lakes of Killarney (q.v.), of exquisite beauty. The climate is mild, but moist, especially on the coast. The soil rests on slate and sandstone, with limestone. Iron, copper, and lead ores abound, but are not much worked. Slate and flagstone are quarried in Valentia. The manufactures are inconsiderable; oats and butter are the chief exports. The fisheries on the coast are considerable. Kerry returns seven members to Dáil Éireann. Pop. (1841) 293,880; (1871) 196,014; (1881) 201,039; (1911) 159,691, nearly all Roman Catholics. The county is rich in ancient ruins, including Muckross Abbey and Innisfallen.

Kersantite, the name given to certain lamprophyres, igneous rocks of somewhat abnormal chemical composition, which occur typically as narrow dykes and other small intrusions. The kersantites consist essentially of biotite and plagioclase felspar, and, together with the minettes, biotite-orthoclase rocks, are included in the term 'mica-trap.' They are frequently much weathered and rich in secondary carbonates. The name is taken from Kersanton, a small hamlet near Brest.

Kersey, or KERSEYMERRE, a variety of woollen cloth, differing from ordinary broadcloth by being woven as a Twill (q.v.). It is easily distinguished from the common cloth by the diagonal ribbed appearance of its upper side, where the nap, not being raised, allows its structure to be seen. A very thin fine make of Kersey is called cassimere.

Kertch is (as it was also before being destroyed by the allies in 1855) an important port of the Crimea, on the strait of Kertch or Yenikale, which, 26 miles long and 3 to 25 wide, connects the Sea of Azov with the Black Sea. It exports grain, linseed, fish, and caviare, and has tobacco, metal, and fish-curing works and flour-mills. There are oil-borings in the peninsula. The museum for the Greek and other antiquities discovered in the neighbourhood was removed to Petrograd after having been partly rifled by the allied soldiers in 1855, but many fine antiquities continue to be found near by. The mineral springs attract considerable numbers. Kertch, the ancient *Panticapæum* or *Bosporus*, founded in the middle of the 6th century B.C. by Milesians, was the capital of the ancient kingdom of the Bosporus, and subsequently of a state founded by the son of Mithridates about 100 B.C. From 1318 to 1475 it was a depôt of the Genoese; then it came into the hands of the Turks; and in 1771 it was acquired by the Russians. Pop., with Yenikale, 56,000.

Keshub Chunder Sen. See BRAHMA SAMAJ.

Kesteven, THE PARTS OF, the south-west division of Lincolnshire (q.v.), an administrative county, and, with Rutland (since 1918), a parliamentary county with two divisions.

Kestrel, or WINDHOVER (*Falco tinnunculus*), a small species of falcon found in the north of Europe in the warmer months, resident in the south all the year round, and particularly abundant in Spain. In Britain it is one of the commonest birds of prey, though its numbers were considerably reduced by persecution before its harmlessness and its utility as a check on the too rapid multiplication of mice were fully recognised. The name windhover refers to the bird's graceful habit of balancing

itself in gale or calm, as some other birds do, by a slight, continuous flapping of the wings. Jefferies thus describes the mechanism of hovering: 'While hovering there are several forces balanced: first, the original impetus onwards; secondly, that of the depressed tail dragging and stopping that onward course; thirdly, that of the wings beating downwards; and fourthly, that of the wing a little reversed beating forwards, like backing water with a scull.' The kestrel feeds chiefly on mice and voles, and in the south it often captures grasshoppers and large beetles, such as cockchafers. It is one of the best friends of the farmer. It seldom attacks birds. The eggs are laid in the old nest of a crow or the like, or in any convenient cavity; they are usually of a fine brownish-red colour, four

Kestrels (*Falco tinnunculus*):
1, the male; 2, the female.

to six in number. The adult male is 14 inches in length, with bluish-gray, chestnut, and buff coloration; the female, which is not appreciably larger, has more rufous plumage, but becomes very like the male in later life. The Lesser Kestrel (*F. cenchris*), a southern bird, is a very rare visitor to Britain; it is 12 inches in length, and has white instead of yellow claws. In America the representative of the kestrel is *F. sparverius*, known in the States as the 'Sparrow-hawk.'

Keswick, a market-town of Cumberland, near the confluence of the Greta and the Derwent, 16 miles NNW. of Ambleside. In its immediate vicinity are wooded Castle Head and beautiful Derwentwater (q.v.), whilst to the north towers Skiddaw (3058 feet). A great tourist centre, it is a pleasant little place, with a town-hall (1813), lead-pencil manufactories, and a church (1839). Greta Hall was Coleridge's home and Southey's. Southey's grave is in Crosthwaite churchyard near by; his monument, with epitaph by Wordsworth, in Crosthwaite church. The Keswick convention 'for the promotion of personal holiness' has met annually since 1875. Pop. 5500. See LAKE DISTRICT.

Ket, ROBERT. See KETT.

Ketch, JACK. See EXECUTION.

Ketones. See ACETONES.

Kett, ROBERT, a tanner, who held a manor in Wymondham, in Norfolk, raised the standard of insurrection in that county in July 1549. The cause of the outbreak was a wide-spread dissatisfaction of the country-people against the gentry, particularly with regard to the enclosure of common lands. Sixteen thousand men gathered round Kett on Mousehold Heath, overlooking Norwich. This

city was twice captured by the rebels; on the second occasion they held it until they were driven out by the Earl of Warwick, and compelled to fight a battle, in which Kett was defeated and captured. He was afterwards hanged at Norwich.

See works by A. Neville (1575), F. W. Russell (1859), and J. Clayton (1912).

Ketteler, BARON VON (1811-77), bishop of Mainz, energetically opposed rationalism in theology, cherished socialist views, first opposed and then accepted the Infallibility decree, and was Bismarck's most strenuous opponent in the *Kulturkampf*.

Kettering, in Northamptonshire, 75 miles NNW. of London, has a fine Perpendicular church, town-hall, art gallery, and corn exchange, and manufactures boots and shoes, plush, brushes, &c. The charter for the market was given by Henry III. in 1227 to the monks of Peterborough. Pop. 30,000.

Kettledrum. See DRUM.

Keuper, the upper division of the Triassic System (q.v.).

Kew, a village in Surrey, in the borough of Richmond, and on the right bank of the Thames, which is here crossed by a fine granite bridge, rebuilt in 1899, 55 feet wide. Foremost among objects of interest at Kew are the Royal Botanic Gardens, containing magnificent collections of plants, both native and exotic. Established in 1760 by the mother of George III., and made a national institution in 1841, the gardens now extend over nearly 300 acres, and have a million visitors yearly. In 1903 the administration of Kew Gardens, which until that year had been under the Office of Works, was transferred to the Board of Agriculture and Fisheries. In addition to numerous hot-houses and conservatories, the principal features are a palm-house 362 feet by 100 and 66 feet high; a temperate-house of the same height, occupying three-fourths of an acre; four museums; a laboratory; the North gallery, containing sketches from nature taken in different parts of the world; and the Pagoda, an octagonal ten-storied building 163 feet high. To the south-west of the gardens is an observatory, chiefly used as a meteorological station; here are kept the thermometer and other meteorological and magnetical instruments which serve as standards for the United Kingdom. Close to the northern entrance is Kew Palace, formerly a favourite residence of George III. and of Queen Charlotte, who died there. In the church, built in 1714, and subsequently enlarged, is an organ presented by George IV., said to have been used by Handel; and in the churchyard adjoining are the graves of Gainsborough and two less-known artists, Meyer and Zoffany. Sir Peter Lely once lived on the Green.

Kewatin. See KEWATIN.

Ke'weenaw Point, a peninsula of Michigan (q.v.), projecting into Lake Superior, and co-extensive with Keweenaw county (350 sq. m.). It is famed for its copper-mines.

Key, in Music, the series of notes, or scale, in which modern music is written. Each note on the staff may form the *tonic* or keynote of a scale, which is called after the name of that note (see MUSIC). A piece is said to be in such and such a key when that key predominates throughout; and the tonic harmony of the key is commonly to be found at the close of the piece, unless it leads to some further movement. It is held by many that each of the various keys has a character, or colour, as it is termed, of its own. In connection with music, the name key is also given to the levers by which the pianoforte, organ, &c. are played; to the levers on wind-instruments for opening or closing

certain of the sound-holes; and to the wrest used for tuning the pianoforte, drum, &c.

Key, or **CAY** (Span. *cayo*, 'reef'), in the West Indies and on the Florida coast, a low islet or shoal.

Key, **ELLEN**, Swedish feminist, biographer, and miscellaneous writer, was born 11th December 1856 on her father's estate at Sundsholm, Småland. When her father, a Radical member of the Riksdag, lost his fortune in 1880, she became a teacher in Stockholm, and afterwards lecturer in a people's institute. This work she gave up later for general lecturing and writing. From 1903 she travelled, and lived latterly on the shores of Lake Vettern. Of her many books, *The Century of the Child*, *Love and Marriage*, *The Woman Movement*, and others have been translated into English. *Lifstinjer* (1903-5-6) is also noteworthy. A woman of rich and vital personality, she is rather a prophet than a scientific writer. Her views have given rise to dissensions both among the friends and among the foes of the emancipation of women. See an essay by Landquist (1909), and *Life* by Mrs Nyström-Hamilton (trans. 1913).

Key, **FRANCIS SCOTT**, author of 'The Star-spangled Banner,' was born in Maryland, 9th August 1780, practised law at Frederick City and at Washington, and became district attorney for the District of Columbia. It was during the British invasion in 1814, at the attack on Baltimore, which he witnessed from an English man-of-war, that Key, after watching through the gray dawn to see which flag floated over the ramparts of Fort McHenry, wrote the words which have kept his name alive. He died 11th January 1843. A collection of his poems appeared in 1857.

Key, **THOMAS HEWITT** (1799-1875), headmaster of University College School and professor of Comparative Grammar in University College, London, was eminent as a Latin philologist and author of a *Latin Grammar* and of a *Latin-English Dictionary*.

Key Islands. See **KEI ISLANDS**.

Keyham, with its tidal basin, docks, and naval engineering college, is on Keyham Lake, an eastern inlet of the Hamoaze; see **PLYMOUTH**.

Keyne, **St.**, a holy virgin, said to have lived about 490, whose name survives in an old church in Cornwall, near Liskeard, and still more so in its famous well. Whichever of a newly married pair first drinks of its water will bear rule. See Southey's ballad.

Keys, **HOUSE OF**. See **MAN (ISLE OF)**.

Keys, **POWER OF THE**. See **POPE**.

Key West, a port of entry and capital of Monroe county, Florida, is situated on the island of Key West (Span. *Cayo Hueso*, 'Bone Reef'), 60 miles SW. of Cape Sable; a coral island, 7 miles long, 2 to 3 wide, and nowhere more than 11 feet above the level of the sea. It has a deep-water harbour, and, as the nearest American port to Colón (4200 miles), profits enormously by the opening of the Panamá Canal. In view of this, it was connected with the Florida mainland at Miami (1908) by a very expensive railway passing from islet to islet and over them on concrete arches and bridges—one a viaduct of 7 miles in length. The harbour, which was a great military and naval centre in the war with Spain in 1898, is strongly fortified. There are cigar manufactures and sponge-fisheries. The subtropical vegetation is luxuriant, and the warm and equable climate attracts consumptives. Pop. 19,000.

Khabarovsk, or **KHABAROVKA**, at the junction of the Ussuri with the Amur, and connected by rail with Vladivostok, formerly capital of the Maritime Province of Siberia and of the whole Amur

region, was seized by the Japanese after the Russian revolutions; pop. 50,000.

Khaibar Pass, the great northern military road between the Punjab and Afghanistan, winds in a north-westerly direction for 33 miles between the projecting spurs of two enclosing ranges of hills. The pass is merely the bed of a narrow watercourse, and varies in width from 150 yards to 20, though in one place it is only '10 feet or less.' It is liable at times to be suddenly flooded. The mountains on either side are in many places perpendicular walls of smooth rock, and can be climbed only in a few places; they vary in height from 1404 to 3373 feet. The Khaibar (or Khyber) Pass has been the key of the adjacent regions in either direction from the days of Alexander the Great. During the Afghan wars of 1839-42 it was twice traversed by a British army, in spite of an obstinate defence by the natives. The first fighting in the Afghan war of 1878-80 was in forcing an entrance into this pass. It was stipulated in the treaty of Gandamak (1879) that the Anglo-Indian authorities were in future to have full control of this pass. The treaty of 1919 provided for demarcation of the frontier in the west Khaibar. A railway has been built through the pass, to be extended hereafter to Jalalabad and Kabul.

Khairpur, a Mohammedan state in Sind, E. of the Indus; area, 6050 sq. m.; pop. 193,000.

Khaki (Hind. 'dusty'), a brownish-yellow twilled cotton cloth used for sepoy uniforms; then adopted also by British troops abroad; and later extended, in the uniforms of home troops, to woollen cloth of yellowish, brownish, grayish, greenish hue.

Khalid. See **MOSAILIMA**, **KHALIF**.

Khalif (also spelt *Caliph*; Arab. *Khalifah*, 'successor'; fully *Khalifah Rasul Allah*). In the beginning the Khalifs were 'the successors of the Prophet of God,' and as such were rulers in the land. As Islam became extended and firmly established the khalifate developed into a dynasty which ruled a great empire. It cannot be too definitely emphasised that the khalifs had no resemblance whatsoever to the position of head of a church such as the Pope of Rome. They were great kings who ruled their lands and were never spiritual leaders; indeed they claimed not only to rule their own immediate lands but the whole world. The khalifate was, at any rate so far as the orthodox Sunnis were concerned, an elective post; and it is a matter of fact that only six out of the great dynasty of the Abbasids who ruled for two and a half centuries were succeeded by their sons. However, even when empire and power were both gone, the khalifs were recognised as being the fount of all power, and we see many occasions when powerful kings besought from a khalif, who was little more than a prisoner, the authority of his sanction to rule.

The First Four Khalifs.—The Prophet leaving no son, the wise and good **ABŪ-BAKR**, father of his favourite wife **Āysha**, was elected by an assembly of the faithful (632 A.D.). On **Abū-bakr's** accession, **Muhammad's** prophetic rival, **Mosailima**, was defeated and killed by **Khalid**, 'the Sword of God,' and the Arabs were united in faith and in the holy war which the khalif immediately declared against Syria. **Khalid** routed the Persians in several battles, and a Roman imperial army was severely defeated in this reign. **Abū-bakr** at his death (634) was succeeded by **UMAR** (Omar), another father-in-law, under whom the war was continued. Damascus capitulated; **Baalbek** and **Emesa** fell; and **Jerusalem** after a sharp conflict surrendered (636). **Aleppo** was surprised; **Antioch** yielded after a battle; **Tripoli** and **Tyre** were betrayed, and by the end of 638 **Abū Obeidah** and **Khalid** had given

all Syria to the khalifate. Meanwhile the little Arab Christian kingdom of Hira had been destroyed (632). Persia also fell. With the national banner she lost all hope at the four days' battle of Kadiisiya (635), west from the Euphrates, not far from old Hira. A few months after the battle Seleucia and Ctesiphon, the Persian capital, were taken. Kūfa was planted near Hira, which soon disappeared. Now Kūfa's great rival Basra was founded. 'The victory of victories' at Neha-wend (642) permitted one army to reduce Ecbatana and Media, then to help the army of Syria to subdue 'Iraq and part of Armenia. Another army with Saad had conquered as far as the east end of the Persian Gulf. Egypt had also been subdued. From Syria Amru broke into Egypt by Pelusium and took Memphis. The native monothelite Christians helped him to expel the orthodox Greeks. Alexandria capitulated in 641; was recovered, retaken, and dismantled in 646. Thereafter Cairo became the capital of Egypt. Umar it was who began the use of the Hegira (Hijra or Hedjra), the Prophet's retreat from Mecca (622), as the Muhammadan era, and took the title Amīr ul-Mu'minin, 'Commander of the Faithful.' Uthmān's lieutenant Abdullah fought many battles in the North African provinces of Tripoli and Cyrene, and gathered much tribute, but effected no settlement in this region.

Umar was stabbed by a Persian slave in 644. On his death a council of six appointed as third khalif UTHMĀN (Othman), the Prophet's secretary and son-in-law. He fixed the text of the Koran, and prevented disputes by burning all previous copies. His weak government, however, raised complaints and insurrection on all sides, although success still followed Islamic arms, and in his reign Persia was finally subdued. Also, by the capture of Herat, Merv, and Balkh, Uthmān's hold on the country between the Gulf and the Oxus was completed. He was besieged in Medina and murdered (656).

Uthmān was succeeded by the heroic ALI, poet, soldier, and saint, husband of Fāṭima, and son of the Prophet's uncle Abū Tāleb. Ayesha, fomenting rebellion, he defeated near Basra on the 'Day of the Camel,' in the first battle of the first Moslem civil war. She was taken on her camel and sent into retirement in Medina, for Ali had transferred the seat of government to Kūfa. Mu'āwiyah, governor of Syria, son of that Abū Sufiān who as Muhammad's enemy had been beaten at Bedr, and had helped to beat him at Ohud, claimed to succeed his cousin Uthmān, and seduced or subdued Syria, Egypt, Yemen, and Persia. On Ali's murder by a fanatic he negotiated the abdication of Ali's son Hassan, and becoming khalif in 'the year of union' 661, made the title hereditary.

The khalifate arose in the most degenerate period of Persian, Roman, and European rule. An explanation of its progress is found in the exhaustion of the empire and Persia in their mutual wars; the real valour of the Arabs enormously enhanced by their religious enthusiasm and greed of spoil; in their comparative moderation towards the conquered; and in their elsewhere unknown principle of comparative toleration in religion. But underlying the onward sweep of Islam there was not so much a religious movement as a breaking forth of the Arab peoples from their narrow and unattractive desert to the more fertile lands of their neighbours. Christian sects were bitter against one another, and in Christian nations imperial centralisation, extortion, and tyranny, and ecclesiastical tyranny and persecution, had almost extinguished patriotism. The invaders, therefore, were regarded with indifference or welcome, though few except Arabs yet preferred Islam to tribute or the sword. The difficulty for the Arabs, headed by a khalif account-

able only to God, his own conscience, and the patience of his subjects, was not to conquer, but to govern, and so to keep.

The Umayyads.—MU'ĀWIYAH (661-80) was the first khalif of the Umayyad dynasty, and his seat was at Damascus. The conquest of Syria had now provided harbours, men, and materials for fleets, but in naval warfare the Saracens had to acknowledge the superiority of the Greeks. As archers and horsemen they had no superiors, but in the scientific part of warfare they never attained eminence. Mu'āwiyah had captured Rhodes in 653. In 672 he began a siege of Constantinople by sea and land which lasted intermittently for seven years. In Africa conquest was resumed in 661, when Mu'āwiyah was asked for aid by the province, groaning under the civil and military tyranny of the Patriarch of Carthage. Okba subdued the open country, until in 670 he founded Kairawān and the great mosque which bears his name. The Greek empire being thus expelled, the mixed population preferred the khalifate to Moorish anarchy. The most important occurrence in Mu'āwiyah's reign was probably his dealings with Ali and his son Hassan. Ali was defeated and murdered in 661; and his son, appointed khalif in his stead by their followers the Shiites, had no desire to continue the struggle, and retired to Medina, where he died eight or nine years afterwards. Ali, Hassan, Husain, and his lineal descendants to the ninth generation are the only Imāms or spiritual rulers recognised by the Shiites. The twelfth, the Mahdi, is not yet dead, but will appear before the judgment day. The tomb of Ali, the first khalif recognised by the Shiites, whose name is the watchword of undying hatred between Turk and Persian, is at Meshed Ali, the ancient Hira, south of Kūfa. All the Imāms' tombs are centres of Shiite pilgrimage.

Mu'āwiyah was an Arab gentleman, but the same can hardly be said about the rest of his line. His son YAZID I. (680-83) succeeded him. Ali's son HUSAIN had fought well at Constantinople under the father, but the son's right he would not own. Splendid promises lured him from Medina to lead a rebellion in 'Iraq. On the plain of Kerbela he and almost all his followers were slain in battle. The Shiites look upon Husain as a martyr, and his tomb at Kerbela is to them one of the holiest places in the world.

Yazid I. was followed by MU'ĀWIYAH II. (683); and he by MERWĀN I. (murdered 685). ABD-UL-MĀLIK's troubled reign lasted till 705. He encouraged scholars to translate Persian literature into Arabic, and gave the khalifate a coinage of its own. He negotiated with Justinian II. in 686 the removal of the Mardaites, who in Lebanon, round Byblos, their port and nucleus, had been a most willing and useful barrier to Muhammadan conquest. But they were monothelite Christians. They were scattered over the empire. In 692, to support his wars he imposed the Haratch or capitation tax on all Christian men, one of the deadliest blights of the Muhammadan and Turkish empires.

The glorious reign of the inactive WALĪD I. (705-15) saw the khalifate extended at one end by the addition of Spain, where, in 711, a Moslem army under Tarik landed at Gebel el Tarik (Gibraltar) and advanced into Spain, and, owing to the indifference of the people and the help of the persecuted Jews, added their lands to the khalifate; Sogdiana, at the other extremity of the empire, between the Oxus, the Jaxartes, and the Caspian Sea, was taken from the Turks by Kuteibah, and the khalifate extended to the mouth of the Indus. SULAIMĀN I. (died 717) sent a magnificent army and fleet under his brother Mūslemah against Constantinople; but next year (718) both perished

almost utterly. The newly invented Greek fire had immensely aided the city in this siege and the former. To Constantinople belongs the honour of having been the first and strongest bridle of Islam. Good UMAR II.'s reign ended in 720. YAZID II. died 724. HISHAM died 743. WALID II. was killed in the insurrection (744). YAZID III. died 744. IBRAHIM was dethroned by MERWAN II., governor of Armenia (744).

The character of the Umayyads had not made them popular, and the mode of their elevation encouraged civil war, whereof they had continual experience. The whole land between the Indus and Euphrates was convulsed with the struggle between white Umayyads and black Abbasids. Merwan was defeated near the Zab, pursued into Egypt, and there fell in battle near Bushir, near to Memphis (750). With the end of the Umayyad dynasty came also the end of Arab domination, while the seat of rule passed from Damascus to Bagdad. Three brothers descended from Abbas, uncle of the prophet, arose, and Abdallah, their uncle, after inviting eighty of the Umayyads to a conference and a feast at Damascus, murdered them.

The Abbasids.—The first Umayyad united the khalifate; the first Abbasid divided it. One Umayyad, Abd ur-Rahman, escaped from the massacre by Abdallah, and, crossing the strait into Spain, founded after a struggle the Umayyad amirate, which became in later years the khalifate of Spain or Córdoba. The year 800 may be considered the culminating point of the khalifate, though it is also true that it was under the Abbasids that the decline of the khalifate began.

ABU'L-ABBAS (750-54), called also Saffah, 'the shedder' of his enemies' blood, was followed by his brother ABU JAFAR AL-MANSUR (754-75), who founded Bagdad for the seat of empire, AL-MAHDI (775-85), AL-HADI (785-86). Al-hadi's brother, HARUN UR-RASHID, 'The Just' (Haroun al Raschid) (786-809), owes his fame to the interested praise of orthodox and literary men. He persecuted the Christians, and made eight destructive attacks on the Greek empire in Asia Minor, but rather as a brigand and slayer than as a conqueror. Under him the great family of Barmecides ruled the land, and did perhaps more than any other family to increase the wealth and glory of the khalif. His three sons, instead of accepting his partition of the empire, fought for supremacy. AL-AMIN, the khalif, was defeated and slain (813); AL-MA'MUN, his brother (813-33), aided the culmination of Moslem culture. He was the first to put 'Imam' on his coinage, his predecessors having used only Amir ul-Muminin. In the years 830, 831, and 832 he penetrated into Asia Minor with great success. He was a great patron of science and literature, and his reign may be considered as one of the greatest in the Abbasid line.

AL-MO'TASIM (833-42), following his brother, maintained the desolating indecisive wars in Asia Minor. With him departed the glory of the Abbasids. Afraid to arm or to trust his own subjects, he left Bagdad for Samarra, 100 miles up the Tigris, and surrounded himself with 50,000 Turks. Civil and military administration was soon in their hands. Their steadier valour and strength compensated the decayed religious enthusiasm of the Arabs. Thereafter the khalifs held power and life by the grace of the Turks.

Before the Abbasids, religion and conquest were the ends of Moslem power. The Abbasids strove after science and refinement. Yet of wars they had no end. Rebellion hardly ever ceased. Sectarian persecution was the bane of AL-WATHIQ's reign (842-47), although in many respects he took after Ma'mun as a patron of learning. The same

may be said of AL-MOTAWAKKIL's (847-61). His son, AL-MONTASIR, conspired with the Turks against him, slew him, and reigned 861-62. AL-MOSTA'IN reigned 862-66; AL-MO'TAZZ, 866-68; AL-MUH-TADI, 868-70; AL-MO'TAMID, 870-92; AL-MO'TADID, 892-902; AL-MUKTAFI, 902-7; AL-MUKTADIR, 907-32; AL-QAHIR, 932-34. AL-RADI, 934-40, was the last khalif that like a true Imam and khalif preached to the people. AL-MUTTAQI died 944; AL-MUSTAKFI, 944-46, his successor, had no temporal power beyond the walls of Bagdad.

Another blow to the khalifate was the rise of the Karmathian heresy preached by the prophet at Kufa (890), and spread by the swords of Abu Saïd and his son Abu Taher. In Bahrein and Oman, where the sect is still numerous, their temporal power began. Basra was taken, Mecca was captured with great slaughter (930), and the black stone (see KAABA) was carried away by those despisers of pilgrimages and other formalities. However, in a few years the Karmathian power melted away under the swords of the orthodox. See KARMATHIANS.

Still greater mischief resulted from the size of the khalifate itself. Amirs everywhere became hereditary by favour of the khalif, then without it; then instead of men and revenue were sent complimentary gifts—an elephant, a jewel, a few slaves. Then came independence. The Aghlabides, one of whom, Ziyadat Allah, was governor of North Africa, while his brother led the expedition against Sicily, reigned over these two regions till 909. Their seat was Kairawan. IDRIS, of Hassan's and Ali's blood, was proclaimed king in West Africa in 788, and established the kingdom of Fez; he built the city (806). He was poisoned, it was said, by an emissary of Harun ur-Rashid. His descendants reigned till 967. With Berber aid Fatimides overthrew the Aghlabides and Edrisides, and (969-70) possessed themselves of Egypt, which had been independent since 935. Thence they quickly subdued Syria, which they soon lost to the Crusaders. They gradually became merely phantasmal khalifs under their wazirs, who even became sultans, till in 1171 Saladin, a Kurd, founded the line of Ayubid sultans of Egypt. That country thereafter always recognised the khalifs of Bagdad as the Commanders of the Faithful. Mamun's great general, Tahir, and his children to the fourth generation, reigned in Khorasan.

In 917 three Persian brothers, Buwayhids, of whom the youngest, Ahmad, was the strongest, usurped dominion from the Caspian Sea to the Persian Gulf. The khalifs, miserable slaves of the Turks, called in the Buwayhid sultan, who in 946 took Bagdad and became the lieutenant or commander of the Commander of the Faithful, leaving him merely a nominal superiority. When Abud ud-Dawlah had his name inserted in the Khutbah and pronounced in the mosque at Friday service, the khalifate reached its lowest degradation. In 963-75 Nicephorus Phocas and John Zimisces swept everything but the impregnable Tripoli before them, from Cappadocia to the walls of Bagdad, retaining the oft-contested Cilician cities and Antioch and Cyprus for the empire. From the Buwayhid, who then and at other times proved himself a tyrannical master but a weak protector, the khalif had to appeal to the Turkish Saljuk's grandson, Tughril Beg. He, pushing towards India the Ghaznaide Turkish princes who reigned from the Caspian Sea to the Indus, had planted himself in Ecbatana (Hamadan). Marching thence, he destroyed the Buwayhid dynasty, took Bagdad (1050), and became Defender of the Faith and protector of the khalif. When the Saljuks, running the usual round of Asiatic dynasties—valour, greatness, discord, degeneracy, decay—had succumbed to Genghiz Khan,

the khalifs recovered the civil rule of Bagdad and 'Iraq Arabi. But Hulagu, prosecuting his grandfather's conquests, laid siege to Bagdad (1258). The khalif Mōtasim, from among his seven hundred concubines, exhorted him to repent; but after two months the city was sacked with fearful slaughter, and Hulagu pronounced sentence of death on the last of Muhammad's temporal successors. The khalifate as an entity had died, but the ghost of a great tradition still survived in Egypt. Al-Mo'tasim's representative was found in Egypt in 1517 when the Turks seized that country. On his death in 1538 the sultan of Turkey assumed the title of khalif, which his successors held till 1924, when the civil government of Turkey abolished the title. As a political entity the khalifate had long lost the meaning it had in the past. Although the khalifate started with one supreme head of the Muhammadan world, by the 11th century there were eight rulers who took the title, and there are as many scattered over the world to-day who are revered by their subjects as holders of the ancient title, from the Shārif of Morocco, the Amir of the Wahhabis, and the Amir of the Senussi to the Prince of Sambiling in Borneo. For the detailed history of the other dynasties of importance not treated of in this article, see such headings as SPAIN (for the Umayyad dynasty of Abd ur-Rāhman), EGYPT (the Abbasids of Egypt), TURKEY (the Ottoman Khalif), SHITES, SUNNIS, SENUSSI, MAHOMMED and the more important of the khalifs. For those who wish to study the history of the khalifate more closely, the following books are recommended: Sir W. Muir, *The Caliphate, its Rise, Decline, and Fall* (1898; ed. Weir, 1924); Prince Caetani, *Annali dell' Islam* (1905-12); Sir Mark Sykes, *The Khalif's Last Heritage* (1915); and Sir T. W. Arnold, *The Caliphate* (1924).

Khalifa, THE, ABDULLAH ET TAAISHA (1846-99), successor to the Madhi Mahommed Ahmed, born in south-west Darfur. See SUDAN.

Khama (c. 1830-1923), the reforming chief of the Bamangwato in Bechuanaland (q.v.).

Khammurabi. See HAMMURABI, BABYLONIA, CODE.

Khamsin, or KHAMĀSIN. See EGYPT.

Khan, a Turki word taken over into Persian and Arabic, and used for sovereigns and nobles. See also CARAVAN.

Khandeish, or CANDEISH, two districts (E. and W.) near the northern edge of the Deccan, in Bombay Presidency. Both are intersected by the Tapi River, and are fairly well watered. Area, 10,951 sq. m.; pop. 1,718,000, including 250,000 Bhils.

Khan Tengri, the highest peak (24,000 feet) of the Tian-shan (q.v.).

Kharasm. See KHIVA.

Kharbin, or HARBIN, town of Kirin province, Manchuria, on the Sungau River. It is an important railway centre, being the junction where the Siberian railway branches off to Vladivostok and to Port Arthur, and as such was prominent during the Russo-Japanese war. There are three towns, Old Kharbin, New Kharbin, and the industrial town with large flour-mills and breweries. Pop. (estimated) 100,000.

Khargeh. See OASES.

Kharkov, capital of the republic of Ukraine, 312 miles NW. of Taganrog, is the seat of a Greek bishop and of a great university. The chief industrial products are sugar, oils, textiles, soap, candles, felt, tobacco, and iron; but the place is principally celebrated for its four great fairs. Pop. 300,000.

Khartum, or KHARTOUM, the most important town in the Anglo-Egyptian Sudan, stands partly on the low land between the Blue and the White Nile, just above their junction, partly (North Khartum) across the Blue Nile, and may be held to include Omdurman. It is 445 miles SW. of Suakin (*viâ* Berber), and 1350 S. of Cairo by rail and steamer. It was founded under the rule of Mehemet Ali (q.v.) in 1823, and soon became a place of commercial importance, and was made the capital of Egyptian Sudan. As starting-point and terminus of caravans to the interior, it was notorious for its great activity in the slave-trade. Ivory, ostrich-feathers, gums, and tamarinds were other articles of commerce. It shared the evil fortune of the Sudan (q.v.); and General Gordon (q.v.) defended it against the forces of the Mahdi (q.v.) in 1884-85. Two days before the rescue army reached it Khartum fell, and Gordon was amongst the slain (26th January 1885). Pop. then about 60,000, one-half being Turks, Greeks, Syrians, Arabs, and Egyptian craftsmen, the rest representing the varied races of Eastern Africa. But Khartum was now deserted for Omdurman, just below and on the left bank of the river, which was the capital of the Mahdi and his successor, the Khalifa, till the advance of Kitchener's force in 1898. On 2d September the dervishes were routed and the Khalifa's power broken at Omdurman. Khartum, again the capital, has recovered its prosperity, and is rapidly extending. It has fine public buildings, including government house and the Gordon Memorial College for literary, scientific, and technical instruction, with a training college for teachers. The Kitchener Memorial Medical School was opened in 1924. Khartum has railway communication with Wady Halfa; by the Atbara junction and the Suakin railway, with Port Sudan on the Red Sea; and with Sennaar and El Obeid. Pop. 31,000, or (including Omdurman, 79,000, and Khartum North, 14,000) 124,000.

Khāsi, a series of hills or step-like plateaus in Assam, on the watershed between the Brahmaputra and the Surma, and with the connected Jaintia Hills giving name to a district. The rainfall is enormous, Cherrapunji, on the southern face of the Khāsi Hills, recording the heaviest rainfall in India (average 458 inches). Lime, oranges, and potatoes are exported. Coal is, and iron ore used to be, worked. The language of the Khasis, an Indo-Chinese race, 'has no analogy elsewhere in the whole of India; it is described as 'monosyllabic in the agglutinative stages.' The principle of female descent and female authority are the most marked among their social customs. See Dalton's *Ethnology of Bengal* (1872); Gurdon, *The Khasi* (1907).

Khāt. See CATHA.

Khatmandu, the capital of Nepal, stretches for about a mile north from the confluence of the Baghmati and Vishnumati rivers. It contains a great number of temples, many in pagoda shape, with roofs of brass, and others domed; but the houses are in general mean, their courtyards filled with rubbish-heaps, and the streets are narrow and filthy in the extreme. The principal building is the immense ugly palace of the Maharaja; close to its modern *darbār*, or reception-room, is the large military council-chamber, the Kōt, where in 1846 most of the chief men of the state were massacred. Pop. (estimated) 70,000 to 80,000.

Khayyām, 'OMAR. See 'OMAR.

Khazars. See CHAZARS, CYRIL.

Khedive, a title granted in 1867 by the Sultan of Turkey to the Viceroy of Egypt. The word (Persian, *khidiv*) means 'sovereign,' and is a more dignified title than *vali*, 'viceroy.' In December

1914 Turkish suzerainty was abolished, the khedive deposed, and a Sultan of Egypt installed in the British protectorate, which became an independent kingdom in 1922.

Khelat. See KALAT.

Kherson, or **CHERSON**, an Ukrainian town on the Dnieper, 19 miles from its mouth, and 81 NE. of Odessa. The town was laid out by Prince Potemkin in 1778 as a naval dockyard; but in a few years, owing to the unfavourable character of the river, it was supplanted by Odessa and Nikolaieff, both as a dockyard and a commercial outlet. It trades in timber and grain, manufactures soap, tallow, and tobacco, and wool-cleansing is important. At Kherson Potemkin is buried, and John Howard, the prison reformer, died. Pop. 75,000.

Khitans. See CATHAY.

Khiva, also called **KHARASM**, **KHWARIZM**, or **URGENJ** (anc. *Chorasnia*), a district, formerly a state, of Turkestan in Central Asia, between 40° and 44° N. lat. and 56° and 63° E. long., contains about 26,000 sq. m., mostly desert. A mere remnant of the former kingdom, the country is bounded on the N. by the Sea of Aral, W. by the Ust-Urt plateau, S. by the Kara-kum desert, E. by the Amu-Darya, which separates it from the Kizil-kum desert. The chief oasis, in which the capital, Khiva, is situated, stretches from the mouth of the Oxus or Amu-Darya for 200 miles along its banks, and is watered by artificial canals supplied from that river. The inhabited area is about 5000 sq. m. The population has been estimated at 500,000 to 800,000, mostly Uzbek agriculturists in the S. and Turkomans and Karakalpaks (still partly nomadic) in the northern delta, which is more sparsely inhabited. The Amu-Darya and some canals are navigable. Agriculture, horticulture, and cattle-rearing are carried on, and the chief exports are cotton, lucerne, skins, wool, rice, butter, silk, carpets, cloth. The quiet colour of the Khivan costume contrasts strangely with the bright and showy garb of Bokhara or Samarkand.

Khiva in ancient times was nominally subject to the Seleucidæ; subsequently it formed a part of the kingdoms of Bactria, Parthia, Persia, and the Khalifate, and became an independent monarchy in 1092 under a lateral branch of the Seljuk dynasty. The Khivans (or Chorasmiens), after conquering part of Persia and NW. Afghanistan, were overthrown by the Moguls, under Genghis Khan, in 1221. In 1370 Khiva came into the hands of Timûr. Timûr's descendants were subdued in 1511 by Shahy Beg (called Sheibani Mehemmed Khan by Western writers), chief of the Uzbeks, a Turkish tribe, and his successors ruled over Khiva till the end of the 18th century, when they were supplanted by Kirghiz and Karakalpak princes, and from the beginning of the 19th century by the Kungrat branch of the Uzbeks. Slave-raiding, brigandage, and the sowing of sedition among her Kirghiz subjects led to the intervention of Russia. In 1717 Peter the Great endeavoured to conquer Khiva, but was defeated, and in 1839 Tsar Nicholas met with no better success. Russian forts in 1869 and 1871 were founded on the shores of the Caspian, and in 1873 a strong Russian force entered Khiva. The khan ceded to Bokhara the Khivan possessions on the right bank of the Amu-Darya, and they soon became Russian territory. Under Russian suzerainty from 1873 unruliness in the khanate was suppressed. A Soviet republic, set up in 1919, was in 1920 recognised by Russia as an independent state in alliance with Moscow. In 1925 the Turkoman and Uzbek republics were set up, and the greater part of Khiva was included in the former.—The town of **KHIVA**, once a busy slave-market, is on the Hazveti Pehlivan Canal, at the south-west

verge of the great oasis. It consists almost entirely of earth-huts. It has two walls, and contains the palace, a big library, several mosques, a hospital, schools, and a small Russian colony. Pop. 20,000. Yenghi-Urgenj is the commercial centre. See **TURKESTAN**, **OXUS**, **ASIA (CENTRAL)**, and works by Vambéry (1864), Burnaby (1876), and Colquhoun's *Russia against India* (1900).

Khmer. See CAMBODIA.

Khoi, a town in the Persian province of Azerbaidjan, on the highway between Erzerum and Tabriz, which lies 75 miles to the SE. Here Selim I. defeated the Persians in a great battle in 1514. The surrounding district, which is a fertile plateau, yields grain, fruit (especially mulberries), and cotton. Pop. 35,000.

Khoikhoi. See HOTTENTOTS.

Khojend, a walled town of Turkestan, on the Syr-Darya, 75 miles S. by W. of Khokand, and 150 E. by N. of Samarkand. It stands in the midst of gardens, and manufactures silk. At one time independent, it was disputed by the emirs of Bokhara and Khokand until the Russians seized it in 1865. Pop. 36,000.

Khokand, or **KHOQAND**, once a khanate of Turkestan, extending over the whole upper basin of the Jaxartes or Syr-Darya, but long previous to the commercial treaty with Russia, in 1868, confined to an area of some 30,000 sq. m. In 1875 a rebellion against the khan, who was already practically a Russian vassal, led to Russian intervention. Now the khanate forms the Russian province of Ferghana (q.v.), a name under which Khokand was famous throughout the East during the middle ages. Khokand (pop. 121,000), notwithstanding its insalubrity, is the second largest town in Russian Turkestan and the centre of its cotton trade. It is on the Transcaspian railway, 85 miles from its terminus, Andijan, and has a branch line to Namangan (60 miles).

Khonds, a primitive Dravidian people of Orissa and adjacent regions, who formerly practised human sacrifice. They number half a million.

Khonsar, or **KHUNSAAR**, a town of Persia, in the province of Iraq-Ajemi, 80 miles NW. of Isfahan, and on the route from that city to Hamadan; pop. 12,000.

Khorasan, **KHURASAN**, or **KHORASSAN**, an extensive region of Persia bordering on Afghanistan, contains about 210,000 sq. m., of which nearly one-third is a vast salt waste; of the remainder a large portion consists of plains of shifting sand. In the north the high range of the Elburz crosses, throwing out spurs, and forming a mountainous district, abounding with fertile and well-watered valleys. There was much irrigation in ancient times, but the disturbances of a thousand years almost put an end to it. The chief products are grain, cotton, wool, carpets, silk, hemp, tobacco, aromatic and medicinal plants, fruits, wines, salt, gold, silver, and precious stones, especially turquoises, also camels, horses, and asses. The chief towns are Meshed, or Meshhed (q.v.), the capital, Nishapur, Kutchan, Shahrud, Khaf, Kain, and Tebbes.

Khorasan (ancient Persian, 'eastwards') is said to have extended all over central Asia in the north, to the Helmand on the S., to the Pamir on the E., and to the Caspian on the W. After the conquest of the Arabs the country beyond the Oxus became a possession of the Samanide dynasty, whilst Kharasm (the modern Khiva) was taken by the Seljuks. Herat, with the adjoining districts, remained in the possession of the Timurides, though sometimes retaken by the Persians, until finally it fell under the sway of the Afghans. Khorasan, being situated

on the highway of the Turko-Tatar inroads into the west of Asia, had always to bear the brunt of predatory hosts coming from beyond the Oxus, and its chief towns repeatedly suffered destruction. Later the invasion has come from the west, the northern slopes of the Kubbet Mountains, together with the oasis of Merv, including the middle course of the Hari-Rud, being annexed by Russia. For the 'Veiled Prophet of Khorasan,' see MOKANNA.

Khorsabad. See NINEVEH.

Khosrū. See CHOSROES.

Khotan, called locally ILCHI, a city and oasis of eastern Turkestan, at the northern base of the Kuen-Lun Mountains, 6 miles from the desert. The district is rich in jade, manufactures silk, and exports silk stuff, carpets, and jade-ware. In the early Christian centuries the city was the capital of an important kingdom, and a great Buddhist centre. The district has yielded works of art showing Greek influence, and MSS. in several languages. It is the chief source of MSS. in the recently discovered 'North Aryan' language (Iranian in its affinities but leaning towards Indian in vocabulary)—translations of Indian Buddhist literature written in a modification of the Brāhmī alphabet ('Central Asian Gupta'). Pop. of oasis, 150,000.

See Sven Hedin, *Through Asia* (1898); and for the important results of Stein's excavations, his *Ancient Khotan* (1907), *Ruins of Desert Cathay* (1912), and *Serindia* (1921), &c.

Khuastuanift, a Manichæan litany, of which texts and fragments, in Turkish, have been found at Tunghwang and Turfan during the 20th century.

Khunsar. See KHONSAR.

Khurja, a town of British India, lying 50 miles S. of Meerut and 50 SE. of Delhi, is the chief commercial centre in the district of Bulandshahr. There is a large export of raw cotton to Cawnpore and Calcutta. Population, 25,700, chiefly Pathans and Baniyas. The latter have banking establishments all over India. They are Jains in religion, and own a fine modern temple.

Khuzistan. See ARABISTAN.

Khwarizm. See KHIVA.

Khyber. See KHAIBAR PASS.

Kiaipeda, Lithuanian name of Memel (q.v.).

Kiakhta, or KAICHTA, a town of Transbaikalia, in Siberia, on a tributary of the Selenga, 165 miles SE. from Irkutsk, adjoining the Mongolian town of Maimatchin. The place stands in a desolate valley. Kiakhta was appointed by the treaty of Nerchinsk in 1689 the sole trading-place between China and Russia; but down to 1727 the general trade did not flourish much, because the imperial crown reserved the fur trade as a monopoly in its own hands. From 1727 celebrated fairs were held in December, when Russian furs and cotton, cloth, and leather were exchanged for tea, silk goods, &c. But since the treaty of Peking (1860), when the treaty-ports of China were thrown open to Russian vessels and trade was declared legitimate all along the Russo-Chinese frontier, it has lost much of its importance as a trade centre. It has still a large tea trade, though the opening of the Suez Canal has diverted much of it. An agreement between Russia and Mongolia with regard to Mongolian railways was signed at Kiakhta in 1914. A branch of the Trans-Siberian railway runs from Lake Baikal.

Kiangsi, an inland province of eastern China, has many mountain-ranges of moderate height running NE. and SW. The principal rivers drain into the Po-Yang lake, in the north, which discharges into the Yang-tse. Tea, tobacco, china, grass-cloth, and paper are produced. Coal and other

minerals are found. Area, 70,000 sq. m.; pop. 24,000,000; capital, Nanchang.

Kiangsu, a coast province of China, on the Yellow Sea, forms an alluvial plain, much broken up by lakes, traversed in the south by the Yangtse, as it was in the north (till 1853) by the Hoang-ho. The Grand Canal runs from end to end. Tea, cotton, silk, sugar, and grain are produced. Among its many cities are Nanking, the capital, and Shanghai. Area, 40,000 sq. m.; pop. 26,000,000.

Kiao-chau, or KIAU-CHOW, a port on the south side of the Shantung peninsula, leased by Germany in 1898. The harbour is silted, but advantageously situated. Japan demanded the surrender of the leased territory (August 1914) 'with a view to its eventual restoration to China,' and receiving no reply, declared war. The leased territory was besieged, with British help, and capitulated in November. By the treaty of Versailles (1919) Germany's rights in Kiao-chau and Shantung generally were transferred to Japan. After much discussion, especially in China and America, the territory (area, 200 sq. m.) was restored to China, 10th December 1922.

Kidd, WILLIAM, pirate, was a native of Scotland, born probably at Greenock, and is supposed to have been the son of a worthy Covenanted minister who was put to the torture of the boot, and who died in 1679. The lad went early to sea, saw much hard service privateering against the French, and gained a high reputation for stubborn courage, and in 1691 a reward of £150 from the council of New York city. At this time the American colonies were supposed to be nests of pirates who infested the Indian Ocean, and Coote, Earl of Bellamont, was sent out by William III. as governor of New York and Massachusetts with special instructions to suppress the pest. A ship of 30 guns was fitted out by a private company in London and given to Kidd, who was furnished, moreover, not only with the usual letters of marque, but with commissions under the great seal both to act against the French and to seize pirates. In January 1697 he reached Madagascar, the chief rendezvous of the pirates, but ere long disquieting reports reached England that Captain Kidd was playing the game of pirate himself. After a two years' cruise he returned to the West Indies, and a few months later had the temerity to go to Boston without securing himself by a satisfactory safe-conduct. In spite of the half-promises that had been made him he was arrested and sent to England, where he was tried for piracy and the murder of one of his men. Of the latter charge he was formally found guilty, and hanged at Execution Dock, London, 23d May 1701, protesting his innocence to the last. He had buried treasure on Gardiner's Island, off Long Island, which was recovered and seized, amounting with what was found elsewhere to £14,000. See Sir C. N. Dalton, *The Real Captain Kidd: a Vindication* (1911).

Kidderminster, a municipal borough of Worcestershire, on the Stour, 4 miles above its junction with the Severn, and 14½ miles by rail N. of Worcester, 121 NW. of London. It is a busy, thriving-looking place, chiefly noteworthy on account of its carpet manufacture (see CARPETS), which was first established here in 1735. Worsteds spinning and dyeing are also carried on. The introduction of the beet-sugar industry was undertaken in 1924. Richard Baxter was for fourteen years vicar of the parish, and an illustrious native was Sir Rowland Hill. There are statues of both. Among the public buildings are the parish church, Early English to Perpendicular in style, with a noble pinnacled tower; a Renaissance town-hall

(1877), a corn exchange (1855), a free library, a free grammar-school (founded in 1637), and a public park and recreation ground (1887). There is a complete drainage system and water-supply, with baths and wash-houses. Kidderminster was incorporated as a municipal borough by Charles I., and from 1832 to 1918 returned one member to parliament. Pop. 27,000.

Kidnapping, the abduction specially of children; the word being derived from *kid*, slang for 'a child,' and *nap* or *nab*, cant for 'to seize.' The law of the subject is given at ABDUCTION; the charge of kidnapping frequently made against gypsies is dealt with at GYPSIES.

Kidney-bean. See BEAN.

Kidneys, two glands having for their function the excretion of the urine. The human kidneys are situated in the region of the loins, one on each side of the spine, and are imbedded in a layer of fatty tissue. Their form is distinctive. They possess a convex outer border and a concave inner border, the extremities are somewhat enlarged, and the organ as a whole is compressed from before backwards. The average length of each kidney is a little more than 4 inches, and its usual weight is from 4 to 6 ounces. The left kidney is longer and narrower than the right, and in the female the weight is slightly less than in the male. The concave inner border presents a longitudinal fissure—the hilum—at which the vessels enter; in front there is the renal vein, behind it the renal artery, and most posterior the ureter, which conveys the urine to the bladder. When the sides of the hilum are held apart a deep indentation is seen—the sinus of the kidney—in which the ureter dilates to form a large sac, the pelvis of the kidney. Investing the kidney there is a fibrous coat—the *tunica albuginea*—which readily peels off from the substance of the gland to which it adheres by minute processes and fine blood-vessels. At the hilum it turns inwards, and becomes continuous with the sheaths of the vessels. Under cover of this capsule there is an incomplete layer of involuntary muscular fibre. The substance of the kidneys is dense, extremely friable, and of a deep red colour. On making a longitudinal section of the kidney from the convex outer border to the hilum it is seen to consist of two different substances, which are named, from their position, the external or cortical and the internal or medullary substance, arranged in pyramids with their apices towards the hilum.

The *cortical substance* forms by far the greater part of the gland, and sends numerous prolongations inwards between the pyramids of the medullary substance. It is soft, granular, and contains numerous minute red globular bodies diffused throughout it, which are called, from their discoverer, the Malpighian bodies. Its substance is made up of the *uriniferous tubes*, capillaries, lym-

phatics, and nerves, held together by an intermediate parenchymatous substance.

The *medullary substance* consists of pale reddish, conical masses, called the pyramids of Malpighi. They are usually about twelve in number, but vary from eight to eighteen, and their apices (the *papillae*) point towards the hollow space (termed the *sinus* or *pelvis*) which occupies the interior of the gland. The medullary structure is firmer than the cortical, and instead of being granular presents a striated appearance, from its being composed of minute diverging tubes (the uriniferous tubes), which run in straight lines through this portion of the kidneys, after having run in a highly-convoluted course through the cortical portion. From the base of each pyramid streaks pass through the cortex, named *medullary rays*, and the portions of cortical substance between the rays are called the *labyrinth of the cortex*.

The cavity occupying the interior of the kidneys (the *sinus* or *pelvis*) is lined by mucous membrane, which, through the medium of the ureter, is continuous with that of the bladder, and which extends into the tissue of the kidneys, to line the uriniferous tubes. The mucous membrane forms a cup-like cavity around the termination of each pyramid, and the cavity, termed the *calyx*, receives the urine from the open terminations of the tubes, and conveys it towards the pelvis, from whence it passes down the ureter into the bladder.

Each kidney is supplied with blood by a renal artery, a large trunk which comes off at right angles to the aorta. The blood, after the separation of the various matters which constitute the Urine (q.v.), is returned into the venous system by the renal or emulgent vein, which opens into the inferior vena cava. The nerves are derived from the renal plexus.

The Malpighian bodies are found in all vertebrate animals. In mammals, which are the only animals in which there is a division into a cortical and a medullary portion, these bodies are only found in the former. They are for the most part of a spherical, oval, or flask-like form. Their diameter in man may range from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch, the mean being $\frac{1}{14}$. A small artery, termed the *afferent vessel*, may be traced into each Malpighian body, while a minute

venous radicle, the *efferent vessel*, emerges from it close to the point at which the artery had entered. The Malpighian body itself, situated in the labyrinth, consists of a rounded bunch or tuft of capillaries, derived from the afferent and terminating in the efferent vessel, and enclosed in a clear and transparent capsule—the capsule of Bowman—lined with flattened epithelium. Each capsule is continuous with the uriniferous tube by a narrow neck.

It now remains to consider the respective functions of the Malpighian bodies and the tubes. From the researches of Bowman and others it appears that in animals in which the urinary excretion is passed in an almost solid form (as in birds and reptiles) the tufts are small and simple as

Fig. 1.—Vertical Section of Kidney:

a, supra-renal capsule; bb, cortical substance of kidney; cc, medullary substance of kidney; dd, tunica albuginea; eee, the sinus or pelvis; ff, the ureter, proceeding to the bladder.

Fig. 2.—Plan of the Renal Circulation in Man and the Mammalia (from Ludwig):

a, terminal branch of the artery, giving the terminal twig, af, to the Malpighian tuft, m, from which emerges the efferent vessel, ef. Other efferent vessels, e, e, e, are seen proceeding from other tufts, and entering the capillaries surrounding the uriniferous tube, t. From this plexus of capillaries the emulgent vein, ev, springs.

compared with those in the kidneys of animals which (like man and most mammals) pass the urinary constituents dissolved in a large quantity of water. On these grounds, as well as from the fact that the anatomical arrangement of the tufts is well calculated to favour the escape of water from the blood, Bowman arrived at the conclusion that the function of the Malpighian bodies is to furnish the fluid portion (the water) of the urine. Recent observations tend to show that the saline ingredients of the urine are also excreted by Bowman's capsule. The arrangement of the convoluted portion of the tubes, with a capillary network on one side of their basement membrane, and secreting epithelial cells on the other, is the exact counterpart of the arrangement in other secreting glands, and there can be no doubt that the functions of the cells in the convoluted portion of the tubes is to separate from the blood the various organic constituents (urea, uric acid, creatinine, &c.) which collectively form the solid constituents of the urine. It does not necessarily follow that these secreting cells undergo rapid decay and renewal; it is more probable that they have the power of selecting certain materials from the blood, and of transmitting them, without the disintegration of their own structure, to the interior of the tube. The physical and chemical characters of the secretion yielded by the kidneys will be considered in the article URINE.

DISEASES OF THE KIDNEYS.—By far the most important are the group included under the general name of Bright's disease, which may be defined as comprising cases where structural changes in the kidneys, usually inflammatory, but without suppuration, lead to the presence of albumen in the urine. Dr Richard Bright published in 1827 researches showing that many cases of dropsy are attended by albuminuria on the one hand, and by marked changes in the kidneys on the other. His observations have been confirmed and extended by many subsequent observers; and it is now agreed that there are three distinct groups of cases, differing much in causation, symptoms, course, and post-mortem appearances, to which the above definition applies. These must be considered separately.

(1) *Catarrhal or Parenchymatous Nephritis* (inflammation of the kidneys).—In this form the inflammation affects chiefly the secreting structures of the kidney—i.e. the cells lining the tubules. The kidneys are at first much enlarged; in acute cases in the early stage redder than in health; in later stages and in chronic cases paler. If the duration of the disease is long, however, they may ultimately become much diminished in size, so as much to resemble, except in their paler colour, the kidneys in the cirrhotic form of Bright's disease. This disease may often be traced to exposure to cold; frequently complicates pregnancy; and occasionally occurs in connection with most of the eruptive fevers, but particularly scarlet fever, of which

it is one of the most common and serious complications. In acute cases it sometimes begins with a rigor and elevation of temperature. Dropsy is almost always one of the earliest symptoms, and often appears first in the skin under the eyes. Pain in the region of the kidneys, headache, and vomiting are usually present. The urine is scanty, often bloody, and contains albumen and tube-casts. Symptoms of Uræmia (q.v.) often occur. In favourable cases complete recovery takes place in the course of a few weeks, all the symptoms gradually subsiding. Frequently, however, though the severer features of the case disappear, the urine continues to contain albumen, and the disease becomes chronic. Death may result from uræmia, from dropsical effusion, especially in the large serous cavities, frequently from the occurrence of some acute inflammation, particularly of lungs, pleura, or pericardium.

(2) *Cirrhosis of the Kidneys, or Interstitial Nephritis*.—In this form the morbid process consists chiefly in chronic inflammation of the connective tissue of the kidney, which leads to destruction of the tubules and glomeruli by cicatricial contraction. In advanced cases the kidneys are much diminished in size, rough and nodular on the surface, and red in colour. This disease is often traceable to gout, either inherited or acquired, or to chronic lead-poisoning. It is rare before the age of thirty, most common after forty or forty-five. The chief feature of this affection is its extremely chronic and insidious nature, which is so marked that it is almost always for some secondary result of the disease that the patient seeks medical advice, and not for symptoms directly referable to the kidneys. The earliest symptom is usually an increase in the quantity of urine, which contains albumen only in small quantities, and may sometimes be quite free from it. Hypertrophy of the heart, with a hard pulse, is one of the most constant features of the disease; and in many cases symptoms due to heart affections are the first which excite the patient's alarm. Persistent headache, unaccountable vomiting or diarrhoea, failure of sight owing to albuminuric retinitis, simple debility, symptoms of uræmic poisoning, cerebral hæmorrhage (apoplexy), or the occurrence of acute inflammation of some internal organ—all these are among the occurrences which may lead to the discovery of this singularly insidious disease. It frequently becomes complicated by addition of inflammation of the kidney tubules (above described) to the primary process, and the symptoms are modified accordingly.

(3) *Waxy or Lardaceous Degeneration of the Kidney*.—The smaller arteries and capillaries are first and most affected; later other portions of the organ partake in the morbid process. But in the great majority of cases some degree of inflammation of the tubules is also present. Like waxy degeneration elsewhere, it can almost always be traced either to syphilis or to prolonged suppuration. The flow of urine is generally increased in the early stage, and contains albumen. Dropsy is usually present, with some others of the symptoms enumerated above as characteristic of the first form of Bright's disease. But in general the symptoms are rather variable, and could hardly lead to the recognition of the condition present apart from the clue given by the previous history of the case and the occurrence of signs of waxy disease in other organs.

Treatment of Bright's Disease.—In acute cases (first form) prompt and active treatment is necessary, and is often signally successful. Confinement to bed between blankets, light diet, mainly of milk and cereals, and the production of very free action of the skin and bowels are usually the chief points to be attended to. In the most severe cases wet-

Fig. 3.—Diagrammatic View of Tubules (right side, A) and Blood-vessels (left side, B) of Kidney.

(From Macalister.)

cupping or bleeding from the arm is sometimes required. Extreme care is necessary till perfect recovery has taken place. In chronic cases warm clothing, with attention to the action of the skin, strict regulation of the diet, avoidance of alcohol, and where possible removal to a warm climate during the cold season can do much to keep the disease in check. Experience has shown that under favourable conditions the course of the disease may be very much retarded by attention to dieting and care of the general health.

Albuminuria without Bright's disease may occur in the course of fevers, in heart disease, and many other morbid conditions. It is now believed by most observers, though the subject is still under discussion, that it may also be present without any actual disease. *Hæmoglobinuria* (impregnation of the urine with the colouring matter of the blood) is a troublesome, and in the case of blackwater fever a dangerous, disease. *Hæmaturia* (blood in the urine) is indicative of disease in some part of the urinary passages; but it is often difficult to be certain what portion is at fault. Besides Bright's disease, the most common conditions leading to it are stone in the kidney or bladder, inflammation of the bladder, and tumours. For *Glycosuria* (sugar in the urine) and *Polyuria* (increase in the quantity of urine), see DIABETES.

Stone in the Kidney.—The symptoms attending the passage of a stone from the kidney to the bladder have already been described (see CALCULUS); but it not infrequently happens that a stone formed in the kidney remains there, or, though it enters the ureter, fails to escape, blocking it and preventing the discharge of urine from that kidney. In either case the symptoms are often somewhat obscure and difficult to trace to their true cause. When the stone remains in the kidney blood generally appears from time to time in the urine, and there is persistent pain in the loin, often aggravated by such movements as the jolting of a carriage. Medicinal and dietetic treatment may often prevent the formation of fresh stones, where one has been discharged, and sometimes even seems to lead to the removal by solution of a stone from the kidney. Operation is a more satisfactory mode of treatment when the presence of a stone is diagnosed by X-ray examination, and sometimes relieves the symptoms even when no stone has been discovered. When a stone becomes impacted in the ureter the kidney is gradually destroyed, and either atrophies or becomes converted into a large sac containing fluid. The remaining kidney generally becomes enlarged, and carries on the function of excretion; but if its ureter subsequently becomes obstructed in the same way death rapidly ensues.

Suppurative inflammation of the kidney may occur in the course of pyæmia, but usually results from disease of the lower urinary passages (bladder or urethra, hence often called surgical kidney), and is a very fatal disease. The kidneys may become the seat of *tubercular disease*, of *malignant tumours*, of *hydatid cysts*. But none of these conditions is of common occurrence.

Floating or Movable Kidney.—One kidney, more rarely both, may have its attachments to the posterior wall of the abdomen so loosened and elongated that it can move about in the abdominal cavity, somewhat as the intestines normally do. This condition is much more common in women than in men, and may either produce no symptoms, or lead to great discomfort and distress. In the latter case it is usually possible so to adapt a bandage and pad as to restrict the movements of the organ and to relieve the symptoms.

Kidney-stones, the name formerly given to small nodules of reddish-brown ironstone veined with calcite, which are common in the Oxford

Clay in the sea-cliffs and on the shore north of Weymouth, Dorsetshire. They are now termed 'septarian nodules.'

Kidney-vetch (*Anthyllis*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, containing a number of species, some shrubby and some herbaceous, natives chiefly of the Mediterranean. They have the petals nearly equal in length, and an oval 1-3-seeded pod, enclosed in the permanent inflated and generally downy calyx. The only British species is the Common Kidney-vetch (*A. Vulneraria*), also called *Lady's Fingers*, a herbaceous perennial, with pinnate unequal leaves, and crowded heads of yellow (or sometimes scarlet) flowers. It grows on very dry soils, and is eaten with avidity by cattle, but does not yield much produce. *A. Barba-Jovis* (Jupiter's Beard), from the south of Europe, is so called on account of the long, silky hairs which clothe the leaves, and conspicuous bracts that accompany the flower-heads.

Kidron. See KEDRON.

Kieff, or KIEV, chief city of Ukraine, on the Dnieper, was one of the oldest towns of Russia, and ecclesiastically one of the most important. According to tradition it was founded before the Christian era. In 882 it was made the capital of the Russian principality, and remained so until 1169. Here in 988 Christianity was first recognised in Russia by St Vladimir; and ever since that date Kieff has been one of the chief ecclesiastical and intellectual centres of eastern Europe. It was captured and nearly destroyed by the Mongols in 1240, and it remained in their hands for eighty years. From 1320 to 1569 it was in the possession of Lithuania, then of Poland down to 1654, in which year it was annexed to Russia. In the great European war and its sequel Kieff repeatedly changed hands, being held by Germans, Poles, Ukrainians, and Russians, Bolshevik and anti-Bolshevik. The town is built on elevated ground (350 feet above the river), trenched by ravines, and is connected with the opposite bank of the Dnieper by a fine suspension-bridge, built in 1851. The most notable institution in the town is the celebrated Petchersk monastery, which is visited by more than a quarter of a million pilgrims annually. Underneath the monastery are a number of caves, containing tombs of the chief saints of the Russian Church. The cathedral of St Sophia, erected in 1037 on the spot where Yaroslaff defeated the Petchenegs (1036), contains the tombs of the grand-dukes of Russia, and a magnificent altar, ornamented with beautiful mosaics; the interior of the cathedral resembles a labyrinth. The cathedral church of the Assumption harbours the bones of seven saints brought from Constantinople, and has a beautiful belfry with a peal of twelve bells. That of St Vladimir (1862-96) is richly decorated. Many of the churches have gilded domes and pinnacles, which, seen from a distance, give the city a striking appearance. The university was removed to Kieff from Vilna in 1833. There are also theological and music colleges, a polytechnic, and an arsenal. Considerable trade, especially in sugar, is done at the fairs, the most celebrated of which is held during February. Pop. (1871) 79,773; now about 400,000. The fortress of Kieff, begun by Peter the Great in 1706, and afterwards fortified in modern style, occupies a commanding site on the right bank of the Dnieper.

Kiekie (*Freycinetia Banksii*), a scandent shrub of the natural order Pandanaceæ, yielding an edible, aggregated fruit, said to be the finest indigenous fruit of New Zealand. The kiekie is found in the northern part of New Zealand. The fruit is a mass of fleshy bracts, and the jelly made of it tastes like preserved strawberries.

Kiel, chief town of the Prussian province of Sleswick-Holstein, stands 66 miles N. by E. from Hamburg by rail, at the head of a deep fjord (11 miles long) of the Baltic, which admits large ships to anchor close to the town. It was the headquarters of the German Baltic Sea fleet. The imperial shipbuilding-yards, slips, dry and wet docks, &c., were given up to commercial purposes in 1919-20, and a free port was set up. There is an observatory (removed from Altona in 1874). Kiel is the principal centre of yacht-racing in Germany. It is also an important commercial port. The chief part of its trade is carried on with the towns of Denmark and Sweden, corn, coal, timber, and cattle being imported; whilst coal, flour, beer, butter, cheese, and fish are exported. The industrial activity is considerable, and is mostly exercised in iron-foundries, shipbuilding-yards, corn-mills, breweries, and cabinet-makers' works. Kiel is the seat of a university, founded in 1665, with new buildings completed in 1876. The castle, built in the 13th century and enlarged by Catharine II. of Russia in the 18th, shelters the university library (a large collection) and a museum with sculptures by Thorwaldsen. The Thaulow Museum contains Sleswick-Holstein carved work of the 15th-18th centuries. The bay is defended by a series of forts placed near its sea entrance. For the Kiel Canal connecting the Elbe and the Bay of Kiel, see **BALTIC SEA**, and **CANAL**. Kiel affords good facilities for bathing. The old town, dating from before the 10th century, has been enlarged by the suburbs of Brunswick and Düsterbrook; the latter has beautiful promenades. Pop. (1875) 37,270; (1890) 69,172; (1910) 211,044; (1919) 205,330. Here was signed in 1814 the treaty between Denmark, Sweden, and England, by which Sweden exchanged Pomerania for Norway.

Kielce, a Polish town, 85 miles N.E. of Cracow, has manufactures of cement, fertilisers, copper, marble, zinc, and lead; pop. 41,000.

Kjelland, ALEXANDER, Norwegian novelist, was born at Stavanger in 1849. He studied law in Christiania, became manager of brickworks, and burgomaster of Stavanger, and died in 1906. After two series of *Novelettes* (1879-80), he published *Garman og Worse* (1880), *Arbeidsfolk* (1881), *Gift* (1883), *Fortuna* (1884), *Sne* (1886), *Sankt Hans Fest* (1887), *Jacob* (1891), besides a number of plays. His work, which was much influenced by French novelists, is realistic and satirical.

Kienzl, WILHELM, Wagnerian composer, born 17th January 1857 at Waitzenkirchen, Upper Austria, composed *Der Evangelimann* (1895) and other operas, and wrote a monograph on Wagner (1903).

Kiepert, HEINRICH, cartographer and geographer, was born at Berlin on 31st July 1818, and first established his reputation as a map-maker by preparing in co-operation with Ritter the *Atlas of Hellas and the Hellenic Colonies* (1840-46; new ed. 1870). Thereafter he gave his time and energy to constructing atlases of the Orient, especially of the Orient in ancient times, his best-known works in this connection being the maps of Asia Minor, the Osmanli empire in Asia, the Caucasus, Palestine, and Turkey, and atlases of the Ancient World. Kiepert, who conducted the Geographical Institute at Weimar from 1845 to 1852, and from 1859 was professor of Geography at Berlin, wrote, amongst other works, a *Lehrbuch der alten Geographie* (1879), *Leitfaden der alten Geographie* (1879; Eng. trans. 1881), and numerous papers, mostly dealing with ancient oriental geography, in the proceedings of the Berlin Academy of Sciences. He died in April 1899.—His son, Dr RICHARD KIEPERT (1846-1915), born at Weimar, was also a cartographer. His

work includes some remarkably good maps of European countries, of China, and of Asia Minor.

Kierkegaard, SÖREN AABY, the greatest thinker of Denmark, was born at Copenhagen on 5th May 1813, led the simple but busy life of a thinker and writer, and died on 11th November 1855. He was a very voluminous author. His greatest books are *Either—Or* (1843) and *Stadica on Life's Way* (1845); these and many others were published under fictitious names. Kierkegaard applied the Socratic method to the examination of the fundamental philosophical principles of Christianity, regarded not as an organised or church religion, but as the religion of the individual soul. Both thought and style are singularly original. In dialectical skill, eloquence, and imaginative qualities he is scarcely inferior to Plato; and to these he joined wit and a love of irony and paradox. He has been one of the most potent influences in modern Dano-Norwegian literature. In his last years he made a bitter attack on the official church. See *Life* by Georg Brandes (in Danish, 1877; in German, 1879), and biographical studies by Barthold (in German, 1875-86).

Kiery. See **AMARANTH**.

Kieselguhr. See **DIATOMS**, **DYNAMITE**.

Kiev. See **KIEFF**.

Kilauea, the great volcano of Hawaii (q.v.).

Kilbowie, in Dumbartonshire, 9½ miles N.W. of Glasgow, is the seat of the huge sewing-machine works of the Singer Company. The town is part of the police-burgh of Clydebank, whose population increased from 3830 in 1881 to 46,515 in 1921.

Kilburn. See **KINBURN**.

Kildare, a county of the province of Leinster, Ireland, bounded by Dublin, Wicklow, Queen's and King's Counties, Meath, and Carlow. Its chief town is Naas, and other towns are Kildare, Kilkullen, Maynooth (where is the Roman Catholic College), and Athy, besides which there are quite a number of small towns. The area is 418,836 acres, or 654 sq. m.; the surface is generally flat and the soil very productive. A great portion of the county belongs to the central Carboniferous plain of Ireland. In the northern part there is a large extent of bog, and the great Bog of Allen covers some 40,000 acres, intersected by elevated ridges of dry ground. From this bog rises the Hill of Allen, a conical rock of porphyry and greenstone, 300 feet high. Towards the south-east the surface rises to meet the hills of Dublin, and in the south to meet those of Carlow. There are a few small woollen, paper, and corn mills, breweries and distilleries, but agriculture is the main occupation. The most fertile and best-farmed districts are the valleys of the Liffey and the Greese. Besides these rivers the county is watered by the Boyne and Blackwater (both having their source in County Kildare), the Barrow and the Lesser Barrow. The Royal Canal, connecting Dublin with the Shannon, traverses the northern portion, and the Grand Canal traverses the valley of the Liffey. To the south of the town of Kildare is the Curragh of Kildare, an undulating plain of bright green grass covering about 8000 acres; a portion of it forms the Newmarket of Ireland, and on another portion is the Curragh Camp. Kildare returns three members to the Dáil Éireann. Population (1841) 114,488; (1911) 66,627—mostly Catholics. Kildare is noted for its antiquities. There are old giant stone pillars at Punchestown, Harristown, Jigginstown, and Mullamast, and remarkable earthworks near Naas and elsewhere. There are numerous sepulchral mounds on the Curragh, and also the remains of a stone circle. There

are five round towers in the county, and the ruins of a great many religious houses and castles.

Kildare, a town in Kildare county, 30 miles SW. of Dublin. St Bridget (q.v.) is said to have founded a nunnery there, and the older name *Druim Craidh* was changed to *Cil-dara*, the cell or church of the oak, from an old tree under whose shadow the saint built her cell. There are remains of three other monastic institutions, and a round tower, the finest in the county, 103 feet high. Kildare was one of the first sees founded in Ireland; its first prelate died in 519. The Protestant see (1550) is now united with Dublin, and the Roman Catholic see forms the diocese of Kildare and Leighlin. After the Norman invasion Kildare became a place of considerable importance, and a parliament was held there in 1309. It suffered severely, however, in the wars of Elizabeth and during the great Civil War, and has never recovered its former standing, although historically one of the most interesting old towns in Ireland. The rebellion of 1798-99 began in Kildare, where, on the night of the 23d May 1798, a number of officers from Dublin were murdered by the insurgents. Pop. 2600.

Kilian, St, the apostle of Franconia, a native of Ireland, who, sent by the pope as a missionary bishop to the heathen, preached at Würzburg about 690, and was slain by his convert Duke Gozbert for denouncing his marriage with Geila, his brother's widow. Würzburg claims him for its first bishop; his day falls on 8th July.

Kilima-Njaro, an isolated mountain mass in East Africa, standing between Victoria Nyanza and the coast, just within the northern limit of the Tanganyika Territory, in 3° 20' S. lat. and 37° 50' E. long. The mass consists of two peaks, or rather craters, Kibo and Kimawenzi, connected by a broad saddle (14,000 feet) studded with lava hills. Kibo was first climbed by Dr Meyer in October 1889. Its highest point is about 19,680 feet above sea-level; its crater is 650 feet deep and 5500 feet in diameter. On the same occasion Dr Meyer climbed the second highest pinnacle of Kimawenzi, and found it to be more than 17,250 feet high. The crater-rims of both peaks are covered with a thick crust of ice.

Kilindini ('the place of deep waters'), a port of Kenya, on Mombasa Island, 3 miles from Mombasa town, is the best harbour of East Africa, accessible to the largest ships. Deep water wharves are being built. There are great customsheds, and the trade of the country—cotton, hides, coffee, fibres, copra, &c.—passes through.

Kilkenny, an inland county of Leinster, bordering on Queen's County, Carlow, Wexford, Waterford, and Tipperary. Its area is 509,732 acres, or 796 sq. m. The proportion of bog is small, and owing to this and the slope of the country the climate is dry, salubrious, and temperate. Vegetation is earlier here than in the rest of Ireland, and the soil along the valleys of the Suir, Nore, and Barrow is very rich. In the northern part there are large tracts of moor devoted to sheep and cattle, but almost nothing has been done to improve the pasture in the hilly districts. Kilkenny forms for the most part a continuation of the Carboniferous-limestone plain, but to the south and south-east the surface rises to a considerable elevation. In the north there is another hilly region forming part of the Castlecomer anthracite coalfield. The output is more than one-half the annual coal production of Ireland. In the western district are the Walsh Mountains. The principal rivers are the Suir, the Barrow, and the Nore, which all rise in the Slieve Bloom Mountains, and

after widely divergent courses empty themselves into Waterford Harbour. The chief towns are Kilkenny, Callan, Thomastown, Freshford, Urlingford, and Castlecomer. Pop. (1841) 202,420; (1891) 87,261; (1911) 74,962—94 per cent. being Catholics. Prior to the Union Kilkenny returned sixteen members to the Irish parliament, but now, together with Carlow, only five. The linen manufacture was once a prosperous industry, but is now practically extinct, and the woollen manufacture is nearly so. There are a few breweries, distilleries, tanneries, flour-mills, and marble-polishing works.

Kilkenny, anciently part of the kingdom of Ossory, was formed into a county by King John in 1210, and during the Revolution was held by the Irish for James II. It was made an English settlement after the Norman invasion, and was the scene of a long succession of conflicts between the two races. The Norman remains are very numerous, and among other antiquities are circular groups of stones on Slieve Grian and the Hill of Cloghmanta, several cromlechs and raths, numerous forts and mounds, five round towers, and monastic ruins at Jerpoint, Rosbercon, Thomastown, Knocktopher, and elsewhere. The most notable castle is Graney, in Iverk, supposed to have been founded by the Earls of Ormonde in 1521, and of which three towers are still standing. The cave of Dunmore, between Kilkenny and Castlecomer, which opens with a natural arch 50 feet high, is noted for its beautiful stalactite chambers and its subterranean stream. At Silverwood and Ballygunnion are the remains of very ancient lead-mines. Manganese, marl, pipeclay, marble and copper are still found. See Robertson, *Antiquities and Scenery of Kilkenny* (1851).

Kilkenny, the capital of the county of that name, is also a county of a city, and was till 1918 a parliamentary borough, returning one member. It is situated on the Nore, 81 miles SW. of Dublin by rail. Pop. (1851) 19,975; (1911) 10,514. At one time it was the seat of busy linen and woollen manufactures, but very little of either now remains. It is still, however, the centre of a considerable industry in marble-polishing. In the neighbourhood are extensive quarries of shelly black marble, which is in extensive request for chimney-pieces, tombstones, and other purposes. The name is Celtic—*Cil-Canice*—the church of St Canice or Kenny, cathedral of the Bishop of Ossory, a building dating from 1052 and the largest ecclesiastical edifice in Ireland except St Patrick's at Dublin. It is in the Early English style, 226 feet long by 123 across the transepts. There are many old sepulchral monuments, and quite close to the south transept are the remains of a round tower still 100 feet high. Other ecclesiastical remains are the preceptory of St John's, founded in 1211; the Dominican abbey, founded in 1225, still used as a Roman Catholic church; and the Franciscan abbey, founded in 1230. In 1857 was erected the Roman Catholic cathedral, at a cost of £30,000, a handsome building with a massive central tower 186 feet high. On a precipitous rock above the Nore is the famous castle of Strongbow and his son and successor, dating from about 1175, and restored during the 19th century as a place of residence for the Marquis of Ormonde. The grammar-school, founded in the 16th century, also stands on the banks of the river, fronting the castle, and here Swift, Congreve, and Bishop Berkeley received their education. Near the city is the Roman Catholic college of St Kieran. Several parliaments were held at Kilkenny in the 14th century, and even down to Henry VIII. it was the residence, occasionally at any rate, of the lord-lieutenant. It was here that in 1367 was passed the stringent 'Statute of Kil-

kenny,' meant to prevent the Anglo-Irish from becoming more Irish—forbidding intermarriage, &c.—and here that in 1642 the Assembly of Confederate Catholics gathered. Cromwell laid siege to the city in 1648, and in 1650 it capitulated on honourable terms. The principal trade of the city is now in provisions, through the port of Waterford, by which it is united by rail. The fable of the 'Kilkenny cats,' which fought till nothing but the tails was left, was perhaps a satire on the contentions of Kilkenny (Englishtown) and Irish-town (now within the city) in the 17th century about boundaries and rights.

Killarney, a small market-town in the county of Kerry, 185 miles by rail SW. of Dublin, 47 WNW. of Cork, and $1\frac{1}{2}$ mile from the lower Killarney Lake. Its importance depends on the crowds of tourists who come to visit the famous lakes. The town has been practically rebuilt, and now possesses some spacious streets with a number of good houses and public buildings. Most notable among the latter is the Roman Catholic cathedral, a very imposing structure, which, along with the Bishop's Palace, was designed by Pugin. There are also a large Episcopal church, a lunatic asylum, a court-house, and a market-house. Pop. (1851) 7127; (1911) 5796. There is a small trade in making fancy articles to attract the strangers, principally from the wood of the arbutus, which grows on the islands. On the shores of the lakes are marble-quarries, yielding several varieties—green, red, white, and brown—and also some old copper-mines. Near the town is the seat of the Earl of Kenmare, whose estates were the scene of disturbances, in connection with evictions, during the Irish agitation of 1888–89.

Killarney, LAKES OF, are a series of three connected sheets of water, the lowermost of which is within $1\frac{1}{2}$ mile of the town of Killarney. The outflow is by the river Laune north-west to Castlemain Harbour. These famous lakes are situated in a basin in the midst of the mountains of Kerry, some of which rise abruptly from the water's edge densely clothed with trees from base to summit. Arthur Young called those which surround the upper lake 'the most tremendous mountains that can be imagined,' and said that the wooded hills along the margins 'form the most magnificent shore in the world.' This is exaggeration, but the scenery of Killarney is very beautiful, and in some of its aspects unique. It presents, as Arthur Young quaintly said, an admirable mixture of the beautiful and sublime. The lower lake, Lough Leane, covers an area of 5001 acres, and is studded with richly-wooded islands. The largest of these is Ross Island, on which is situated Ross Castle, an old stronghold of the O'Donoghues. Another island is the 'sweet Innisfallen' of Moore's song, and on this is the picturesque ruin of an abbey, founded by St Finian the leper in the 6th century. The upper lake covers some 430 acres, and is also studded with islands. Between the two is Lough Torc, covering 680 acres. Connecting the upper with the lower and middle lakes is the Long Range, a beautifully-wooded and picturesquely-winding stream $2\frac{1}{2}$ miles long. About midway in its course occurs the famous echo, caused by a lofty rock called the Eagle's Nest. Between the lower and the middle lakes is the fine ruin of Muckross Abbey, founded by the Franciscans in 1440. A peculiarity of the scenery is the luxuriant growth of arbutuses on the islands of the lakes, which add such richness and colour to the general effect. See works by Mr and Mrs Hall (1843–78).

Killiecrankie, a beautiful wooded pass in Perthshire, on the Garry River, 15 miles NNW.

of Dunkeld. It is traversed by Wade's Great Highland Road (1732), and by the Highland Railway (1863; now London, Midland, and Scottish). For the battle, see GRAHAM (JOHN).

Killigrew, THOMAS, born in 1612, served as a page in the household of Charles I., and was afterwards a dissolute companion of Charles II. in exile and his groom of the bedchamber after the Restoration. He published in 1664 nine indifferent plays, which he tells us were written in nine different cities. He was some time manager of the king's company, and in his patent obtained permission to give the female parts to women. He died in 1683. Sir John Denham's lines form his best epitaph:

Had Cowley ne'er spoke, Killigrew ne'er writ,
Combined in one, they'd make a matchless wit.

—SIR WILLIAM KILLIGREW, his brother, was born in 1606, fought in the Civil War, and died in 1695. His works include a comedy, *Pandora*, and three tragi-comedies, *Selindra*, *Ormasdes*, and *The Siege of Urbin*.

Kilmarnock, a township of Dublin county and a western suburb of Dublin city. Here is the Royal Hospital for the reception of wounded and pensioned soldiers. It was originally founded by Charles II., and is similar to the sister institution, Chelsea Hospital. Near it is the government prison of Kilmarnock. The phrase, 'the treaty of Kilmarnock,' played a prominent rôle in party political warfare in 1882. The phrase pointed to an alleged arrangement between Mr Gladstone and Mr Parnell (then in Kilmarnock gaol), whereby the latter promised to use his influence to prevent agrarian crime in Ireland on condition that a legislative measure affecting the Land Act of 1881 was introduced into parliament.

Kilmarnock, the largest town in Ayrshire, on Irvine and Kilmarnock waters, 12 miles by rail NNE. of Ayr, and $22\frac{1}{2}$ SSW. of Glasgow. It received its name *Kil-mo-Ermin-occ* (Gael, 'church of my little Ermin') from the dedication of its church about 1200 to an Irish saint of the 7th century; and in 1591 it was made a burgh-of barony under the Boyds, from which date its hose and bonnet making grew into thriving industries. The great carpet manufacture was introduced in 1777, and the printing of calicoes in 1770, of shawls in 1824. Railway works were transferred thither in 1858. Tweeds, winceys, boots, &c., are also manufactured. The staple trade, however, is in connection with engineering, owing to Kilmarnock's situation in a great mineral district. In addition to the railway works there are numerous large engineering factories in the burgh, making locomotives, meters, &c. The October cheese-fair (established 1855) is second to none in the kingdom. The Boyds' Dean Castle, 1 mile NE., was reduced by fire to ruin in 1735. The town itself, though it suffered twice from fire (1668 and 1800), and once from flood (1852), has a few buildings of interest. The town-hall (1805), the court-house, the corn exchange (with its Albert tower, 110 feet high), the academy, the Technical School, and the Dick Institute (public library and museum, gift of a native) may be noticed, as also may a statue of Sir James Shaw (1848), and the Kay Park (1879), with its Burns monument, a tower 80 feet high; the Dean Park, the Howard Park, and (a little way out) Bellfield Estate. Of Burns (q.v.) and of the Covenanters Kilmarnock has memories; and it was the birthplace of Alexander Smith. From 1832 till 1918 it united with Rutherglen, Dumbarton, Port-Glasgow, and Renfrew to return one member to parliament, its boundary being extended in 1885. Pop. 36,000.—For Lord Kilmarnock, see JACOBITES.

Kilo (Gr. *chilioi*, 'a thousand'), in the Metric System (see METRE) as a prefix, or (familiarily) by itself, indicates a thousand units.—*Kilogramme*, a thousand grammes = 2·2046 lb.—*Kilogramme-metre*, the amount of work done in lifting one kilogramme one metre = 7·23308 foot-pounds.—*Kilometre*, a thousand metres = 3280·9 feet = 0·6214 mile.—*Square kilometre*, a million square metres = ·386 square mile.—*Kilowatt*, one thousand watts = 1·3406 horse-power = 1·3591 chevalvapeur.

Kilrush, a small seaport in Clare, on the northern shore of the Shannon estuary, 36 miles W. of Limerick. It is resorted to for sea-bathing, and exports grain and timber. Pop. 3700.

Kilsyth, a police burgh of Stirlingshire, 13 miles NE. of Glasgow, with quarries and coal and iron mines. Here, on 15th August 1645, Montrose with 4900 followers almost annihilated 7000 Covenanters under Baillie. A remarkable religious revival here in 1839 originated in the preaching of W. C. Burns, afterwards missionary to China. Pop. 7600.

Kilt. See HIGHLANDS.

Kilwa. See QUILLOA.

Kilwinning, a town of Ayrshire, on the Garnock, $\frac{3}{4}$ miles NNW. of Irvine. The stately Tironensian abbey, founded in the 12th and demolished in the 16th century, was dedicated to Winnin, an Irish saint, who is said to have founded a church here about 715. The traditional birthplace of Freemasonry in Scotland, Kilwinning has also been celebrated since 1488 for archery; its July shooting at the popinjay, placed on the steeple (105 feet high), is described in Scott's *Old Mortality*, and continued till 1870. Eglinton Castle (1798), the seat of the Earls of Eglinton (q.v.), is $\frac{1}{2}$ mile SE. There are gauze, muslin, and woollen factories, ironworks; and coal and fire-clay are got near by. Pop. 5400.

Kimberley, chief town of Griqualand West, the most important inland town of the Cape Province, 540 miles NE. of Cape Town by rail, was named after the first Earl of Kimberley (John Wodehouse, 1826–1902), colonial secretary in 1870–82, and later Indian secretary and foreign secretary. Pop. 38,700, more than half coloured. The British flag was first hoisted at Kimberley in November 1871; but Griqualand West did not become part of Cape Colony till 1880. It stood a siege of four months by the Boers (1899–1900). The rise of Kimberley has been rapid; and its situation on the main railway line is favourable to its further development. There are a handsome town-hall, post-office, high court, public library, and botanic gardens. Kimberley owes its existence to the diamond-mines, the working of which dates only from July 1871, and of which the most important, known as Du Toit's Pan, Bultfontein, De Beer's, and Kimberley Central, were amalgamated into one huge company. The number of diamonds found elsewhere in the whole world is comparatively insignificant (see CAPE OF GOOD HOPE, DIAMOND).

Kimberley, the name of a fertile district in the Fitzroy basin, in the north of Western Australia, where gold was found in 1893.

Kimhi, DAVID, the most eminent Jewish grammarian and exegete, was born about 1160, probably at Narbonne, where he spent the greater part of his life, and died about 1235. His father, Joseph Kimhi, was the author of a number of commentaries and other theological works. His brother Moses wrote similar works and a Hebrew Grammar. His own celebrity, however, far exceeds theirs, and even with competitors like Rashi and Ibn Ezra he has preserved his place as the most popular of Jewish commentators. His Grammar, *Michlol*, and his Lexicon, *Sefer hashorashim*, have to a certain degree been the basis

of all subsequent Hebrew grammars and lexicons. His commentaries cover almost all the books of the Old Testament. That on the Psalms was edited by Schiller-Szinessy (Camb. 1885).

Kimmeridge Clay, the lowest series of the Upper Oolite, consists of dark, bluish-gray shaly clay, which is sometimes bituminous, and occasionally (as at Kimmeridge, or Kimeridge, in the Isle of Purbeck) passes into a shale so rich in bituminous matter as to be used as a fuel. In other places the clay is calcareous, and contains nodules of argillaceous limestone or septaria. While the lithological characters remain uniform from Dorset to Yorkshire, the thickness varies, the maximum in the south of England being well over 1000 feet, in Oxfordshire only 100 feet.

Kimpulung. See CAMPULUNG.

Kin, Kinship, a word connected with *L. genus*, Gr. *γένος*, with the root meaning of 'begetting'; (a) hence the first meaning of the term kin is blood relations, a group of persons descended from a common ancestor; (b) in a derived sense the term is applied to the clan or similar social group, among whom there is not necessarily any tie of consanguinity. In its strict sense kinship, as used by anthropologists, means relationship which can be determined and described by means of genealogies. 'Sibship' may be used as the equivalent of clan relationship. Kinship is sociological in its nature; in other words, social factors and processes mould ideas of kinship, whereas consanguinity is primarily a physiological fact, though ideas on the subject may be modified by erroneous theories and in other ways. Thus, according to the law of England, the father of an illegitimate child is not akin to it; in parts of Melanesia a child is not akin to its father, even though he be the legal husband of its mother, unless and until he has performed the customary acts, such as payment of the midwife, feeding of the child, &c. Conversely, performance of the prescribed ceremonies—e.g. among the Todas—makes a man the father of a child, even though he is only one of a number of possible begetters of the child, owing to the polyandry that prevails among that people.

Kinship thus defined is both wider and narrower than when it is used in the loose sense of membership of one social unit, or exogamous social group; where a social group is patrilineal, the mother and her relatives are in group A, while the children, with the father and his relatives, are in group B. In neither case, however, do these relatives compose the whole of the group; under the genealogical definition, a child is akin to a portion of group A and a portion of group B.

The genealogical definition of kinship cuts across primitive systems of relationship; for where society is organised on a dual basis (see TOTEMISM) all members of groups A and B stand in certain definite relationships to any given individual, irrespective of whether the relationship is traceable genealogically; thus in Hawaii all persons of the same generation are, or were, classed with brothers and sisters, all of the previous generation with fathers and mothers, and so on.

I.—(a) Kinship determined by genealogies is recognised when society is based on the Family (q.v.); and the terms of relationship used in denoting kinship are those which denote in the main individual relationships; precisely those terms—father, mother, husband, wife, &c.—are used in the more definite sense, which are most intimately connected with the individual family; other terms—grandfather, &c.—are used with less definiteness, but even then only of persons related by consanguinity; uncle and allied terms are further enlarged to include relatives by marriage, or affinity, as it is

termed. The word cousin alone is used with a wide connotation; and here precisely we have to do with a relationship which has no social obligations or privileges, and, in particular, with persons who are as eligible for marriage as any other members of the community.

This system of relationship was termed by Lewis Morgan (*Systems of Consanguinity and Affinity*, 1871) the 'descriptive' system—an unfortunate term, as it can be correctly used, at most, of such terms as husband, which apply to one person only; grandfather, brother-in-law, uncle, &c., are not exactly descriptive of the relationship in which such persons stand. The terms are (1) denotative, and (2) classificatory. This type of relationship may be called the 'family,' denotative, or individual system.

(b) The term descriptive may properly be applied to systems found in West Africa, Samoa, the Anglo-Egyptian Sudan, and in Celtic and Semitic languages. Among the Edo (or Bini) of Benin there are distinct terms for brother by the same father (*owihra*), by the same mother (*owiye*), and the same father and mother (*owihrowiye*); and these indicate in each case by their composition their exact meaning; *owihra* is derived from *owi*, son, and *erha*, father, and so on. Terms for mother's brother, and so on, are built up in the same way. In other cases, as among the Mendi of Sierra Leone, there are specific terms for such important relationships as mother's brother, which do not, however, indicate the precise relationship to the mother.

Dr Rivers suggested (*Kinship and Social Organisation*, 1914) that this type of system of relationships is the outcome of the form of social organisation generally known as the patriarchal family, and technically termed the 'extended family.' He proposed to call it the 'kindred' system.

(c) Far more widely extended than either of the foregoing is Morgan's 'classificatory system,' which might also be called the 'clan system.' 1. In the complete form of this system terms of relationship are not used to distinguish individuals, but apply to whole groups of persons, irrespective of consanguinity and affinity. In an Australian tribe with eight intermarrying classes (see MARRIAGE), we may find in the grandparents' generation only four kinship names, one for each grandparent; these are applied by *all* persons two generations below them to *all* persons of the grandparents' generation. The next generation (that of the father and mother) has six names, those for (1) the father, (2) father's sisters, (3) mother, (4) mother's brothers, (5) wife's mother and her brothers, (6) wife's father and his brothers. It must be remembered that each of these terms refers not to a single individual, but to a group of persons; a man's wife's father is, e.g., the father of *any* woman whom he could legally marry—i.e. about one-fourth of the men of a given generation.

It follows that for classificatory peoples no equivalents exist for European ('family') terms of relationship; and we have no adequate means of expressing classificatory terms without a long periphrasis.

Among features of the clan system which demand notice are: (i.) the reciprocal character of some terms (this occurs among ourselves only between people of the same generation); in this group system, where the terms often denote relationships rather than relatives, a man and his grandchild may use the same term in referring to each other; (ii.) the custom of naming a man after his children ('teknonymy'), according to which a woman will call her husband, e.g., the father of John, the father of Mary, &c., rather than by his own name; (iii.) the use of distinct terms between two males, two females, and male and female where such relation-

ships as brother (and sister) or brother- (and sister-) in-law are in question; (iv.) the importance of relative age, especially in the case of brother, sister, or father's brother; in some cases the important factors are the ages of the two persons concerned; in others it is rather seniority than age that weighs, and the terms vary according to whether the parties belong to the older or younger branch of the family; (v.) the terms are largely used as terms of address.

It frequently happens that the terminology of an advanced group is far richer than our own, not only because it distinguishes different classes among relatives (e.g. uncles, cousins) grouped by us under one head, but because terms are in use for relationships for which we do not need a special word. Marriage is held to set up a relationship between the parents of the spouses, or between the spouses of two sisters or two brothers, and so on. Conversely, it also happens that such peoples group together relatives whom we distinguish, such as the father and the father's brother. Dr Rivers has shown that in Melanesia many of these identities of terminology ('correspondence') are due to special forms of marriage (see FAMILY); the names for father-in-law and father's sister's husband may, e.g., be the same. In so far as these extensions or limitations of the group systems depend on relationships set up by marriage, they tend to abolish the distinctive feature of the group system and make terms of relationship indicative of consanguinity or affinity instead of status; so much is this the case that primitive peoples in the present day will frequently lay emphasis on the fact that their terms indicate kinship, when they are in fact applied in the group sense, and this even though some of those to whom they are applied are in fact relatives by blood. Transition forms lead from the clan system to the kindred and the family systems.

2. Morgan distinguished three main forms of his classificatory system. (i.) The Malayan, now more commonly termed the Hawaiian, based on previous stages of intermarriage of brothers and sisters and the communal family; this has now been shown to be, not an early stage, as Morgan imagined, but a very late one, and is not necessarily due to sexual communism (see MARRIAGE). The Hawaiian system is extremely simple: all relatives of the same generation are classed with brothers and sisters, all of the preceding generation with fathers and mothers, and so on; there are in the islands only fifteen terms in all for consanguine relationships. (ii.) The Turanian (Asiatic and Oceanic) and Gano-wanian (North American) systems, based on totemic exogamy plus modified promiscuity.

3. Rivers suggested as an alternative principle that classification should be based on the forms of marriage which give rise to the special features of each system. It happens, however, that if more than one form of marriage are in vogue among a certain people, the resulting system will be complex; and if some of these forms of marriage have ceased to be practised, the system may provide the only evidence of their former existence. Though certain forms, such as cross-cousin marriage, leave traces easily recognisable, other forms are only recognisable with extreme difficulty by their influence on terms of relationship (cf. Rivers, *Kinship*, pp. 32, 40).

4. Morgan entered on his researches into systems of relationship or of 'consanguinity and affinity,' as he termed them, primarily in order to show the relationships between the various races of mankind, and especially the Asiatic origin of the Red Indians; he supposed that all the terms were explicable on the assumption that the system was a system of blood ties; and he referred the origin of such terms as the Hawaiian, now known to be late,

to a very primitive form of society, for which no direct evidence could be produced.

J. F. McLennan admitted that the classificatory system had been produced by social conditions, but maintained that the terms were terms of address which grew up side by side with a system of blood ties. He was at that time ignorant of the social functions connected with classificatory terms (*Studies in Ancient History*, 1886, p. 273). However, he suggested (*ibid.*, p. 310) that if classificatory terms 'have originated in some form of the family, it is unnecessary to imagine a form of the family large and complex beyond anything that observation has disclosed,' thus showing an approach to the modern view.

It is now generally accepted that group terms are far more than terms of address; and the material brought by Dr Rivers from Melanesia makes it clear that they have been moulded and modified by social facts. At the same time there is no reason to suppose that the group (i.e. collective) character of the terms indicates an original state of sexual communism; Sir J. G. Frazer (*Totemism and Exogamy*), after maintaining that group terms preceded family terms, found his position untenable, and in his appendix recognised that individual terms must have come first. In view of the impossibility of showing how the classificatory system could originate, save as a modification of a system based on the family, Morgan's theory of promiscuity must be given up; if sexual communism can be deduced from features of the classificatory system, it is a secondary, not a primary, feature.

Though there are cases in which the classificatory system is not in use, even where society is organised in clans, Dr Rivers is probably right in suggesting that we may trace this system back to the organisation into exogamous clans, and especially to the dual organisation (see TOTEMISM).

II. *Geographical Distribution of Systems.*—Generally speaking, European peoples use denotative and descriptive systems; the tendency in Romance and Teutonic languages seems to have been to pass from the latter to the former; Slavonic languages, Magyar, and Basque seem to be passing from a classificatory to a denotative standpoint. Outside Europe the descriptive system is used among the Eskimo, Sudanese negroes, Semites, and Persians, in the two former cases in combination with the denotative system; the Sanskrit system was perhaps descriptive. In South India, North and East Asia, Oceania, South Africa, Australia, and North America we find the classificatory system; and there is reason to suppose that it is used in South America, though no example has yet been printed.

III. *Social Functions of Relatives.*—A given relationship may involve one or both parties to it in duties, privileges, and restrictions. These functions are of minimal extent among ourselves, and only slightly more extensive in many other European countries; marriage restrictions and responsibilities apart, they may be said to be almost non-existent.

(a) The study of the social functions of relatives is still in its infancy; but among the points on which information is available is the custom of 'avoidance,' which is enjoined between consanguine and sib relatives of different sex, such as brother and sister or mother and son, and, more especially, between relatives by marriage; in the latter case persons of the same sex may practise avoidance, but the custom is of a much more pronounced type in the case of two persons of different sexes. In extreme cases relatives may not stay in the same village; in other cases the prohibition is only against entering a house in which a relative is, seeing, touching, speaking to, addressing in an ordinary tone or from close at hand, using certain words and expressions, or performing certain acts, such as taking a load

from the head of a relative who must be avoided. It appears probable that customs of avoidance are connected with the prohibition of sexual relations; they may have been extended by analogy in the case of relatives by marriage of the same sex; but Dr Rivers suggested that they are due to social relations arising out of the interaction and fusion of different races.

It appears probable that if the object of avoidance between persons of different sexes is the prevention of sexual intercourse, we can infer from the existence of these customs that intercourse or marriage was formerly the practice between persons standing in those degrees of relationship.

Sir E. B. Tylor (*Journ. R. Anthropol. Inst.*, xviii, p. 242 *et seq.*) attempted a statistical study of customs of avoidance with a view of putting sociological studies on a firmer basis; it is, however, generally recognised that the attempt failed in view of (1) the difficulty of deciding what unit must be made the basis, and (2) the fact that customs of avoidance are open to observation in very different proportions in different types of society.

(b) Another point of importance in the function of the kin is the position of the mother's brother, who in some tribes occupies the same position with regard to the child that is held by the father among European peoples. The importance of the mother's brother points to a state of society in which the child belongs to the mother's group, and inherits property and possibly rank from the mother's people.

L. H. Morgan, *Ancient Society* (1877); *Systems of Consanguinity and Affinity* (1871); Rivers, *Kinship and Social Organisation* (1914); *History of Melanesian Society* (1914); A. E. Crawley, *Mystic Rose* (1902).

Kin, NEXT OF. When a person died intestate his real property devolved, according to English law, on his Heir (q.v.), and his personal property was distributed among his next of kin. The degrees of kindred are divided into lineal and collateral. The lineal consists of the ascending, such as father, mother, grandfather, grandmother, paternal and maternal, and so on *ad infinitum*; and the descending, such as son, daughter, grandson, granddaughter, and so on *ad infinitum*. The collateral kindred consists of brothers, sisters, uncles, aunts, &c., and the children of such *ad infinitum*. The mode by which the civil law computed the propinquity of degree was this: it allowed one degree for each person in the line of descent exclusive of him from whom the computation begins, and in the direct line counted the degrees from the deceased to his relative; but as regards collaterals it counted the sum of the degrees from the deceased to the common ancestor, and from the common ancestor to the relatives. Thus, a brother was in the second degree, counting one to the father, and one from the father to the brother; a nephew, and also an uncle, a great-grandfather and a great-grandson, were all in the third degree; a son and a father were in the first degree; and so on. This mode of computing the degrees of kindred has been adopted in the law of England and Ireland.

When a person died intestate, leaving personal property, the next of kin was entitled to take out letters of administration. As regards the right of administration, the court had discretion to appoint a fit person, but a preference was to be given to the widow or widower, and to the next of kin. Among the next of kin those were to be preferred who were nearest in degree according to the above computation: thus, a son or father was preferred to a brother, grandfather, or grandson; and these to a nephew, uncle, great-grandson, or great-grandfather; and so on. By the Administration of Estates Act, 1925 (15 Geo. V. chap. 23, sect. 10),

where a person dies wholly intestate as to his real and personal estate, administration is granted to some one or more of the persons interested under the act in the residuary estate of the deceased. In distributing the personality the widow took one-third if there were children or other descendants, one-half if there were none; and she had in addition a statutory right to £500, or to the whole estate if less. Subject to the claims of the widow, the next of kin took according to the Statute of Distribution; the children exclusively took the whole if children survived; if some of the children were dead, leaving issue, then the issue collectively of each dead child took an equal share with the living children, by what was called the principle of representation. If there were none nearer than grandchildren, each family of grandchildren took the share of the child whom it represented, and the issue of a deceased grandchild also took the share of their parent. If there were no descendants, the father, if alive, was entitled to the whole. If he also was dead, then the mother and the living brothers and sisters (together with the issue of deceased brothers and sisters collectively) took each one share. After these were dead, then grandfathers and grandmothers, paternal and maternal, and nephews and nieces, if alive, took each a share. The right of representation—i.e. the right of the children of a deceased person being one of a class (who, if alive, would have been one of the next of kin) to represent him, and take his share—applied as far as the children of brothers and sisters, but no further. The heir-at-law was one of the next of kin, and took his share of the personality, though he also took all the real estate. The half-blood counted among the next of kin equally with the whole blood; males were not preferred to females; and the rule of primogeniture never had application.

By the Administration of Estates Act, 1925, the residuary estate of every person who dies intestate is to be distributed according to its terms, or be held on the trusts mentioned therein. If the intestate leaves a husband or wife (with or without issue) the surviving husband or wife takes the personal chattels absolutely, and, in addition, the residuary estate of the intestate (other than the personal chattels) is charged with the payment of a net sum of £1000, free of death duties and costs, to the surviving husband or wife; and, subject to providing for that sum and the interest thereon, the residuary estate (other than the personal chattels) is held, if the intestate leaves no issue, upon trust for the surviving husband or wife during his or her life; if the intestate leaves issue, upon trust, as to one half, for the surviving husband or wife during his or her life, and, subject to such life interest, on the statutory trusts for the issue of the intestate; and, as to the other half, on the statutory trusts for the issue of the intestate; but if those trusts fail or determine in the lifetime of a surviving husband or wife of the intestate, then upon trust for the surviving husband or wife during the residue of his or her life. If the intestate leaves issue, but no husband or wife, then the residuary estate of the intestate is held on the statutory trusts for the issue of the intestate. If the intestate leaves both parents but no issue, then, subject to the interests of a surviving husband or wife, the residuary estate of the intestate belongs to the father and mother in equal shares absolutely. If the intestate leaves one parent only, but no issue, then, subject to the interests of a surviving husband or wife, the residuary estate of the intestate belongs to the surviving father or mother absolutely. If the intestate leaves no issue or parent, then, subject to the interests of a surviving husband or wife, the residuary estate of the intestate is held in trust for

the following persons living at the death of the intestate, and in the following order and manner, namely: Firstly, on the statutory trusts for the brothers and sisters of the whole blood of the intestate; but if no person takes an absolute interest under such trusts, then secondly, on the statutory trusts for the brothers and sisters of the half-blood of the intestate; but if no person takes an absolute interest under such trusts, then thirdly, for the grandparents of the intestate, and, if more than one survive the intestate, in equal shares; but if no member of this class takes an absolute interest, then fourthly, on the statutory trusts for the uncles and aunts of the intestate (being brothers or sisters of the whole blood of a parent of the intestate); but if no person takes an absolute interest under such trusts, then fifthly, on the statutory trusts for the uncles and aunts of the intestate (being brothers or sisters of the half-blood of a parent of the intestate); but if no person takes an absolute interest under such trusts, then sixthly, for the surviving husband or wife of the intestate absolutely. The act repeals the Statute of Distribution.

In Scotland the rules of priority among the next of kin vary considerably from the order which prevails in England and Ireland. The children, being entitled to an absolute legal share called Legitim (q.v.), take the father's property in two characters—one part as legitim the other as being next of kin—and the result is often different from what obtains in England. Moreover, in Scotland, though the heir-at-law may be one of the next of kin, still he is not entitled to take such share unless he collate the heritable estate (resign it to the executors). The degrees of kindred are now counted in exactly the same way. The father never can take more than one-half, nor the mother more than one-third, while any of the brothers and sisters, or their issue, are alive. The half-blood does not share equally with, but in an inferior degree to, the full blood.

Kina. See CINCHONA.

Kinabalu. See BORNEO.

Kinburn, or **KILBURN**, a former fort of south Russia, situated opposite Otchakoff, on a long narrow sandbank which forms the southern boundary of the estuary of the Dnieper. Paul Jones first suggested to Suvaroff that it should be fortified; it figured prominently in the Russo-Turkish wars of 1771-74 and 1787; and during the Crimean war it fell before the allies, October 17, 1855. The fortifications were razed in 1860.

Kincardineshire, or **THE MEARNS**, a maritime county of Scotland, with Aberdeenshire and the Dee on the N., Forfarshire and the North Esk on the S. and W., and the North Sea on the E. The rocks are granite, gneiss, sandstone, conglomerate, mica-slate, clay-slate, limestone, and trap. Area, 383 sq. m., of which one-half is in cultivation, and one-tenth in wood. The county may be divided into four sections—viz. the Coast, the 'Howe o' the Mearns,' the Grampians, and Deeside. The coast-land and much of the 'Howe' is of superior quality. The 'Howe' forms a continuation of the Valley of Strathmore (q.v.). The Grampians, running across the country from east to west, parallel to the Dee, with an average breadth of from 7 to 8 miles, cover about 80,000 acres; one of the peaks, Mount Battock, is 2555 feet high. The Deeside portion of the county is a comparatively narrow strip of light, sharp soil. There are few manufactures in the county. The principal towns are Stonehaven (q.v.), the county town; Bervie, a royal and parliamentary burgh; Laurencekirk and Banchory, police burghs; and Johnshaven. Of the objects of antiquarian interest the most noted are Dunnottar Castle (q.v.) and Raedyke's Camp, an

entrenchment seemingly on the Roman method, in which it has been supposed that the ancient Caledonians under Galgacus encamped prior to their battle with the Romans under Agricola. Kincardineshire was the birthplace of George Wishart, Robert Barclay, Dr J. Beattie, and Dr Thomas Reid; and the father of Robert Burns was born in Dunnottar parish. Pop. (1801) 26,349; (1871) 34,630; (1901) 40,923; (1911) 41,008; (1921) 41,779.

Kinchinjing (Tibetan *Katzodchonga*), a Himalayan peak (28,176 ft.), between Sikkim and Nepal. See Freshfield's *Round Kangchenjunga* (1903).

Kindergarten, the name of a kind of school or training-place for young children—name and thing imported from Germany. The principle was first propounded (1826) and the system invented by Friedrich Froebel (q.v.). He was early impressed with the insufficiency of the teaching and training given in the ordinary infant-school, and with the fact that the loving instinct of the mother remained merely an instinct, which required for the training of the child thoughtful guidance and direction. He saw that the teaching in the infant-school was to a large extent traditional; that the selection of subjects and exercises depended on fashion, or upon the likings or prejudices of the teacher, and not upon a genuine knowledge of the nature of children; and that the whole procedure was based upon an induction of facts and phenomena which had been hastily made, and rested upon no firm ground of principle. He therefore set to work to study the ways and doings of infants from their birth, and to note down systematically what kind of mental food and what kind of bodily activity Nature prompted them at each stage of their existence to prefer. He reached the following principles: (a) That Education means a harmonious development of all the bodily and mental powers; (b) that the *spontaneous* is the raw material and the only element that is valuable in education, and that the teacher must connect all his instruction with that, and graft it upon the spontaneous activity of the child; (c) that the work of the teacher is not to give knowledge *ab extra*, but to supply material, means, and opportunities in a rational and harmonious order for the child's mind spontaneously to work upon; and (d) that in the presentation of their materials or occupations there must be no break (*in Naturā non datur saltus*), because all occupations which train must be developed out of each other. The early materials for instruction are called *gifts*, because they are presented to the child only when his nature and stage of development call for them. The province of the educator is to map out the world of early childhood, and to engineer—i.e. to give each step in—the paths to knowledge or power in each subject; the province of the teacher is to apply this general knowledge to particular cases, and with loving care and delighted patience to provide the right mental food—the most suitable activities for each hour and stage of development. His complete aim is the systematic cultivation of all the powers in complete equilibrium. Hence, while the infant-school goes too much into work and drill, Froebel's system calls for attention to the individual child; he weaves the work into 'play' (spontaneous activity), and he evolves 'drill' out of the free individual desire for society. Hence Froebel's large use of song and dance. He respects freedom and the right order of development so much that he would not give a word to a child until a mental necessity and desire had been created by an ordered set of experiences for that word; and he cultivates the senses and the hand with the utmost care, so that perfectly accurate perception and comparison may produce true and

clear conceptions, which again give rise to true and just judgments. 'All the byways to untruth,' says Miss Shirreff, 'such as exaggeration, confusedness of mind, inaccuracy of speech, are cut off.' The child is not *taught*, but *led* by a set of ordered experiences to the perception of the principles of number (*Arithmetic*) and of space (*Geometry*); and his senses and powers of hand and eye are cultivated by an elaborate series of exercises. The steps in Froebel's system are (1) *Spontaneity* or *Play*, which, however, in a child is always serious and never frivolous; (2) direction of this towards external fact and truth; (3) weaving of spontaneous powers into ordinary occupations; (4) development into self-culture, independent action, a love of knowledge, beauty, and society. The process, like the process of Nature, is slow, tranquil, and organic; but no part of it requires to be undone. The child sees, imitates, or reproduces and invents new forms; these are the three steps in each subject for each pupil.

Kinderscout Grit, name given to the coarse grits and flagstones which occur towards the base of the Millstone Grit of England (see CARBONIFEROUS SYSTEM). The rock forms the tableland of Kinderscout in the Peak country. The grit is quarried at Eyam Moor, Derwent Edge, and other places, and is used for engine-beds, foundations, and reservoir work.

Kindly Tenant. See BORDERS.

Kinematics is the science which treats of pure motion. It involves the fundamental conceptions of space and time and takes no direct cognisance of force or mass. Strictly speaking, any kinematical problem dealing with motions that exist in nature is at bottom dynamical, and every dynamical problem is of necessity approached in the first instance on its kinematical side. Thus, to take a familiar example, Kepler's laws of planetary motion were purely geometrical and kinematical statements, from which Newton deduced the dynamical law of universal gravitation. Again, the *Nautical Almanac* is essentially a book of kinematical statistics, giving the positions of the important heavenly bodies at definite successive intervals of time, and not unfrequently the rates of change of position; and the calculation of these statistics has a strict dynamic basis.

Kinematics may be regarded as a geometry of position into which the idea of time or duration has been introduced. Thus, change of position, regarded as taking place continuously in time, leads to the idea of velocity, linear and angular. Velocity itself is, of course, subject to change, and this change, regarded as taking place continuously in time, leads to the idea of acceleration, linear and angular. The distinction of linear and angular as applied to velocities and accelerations is very necessary for a clear study of the kinematics of systems of points, such as plane and solid figures, rigid or deformable, or of the kinematics of fluids. Rotation, strain, twist, vortex are important cases. The kinematics of solid figures is a subject of growing importance to the mechanician and engineer; so much so that in the kinematics of machinery we have a highly specialised branch of the subject. A glance at any ordinary piece of mechanism, from a steam-engine to a sewing-machine, shows how various are the relative motions of the wheels, rods, cranks, belts, and other pieces that build it up. The function of a machine is dynamic—viz. to transform energy to a certain end—but this must be effected by suitable kinematical arrangements.

Kinematograph, or popularly (through Fr. *cinématographe*) CINEMATOGRAPH (Gr. *kinēma*, motion, and *graphein*, to record), the contrivance which its inventor prefers to call KINETOSCOPE;

an apparatus for exhibiting pictorial reproductions of animate motion or 'motion-pictures,' invented in the late eighties by Mr Thomas A. Edison (q.v.). Its operation is based upon the physiological phenomenon known as persistence of vision, through which the retina of the eye retains for one-seventh to one-tenth of a second any image impressed upon it. If a series of identical portraits were rapidly exhibited to the eye, a single portrait would apparently be viewed; or if there is represented to the eye a series of photographs of a moving object, each one representing a minute successive phase of such movement, the movements would apparently themselves again take place.

One of the earliest suggestions of motion-pictures was embraced in an optical toy called the Zoetrope, or 'wheel of life,' introduced about 1845. Instantaneous photography being then unknown, a few rough silhouette drawings, broadly outlining successive phases of movements, were made on a strip of paper. This was placed around the interior of an open cylinder whose periphery was perforated with a number of vertical openings above the edge of the picture-strip. The cylinder was mounted on a pivot so as to be easily rotated. On looking through the openings when the cylinder was revolved the figures seemed to be in motion—an *illusion of theoretical motion*.

With the growth of photography came attempts to preserve and present actual scenes and events. In 1878 Eadward Muybridge made photographs of a horse trotting by arranging a series of cameras along the line of a track, the exposures being made at the right instant by the horse striking wires or strings attached to the shutters (see HORSE). From the negatives thus obtained positive prints were secured and projected upon a screen, showing the horse in motion, but always in the centre of the screen. The work of Muybridge was followed by that of other experimenters, but no appreciable progress was made by them toward the production of modern motion-pictures. The photographic film had not yet been brought out; thus they were handicapped by being compelled to use glass plates. But the principal thing that obstructed their progress was the employment of a multiplicity of cameras or lenses; and while they were successful in obtaining photographs of the movements of single objects, such pictures were always centrally located on the plates. Thus, when projected, they would appear always in the centre of the screen in life-like motion, but not making any progress. When Edison entered the field in 1887, he realised that in order to reproduce pictures of animate scenes and events the original photographs must be taken from *one* central view-point by a *single* camera, so that the objects should move across its field just as they move across the field of the human eye. Two very serious difficulties lay in the way, however—first, the production of a sensitive surface in such form and weight as to be capable of being successively brought into position and exposed at the necessarily high rate; and, second, the production of a camera capable of making successive exposures and coincidental pictures at the rate of twenty to fifty per second. Edison saw that glass plates were entirely out of the question for the purpose, and tried cylinders whose surfaces were coated with a sensitised emulsion. Microscopic photographs were taken on these cylinders, spirally, at as high a rate of speed as fifty per second. A great variety of experiments were made on fine-grained emulsions and on camera mechanism. During this experimental period the kodak-film was being slowly developed by the Eastman Company. In it Edison saw a solution of the problem, and, applying himself to the invention of a suitable camera for its use in tape-like

form, after a vast amount of experiment produced in 1889 the first modern motion-picture camera. From that day to this the Edison camera has been the accepted standard for securing pictures of objects in motion. Edison's invention consisted not only of the camera; to him is also due the conception and invention of a continuous, uniform, and evenly spaced tape-like film, essential for taking and reproducing photographs of animate motion.

The apparatus for securing and reproducing motion-pictures consists of two principal parts—viz. the kinetograph or camera for taking the photographs, and the kinetoscope for projecting them for exhibition purposes. The accompanying sectional view

Section of Kinetograph or Camera for taking Motion-pictures.

of a simple form of such a camera, with description, is taken by permission from *Edison: his Life and Inventions*, by F. L. Dyer and T. C. Martin (1910).

In this diagram, A represents an outer light-tight box containing a lens, C, and the other necessary mechanism for making the photographic exposures, H¹ and H² being cases for holding reels of film before and after exposure; F the long tape-like film; G a sprocket, whose teeth engage in perforations on the edges of the film, such sprocket being adapted to be revolved with an intermittent or step-by-step movement by hand or by motor; and B a revolving shutter having an opening and connected by gears with G, and arranged to expose the film during the periods of rest. A full view of this shutter is also represented, with its opening, D, in the small illustration to the right.

In practice, the operation would be somewhat as follows, generally speaking: The lens would first be focussed on the animate scene to be photographed. On the main shaft of the camera being turned the sprocket, G, is moved intermittently; and its teeth, catching in the holes in the sensitised film, draw it downward, bringing a new portion of its length in front of the lens, the film then remaining stationary for an instant. In the meantime, through gearing connecting the main shaft with the shutter, the latter is rotated, bringing its opening, D, coincident with the lens, and therefore exposing the film while it is stationary; after which the film again moves forward. So long as the action is continued these movements are repeated, resulting in a succession of enormously rapid exposures upon the film during its progress from reel H¹ to its automatic rewinding on reel H². While the film is passing through, it is guided and kept straight by various sets of rollers, between which it runs. By an ingenious arrangement the film moves intermittently, so that it may have a much longer period of rest than of motion. As in practice the pictures are taken at the rate of twenty

or more per second, it will be quite obvious that each period of rest is infinitesimally brief, being generally one-thirtieth of a second or less. Still, it is sufficient to bring the film to a momentary condition of complete rest, and to allow for a maximum time of exposure, comparatively speaking, thus providing means for taking clearly defined pictures. The negatives so obtained are developed in the regular way, and the positive prints subsequently made from them are used for reproduction in a projecting kinoscope, which employs the above principles and mechanism in general; but the light-tight box is omitted, and a powerful light, a condenser, and a reflector are added. The machines are run by a small motor, and the film is projected at the average rate of 1000 feet every 14 minutes. Later improvements are the 'Maltese Cross,' superseding the old knob or 'dog-lash,' which was apt to break the film; and an arrangement which moves the entire mechanism on which the film is strung leaving the gate aperture fixed, and supplying a fixed optical centre from the carbon to the lens.

'Cinema-houses,' 'picture-houses,' or succinctly 'cinemas,' have everywhere multiplied rapidly, and become one of the most attractive forms of popular entertainment; and vast sums have been invested in their erection, equipment, and maintenance. Each year the cinematograph has reached a higher level of excellence in the mechanical treatment of the subjects under portrayal, as well as in the artistic field, where wonders continue to multiply themselves without ceasing. America is pre-eminently the home of the motion-picture, and a large colony is settled at Los Angeles, California, where the attractions of light and scenery are appreciated at their full. The majority of pictures, however, are made in studios under conditions which do not vary. Very complicated lighting effects are obtained, and whole towns are built with amazing reality. Films are also made in England, where the work is of a high level of excellence. As art the value of the picture-show is still very low. In Germany, however, there are signs that a true art is arising. The cinematograph has been of late applied also to educational as well as to various scientific uses.

'Talking motion-pictures' have been produced by various methods, but their success is not yet assured.

Kinetics. See DYNAMICS, ENERGY, MATTER.

King (O.E. *cyning*, from *cyn*, 'a kin,' 'a tribe,' and the termination *-ing*, 'belonging to.' Hence *cyn-ing* is 'man of the tribe,' 'chief'). A widespread ancient custom, surviving to our own time among various peoples, is the killing of a priestly king by his successor. The king being the centre of the ritual connected with the fertility of the soil, it seems to have been thought that his failing powers endangered the crops. Then it was discovered that a vicarious sacrifice would serve the purpose. Those who recognise a world-wide 'archaic civilisation,' diffused from Egypt, find an early kingship of 'Children of the Sun,' culture-heroes ultimately of Egyptian origin, broken in upon later by a kingship of earth-born 'War-lords' when the capture of victims for sacrifice had developed into war. See ARICIA; Sir J. G. Frazer, *The Golden Bough*, and *Studies in the Early History of Kingship*, and Perry, *Growth of Civilisation* (1924). For the relation of king to people in Britain, see ENGLAND (HISTORY OF), PARLIAMENT; and for other countries, see the sections on their constitutions. See also DIVINE RIGHT, GOVERNMENT.

King, HENRY (1592-1669), poet, was born at Worminghall, Bucks, son of John King (c. 1559-1621), who was bishop of London from 1611. He

was educated at Westminster and Christ Church, Oxford, and became bishop of Chichester in 1642. He was expelled in 1643, but reinstated at the Restoration. He was a friend of Ben Jonson, Izaak Walton, and John Donne. He published elegies, translations of psalms, sermons, &c. See his *Poems*, ed. L. Mason (1915); ed. Sparrow (1925).

King, WILLIAM RUFUS, vice-president of the United States, was born in North Carolina, 6th April 1786, and was admitted to the bar in 1806. He was a member of the legislature for three years, was returned to congress as a War-Democrat in 1810, and represented Alabama in the senate from 1820 to 1844. He was then minister to France for two years, and a senator again from 1848 to 1853, when he became vice-president. He died, however, on 18th April of the same year.

King Country. See WAIKATO.

King-crab (*Limulus*), a curious animal, the last of its race, usually referred to a special group, Xiphosura, within the spider and scorpion class Arachnida. A large convex chitinous buckler covers the head and thorax, a flatter hexagonal shield protects the abdomen, while a long spear runs out from the hind end. On the under-surface of the 'cephalothorax' there are the following appendages: a pair of 'chelicerae' in front of the mouth, a pair of 'pedipalps' lateral to the mouth, four pairs of walking legs whose bases help in mastication, and a pair of small 'chilaria.' On the under-surface of the abdomen there are the following appendages: a double 'operculum' with the genital apertures, and five pairs of flat plates bearing peculiar gill-books. The larvae have a superficial resemblance to Trilobites.

The king-crabs attain a length of over 2 feet. They live on muddy bottoms at a depth of 2 to 6 fathoms, where they sometimes swim slowly about or more frequently burrow their way in the mud by alternately bending and straightening their shields and spine. The food consists for the most part of marine worms, which are sucked into the mouth and there crushed. King-crabs are restricted to the warm coasts, from the Bay of Bengal to Torres Straits, the Moluccas and Japan, and to the east of North America. The group first appears in Triassic strata, but the allied *Bellinuridae*, represented by *Neolimulus* in the Upper

Silurian and by other genera of later date, seem to link the king-crabs to the ancient Eurypterids. In some of the Indian islands the spine is used for

Fig. 1.—Young King-crab, just hatched (greatly enlarged).

Fig. 2.—Under-surface of King-crab (*Limulus polyphemus*).

pointing arrows, and in tropical America the shell sometimes serves as a ladle. See Ray Lankester, 'Limulus an Arachnid,' *Quart. Jour. Micr. Sci.*, vol. xxi. 1881; also vols. xxiii., xxiv.

Kingfish. See OPAH.

Kingfisher (*Alcedo ispida*), a well-known British and European bird, famous for its brilliant blue, green, and chestnut plumage and fish-bone nest. It is $7\frac{1}{2}$ inches in length, and is marked by the long, hard, sharp bill, the short rounded wings, the very short tail, and the partial union of the toes of the weak feet. It is a shy and wary bird, frequenting rivers and lakes and occasionally the seashore, usually living in isolated pairs. It has a rapid, fitful flight, and a faint but shrill cry, like *tit-tit* often repeated. The kingfisher feeds on aquatic insects and crustaceans, small fishes like minnows, and young fishes. The prey is caught by a rapid, almost vertical, dive. The fishes are carried to the perch, killed by a few blows on a branch, and swallowed whole. The bones are afterwards disgorged, and may be used as a floor for the nest, which is usually at the end of a long tunnel

Kingfisher (*Alcedo ispida*).

bored in the bank, and eventually becomes anything but clean. There are six to ten eggs, almost spherical, glossy white, with a pink tinge due to the contents. The plumage of the bird is unfortunately used in decoration and in making artificial flies. Among the other kingfishers (Alcedinidæ) may be mentioned the Belted Kingfisher (*Ceryle alcyon*) of the northern United States and Canada, the beautiful *Alcyon azurea* of Australia, and the numerous Wood-kingfishers, such as the Laughing Jackass (*Dacelo gigas*), also Australian.

The kingfisher is the old halcyon, 'whose dead body carefully hung by a single thread always turns its beak towards the wind,' a popular and still surviving notion to which Shakespeare makes more than one reference. With the halcyon the imagination of the ancients played lovingly, for to them the bird was Alcyone the daughter of Æolus and wife of the king of Trachis, the son of the morning star, 'who, mourning in her youth for her lost husband, was winged by divine power, and now flies over the sea, seeking him whom she could not find, sought throughout the earth.' 'The bird is not great,' as Socrates continues in Lucian's dialogue 'The Halcyon,' 'but it has received great honour from the gods because of its lovingness; for while it is making its nest, all the world has the happy days which it calls halcyonidæ, excelling all others in their calmness.' So Aristotle, quoting Simonides, says that the halcyon has its young about the turn of the year in winter, 'when Zeus gives the wisdom of calm to fourteen days. Then the people of the land call it the hour of wind-hiding, the sacred nurse of the spotted

halcyon.' See R. Bowdler Sharpe's *Monograph of the Alcedinidæ or Kingfishers*; Ruskin's *Eagle's Nest*; and HALCYON DAYS.

King George's Sound, an inlet 5 miles north and south, and 5 miles broad, at the south-west angle of West Australia, which is an excellent roadstead, and leads to two landlocked recesses, Princess Royal and Oyster Harbours. Albany (q.v.), on Princess Royal Harbour, is a port of call for South African mail-steamers; and under Admiral Henderson's scheme for the naval defence of Australia it became (1912) a sub-base for destroyers and submarines.

Kinghorn, a royal burgh of Fife, on the Firth of Forth, 3 miles S. of Kirkcaldy, has golf-links, and manufactures golf-clubs. Alexander III. was killed (1286) at Kinghorn, and a monument was erected on the spot in 1887; but the name (really King-gorn) has nothing to do with kings. Pop. 2300.

Kinglake, ALEXANDER WILLIAM, historian, was born at Wilton House, near Taunton, in 1809, and was educated at Eton and Trinity College, Cambridge. He was called to the bar at Lincoln's Inn in 1837, and speedily acquired a lucrative practice; but he retired from the profession in 1856, in order to devote himself to literature and politics. He had already published, in 1844, *Etöthen*, a work of Eastern travel, written in a graphic and poetic vein, yet with great truthfulness to nature, which has always remained one of the most popular books of English travel. He was returned for Bridgwater in the Liberal interest in 1857, took a prominent part against Lord Palmerston's Conspiracy Bill in 1859, and in 1860 warmly denounced the annexation of Savoy and Nice by France. In 1854 he went out to the Crimea, where he met Raglan, and had every facility for watching the progress of the war. After his return he undertook the defence of the British commander in his *History of the War in the Crimea* (8 vols. 1863-87). As the history was very largely based upon Lord Raglan's papers, it has been regarded by some as a prejudiced narrative of the war; but from the literary point of view opinion is practically unanimous that it is one of the finest historical works of the 19th century. The criticism of Napoleon III. and the second empire was so searching that the work gave great offence at the Tuileries, and its circulation was prohibited in France during the Empire. Replies have been made to strictures upon other actors in the war, and occasionally with success. But the history remains on the whole a wonderfully accurate, brilliant, and minute record of the great struggle with Russia. In 1868 Kinglake was again returned for Bridgwater, but was unseated on petition. He died 2d January 1891. See *A. W. Kinglake*, by W. Tuckwell (1902).

Kinglet. See GOLDEN-CRESTED WREN.

Kings, THE FIRST AND SECOND BOOKS OF, in the English Authorised Version titled *The First Book of Kings*, commonly called *The Third Book of Kings*, and *The Second Book of Kings*, commonly called *The Fourth Book of Kings*. In the ancient Rabbinical enumeration, implied in Josephus and followed in the Peshito, and by Jerome, the Book of Kings (*Melāchīm*) was reckoned one, ranking fourth and last in the series of the 'earlier prophets' (after Joshua, Judges, and Samuel); the division into two first appears in the Septuagint translation, where they are called the third and fourth 'of the kingdoms' (*Basileion*, Heb. *Melāchōth*), the books of Samuel forming the first and second. This division was copied by the Vulgate, whence it passed into the 'common' usage of Christendom. The separation between

Samuel and Kings is itself not original; for the first two chapters of Kings, concluding the life of David, are consecutive with 2 Sam. ix.-xx. and by the same hand. The books of Kings as we now have them are evidently a compilation, and careful examination shows that they have passed through more than one redaction. In their composition at least four elements can be distinguished: (1) In 1 Kings, xi. 41, reference is made to 'the book of the acts (chronicles) of Solomon,' and for the reigns of subsequent kings there is very frequent mention of 'the book of the chronicles of the kings of Judah,' and of a corresponding book of the kings of Israel. The exact nature of these chronicles cannot now be determined; but the probability is that they were themselves compilations, chiefly digests of a statistical and annalistic character, further epitomised by the writer of the canonical book. (2) The official records of the temple at Jerusalem, though nowhere expressly named, must have been directly or indirectly the source of much of the information given about the worship there, especially under the reigns of Solomon, Joash, Ahaz, and Josiah. (3) The book owes most of its vividness and picturesqueness to materials derived from a series of unofficial narratives, having their origin chiefly in the northern kingdom, and in which the acts of the prophets had special prominence. To this category belong in particular the history of Elijah (1 Kings, xvii.-xix., xxi.), and the much more complicated series of passages relating to Elisha, for the northern kingdom; and the story of the man of God from Judah (1 Kings, xiii.), for the southern. (4) The main redactor has contributed the chronological scheme of synchronisms in which the histories of the two kingdoms are brought together under one view, and has given a pragmatical tone to the narrative by undertaking, in the case of each king, an estimate of his religious character and work. This is done in the spirit of the Deuteronomic legislation, and it may be inferred with certainty therefore that the main redaction did not take place till after the reformation of Josiah. Such passages as 2 Kings, viii. 22; xiv. 7; xvi. 6 ('unto this day'), are not necessarily prior to the fall of the kingdom of Judah (cf. e.g. 2 Chron. xxi. 10); but evidence of a later pen is found in 2 Kings, xvii. 19, 20; xxiii. 26, 27; while 2 Kings, xxv. 27 *seqq.*, brings us down to a far advanced period of the exile. Important variations (especially in the series of rather disconnected notes which form a large part of the history of Solomon) between the existing Hebrew text and that which must have lain before the LXX. translators show that the book was still in a somewhat fluid state at a very much later date.

See further, F. C. Kent, *Israel's Hist. and Biog. Narratives* (1905); C. F. Burney, *Notes on the Hebrew Text* (1903); J. Skinner's commentary in *The New Century Bible*; W. E. Barnes (*The Cambridge Bible*, 1908); and S. A. Cook, *Ency. Brit.*, ed. xi., articles 'Jews,' 'Kings,' 'Palestine.'

King's Bench. See COMMON LAW.

King's College, in 1910 incorporated with the University of London (q.v.), save as to its theological faculty, is housed close to Somerset House in the Strand. It was founded by royal charter in 1828, and confirmed by act of parliament in 1882, the fundamental principle of the institution being 'that instruction in the Christian religion ought to form an indispensable part of every system of general education for the youth of a Christian community.' The college was strictly in connection with the Church of England. In 1882 the rights of the proprietors were extinguished; in 1900 the college became in all its faculties a school of the University of London, and in 1910 an integral part of that university. In 1903 the obligation for professors,

lecturers, and members of council to be members of the Church of England was removed, save as regards members of the faculty of theology. The theological department is a school of the university, and in some respects is still united with King's College as part of the university; and 'University of London, King's College,' is governed by a delegacy appointed by the senate of the university. It comprises King's College in the faculties of arts, law, medicine, science, engineering, and economics. It has absorbed also the arts and science departments of King's College for Women, formerly in Kensington, the home science department alone surviving in new buildings in Campden Hill. King's College Hospital, an advanced medical school (at Denmark Hill since 1913) is separate; as is also King's College School for boys (at Wimbledon Common).

King's or Queen's Counsel are certain barristers at law and advocates who have been appointed by letters-patent. The office is entirely honorary, but it gives a right of pre-audience in all the courts, according to the date of appointment. The appointment is made on the recommendation of the Lord Chancellor in England; in Ireland, of the Irish Lord Chancellor; and in Scotland, since 1897, of the Lord President of the Court of Session. In spite of their title, they are not prevented from being retained and acting for ordinary clients, except that in defending prisoners and acting in suits against the crown they require a special licence from the crown, which is, however, never refused. The appointment is for life, but in case of disgraceful conduct the letters-patent are revoked.

The King's Counsels' robes are of silk instead of the ordinary (alpaca) 'stuff' of which the junior's gown is made; and 'taking silk' is thus the common phrase signifying that an 'utter' or 'outer' barrister has become a King's Counsel or K.C. 'Taking silk' is frequently injurious rather than advantageous to a professional career. A King's Counsel is prohibited by legal etiquette from taking a good deal of minor business which fell to his share as a junior, and 'silk,' a stepping-stone to the great men, is a stumbling-block to the small. When a junior has reached the position in which he feels justified, or is forced by the public opinion of his circuit, to 'apply for silk,' his demand is very rarely refused, or at most postponed, and the honour is little more than a necessary incident in every successful legal career. Henry Brougham, indeed, was debarred for some years from what was in his case a professional right by the personal antipathy of George IV. and Lord Eldon, and it was not until 1827, on the accession to power of George Canning, that Brougham received a patent of precedence which clothed him in silk and gave him all the professional advantages without the actual title. But this is a striking and almost a solitary exception. Of late years colonial barristers have been gratified with the title of King's Counsel conferred by the Lord Chancellor, on representation made by the governor of the colony through the Secretary of State.

King's County, an inland county of Ireland, in Leinster, is bounded on the W. by the Shannon, which separates it from Roscommon and Galway. It is 20 miles long from north to south by 58 wide. Area, 493,985 statute acres, or 772 sq. m. Of this about a fourth is under crops; and of this again nearly one-half is in grass, whilst a fourth is under corn and green crops (oats, barley, potatoes, and turnips). Over a third of the total area is covered with bogs, including a large part of the Bog of Allen. The population has steadily decreased—(1841) 146,857; (1861) 90,013; (1881) 72,852; (1891) 65,563; (1911) 56,832 (90 per cent. Catholics). The surface is flat, except for the Slieve Bloom Mountains (1733 feet) on the south

boundary. The soil, a light loam of medium depth, resting on limestone gravel, is of average fertility. The Grand Canal traverses the northern portion of the county, and joins the Shannon. The river Barrow separates it from Queen's County on the south-east. King's County, constituted a shire in 1557, was named in honour of King Philip. In the north-west is Clonmacnois Abbey, founded in 548, one of the most interesting ecclesiastical ruins in Ireland. At Birr Castle Lord Rosse erected his great telescope. The chief towns are Tullamore, Parsonstown or Birr, and part of Portarlinton, the remainder being in Queen's County.

King's or Queen's Evidence. See AP-PROVER.

King's Evil. See SCROFULA.

Kingsley, CHARLES, was born at Holne vicarage, Dartmoor, Devon, 12th June 1819. After education partly at King's College, London, he went up to Magdalen College, Cambridge, and took his degree in 1842—first-class in classics, senior optime in mathematics—and was immediately ordained to the curacy of Eversley in Hampshire, of which parish he became rector in 1844. There he lived for the remainder of his life, having married a daughter of Mr Pascoe Grenfell in the year in which he was presented to his living.

His dramatic poem, *The Saint's Tragedy, or The True Story of Elizabeth of Hungary*, a presentation of medieval piety (not accepted by Catholics), appeared in 1848, and was followed by two works of very different character, *Alton Locke* and *Yeast*, both published in 1849. These brilliant novels are the work of a Radical, a 'Christian Socialist,' and deal with modern social questions in a bold and a strikingly original manner. The hero of *Alton Locke*, 'tailor and poet,' is found in a London workshop. In *Yeast* the condition of the English agricultural labourer is dealt with by one whose sympathy with the people is aristocratic, not democratic; whose radicalism is Christian, and not sceptical; whose enthusiasm never degenerates into unreason; and whose most brilliant invective is always balanced by common-sense. The influence of these books at the time was enormous; and if Kingsley wrote nothing more of the same character, it was not so much that time had modified his views as that his views had modified the times. For two or three years previous to the publication of these novels Kingsley had thrown himself with all the ardour of youth and of his own impetuous nature into various schemes for the improvement of the condition, material, moral, and religious, of the working-classes, a subject of which we all hear a good deal at the present day, but which was somewhat strange in 1844. In this work he was associated with Maurice, the recognised leader of the movement known as 'Christian Socialism;' and he published under the well-known pseudonym of 'Parson Lot' an immense number of articles on current topics, especially in the *Christian Socialist and Politics for the People*. In 1853 appeared *Hypatia*, one of his most fascinating works, a vigorous and brilliant picture of early Christianity in conflict with Greek philosophy at Alexandria in the beginning of the 5th century. *Westward Ho!* followed in 1855, and the presentation of Elizabethan England and the Spanish Main, of Devonshire worthies and their Spanish foemen, is wonderfully vivid and life-like, though not without historical errors, a too English dislike of Spain and Spaniards, and a too Protestant prejudice against Catholicism and Catholics (see also NEWMAN). In *Two Years Ago* (1857) he sketched with a master-hand the North Devon scenery so dear to the west-countryman; and *Hereward the Wake* (1866), a novel of the days of the Conqueror, brought the noble series of works

of fiction to a close. In 1860 the university of Cambridge had chosen the author of *Hypatia* and *Westward Ho!* to be professor of History, and his inaugural lecture was published at the end of that year under the title of *The Limits of Exact Science as applied to History*. *The Roman and the Teuton* (1864) is also based upon his Cambridge lectures.

In 1869 Kingsley resigned his professorship and was appointed a canon of Chester; and in 1871 he made the voyage that he had so long contemplated, to the tropics, of whose scenery he had already written so enthusiastically; and on his return to Eversley from the West Indies he gave to the world one of its most charming books of travel, *At Last*. In 1873 Kingsley was appointed a canon of Westminster and chaplain to the Queen. He died at Eversley on 23d January 1875. His *Life*, by his widow, in 2 vols. published in 1876, is a biography of deep and sustained interest. Kingsley was by nature hot-tempered, enthusiastic, and combative, yet infinitely sympathetic and tender of heart; his 'muscular Christianity' (a phrase he disliked) was cheerful and robust; he had great and varied information, a keen wit, and a mind's eye that ever looked below the surface. His collected works fill 28 volumes (1879-81). Among these, besides those already named, and many volumes of sermons, are *Glaucus* (1854), *The Heroes* (1856), *The Water Babies* (1863), *Town Geology* (1872), *Prose Idylls* (1873), *Health and Education* (1874). An unfinished novel, *The Tutor's Story*, was revised and completed by his daughter, Lucas Malet (1916).

Kingsley, HENRY, brother of the foregoing (born 1830, died 1876), was educated at King's College, London, and Worcester College, Oxford. From 1853 to 1858 he resided in Australia, and on his return commenced his career as a writer of fiction with a vigorous picture of colonial life in *Geoffrey Hamlyn* (1859). To this succeeded *Ravenshoe* (1861), his masterpiece; *Austin Elliot* (1863); *The Hillyars and the Burtons*, another novel of Australian life and manners (1865); *Mademoiselle Mathilde*; and *Stretton* (1869). His best novels are manly, pathetic, strong, yet full of improbabilities, and written in a somewhat undistinguished style. In 1869-71 he edited the *Daily Review* at Edinburgh.

Kingsley, MARY HENRIETTA, daughter of George Henry Kingsley (1827-92), Charles's second brother, who practised medicine and wrote a book of South Sea travel 'by the Earl and the Doctor.' She was early interested in science, travelled extensively in West Africa, studied native problems with singular insight and sympathy, and wrote two very suggestive and successful books—*Travels in West Africa* (1897) and *West African Studies* (1899). She fell ill nursing sick Boer prisoners, and died in hospital at Simon's Town, 3d June 1900.

King's Lynn. See LYNN.

Kingsmills. See GILBERT ISLANDS.

Kingston, in Ontario, is situated at the NE. and lower end of Lake Ontario, 161 miles ENE. of Toronto. It is the seat of the Royal Military College of Canada (1876), of Queen's University (1841), a school of mining, and a dairy school. The city has, besides excellent railway facilities, good water-communication by the lake, the St Lawrence, and the Rideau Canal, which last connects it with Ottawa. It possesses a large, sheltered harbour, with a graving-dock and an active trade, and, besides busy shipyards, has manufactories of locomotives and stationary engines, machinery, leather, boots and shoes, agricultural implements, wooden-ware, &c. Grant Allen and George Romanes were both Kingston men. Kingston is the seat of an Anglican bishop and of a Roman Catholic

archbishop. Its site was occupied by the old French fort of Frontenac. The town was the capital of Canada from 1841 to 1844. Pop. (1881) 14,091; (1911) 18,874; (1921) 21,753.

Kingston, the commercial and political capital of Jamaica (q.v.), stands on the north side of a landlocked harbour, the best in the island, and, for its size, one of the best in the world. Population, 63,000. It was founded in 1693-1703, after the neighbouring town of Port Royal had been destroyed by an earthquake. From this place, afterwards rebuilt, Kingston is distant 6 miles, the breadth of its noble haven; while with Spanish Town, towards the interior, it has since 1846 been connected by railway. In 1758 Spanish Town was made the capital of Jamaica, but in 1872 the seat of government was removed to Kingston. Kingston was visited in 1880 by a violent hurricane, was in 1882 well-nigh consumed by fire, and on 14th January 1907 was almost totally destroyed by an earthquake, the focus of seismic activity being close to the city; over 700 persons were killed outright (including a number of English visitors to a congress being held in the town) and more than 1000 injured. The city is well drained, and has a good water-supply, though the condition of the harbour leaves much to be desired. The maximum temperature is 93° in the hot season, minimum 56° in cold. In its Old Church, Benbow was buried. The exports include sugar, rum, coffee, dye-woods, fruits, cocoa, and cotton.

Kingston, capital of Ulster county, New York state, stands on the right bank of the Hudson, 54 miles S. of Albany. It is a railway and canal terminus, and is the centre of extensive transit trade by steamer. Enormous quantities of blue-stone flags are forwarded from Kingston, which is also a principal centre of the hydraulic cement business, and contains a number of boat-building yards, foundries, brick-yards, and other manufactories. Pop. 26,700.

Kingston-on-Hull. See HULL.

Kingston-upon-Thames, a municipal borough and market-town of Surrey, since 1918 a parliamentary borough including Surbiton, the Maldons, and Coombe, 12 miles SW. of London, lies on the right bank of the Thames, here crossed by two bridges—one of stone completed 1828 and freed 1870, and the other an iron railway viaduct. Of late years it has rapidly increased, its easy access to London, coupled with its facilities for boating and the pleasant surroundings of the neighbourhood, notably Hampton Court, Bushy and Richmond Parks, having rendered it a popular suburban resort for residents and visitors. The borough is within the London Metropolitan Police District. Pop. (1891) 27,059; (1921) 39,484. The parish church, of which William Coxé the historian was once rector, has some fine monuments; the county council buildings, costing £36,000, were undertaken in 1890. In history Kingston has figured somewhat conspicuously: in 838 it was the scene of a great council, convened by Egbert, king of Wessex, and his son Ethelwulf; seven of the Anglo-Saxon kings were crowned here, as recorded on the coronation-stone still standing near the market-place; King John, who granted the town its first charter, was a frequent visitor in 1204-15; in 1264, during the civil war with Simon de Montfort, Kingston Castle (of which no traces now remain) was captured by Henry III.; Fairfax made the town his headquarters in 1647; and a year later took place in the neighbourhood the last fight between the royalists and Roundheads, when Lord Holland and the Duke of Buckingham were defeated. At Ham Common lived Gay's 'Kitty,' Duchess of Queensberry. See Biden's *History of Kingston-upon-Thames* (1852).

Kingston, WILLIAM HENRY GILES, a popular writer of boys' stories, was born in London, 28th February 1814. His father was a merchant in Oporto, and there much of his youth was spent. At first a merchant, he had already published two stories and a book of Portuguese travel, when in 1851 he found the work of his life in the immediate success of *Peter the Whaler*, his first book for boys. During the next thirty years he published more than 120 similar books, all simple, vigorous, and healthy in tone; full of daring adventures, hair-breadth escapes, and all the magic of the sea which he not only loved but knew. His heart never lost its wholesome glow of admiration for any form of human heroism, and the simple and sincere veracity of his style easily generated a corresponding sympathetic enthusiasm in his young readers. And he possessed in no small share the pictorial imagination which enabled him to borrow colour from travellers' accounts of countries he had never seen. Among his most popular books were *The Three Midshipmen*, *The Three Lieutenants*, *The Three Commanders*, and *The Three Admirals*. Kingston took an active interest in many philanthropic schemes, as the mission to seamen and assisted emigration. He was knighted by the queen of Portugal for his services in helping to bring about a commercial treaty between England and Portugal. He died at Willesden, 5th August 1880.

Kingstown, a naval station and suburb of Dublin, 7 miles SSE. from the General Post-office. Previous to 1817, when the harbour-works were begun, it was merely a fishing village known as Dunleary. On the occasion of the visit of George IV. in September 1821 its name was changed to Kingstown. The situation of the town and the invigorating air have made Kingstown a favourite residence for the well-to-do classes having business in Dublin. There is little general trade, though the harbour, completed by the Admiralty in 1859 at a cost to the imperial treasury of £825,000, is one of the finest in these islands. The east pier is 3500 feet in length; the west, 5000 feet, enclosing an area of over 250 acres.

Kingstown, capital of the British island of St Vincent, in the West Indies, stands at the south-west extremity of the island, on a large bay, at the foot of one of the spurs of Mount St Andrew (about 2000 feet); pop. 4000.

King-te-chin, the principal seat of porcelain manufacture in China, in the province of Chiang-hsi, on a small river which falls into Lake Po-yang from the east; pop. 500,000.

King Williamstown, capital of a division of the same name on the Buffalo River in the SE. of Cape Province, 80 miles ENE. of Grahamstown, and by rail (1877) 42 WNW. of East London, on the coast. It has considerable trade, military barracks and stores, and a college. Pop. about 10,000.

Kinkajou (*Cerculeptes cordivolvulus*), a quadruped of the group Arctoidea, and allied to the raccoons and coatis. It has six incisors, one canine tooth, and five molars in each jaw, the three hinder molars tuberculous. The kinkajou is larger than a polecat, has a yellowish woolly fur, climbs trees, feeds on fruits, honey, &c., as well as on small animals. It is a native of the warm parts of America, from central Mexico to the Rio Negro of Brazil. It used to be classified with the lemurs, to which it bears not a little resemblance, particularly in its habit of sitting on its hindquarters and feeding itself with its hands. Sir R. Owen was one of the first to show that here appearances are deceptive, and that the animal is a true carnivore.

Kinkel, JOHANN GOTTFRIED, a German poet and writer, was born at Oberkassel, near Bonn,

11th August 1815. He studied theology at Bonn and Berlin, and then lectured on theology, afterwards on poetry and the history of art, at the university of Bonn. But, becoming involved in the revolutionary movement of 1848, he was imprisoned in the fortress of Spandau, whence, however, he escaped with the help of his wife and Karl Schurz. Settling in London, he earned his living by teaching German until 1866, when he was appointed professor of Archæology and Art at Zurich. There he died, 13th November 1882. As a poet Kinkel's fame rests upon the epics *Otto der Schütz* (1846; a graceful poem of the chivalry of the Rhine; *Der Grobschmied von Antwerpen* (1872); *Margret, eine Dorfgeschichte* (1872); *Tanagra* (1883); two volumes of *Gedichte* (1843-68); and a drama, *Nimrod* (1857). He also wrote a history of art (1845); a series of essays on art subjects (1876); and monographs on Rubens (1874), Freiligrath (1867), &c. See *Lives* by Strodttmann (1850), Am Rhyn (1883), Lübke (1893).—His first wife, JOHANNA (1810-58), a distinguished musician, wrote with her husband *Erzählungen* (1849). After her death appeared her novel, *Hans Ibeles in London* (1860).

Kinlochleven. See LEVEN (LOCH).

Kinnaird Head. See FRASERBURGH.

Kino, an astringent substance resembling Catechu (q.v.), the concrete exudation of certain tropical trees, especially of *Pterocarpus Marsupium*, a native of the forests of Madras and Ceylon. East Indian kino is the kind which now chiefly occurs in commerce, and is the ordinary kino or *gum kino* of the shops. It is in small angular glistening fragments, the smaller reddish, the larger almost black. Thin pieces are ruby red. It is brittle and easily powdered, has no smell, but has a very astringent taste. Bengal kino is a similar astringent substance, produced by *Butea frondosa* (see BUTEA). Botany Bay kino is the produce of *Eucalyptus resinifera*. The astringency of kino is due to tannin and pyrocatechin. It is employed in certain forms of diarrhoea as *compound kino powder* (with opium and cinnamon). The *tincture of kino* forms a good gargle for the uvula. Kino serves in India as a yellowish-brown cotton dye.

Kinross-shire, the smallest Scottish county after Clackmannanshire, lies between Perthshire and Fife, and, measuring 9½ by 12¼ miles, has an area of 78 sq. m., or 49,812 acres, of which 3327 are water. Most of the drainage belongs to Loch Leven (q.v.), from which the surface rises to encircling hills 734 to 1573 feet high. A separate county since 1252 and earlier, Kinross-shire unites with West Perthshire to return one member to parliament. Pop. (1801) 6725; (1851) 8924 (1881) 6697; (1911) 7527; (1921) 7963, of whom 2600 were in the county town, Kinross, 27 miles NNW. of Edinburgh, and near the west end of Loch Leven. See *Æneas Mackay's Fife and Kinross-shire* (1890).

Kinsale, a municipal borough and seaport of County Cork, at the head of Kinsale Harbour, which is formed by the estuary of the river Bandon, 24 miles SSW. of Cork by railway (1863). The harbour, landlocked, is about 2 miles long. Its once flourishing trade has passed to its rivals, Cork and Queenstown. Much mackerel is cured in the district. Pop. 4000. In 1601 3000 Spaniards landed at Kinsale in order to fight for the O'Neill confederacy. Here James II. landed on 12th March 1689, and here he re-embarked in July 1690. In the following October the fort was captured by Marlborough.

Kinshasa is now included in Léopoldville (q.v.).

Kintyre, or CANTYRE (Gael. *ceann-tìr*, 'headland'), a long, narrow peninsula of Argyllshire, between the Atlantic and the Firth of Clyde, extending 42 miles south by westward, and 4½

miles broad. At the north end it connects with the mainland by the isthmus of Tarbert, 1½ mile broad, between East Loch Tarbert, a bay of Loch Fyne, and West Loch Tarbert. The surface is diversified by a ridge of low, moorish hills, with many lochs, the highest point being Ben-an-Tuirc (1491 feet). Coal is found at Drumlemble, 4 miles to the west of Campbeltown (q.v.). Machrihanish Bay, on the west coast, just beyond, possesses noted golfing links. A fair proportion of the soil is in cultivation. A lighthouse (1787), 297 feet above sea-level, stands on the Mull of Kintyre (the *Epidium Promontorium* of Ptolemy), which is overhung by Ben-na-Lice (1405 feet), and is only 13 miles distant from Ireland. The ancient seat of the kingdom of Dalriada (q.v.), Kintyre ranked till the 17th century as part of the Hebrides, being held successively by Norsemen, by the Macdonalds of the Isles, and by Campbells. Its antiquities include the ruins of the Cistercian abbey of Saddell, of the castles of Dunaverty, Dundonald, Saddell, and Skipness, and of many forts and pre-Reformation chapels. See T. P. White's *Archæological Sketches in Kintyre* (1873).

Kioto. See KYOTO.

Kipchaks, a Turkic people, who in the 11th century were settled in the steppes of south-east Russia, between the Ural and the Don, north of the river Kuma. The name (*K'in-cha* or *K'im-ch'at*) does not appear in Chinese history before 1223, and Bretschneider distinctly identifies this people with the Comans or Kumaro of Mohammedan authors, and with the Polovtsy of the Russian annals; in fact Rubruquis says, '*Commans, qui dicuntur Capchat.*' After the death of Genghis Khan, one of his four sons, Batu, conquered (1238-43) nearly all the central and southern districts of Russia, and founded the great empire of the Golden Horde or the Kipchaks, fixing his magnificent camp (Turkic, *urdu*, 'camp,' hence the words *Horde* and *Ordos*) on the Volga. They gradually acquired the rudiments of civilisation as they came into contact with the cultured peoples of the west and south. The Golden Horde and the eastern branch, that is to say, the White Horde or eastern Kipchak, were united about 1378; but after the death of Uzbek Khan in 1342 the Golden Horde dynasty had already begun to decline, and the subjection of Russia became quite nominal, especially when this joint empire was broken up by Tamerlane in 1390-95. Out of the fragments were formed the small khanates of Astrakhan, Kazan, the Crimea, &c., all of which were eventually absorbed by Russia. The modern descendants of the western Kipchaks are the Tatars (q.v.) of Kazan, Astrakhan, the Crimea, &c. The descendants of the eastern Kipchaks are the Kirghiz (q.v.), of whose three hordes the middle one is still called Kipchaks. See Howorth, *History of the Mongols* (1880), and Bretschneider's *Notices of Mediæval Geography* (1876).

Kipling, RUDYARD, story-teller, was born at Bombay, 30th December 1865, the son of John Lockwood Kipling, C.I.E. (1837-1911), principal of the School of Art at Lahore in the Punjab, himself the author of *Beast and Man in India* (1891). Rudyard was educated at Westward Ho and elsewhere in England, but returned in 1880 to India, where he began to contribute verses, tales, and articles to Indian journals, making his literary debut at Lahore in 1884 (in *Echoes*). But it was by his *Departmental Ditties* (1st ed., Calcutta, 1886), *Plain Tales from the Hills* (Calcutta, 1888), and *Soldiers Three* (Allahabad, 1889), that he became well known in England, and sprang at once into the front rank of popular favourites. *The Story of the Gadsbys, In Black and White, Under the Deadars, Wee Willie*

Winkie, and *The Phantom Rickshaw*, followed close on the heels of *Soldiers Three*, and like it formed part of an *Indian Railway Library* published at Allahabad. *The City of Dreadful Night* illustrates certain aspects of Calcutta. More ambitious, though hardly so successful, was the longer tale, *The Light that Failed* (1891). The *Barrack-Room Ballads* (1892), in verse more remarkable for vigour of diction and swing of rhythm than for the refinements of poetic form, were amongst his most brilliant successes; and *Naulakha* (1892), a longer tale, was produced in conjunction with Mr Balestier. *Life's Handicap* (1891) and *Many Inventions* (1893) are other collections of short tales and sketches, not exclusively Indian in subject; and the magazines compete for contributions from his pen. In 1892-96 he lived mainly in the United States.

From the first his sketches of the glories and disgraces and views of Tommy Atkins abroad, and of the more mysterious and unfamiliar life of the natives, were felt equally to 'palpitate with actuality.' He seems from an intimate and first-hand knowledge of the minds and hearts alike of natives and soldiers to render their own ideas in their very words; and he deals directly and simply with the elemental passions of human nature, with love and hate, with shame and fear, with joy and misery. The interlocutors, both high and low, are frequently far from refined, reverent, or sinless; and it has been objected to his tales of Anglo-Indian life that the tone is both flippant and cynical. But unquestionably he commands true realistic power, and in his smallest masterpieces pathos and humour, the ghastly and the comic, are combined with the *vraisemblance* of an everyday experience. His inimitable *Jungle Book* (1894) was followed by a second (1895). Later works were *The Seven Seas*, *Captains Courageous*, *The Day's Work*, *Stalky and Co.*, *Kim*, *Just So Stories*, *The Five Nations*, *Traffics and Discoveries*, *Puck of Pook's Hill*, *Actions and Reactions*, *Rewards and Fairies*, *A History of England* (with C. R. L. Fletcher, 1911), *Letters of Travel* (1920), *Irish Guards in the Great War* (1923). See a study by Chevrillon (*Nouvelles Études Anglaises*, 1910).

Kippis, ANDREW, D.D., F.R.S. (1725-95), born at Nottingham, studied at Northampton under Dr Doddridge, and from 1753 was minister of a dissenting congregation in Westminster. He wrote much for the magazines, helped to found the *Annual Register*, edited Lardner's works (11 vols.), wrote *Lives* of the four Earls of Shaftesbury and Dr Doddridge, and edited the new edition of the *Biographia Britannica* (5 vols. folio, unfinished, 1778-93).

Kirby, WILLIAM, entomologist, was born at Witlesham Hall, Suffolk, 19th September 1759. He was educated at Ipswich grammar-school and Caius College, Cambridge, graduated B.A. in 1781, took orders in the following year, and was first curate, after 1796 rector, of the quiet Suffolk parish of Barham, where he died, July 4, 1850. His principal works are *Monographia Apum Angliæ* (Ipswich, 1802), and *Introduction to Entomology* (4 vols. 1815-26), the latter written conjointly with Mr Spence. The first was very favourably received both at home and abroad, and at once secured for Kirby a distinguished place among European savants. The second work is written in the form of letters (fifty-one in number), giving a familiar account of the habits, instincts, and uses of insects, and remains a classical masterpiece of *vulgarisation* in the best sense of the word. To the seventh edition Spence contributed an appendix giving the history of the book. Kirby also contributed a variety of very important entomological papers to the *Linnean Transactions*. His

greatest discovery in this department of science is that of the genus *Stylops*—the type of a new order of insects, living in the larva state parasitically in the bodies of bees. He also wrote one of the Bridgewater Treatises, entitled *Habits and Instincts of Animals* (1835). Kirby was one of the first members of the *Linnean Society* (founded in 1789), honorary president of the *Entomological Society*, and Fellow of the *Royal and Geological Societies*. See the *Life* by the Rev. John Freeman (1852).

Kircher, ATHANASIUS (1601-80), German Jesuit, philologist, physicist, and inventor of the magic lantern. See *HIEROGLYPHICS*; and *Life* by Brischar (Würzb. 1877).

Kirchhoff, GUSTAV ROBERT, physicist (1824-87), became professor in Berlin University in 1874. He distinguished himself in the departments of elasticity, the mechanical theory of heat, optics, and especially of spectrum-analysis. See *SPECTRUM*; and *Life* by Boltzmann (Leip. 1888).

Kirghiz, or KIRGHIZ-KAZAKS, a people spread over the immense territory bounded by the Volga, the Irtysh, Chinese Turkestan, Ala-tau Mountains, the Syr-Darya, and Aral and Caspian Seas. A few tribes of Kalmucks (q.v.) also live within these boundaries. Over this vast tract reigns a dismal monotony; the country has scarcely any important elevation or depression, excepting the Mogudjar Mountain in the north-west; no river of consequence runs through it, no great forests break the uniformity of the scene; it is a vast steppe, containing 850,000 square miles, sterile, stony, and streamless, and covered with rank herbage of five feet high. It abounds in lakes and marshes, the water of which is generally brackish and unfit for use, and in the southern portion lies the Kara-Kum, an extensive salt desert.—The Kirghiz are a Turkish race, and speak a separate dialect of eastern Turkish; but from the earliest times the Kirghiz were known to the Chinese as *Kien-k'un* or *Kiet-kut*, eight centuries before the word *Turk* was introduced; both they and the later Turks had formed part of the ever-shifting empire of the Hiung-nu or ancient Huns. They have from time immemorial been divided into the *Great*, *Middle*, and *Little Hordes*. The first of these wanders in the south-west portion of the Russian steppe, partly in the regions north of the Ala-tau and Khokand, and partly in the territory of China. The Middle Horde possesses the territory (called the country of the Siberian Kirghizes) between the Ishim, Irtysh, Lake Balkhash, Khokand, and the territory of the Little Horde, and also a great portion of the Russian province of Semipalatinsk. Russia had gradually absorbed them, the result being finally achieved by the victory over Khiva in 1873, and the formation of the province of Anu-Daria. The Little Horde (possibly still more numerous than the other two together) ranges over the country bounded by the Ural, Tobol, the Siberian Kirghiz, and Turkestan. Like the Middle Horde, they were claimed as subjects of the tsars, though partly independent. This horde is partly agricultural, partly nomad. A small offshoot of the Little Horde has, since 1801, wandered between the Volga and the Ural River.

The total number of Kirghiz-Kazaks, according to the *Russian Statesman's Handbook* (1896), amounted then to 3,290,000—probably a smaller number than in former times when unchecked and uncontrolled they moved from one end of central Asia to the other. The Kirghiz are noted for their unbounded love of adventure, wit, and poetical disposition. As nomads they have retained most of the characteristics of their race, they still cling to their ancient habits and customs, and though

some say Islam has never taken a firm hold on them, the handbook classes them all as Mohammedans. Since the suppression of *baranta* ('forays') they have lost their warlike spirit, although they still abhor sedentary life and cannot be persuaded to settle and live by agriculture. Russian schools in the steppes have for long striven to transform these inveterate nomads, some of the better educated of whom seem to be mixed up with the Young Bokhara party who have been giving the Soviet trouble with their claims for self-government.—In August 1920 the Moscow government erected an area north of the Caspian into an autonomous Kirghiz republic, afterwards extended to the Chinese frontier (pop. 5,000,000 capital, Orenburg).

See Russian works by Grodekoff and Nalitzin; Landsell, *Russian Central Asia* (1885); E. H. Parker, *A Thousand Years of the Tartars* (1895 and 1924); Skrine and Ross, *The Heart of Asia* (1899).

Kirin, capital of the province of Kirin, in Manchuria, stands on the river Sungari, 220 miles NE. of Mukden, with an arsenal and great trade in tobacco; pop. 80,000.

Kirkcaldy, a seaport of Fife, on the Firth of Forth, 15 miles N. of Edinburgh, popularly known as the 'Lang Town,' because till comparatively recently the town consisted almost exclusively of one long street about 4 miles in length. Kirkcaldy has grown to breadth, and the old description is scarcely now applicable. It is said to have been created a royal burgh in 1450, although the earliest charter extant is dated 1644. Along with the burghs of (1) Burntisland, (2) Kinghorn, (3) Buckhaven and Methil, it sends one member to parliament. Kirkcaldy has electric tramways and electric light, and a modern harbour built about 1907. The chief industry is the manufacture of floorcloth and linoleum, other industries being spinning and weaving of linen, and manufacturing of furniture, pottery, and engineering. Kirkcaldy lies almost in the centre of the Fife coalfield, and there are two coal-pits practically in the town. The population in 1871 was 18,873; in 1881, 23,315; in 1891, 27,155; in 1901, 34,063; and in 1921, 39,591. Kirkcaldy is the birthplace of Adam Smith; and Edward Irving and Thomas Carlyle were teachers there.

Kirkcudbright, STEWARTRY OF, a county of south-west Scotland, washed on the south for 50 miles by the Solway Firth, and elsewhere bounded by Wigtown, Ayr, and Dumfries shires. Measuring 44 by 40 miles, it has an area of 900 sq. m.; is watered by the Nith, Urr, Dee, Fleet, and Cree; and in the south-east sends up conspicuous Criffel (1867 feet), on the north-west border Merrick (2764), the loftiest summit in the south of Scotland. The rocks are mainly Silurian, with intrusive granite and Carboniferous patches; the soil varies from extremely fertile to extremely barren. Little more than a third of the area is in cultivation, though great improvements have been effected since the foundation in 1809 of the Stewartry Agricultural Society. Nearly 34 sq. m. are occupied by woods. Towns are Kirkcudbright, New Galloway, Castle-Douglas, Dalbeattie, Gatehouse, Creetown, and Maxwelltown; and the antiquities include the Deil's Dyke, Threave Castle, Buittle Castle, the remains of the royal castle of Kirkcudbright, and the ecclesiastical ruins of Dundrennan, Lincluden, New Abbey, and Tongueland. For the history of the Stewartry, see GALLOWAY; among its worthies have been Samuel Rutherford, Paul Jones, Thomas Brown, and Alexander Murray. With Wigtown it returns one member to parliament. Pop. (1801) 29,211; (1851) 43,121; (1881) 42,127; (1901) 39,407; (1911) 38,367; (1921) 37,156.

KIRKCUDBRIGHT, the county town, 30 miles SW. of Dumfries by a branch railway (1864), is beauti-

fully situated on the left bank of the Dee, which soon begins to broaden into Kirkcudbright Bay, opening into the Solway Firth six miles below. Its name (pronounced *Kirkcoo'bry*) is derived from the church of St Cuthbert, as old at least as 1164. It is a royal burgh (1455), till 1918 uniting with Dumfries, &c., to return one member. Chief buildings are the court-house (1868) and town-hall (1879); and a ferro-concrete bridge over the Dee. The ruins of the mansion built by McClellan of Bombie in 1582, ancestor of the Lords Kirkcudbright, still dominate the town. Pop. 2000.

Kirkdale Cave, in the vale of Pickering, Yorkshire, 28 miles W. of Scarborough, is famous for the numerous remains of Tertiary mammals which have been found in it. It was discovered in 1821, in the cutting back of an oolitic limestone rock in which it is situated. It was examined by Buckland, and fully described by him in his *Reliquiae Diluvianae*. Its greatest length is 245 feet, and its height is so inconsiderable that there are only two or three places where a man can stand erect. The fossil bones are contained in a deposit of mud that lies on the floor of the cave: this is covered by stalagmite formed by the water, highly charged with carbonate of lime, dropping from the roof. The remains of the following animals have been discovered: hyæna, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, hare, rabbit, water-rat, raven, pigeon, lark, and duck.

Kirke, COLONEL PERCY (c. 1646–91), served three years as an officer in Tangiers. After the battle at Sedgemoor (1685), his men inflicted fearful atrocities upon the unhappy followers of Monmouth and their suspected sympathisers, as to make their nickname, 'Kirke's Lambs,' a byword for cruelty. Kirke early deserted to William's side, and helped to raise the siege of Londonderry.

Kirkham, a market-town of Lancashire, 8½ miles W. by N. of Preston. It has a grammar-school (1673), and manufactures of cotton. Pop. 3800.

Kirkintilloch, a town in Dumbartonshire (detached), on the Forth and Clyde Canal, 7 miles NNE. of Glasgow. Its Celtic name *Caerpentulach* ('fort at the end of the ridge') referred to a strong fort on Antoninus' Wall, which has left some remains; and as early as 1170 it was made a burgh of barony. Industries are iron-founding and coal-mining. Pop. 12,000.

Kirk-Kilisseh (the 'forty churches'), a town of Thrace, 104 miles NW. of Constantinople, with which it trades in butter and cheese. It is famed for its confections. The Bulgarians gained a great victory there over the Turks in 1912. Pop. 16,000, mostly Bulgarians.

Kirkmaiden. See JOHN O' GROAT'S.

Kirk-session, the lowest court in Presbyterian churches, being the governing body of a particular congregation, and composed of the minister and elders of the congregation. See PRESBYTERIANISM.

Kirkstall Abbey, a Cistercian abbey in Yorkshire, stands 3 miles NW. of Leeds, in the midst of modern manufacturing establishments. Next after Fountains Abbey, it is the best-preserved monastic ruin in the county. First founded at Barnoldswick in the same neighbourhood in 1147, but five years later moved to its present site, the abbey is mainly Transition Norman and Perpendicular in style. The church is, like most Cistercian churches, long and narrow, with little ornamentation, and a low tower. The abbey was presented to the town by Colonel North in 1889.

Kirkwall, the capital of Orkney, on the east coast of Mainland, 49 miles NE. of Thurso, and 225 N. of Leith. St Magnus' Cathedral (1137–1500) is a stately cruciform pile, mixed Norman

and Gothic in style. It measures 253 feet by 102 across the transept, and has a central tower 150 feet high. It serves as a parish church. The last vestige of the royal castle was demolished in 1865; but the roofless Earl's Palace (1607) remains, and a tower (1550) of the Bishop's Palace, in which King Haakon died in 1263. A charter of 1486 ratifies its earlier erection into a royal burgh. Till 1918 it united with Wick, &c., to return one member to parliament. Pop. 3700.

Kirk-Yetholm. See YETHOLM.

Kirriemuir, a small town of Forfarshire, 6 miles NW. of Forfar by rail, with jute-mills. It is the birthplace of Sir J. M. Barrie, and the 'Thrums' of his stories. Pop. 3400.

Kirschwasser (Ger., 'cherry-water') is a liqueur made from cherries, and highly esteemed in Germany. The cherries, gathered when quite ripe, and freed from their stalks, are pounded in a wooden vessel, but so that the stones are not broken. They are then left to ferment, and when fermentation has begun the mass is stirred two or three times a day. The stones are afterwards broken, and the kernels bruised and thrown in. By distillation kirschwasser is obtained.—For cherry-brandy, see BRANDY.

Kisfaludy, SANDOR (ALEXANDER), a Hungarian poet, was born at Sümeg, in the county of Zala, on 22d September 1772. He served in the Austrian army from 1793 to 1801, and again in 1809. The rest of his life was devoted to literature and farming. He established his fame by a collection of lyrics—his best work—entitled *Himfy's Loves* (1801-7), which created extraordinary enthusiasm; and his fame was further enhanced by *Legends of the Olden Time in Hungary* (1807; 2d ed. 1812). Kisfaludy also attempted the drama, but less successfully; his best dramas are *John Hunyadi* and *Ladislav the Cumanian*. He was one of the founders of the Hungarian Academy of Sciences, which has rendered inestimable service in the advancement of the literary and intellectual life of Hungary. He died at Sümeg, 30th October 1844. His *Collected Works* appeared in 6 vols. in 1847, to which 4 vols. of *Posthumous Writings* were added in 1870. A fourth edition appeared in 1893.

KAROLY (CHARLES) KISFALUDY, younger brother of the preceding, and regenerator of the national drama of Hungary, was born at Tet, in the county of Győr (Raab), on 6th February 1788. By quitting the army in 1811 he incurred the anger of an austere father, and was obliged to earn a precarious livelihood as an amateur artist, until in 1819 the success of a drama, *The Tartars in Hungary*, made him suddenly famous. This was followed by several others, all dealing with the past history of his country, and by comedies based upon popular life, the best of them *The Student Matthias*. Kisfaludy steadily improved as a dramatist as years went on. He died at Pesth, 21st November 1830. His *Collected Works* were published in 10 volumes in 1831 (7th ed. 1893).—The *Kisfaludy Society*, established in honour of the brothers in 1837, has rendered important services to Hungarian literature.

Kish, an ancient city of Lower Mesopotamia, near an old course of the Euphrates, 9 miles E. of Babylon, traditionally founded immediately after the flood, is undoubtedly of extreme antiquity. Excavations have brought to light the remains of a palace of the early historical Sumerian and Semitic kings, dating from before 3000 B.C., which furnishes an entirely new idea of the magnificence of early Sumerian architecture. It covers an area of over 2 acres. Cuneiform tablets, bronze work, and silver filigree work of great beauty have been recovered. Tablets, the scientific value of which it is hard to overrate, have been unearthed in large numbers.

Kishineff, or KISHINEV (Rumanian *Chişinău*), capital of Bessarabia, stands on a tributary of the Dniester, 85 miles NW. of Odessa. The old or lower town abuts upon the river; the new town stands on cliffs between 400 and 500 feet above the river. When Russia got it in 1812 it was a place of only 7000 inhabitants; since then, however, it has rapidly increased in size and prosperity, and has now about 130,000 inhabitants, composed of nearly all the surrounding nationalities, with a very large contingent of Jews. On the Jews a series of savage attacks were made in 1903, some 40 being killed and 300 wounded. Kishineff is an important trading centre for Bessarabian products (grain, fruits, wine). It has an archbishop.

Kishm, or TAWILAH (the ancient *Oaracta*), a parched and barren island of Persia, situated at the entrance to the Persian Gulf. It is 55 miles long, and produces salt and sulphur.

Kislovodsk, the most fashionable of North Caucasus health resorts, with mineral springs.

Kismayu, a town and port in Jubaland, 10 miles S. of the mouth of the Juba River, was ceded to Italy in 1925. It has a considerable trade with the interior. Pop. about 3000.

Kismet. See FATE, MOHAMMEDANISM.

Kiss, a familiar form of salutation by touching with the lips as an expression of respect or affection, in earlier times and still in many countries used in the common intercourse of man with man, but mostly limited by modern Englishmen to the domestic and dearer relationships of life. The *osculum* was a formal symbol of goodwill among the ancient Romans, and was adopted by the early Christians, whose 'holy kiss' and 'kiss of charity' carried the weight of apostolic sanction. The 'kiss of peace' at the mass, in the Eastern Church and the Mozarabic and Ambrosian liturgies, is given before the offertory and consecration; but in the Roman mass it follows the consecration and is closely connected with the communion. About the end of the 13th century the kiss of peace in the West gave way to the *osculatorium*, called also the *instrumentum* or *tabella pacis*, *pax*, *pacifical*, or *freda*, a plate with a figure of Christ on the cross stamped on it, kissed first by the priest, then by the clerics and congregation. The kiss of peace was given also at baptism, and is still given by the other bishops to a bishop newly consecrated, and by the bishop to a priest at his ordination; and the Greeks still preserve the rite of giving the kiss of peace to the dead.

The Christians early adopted the practice of kissing the altar as a mark of reverence to the place on which the eucharist is offered, and the officiating priest still does so repeatedly in the Roman mass. It is usual also to kiss the golden cross of the sandal on the pope's right foot on his appointment to office, by newly-created cardinals and by persons on being granted an audience. Even royal persons in former times paid this act of homage to the Vicar of Christ; it is said that Charles V. was the last that did so.

See Kahle, *De Osculo Sancto* (Königsberg, 1867); Valentini, *De Osculatione Pedum Romani Pontificis* (Rome, 1588); and Pongard, *Del Bacio de' Piedi de' Sommi Pontefici* (Rome, 1807).

Kissingen, the most popular watering-place in Bavaria, is situated on the Saale, 60 miles E. by N. from Frankfurt-on-Main. Of its three mineral springs (temperature 50.7°-51.2° F.), the Rakoczy and the Pandur furnish saline and chalybeate waters, while the Maxbrunnen is acidulous and saline. The Solen-Sprudel is remarkable for the periodical ebb and flow of its waters, caused apparently by the accumulation and discharge of carbonic acid gas. Besides these there are two other

springs near the town, and in the same valley the spas of Bocklet and Brückenau. The waters of Kissingen are both drunk and used as baths by the patients, and are considered specially efficacious in cases of dyspepsia, skin diseases, affections of the bowels, eyes, and ears, gout, &c. The population (8000) is increased by an influx of 13,000 to 20,000 visitors annually. Although the existence of mineral (saline) springs at this spot was known as early as the 9th century, it was not until the 16th that their medical properties were recognised, and not until the 19th that the springs came to be in great repute.

Kistna, or **KRISHNA**, a river of southern India, rises in the Western Ghâts within 40 miles of the Arabian Sea, in 18° 1' N. lat., and, flowing eastward across the peninsula, falls into the Bay of Bengal after a course of 800 miles. It forms for some distance the boundary between the Nizam's Dominions and Madras province, and has a delta extending 100 miles inland. It is navigable for about 50 miles only six months of the year.

Kistvaen, or **CIST**. See **BARROW**, **BURIAL**.

Kit-Cat Club, a society formed in London about 1700, consisting of thirty-nine noblemen and gentlemen favourable to the succession of the House of Hanover, and whose ostensible object was the encouragement of literature and the fine arts. Jacob Tonson, the eminent publisher, was founder and secretary; and, not to mention dukes and earls, it included Sir Robert Walpole, Vanbrugh, Congreve, Addison, Steele, and Garth. The club derived its name from having met for some time in the house of Christopher Catt, a pastrycook. Before its dissolution (about 1720) each of the members gave Tonson his half-length portrait, painted a uniform size, by Kneller. Hence a kit-cat is any portrait of that size—about 36 in. by 28.

Kitchener of Khartoum, **HORATIO HERBERT**, EARL, K.G., G.C.B., G.C.M.G., born 22d September 1850 at Gunsborough Villa, near Ballylongford, Kerry, studied at Woolwich Academy, and entered the Engineers in 1871. On the Palestine survey 1874-78, and then on that of Cyprus till 1882, he commanded the Egyptian cavalry 1882-84, served in the Sudan campaign 1883-85, was governor of Snakin 1886-88, and Sirdar of the Egyptian army from 1890. As such he recovered Dongola (1896), for which he was made K.C.B. He then organised the expedition against the power of the Khalifa, defeated the dervishes at the Atbara (April 1898), and by the final victory of Omdurman, 2d Sept. 1898, won back the Sudan for Egypt. He was created baron and received the thanks of both houses of parliament. In December of the same year he accompanied Lord Roberts to South Africa as chief of his staff in the Transvaal war, and on Lord Roberts's return home in November 1900 he assumed chief command with the rank of lieutenant-general, and carried the war to a successful conclusion (see **TRANSVAAL**), being raised to the rank of viscount and made full general. As commander-in-chief in India (1902-9) he reorganised the military forces. Promoted field-marshal, he was made commander-in-chief and high commissioner in the Mediterranean; visited Australia and New Zealand to assist in framing schemes of defence; was made a member of the Committee of Imperial Defence, in 1911 agent and consul-general in Egypt, and in 1914 an earl. On the outbreak of the great European war he was made War Secretary. On 5th June 1916 he went down with the *Hampshire*. See *Life* by Sir George Arthur (3 vols. 1920).

Kitchen-midden (Dan. *kjøkken-mødding*), mounds in Denmark, Scotland, &c., are prehistoric refuse-heaps, mostly of shells, and contain stone,

bone, or wood implements, and bones of animals. See **ARCHÆOLOGY**, **STONE AGE**.

Kite, one of the long-winged, small-footed, short-beaked Falconidae. The typical genus is *Milvus*, confined to the Old World, and represented by half-

Common Kite or Gled (*Milvus icinnus*).

a-dozen species. Of these the Common or Red Kite (*Milvus icinnus*), found throughout Europe, but now very rare in Britain, feeds on offal and small vertebrates of all kinds. The Pariah Kite (*M. govinda*) of India is a useful scavenger. Under the title kite are also included the Black-winged Kites (*Elanus*) of both hemispheres.

Kites (*dragons* in Scotland), paper or cloth-covered frames sent up into the air to fly, with or without tails, and attached to cords, are an ancient and widespread toy not merely for children, but in China and the East—where the kites are made to 'fight'—for grown men. Franklin's scientific use of a kite in connection with lightning is well known. For meteorological purposes box-kites are now much used (in shape like a box with the two ends removed). Complex kites with a sail-area of 500 feet may be sent up 2 miles or more, and kept there, attached by piano-wire and bearing automatic recording instruments. Tailed observation-balloons are called kite-balloons.

Kits Coty House, the best-known dolmen in England, stands on a hillside 1½ mile NW. of Aylesford. See **DOLMEN**.

Kittiwake. See **GULL**.

Kitto, **JOHN** (1804-54), born at Plymouth, became stone-deaf through a fall in 1817, and at the workhouse learned shoemaking. In 1824 he went to Exeter to learn dentistry; at the Islington Missionary College he learned printing. In 1829-33 he accompanied a patron on a tour to the East. The rest of his life was spent in the service of Charles Knight and other publishers. In 1850 he received a pension of £100. He died at Cannstadt. His works include *The Pictorial Bible* (1838; new ed. 1855), *Pictorial History of Palestine* (1839-40), *History of Palestine* (1843), *The Lost Senses—Deafness and Blindness* (1845), and *Daily Bible Illustrations* (1849-53; new ed. by Dr Porter, 1867). See *Lives* by Ryland (1856) and Eadie (1857).

Kiū-kiang, or **CHIŪ-CHIANG**, a Chinese treaty-port on the lower Yang-tze-kiang, at the N.E. corner of the province of Kiang-Si; pop. 53,000.

Kiū-shiū, the southernmost of the larger islands of Japan (q.v.).

Kiustendil, or **KÜSTENDIL**. See **KYUSTENDIL**.

Kivu, an African lake 60 miles long, lies 60 miles N. of the N. end of Tanganyika.

Kiwi. See **APTERYX**.

Kizil-bashes. See AFGHANISTAN, KHIVA.

Kizil-Irmak. See ASIA MINOR.

Kizil-Kum ('Red Sands'), a sandy desert in Turkestan, between the lower courses of the Amu-Daria and Syr-Daria, stretches south-east from the Sea of Aral, and rises from an elevation of 150 feet at the sea to 2000 towards Bokhara. The sands are partly of shifting nature and partly stationary, and are diversified by numerous ridges, between which extensive patches of clay occur. North-east of the Caspian stretches the Kara-Kum ('Black Sands') desert, a former bed of the sea.

Kjerulf, HALFDAN (1815-68), composer, was born at Christiania, and studied law, but devoted himself to music. He wrote much for the piano, but is best known for his charming songs, full of melody and true Norwegian feeling.

Kjöbenhavn. See COPENHAGEN.

Kjökken-mödding. See KITCHEN-MIDDEN.

Kladno, a town of Czechoslovakia, 16 miles WNW. of Prague, has great iron and steel works. The district is rich in coal and iron. Pop. 20,000.

Klagenfurt, the capital (since 1518) of Austrian Carinthia, on the Glan, 262 miles SW. of Vienna by rail. The palace of the Prince-bishop of Gurk possesses a noteworthy chapel; and in the town there are schools of mining, agriculture, technical arts, &c., a library, and the Rudolfinum museum. Klagenfurt has a large white-lead factory, and manufactures leather, cast-iron, tobacco, &c. An active transit trade is carried on. Pop. 30,000. The fortifications were dismantled by the French in 1809, and now, converted into promenades, separate the town from its four suburbs. After the peace of St Germain the Klagenfurt district decided by plebiscite to be Austrian rather than Yugoslav.

Klapka, GEORGE, one of the most heroic and skilful generals of the Hungarian war, was born at Temesvar on 7th April 1820. He rose to the rank of lieutenant-general in the Austrian army, but on the outbreak of the revolution placed himself at the service of the Hungarian government, and took a prominent part in nearly all the battles against the Austrians between February and August; in more than one the fortune of the day was decided by the troops under his command. But the crowning glory of his career was his defence of Komorn, which he continued to hold for some weeks after all the rest of Hungary had submitted. He lived in exile until the amnesty of 1867 let him return; and he died 17th May 1892. He wrote *The National War in Hungary and Transylvania* (1851), one of the best works on the subject; *The War in the East* (1855); and two series of *Memoirs* (1850 and 1886).

Klaproth, HEINRICH JULIUS VON, orientalist, was born at Berlin, 11th October 1783, the son of Professor Martin Heinrich Klaproth (1743-1817), chemist and mineralogist. At fourteen undertaking the study of Chinese, in 1805 he was appointed interpreter to a Russian embassy to China. It was stopped on the frontier, when Klaproth took the opportunity of exploring Siberia, as afterwards (in 1807-8) the Caucasus and Georgia. Returning to Germany in 1812, he settled three years later in Paris, where in 1816 he was appointed professor of Asiatic Languages, and where he died, 20th August 1835. From 1802 onwards he published innumerable works, in German and later in French, on the subject of his travels, of Asiatic philology and ethnology, of Egyptian hieroglyphics, &c. A blot on their erudition and acuteness is his virulent assaults on other scholars. His *Erfindung des Kompasses* was edited by Wittstein in 1885.

Klarenza. See CLARENCE.

Klásterský, ANTONÍN, Czech poet and satirist, born in 1866. See CZECHOSLOVAKIA (*Literature*).

Klausenburg (Magyar *Kolozsvár*, Rumanian *Cluj*), formerly, and again since 1920, capital of Transylvania, 72 miles NNW. of Hermannstadt. It consists of the inner town, formerly fortified, and of five suburbs. Here are a university (founded in 1872, refounded in 1919) and a Unitarian College, both with libraries, an observatory, a music school, and numerous other educational establishments. The town possesses the national museum, with antiquities, scientific collections, and a library. Klausenburg was captured by the Hungarians under Bem on Christmas Day 1848. Machines, oil, and spirits are manufactured. Pop. 85,500, mostly Magyars. See UNITARIANS.

Klausthal, the chief mining-town of the northern Harz Mountains, stands on a bleak plateau (1985 feet), 25 miles NE. of Göttingen. The ores raised are silver, lead, copper, and zinc. There is a good mining academy, with library, museum, and laboratory. Zellerfeld, divided from Klausthal by a brook, is also a mining centre. The men are almost exclusively employed in the mines and smelting-works.

Kléber, JEAN BAPTISTE, a distinguished French soldier, born in March 1753 at Strasburg, where his father was a builder. He was destined for an architect, but his opportune assistance in a Paris tavern brawl to two young German nobles obtained him a nomination to the military school of Munich, and afterwards a commission in the Austrian army. This, however, he resigned after a few years, and returned to France to become inspector of public buildings at Belfort. In 1792 he enlisted in the Haut-Rhin volunteers, and rapidly rose in rank, becoming general of brigade in 1793. As such he commanded in the Vendean war, but was recalled for advocating more lenient measures. Next year, as general of division in the northern army under Jourdan, he led the left wing at Fleurus, and captured Maestricht; and in June 1796 he gained the brilliant victory of Altenkirchen over the Prince of Würtemberg. He accompanied Bonaparte to Egypt as a general of division, was dangerously wounded at the capture of Alexandria, but recovered so as to take part in the expedition to Syria, and won the battle of Mount Tabor (1799). When Bonaparte left Egypt he entrusted the chief command there to Kléber, who concluded a convention with Commodore Sidney Smith for its evacuation; but on Admiral Keith's refusal to ratify this convention Kléber adopted the bold resolution of reconquering Egypt, and destroyed the Turkish army at Helopolis. During an attempt to conclude a treaty with the Turks Kléber was assassinated by a Turkish fanatic at Cairo, 14th June 1800. There are lives by Ernouf (1867) and Pajol (1877).

Kleene-bok. See ANTELOPE.

Kleist, EWALD CHRISTIAN VON, German poet, was born at Zehlin, near Koslin in Pomerania, on 7th March 1715. In 1740 Frederick the Great induced him to enter the Prussian army; he was severely wounded whilst leading an attack on a hostile battery at the battle of Kunersdorf, and died twelve days later (24th August 1759) at Frankfurt-on-the-Oder. The lyric poet Gleim first taught him how to develop his poetic talents. His name is best known from his *Poems*, especially the one entitled *Frühling*, a sort of descriptive lyric. Besides this he wrote tales (*Die Freundschaft und Arist*), idylls (*Iren*, &c.), fables, and hymns. An edition of his *Werke* was issued by A. Sauer (1884). See Life by Einbeck (1861).

Kleist, HEINRICH VON, German dramatist and poet, was born at Frankfurt-on-the-Oder, on 18th

October 1777. At first he followed the family profession and entered the army; but left it in 1799 to study, yet science he soon abandoned for literature. As a writer his aims and desires outran his ability to execute, and his works are marred by want of clearness and artistic completeness; in fact, he has some of the worst faults of the Romantic school, to which he belongs. Nevertheless, his best plays, such as *Der Prinz von Homburg*, *Das Katchen von Heilbronn*, *Hermannsschlacht*, and *Der zerbrochene Krug*, possess sufficient vigour and fidelity to life to make them popular even at the present day. The best of his tales is *Michael Kohlhaas*, a story of Brandenburg in the middle ages. The morbid tendencies in his character made him quail before the adversities against which he had to battle, and at last brought him to a suicide's grave. He shot himself, after first shooting a woman whom he loved, and who like him was weary of life, on the bank of Lake Wann near Potsdam, 21st November 1811. His works were collected by Tieck in 1826. See the translations by Lloyd and Newton (1875); and books on him by Brahm (1911), Conrad (1896), Rahmer (1909), and Herzog (1912).

Klephts, Greek brigands. See BRIGANDS.

Kleptomania (Gr. *kleptō*, 'I steal'). Among the phenomena of certain minds that are not regarded as technically insane or criminal are observed inordinate tendencies to acquire, to collect, and to hoard. These depend upon a morbid exaggeration of the instinct of acquisition, which is one of the important social instincts of man. All young children desire and will at once appropriate whatever they fancy. So long as such impulses do not interfere with the rights and property of others, or involve a flagrant breach of law, they are readily admitted as an indication of mental abnormality, or as an absurdity and eccentricity which concern no one else. But whenever the amount of the object appropriated, or the circumstances under which it is purloined, bring the matter into a court of law, the act is treated as a theft. Such conduct is often the result of disease; it is rarely a disease by itself. The impulse to steal is a premonitory indication of some forms of mental disorder: it is a characteristic symptom of many others, where violence, or delusion, or incoherence leaves no doubt as to the source from which it springs. But there are other cases in which the morbid origin cannot be so clearly demonstrated—where the mind is clear and cogent, the morals pure, and where theft is the only proof of abnormality. There is evidence in favour of the opinion that the propensity to steal may become so irresistible, and the will so impotent, that the appropriation is involuntary, and the perpetrator irresponsible. It then forms one of the varieties of obsession (see the article INSANITY). The gratification of the impulse is commonly found associated with physical changes and conditions which may be regarded as incompatible with the healthy discharge of the functions of the nervous system; but that connection is not invariable, and the best mode of establishing the reality of such a disease is to consider marked cases in relation to the character, interests, and previous deportment of the individual, to the nature of the articles taken, and to the motives. A baronet of large fortune stole, while on the Continent, pieces of old iron and of broken crockery. A clergyman of great usefulness abstracted from book-shops and stalls hundreds of copies of the Bible. The objects are often stolen ostentatiously, or without any adequate precautions to conceal the attempt; they are often of no value; the act is without motive, promptly and spontaneously avowed, and, if over-

looked, repeated. The article is restored or disregarded; money is rarely taken, bright and coloured objects generally exciting cupidity.

See Macdougall's *Social Psychology*; Féré, *La famille névropathique*; Stoddart's *Mind and its Disorders*.

Klinger, MAX (1857-1920), German painter, sculptor, and etcher, was born at Plagwitz, near Leipzig. After studying at Karlsruhe he went to Berlin, where in 1878 he created a great sensation with some black-and-white drawings, 'The Fantasies upon the Finding of a Glove'; more especially by the amazing eccentricity and powerful technique of the drawing, which drew down upon the artist storms of abuse. These only became greater when his painting 'The Judgment of Paris' was exhibited. In all his work, both in his etchings, of which his 'Pietà' is a typical example, and in his paintings is a strain of strangeness. In his sculpture this finds expression in the use of coloured materials to gain his effects. His Beethoven statue is a notable work.

Klondike (properly *Thron-duick*, 'plenty of fish'), a small tributary of the Yukon, in the Yukon Territory of Canada, gives name to an extraordinary rich auriferous region, partially known as early as 1873. Gold-mining was being carried on on the Lewis and Stewart rivers in the early eighties, but only in 1896 was gold found in such abundance as to create a rush, so that soon 30,000 miners were at work. After 1900 the produce declined and the population shrank. Dawson, where the Klondike enters the Yukon River, is 60 miles E. of the Alaskan frontier. See GOLD.

Klopstock, FRIEDRICH GOTTLIEB, was born 2d July 1724 at Quedlinburg. Incited by Virgil's *Æneid* and Milton's *Paradise Lost*, he resolved to write a great epic poem whilst a theological student at Jena (1745), selected for his theme *The Messiah*, and while at Leipzig got the first three cantos published in a Bremen magazine (1748). They were received with enthusiasm, except by Gottsched, who denounced his language and verse structure as heretical innovations. He settled in Hamburg in 1771 with a sinecure appointment, and pensions from the king of Denmark (since 1751) and the margrave of Baden. In 1773 the last cantos of *The Messiah* were published; the poet died 14th March 1803. His name has (or rather had) a very high place in German literature. For instance, he was taken by the Göttinger Dichterbund as their model and poetic hero, and was greatly admired by young Schiller. Whatever may be thought of the intrinsic value of his poetry, it cannot be denied that he helped to inaugurate the golden age of German literature, and exercised a very beneficial influence on the national taste. When he first began to write, the literature of Germany was dominated by French influences—a cold, correct, unimaginative spirit. Klopstock broke loose from this despotism and breathed the air of freedom into German poetry. Odes, tragedies—in which he introduces Arminius as a national hero—and biblical dramas, with some hymns, constitute the remainder of his poetry. Of these his *Odes* alone possess interest and value now.

His works were collected in 12 vols. (1798-1817), and have been repeatedly re-edited. *The Messiah* was translated into English prose (1763) and verse (1826). The standard Life is by Muncker (1888.)

Kluchevskaya. See KAMCHATKA.

Knapweed. See CENTAUREA.

Knaresborough, a market-town in the West Riding of Yorkshire, on the Nidd, 3½ miles NE. of Harrogate and 17 WNW. of York. It has a church (restored 1872), with interesting monuments of the Slingsbys; a grammar-school (1616); remains of a castle (1170), in which Richard II.

was imprisoned, and which was dismantled in 1648; a 'dropping well,' with petrifying properties; and St Robert's Cave, in which Eugene Aram buried his victim in 1745. Mother Shipton is claimed as a native, as well as Jack Metcalf, the blind road-surveyor, and Bishop Stubbs. Linen is the staple manufacture. Knaresborough returned two members from 1550 till 1867, and one until 1885. Pop. 5500. See Fletcher's history (1920).

Knee, the articulation between the femur or thigh-bone, above, and the tibia or shin-bone, below. A third bone, the patella, or knee-cap, also enters into the structure of this joint anteriorly. The articular surfaces of these bones are covered with cartilage, and connected together by ligaments, some of which invest the joint and lie external to it, while others occupy its interior. The synovial membrane is the largest in the body. It lines the investing ligament, and is prolonged on the front of the femur above the articular surface, covers certain of the ligaments in the interior of the joint, and forms folds on a large cushion of fat placed between the tibia and patella.

The most important of the external ligaments are the anterior or *Ligamentum Patellæ*, which is in reality that portion of the *Quadriceps Extensor Cruris* which is continued from the knee-cap to the tubercle of the tibia; one internal and two external lateral ligaments; a posterior ligament; and a capsular ligament, which surrounds the joint in the intervals left by the preceding ligaments. The positions of these ligaments are sufficiently indicated by their names. Of the internal ligaments the two crucial, so called because they cross one another, are the most important. The external and internal semilunar cartilages are usually placed amongst the internal ligaments; they are two crescentic plates of fibro-cartilage. The convex border of each cartilage is thick; the concave free border is thin. Each cartilage covers nearly the marginal two-thirds of the corresponding articular surface of the tibia, and by its form deepens these surfaces for firmer articulation with the condyles of the femur.

The chief movements of this joint are those of a hinge-joint—namely, flexion and extension; but it is also capable of slight rotatory motion when the knee is half-flexed. During flexion the articular surfaces of the tibia glide backwards upon the condyles of the femur; while in extension they glide forwards. The whole range of motion of this joint, from extreme flexion to extreme extension, is about 135°. Judging from its articular surfaces, which have comparatively little adaptation for each other, it might be inferred that this was a weak and insecure joint; and yet it is very rarely dislocated. Its real strength depends on the large size of the articular ends of the bones, on the number and strength of the ligaments, and on the powerful muscles and fasciæ by which it is invested. See JOINTS, where also the excision of the knee-joint is discussed.

Vertical Sagittal Section through the inner half of the Left Knee (from Macalister):

a, femur; b, tibia; c, patella; d, tendon of quadriceps muscle; e, ligamentum patellæ; f, subcutaneous bursa; g, prepatellar bursa; h, internal semilunar cartilage; i, ligamentum posticum; k, inner head of gastrocnemius.

The **KNEE-CAP**, or **PATELLA**, is a Sesamoid Bone (q.v.), developed in the single tendon of the *rectus crureus*, *vastus externus*, and *vastus internus* muscles—the great quadriceps extensor muscle of the leg. It is heart-shaped in form, the broad end being directed upwards, and the apex downwards. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striæ; the posterior or internal surface is smooth and divided into two facets by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh-bone, while the two facets (of which the outer is the broader and deeper) correspond to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture. Dislocation may occur either inwards or outwards; but it is most frequent in the outward direction. The displacement may be caused either by mechanical violence, or by too sudden contraction of the extensor muscles in whose conjoined tendon it lies; and is most liable to occur in knock-kneed, flabby persons. Except in one rare variety, the dislocation is capable of being reduced without any difficulty. Fracture of the patella may, like dislocation, be caused either by muscular action or by mechanical violence.

Fracture by violent muscular action, as when a person in danger of falling forwards attempts to recover himself by throwing the body backwards, is the more common of the two forms. The treatment consists in relaxing the opposing muscles by raising the trunk, and slightly elevating the limb, which should be kept in a straight position. In consequence of the great difficulty of bringing the broken surfaces into exact apposition it is very difficult to obtain bony reunion of the parts, and the case generally results either in mere ligamentous union or in no true union at all.

Kneeling was probably the general posture of the early Christians in prayer not regulated by public authority, but the early church made no distinction in language between kneeling and prostration. At communion the first prayer was said kneeling, the rest of the liturgy standing. At other times of service the rule was for all to kneel in prayer except on Sundays and between Easter and Whitsuntide. In the modern Catholic Church kneeling is the usual attitude at prayer, as in the Church of England. In the Roman and Greek churches, and with some Anglicans, the celebrant, after kneeling in adoration, communicates standing. In the Church of England, and in the Lutheran Church, the sacrament is received kneeling; Lutherans stand at prayer. Presbyterians sit when receiving the communion, and were formerly accustomed to stand at prayer; sitting at prayer has become the usual practice, save in the remoter districts of Scotland.

Kneller, SIR GODFREY, a portrait-painter, was born at Lübeck on 8th August 1646, and learned painting under Rembrandt and Ferdinand Bol. Whilst studying further in Italy he chose historical subjects, but afterwards gave himself entirely to portrait-painting. In 1676 he went to London, and, on the death of Sir Peter Lely in 1680, was appointed court-painter to Charles II. This office he retained during the reign of James II., and continued to fill it after the Revolution. In 1691 William III. knighted him, and in 1715 George I. made him a baronet. He died at Twickenham, 7th November 1723, and a monument was erected to him in Westminster Abbey, with a highly laudatory inscription by Pope. Kneller's best-known productions are the 'Beauties of Hampton Court' (painted by order of William III.), his portraits of the 'Kit-Cat Club,' and of nine sovereigns

(Charles II. to George I. of England, Louis XIV., Peter the Great, and the Emperor Charles VI.). He painted avowedly for the love of money, and hence never did justice to the undoubted talent he possessed. His reputation was due to his rapid brush and his quick eye for likeness, and to the fact that there was nobody to dispute supremacy with him. For Kneller Hall, his house at Twickenham, see **BAND (MILITARY)**.

Knickerbocker, HERMAN JANSEN, of Friesland, Holland, was one of the earliest settlers of New York. A descendant, Johannes (1749-1827), was an intimate friend of Washington Irving, who immortalised the name by his *History of New York* by 'Diedrich Knickerbocker' (1809). It has since been used as a generic term for New York families descended from the original Dutch settlers.

Knight, CHARLES, author and publisher, was born in 1791. The son of a Windsor bookseller, in 1811 with his father he established the *Windsor and Eton Express*, and continued to edit it until 1821, at the same time printing the *Etonian*. The *Plain Englishman* (1820-22), which was the first attempt to produce cheap literature of a high tone, was jointly edited by Charles Knight and Commissioner Locker of Greenwich Hospital. Removing to London in 1822, Knight began to publish important works in various classes of literature, and he also founded *Knight's Quarterly Magazine*, to which Macaulay, Praed, Moultrie, and other writers of promise contributed. In 1827 he became connected with the Society for the Diffusion of Useful Knowledge, for which he published many valuable works and serials, including the *Penny Magazine* (1832-45), which attained a circulation of 200,000 copies weekly. Knight began to issue in 1838 the *Penny Cyclopædia*, upon which he expended for contributions alone the sum of £40,000. This was followed by the *English Cyclopædia* (1854-61), the *British Almanac*, and its *Companion*. Knight edited the *Pictorial Shakespeare*, and was the author of *William Shakespeare: a Biography*. He likewise issued *The Land We Live In* and other works. In 1853 Knight published *Once Upon a Time*, which consisted of a collection of papers from the periodicals; and in 1855 *Knowledge is Power*, a work based upon two smaller volumes—*Results of Machinery* and *Rights of Industry*—which secured a large sale at a time when the improvements in machinery excited a hostile feeling and the relations between capital and labour were considerably strained. In 1862 Knight completed his *Popular History of England*, upon which he had been engaged for seven years. His *Passages of a Working Life during Half a Century*, which appeared in 1863-65, recounted the struggles of his own life and gave interesting pictures of the numerous literary and political personages with whom he had been associated. Knight's compilations, *Half-hours with the Best Authors*, *Half-hours of English History*, and *Half-hours with the Best Letter-writers*, were widely popular. By his appointment in 1860 as publisher of the *London Gazette* £1200 per annum was assured to him. He died at Addlestone, Surrey, 9th March 1873. See *Life* by Alice Clowes (1892).

Knighthood. The word 'knight' is the modern equivalent of the Old English *cniht*, which meant originally a youth, and afterwards a servant or attendant, and soon came to be restricted to the military attendants upon nobles and great officers of state. This personal relation was subsequently strengthened by the feudal relation of tenancy, in virtue of which the knight held land of his superior under condition of rendering him military service in return (see **FEUDALISM**). The origin of mediæval knighthood, as a solemn investiture and profession of arms, is involved in

obscurity. Embryonic forms of the institution can be traced amongst the early Teutonic nations, and especially the Franks. The customs of chivalry associated with King Arthur and Charlemagne's paladins are of course those of a later era, the epoch of the romance writers. The custom and practice of knighthood were established in England, but as an essentially feudal institution, by the Norman kings. The system of knight-service empowered the king, or a superior lord who was a subject, to compel every holder of a certain extent of land, called a knight's fee, to become a member of the knightly order, his investiture being accounted proof that he possessed the requisite knightly arms and was sufficiently trained in their use. After the long war between France and England it became the practice for the sovereign to receive money compensations from subjects who were unwilling to receive knighthood, a system out of which grew a series of grievances, leading eventually to the total abolition of knight-service in the reign of Charles II.

The ceremonies practised in conferring knight-hood have varied at different periods; but two broadly-marked ceremonial forms may be recognised, the simple dubbing and the formal investiture as a semi-religious ceremony. In general, in the more elaborate ceremony, fasting and bathing were necessary preparatives, and the actual creation was preceded by solemn confession and a midnight vigil in the church, followed by the reception of the eucharist. The new knight offered his sword on the altar, to signify his devotion to the church and determination to lead a holy life. The sword was redeemed by a sum of money, had a benediction pronounced over it, and was girded on by the highest ecclesiastic present. The title was conferred by binding the sword and spurs on the candidate, after which the person who conferred the order dealt him a blow on the cheek or shoulder, saying, 'Be thou a good and faithful knight,' or words to that effect. The new knight then took an oath to protect the distressed, to maintain right against might, and never by word or deed to stain his character as a knight and a Christian. The religious character of the ceremony seems to have become thus prominent in and after the foundation of the militant monastic orders in Palestine, as the Knights Templars (see **TEMPLARS**) and Knights of St John (see **HOSPITALIERS**). A knight might be degraded for the infringement of any part of his oath, in which case his spurs were chopped off with a hatchet, his sword broken, his escutcheon reversed, and some religious observances were added, during which each piece of armour was taken off in succession, and cast from the recreant knight. This ceremony was of very rare occurrence, but was performed in effigy in 1814 in the case of Lord Dundonald (q.v.). Sir R. Casement was degraded in 1916.

'Knights errant' were they who wandered seeking foemen worthy of their steel, and acquiring fame at joust and tourney, by maintaining the pre-eminence in beauty and virtue of the ladies to whom they had vowed service. The (unhistorical) 'Knights of the Round Table' (see **ARTHUR**) and the paladins of Charlemagne (see **ROLAND**) are types of those whose mission it was to succour distressed damsels and destroy tyrants; and Amadis (q.v.) may be taken as a representative hero of those romances of chivalry which Cervantes satirised in *Don Quixote*. Sad specimens of the military knights in a degraded condition were the robber knights (*Raubritter*) of Germany, who lived largely by levying blackmail on merchants or by sheer plunder.

Knighthood, originally a military distinction, came, in the 16th century, to be occasionally conferred on civilians, as a reward for valuable services

rendered to the crown or community. The first civil knight in England was Sir William Walworth, lord mayor of London, who won that distinction by slaying the rebel Wat Tyler in presence of the king. Since the abolition of knight-service knighthood has been conferred without any regard to property, as a mark of the sovereign's esteem, or as a reward for services of any kind, civil or military. In recent times it has been bestowed at least as often on administrative officials, scholars, lawyers, physicians, artists, and citizens as on soldiers. Although knighthood could originally be conferred by any person of knightly condition, the right to bestow it was early restricted to persons of rank, and afterwards to the sovereign or his representative, as the commander of an army. In England the sovereign now bestows knighthood by a verbal declaration, accompanied with a simple ceremony of imposition of the sword, and without any patent or written instrument (see ACCOLADE). In some few instances knighthood has been conferred by patent, when the persons knighted could not conveniently come into the presence of royalty, as in the case of governors of colonies, or other persons occupying prominent situations abroad. The lord-lieutenant of Ireland also occasionally, but rarely, exercised a delegated power of conferring knighthood. The monosyllable 'Sir' is prefixed to the Christian names of knights and baronets, and their wives have the legal designation of 'Dame,' which in common intercourse becomes 'Lady.' Ladies upon whom the equivalent of a knighthood has been conferred are also Dames. For the existing orders of knighthood, see ORDERS, BATH, GARTER, THISTLE, GOLDEN FLEECE, &c.

Persons who are simply knights, without belonging to any order, are called in England Knights Bachelors. Knighthood of this kind is now only conferred in Great Britain. A degree of knighthood called Banneret (q.v.) formerly existed in England and France; it was given on the field of battle in reward for the performance of some heroic act. It is noticeable that, whereas the German word for knight is *Ritter*, the word *Knecht*, etymologically the same as knight, means the squire or a still humbler attendant of the knight. The French knight (see LEGION OF HONOUR) is *chevalier*, the Italian *cavaliere*. The form of helmet which the requirements of the later heraldry have appropriated to knights is figured under HERALDRY (fig. xi.). For Knights of the Shire, see PARLIAMENT.

See GROSE, *Military Antiquities*; Stubbs, *Constitutional History*; Nicolas, *British Orders of Knighthood*; Hallam, *Europe during the Middle Ages*; C. Mills, *History of Chivalry* (1826); Gautier, *La Chevalerie* (1884); Reibisch, *Geschichte des Ritterthums* (1842); Schreckenstein, *Die Ritterwürde* (1884); Lawrence-Archer's *Orders of Chivalry* (1888); Shaw's *Knights of England* (1906).

Knight-service. See TENURE.

Knights of Labour, a national labour organisation in the United States, founded at Philadelphia in 1869, extending, through its local assemblies, over the whole country. The first general assembly was held in 1878; from that year the numbers rapidly increased, and the oaths of secrecy formerly administered were abolished soon after. In 1883 there were 53,000 members, in 1886 there were 730,000; in 1886 and 1887, however, the system of 'boycotting' having been introduced, the business of the country was greatly disturbed, and thereafter the strength of the organisation declined. Unavailing opposition to the policy of the leaders led to many withdrawals. See GRANGERS, TRADE UNIONS.

Knights Templars. See TEMPLARS.

Kniphofia, a South African genus of Liliaceæ, cultivated for their handsome flowers, which, aggre-

gated in spikes, have gained for the plants the names of flame-flowers and red-hot poker. Bees are sometimes imprisoned in the flowers. The best-known species in British gardens is *K. Uvaria*, one of the most brilliant of border flowers in late summer and autumn. *K. Thomsoni* is a magnificent plant which has been found on Kilimanjaro.

Knipperdolling, BERNARD, a noted leader (1527-36) of the fanatical Anabaptists (q.v.).

Knitting. See HOSIERY.

Knock, a village in County Mayo, Ireland, 17 miles ESE. of Castlebar, where an alleged luminous apparition of the Virgin on the chapel wall in 1880 drew crowds of pilgrims, and numerous cures were reported.

Knock-knee. See LEG.

Knossos, GNOSSOS, or CNOSSUS, an ancient city of Crete, centre of the Minoan civilisation disclosed by Sir Arthur Evans's excavations, stood near the middle of the island, on the north side, not far from Candia. The extensive and luxurious Great Palace (c. 2000 B.C.), surprisingly modern in its sanitary arrangements, may by its confusing multiplicity of rooms have given rise to the story of the Labyrinth (q.v.; and see MINOS). On its southern side Sir A. Evans discovered, in 1924, a stately entrance-portico, from which a viaduct, whose ruins were found sealed under a deposit of gypsum, conducted the main road across a brook on its way to the haven on the south coast. A supposed caravanserai with a delicate fresco stood near. There is also a smaller and later palace; and other remains illustrate the domestic and religious manners of the Neolithic and Bronze Ages. For history, art, and culture generally, see CRETE.

Knot (*Tringa canutus*), a gregarious wading bird in the same genus as dunlin, stint, and purple sandpiper, common in Britain from mid-August to May on the estuarine flats, breeding in the far north—chiefly in north Greenland and Arctic America. The winter range is almost world-wide. The young have been observed, and in a very few cases the eggs have been found. The food consists of insects and molluscs and pieces of plants. In winter the coloration is gray-and-white; in summer the adult shows a good deal of reddish-brown, chestnut, and black. The body is about 10 inches long.

Knot, the divisions of the log-line on board ship (marked by *knots*), each having the same relation to a geographical mile as twenty-eight seconds has to an hour. Hence the number of knots in the log-line which run out in twenty-eight seconds represents the number of geographical or nautical miles an hour which the ship is going at the time. The geographical mile is $\frac{1}{60}$ th of a mean degree of a meridian on the earth (see DEGREE), and is therefore $\frac{1}{60}$ th of 69·055 English statute miles; hence when a ship is going '13 knots,' it is travelling really at the rate of about 15 English miles an hour. See LOG.

Knots and Splices include all the various methods of tying, fastening, and joining ropes or cords. From 150 to 200 different kinds of knots may be enumerated, mostly used on shipboard, though almost all occupations using ropes or cordage have special kinds of knots adapted to their different requirements. While the great majority of these are purely technical, there are a few so generally useful in the everyday occurrences of life that they may be shortly described. The figures represent the various knots before they are drawn taut, the better to show the method of tying. Generally, the requirements of a useful knot may be stated to be that it should

neither 'slip' nor 'jam'—i.e. that, while it holds without danger of slipping while the strain is on it, when slackened it should be easily untied again. The simplest knot is the common one tied on the end of a thread or cord to prevent it slipping. By passing a loop instead of the end of the cord the common slip-knot (fig. 1) is formed; and a useful fixed loop is got by tying a simple knot, or the 'figure of 8 knot' (2), on the loop of a cord. One of the simplest and most useful running-knots for a

small cord is made by means of two simple knots (3). The most secure method of fastening a line to, say, a bucket is the standing bowline (4); and a running bowline is formed by passing the end *a* through the loop *b*, thus making a running-loop. Another good knot to make fast a bucket is the anchor-bend (5). Out of the score or so of methods of fastening a boat's painter the one which will be found most useful is the well-known two half-hitches (6). The timber-hitch (7) is useful for attaching a line to a spar or a stone, and the clove-hitch (8) is invaluable for many purposes. It is very simple and cannot slip.

A simple method of fastening a rope to a hook is the blackwall-hitch (9), where the strain on the main rope jams the end so tightly against the hook that it cannot slip. There are many methods for shortening a rope temporarily, one of them being the sheepshank, the simplest form of which is shown in fig. 10.

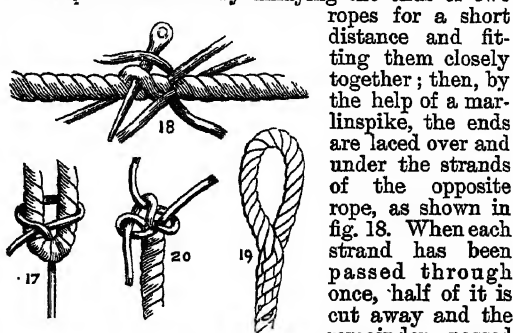

Of the methods for uniting the ends of two

cords the simplest and one of the most secure is the common reef-knot (11), which must be carefully distinguished from the 'granny' (12), which will jam if it does not slip; the reef-knot will do neither. For very small cords or thread the best knot is the weaver's (13). The fisherman's knot is a very useful one for anglers, and is formed by a simple knot in each cord being slipped over the other (14); when drawn taut it is very secure, and it is easily separated by pulling the short ends. A useful method of uniting large ropes is shown in fig. 15; tie a simple knot on the end of one rope and interlace the end of the other, and draw taut. This tie may also be made with the figure of 8

knot. For very large ropes the carrick-bend (16) is the simplest and most secure. The bowline-bend is formed by looping two bowline-knots into each other. For attaching a small line to a thick rope the becket-hitch (17) is very useful.

Splicing is the process employed to join two ropes when it is not advisable to use a knot. The three chief varieties of the splice are the short-splice, the long-splice, and the eye-splice. The short-splice is made by unlaying the ends of two

ropes for a short distance and fitting them closely together; then, by the help of a marlinspike, the ends are laced over and under the strands of the opposite rope, as shown in fig. 18. When each strand has been passed through once, half of it is cut away and the remainder passed through again; half of the remainder being also cut away, it is passed a third time, and, when all the strands are so treated, they are hauled taut and cut close. This reducing the thickness of the strands tapers off the splice. The long-splice is employed when the rope is used to run through a block, as it does not thicken it. The ends of the two ropes are unlaied for a much longer distance than for the short-splice, and similarly placed together. Then one strand is taken and further unwound for a considerable distance, and its vacant place filled up with the corresponding strand of the other rope, and the ends fastened as in the short-splice. Other two of the strands are similarly spliced in the opposite direction, and the remaining two fastened at the original joining-place. The eye-splice is, as the term implies, used to form an eye, or round a dead-eye, and is shown finished in fig. 19.

To prevent a rope fraying at the ends a variety of methods are employed, the simplest being to serve or whip the end with small cord. Other methods are by interlacing the ends, one of which, the single-wall, is shown at fig. 20, the ends afterwards being drawn taut and cut short.

The theory of knots, from the scientific point of view, was first treated of by Listing in his 'Vorstudien zur Topologie' (Göttinger Studien, 1847); and the subject is most exhaustively considered by Professor Tait (*Trans. Roy. Soc. Edin.*, 1876-77), in a paper in which the various kinds of knots are analysed according to their number of crossings, and their 'knottiness,' 'beknottedness,' and 'knotfulness' are dealt with.

See Tom Bowling, *Book of Knots* (new ed. 1890); Alston, *Seamanship* (new ed. 1902); Tom Burgess, *Knots, Ties, and Splices* (1884); Jutsum, *Knots, Bends, and Splices* (1903). For knots in Heraldry, see BADGE.

Knout, an instrument of punishment introduced into Russia under Ivan III. (1462-1505). It was a whip with a handle 9 inches long and one complex lash, comprising a lash 16 inches long, with a metal ring; a continuation with another ring; and finally, a flat lash of hard leather, 21 inches long, and ending in a beak-like hook. The offender was tied to two stakes, stripped, and received on the back the specified number of lashes; 100 to 120 were equivalent to sentence of death, but in many cases the victim died under the operation long before this number was completed. The whipping was inflicted by a criminal. For the knout Nicholas substituted the *pletî*, a three-thonged lash, and this was disused, save in certain penal settlements, by

Alexander II. Knout is the French spelling of a Russian word *knut*, by Russians and French alike pronounced *kénoot*; in English, usually but absurdly *nowt*. The German word is *knute*.

Knowles, JAMES SHERIDAN, dramatist, was born at Cork, 21st May 1784, the son of a lexicographer and teacher of elocution, who was cousin-german to Richard Brinsley Sheridan. The family removed to London in 1793, and here young Knowles became intimate with Hazlitt and Lamb. He had early shown a strong bent for an actor's life, and after serving a while in the militia, and studying medicine for a time, he made his first appearance at the Crow Street Theatre, Dublin. But he never attained much eminence in this profession, and subsequently he conducted a school for several years in Belfast and Glasgow. It was at this time he laid the foundation of his fame as a dramatist. His *Brian Boroihme* (1814) and *Caius Gracchus* (1815) were first performed at Belfast. *Virginus*, his most effective play, had been a success in Glasgow before Macready in 1820 produced it at Covent Garden. Besides *William Tell*, in which Macready achieved one of his greatest triumphs, Knowles's best plays are *Love*, *The Hunchback*, *The Love Chase*, and *The Wife*. His works attract by the strong human feeling that beats beneath their antique dress, and several of them are still among standard acting-plays. Knowles appeared with fair success in many of his own pieces; but in his later years he forsook the stage for the pulpit, became a Baptist preacher, and drew large audiences to Exeter Hall. His earnestness and enthusiasm were great, and two controversial works written to combat Roman Catholic doctrines displayed considerable acuteness. From 1849 Knowles had a civil list pension of £200 a year. He died at Torquay, 30th November 1862.

Knowltonia, a genus of South African plants, of the natural order Ranunculaceæ. *K. vesicatoria* is remarkable for its acridity and blistering power. The bruised leaves are used at the Cape of Good Hope instead of cantharides.

Know Nothings, the popular name for the Native American party which was formed in the United States shortly before 1855, gained considerable successes in that year, lost its ground hopelessly in 1856, and soon after disappeared from American politics. Its distinctive principle was that the government of America must be in the hands of Americans; naturalisation was to follow only after twenty-one years' probation, and allegiance to any foreign potentate or power—presumably including the pope—was to be a bar to selection for political office. The order was a secret one, and the popular name arose from the members professing always to 'know nothing' when questioned about it. In the state elections of 1855 the party carried most of New England, besides New York, Kentucky, and California, and gained some successes in other states. In 1856 they nominated Mr Fillmore (q.v.) for re-election to the presidency, and polled nearly 875,000 votes; but they gained the electoral votes of Maryland only, and this defeat was the death-blow of the party. Nevertheless, its radical principle, in the form of revolt against the tendency to allow political power to fall into the hands of a particular body of foreign-born citizens, occasionally reappears in American politics. In Boston, for instance, in 1889 the native-born citizens combined to snatch the city government from Irish hands; and the unsuccessful attempt to defeat the Tammany Hall nominees at New York at the same time exhibits a similar reaction at work. See Desmond, *The Know Nothing Party* (1905).

Knowsley, a village of Lancashire, 5 miles N.E. of Liverpool. One mile from the village—

between it and Prescot—is Knowsley Hall, the seat of the Earl of Derby, which contains valuable paintings by Rubens, Rembrandt, Teniers, Claude Lorraine, and other great masters.

Knox, JOHN, as the most conspicuous agent in the overthrow of the medieval church in Scotland, and in the establishment of Protestantism in its place, remains a unique figure in the national history. As in the case of so many eminent men of the 16th century, the earlier period of his life is obscure. There is uncertainty even regarding the place and date of his birth. Haddington, Gifford, and Morham have been variously assigned as his birthplace, but as all these places are within a few miles of each other, the uncertainty is not material. It is otherwise with the date of his birth, regarding which the early authorities are at variance. According to one report, he was born in 1505; according to another, as late as 1513 or 1514. On the assumption of the earlier date, Knox, after receiving the elements of his education at the Burgh School of Haddington, proceeded to the university of Glasgow, where his most distinguished teacher was John Mair or Major, also a native of Haddingtonshire. Major had won European distinction as an exponent of the scholastic philosophy in the university of Paris, and the youth of Scotland were eager to sit at his feet. Whether he acquired his interest from Major or not, the writings of Knox show that he was at home in scholastic methods of discussion, and that he had all the schoolman's faculty in handling abstract questions. At the period when Knox was born there were two conflicting ideals in higher studies. The one ideal is represented by Knox's contemporary, George Buchanan, for whom humane learning was an end in itself, while by men like Knox secular studies were regarded only as aids to religion. We may infer that at the close of his university course Knox was well read in mediæval philosophy, and knew Latin and French as written and spoken tongues.

During the years that follow his leaving the university Knox passes completely out of sight. All that is known of him during this period is that from 1540 to 1543 he acted as notary in his native town of Haddington. As in the documents that establish this fact his name appears with the addition of 'Sir,' the title of priests who were not Masters of Arts, Knox must have been in orders in the Church of Rome till as late as 1543. In 1544 we find him acting as tutor to the sons of Douglas of Longniddry and Cockburn of Ormiston—families, it is to be noted, both favourably disposed to the new opinions in religion now rapidly making their way in Scotland. Through these families he was brought into contact with George Wishart, who had lately returned from travelling in Germany and England with the burning zeal to gain his country to the Lutheran reformation. From this period the future direction of Knox's life was decided, and thenceforward with an intensity and self-devotion never surpassed he is the apostle of the cause with which his name is for ever identified—the establishment in Scotland, of what he deemed the only true conception of the primitive church as based on the teaching of Christ and the apostles. We have reason to believe that even before this date his sympathies were on the side of reform in religion; but the teaching and example of Wishart seems first to have brought to him the clear consciousness of his mission. Knox identified himself with Wishart with all the impetuosity of his character, and was in the habit, he tells us, of carrying a two-handed sword before the preacher. When Wishart was seized by the emissaries of Cardinal Beaton, Knox would willingly have attended him to the last; but Wishart, who knew the fate in store for him,

rejected the offer. 'Return to your bairns' (meaning Knox's pupils), he said, 'and God bless you. One is sufficient for one sacrifice.'

Wishart was burned at St Andrews in March 1546, and in May of the same year Cardinal Beaton was murdered. The cardinal's murderers held possession of the castle of St Andrews; and, as Knox was known to be the enemy of Beaton (though he had no share in his assassination), he was forced (1547) for his own safety to join them with his pupils. Here his zeal and theological attainments made him so conspicuous that, at the instance of the leaders of the reforming party (Sir David Lyndsay among the rest), he was formally called to the ministry, and preached with much acceptance in the castle and parish church of St Andrews. A few months later the castle surrendered to the French; and in the teeth of the express terms of capitulation, the more prominent of the besieged party were sent as prisoners on board the French galleys. For eighteen months Knox remained a captive, his first winter being spent in a galley on the Loire, the second in prison in Rouen. His constitution was not naturally robust, and his hard experience during these two years seriously impaired his health for the rest of his life. The breach of faith on the part of the French, and the ignominy to which he was subjected, were never forgotten by Knox, and must in part explain and justify his life-long conviction that no good thing could come of French policy or French religion.

In February 1549, on the express intercession of Edward VI., Knox regained his liberty. As it was still unsafe for him to return to Scotland, for the next four years, till the death of Edward VI., he made his home in England. From all that is known of him during these years it is clear that he made himself a person to be reckoned with by those at the centre of authority in the country. By his preaching at Berwick he gave such offence to the Bishop of Durham that he was removed to Newcastle, where it was supposed his influence would be less mischievous. In 1551 he was appointed one of six chaplains to Edward VI., and in 1552, at the suggestion of the Duke of Northumberland, he was offered the bishopric of Rochester. As the duke's object in suggesting the appointment was simply to check, as far as he could, what he deemed the dangerous activity of Knox, the offer was unhesitatingly rejected. Knox's importance in England is still further proved by the fact that along with five others he was consulted by Archbishop Cranmer regarding his forty-five (afterwards forty-two) articles of religion; and it has been established that largely on Knox's representation the thirty-eighth article was so couched as to commit the Church of England to the Genevan doctrine of the eucharist.

On Mary's accession Knox, like the majority of the Reformed ministers, had to seek refuge on the Continent. That he might be within call should circumstances permit his return either to Scotland or England, he took up his abode at Dieppe till the beginning of the following year (1554), when he proceeded to Geneva. In July of this year he was again in Dieppe, 'to learn the estate of England; but with Mary of Lorraine as regent in Scotland, and Mary Tudor as queen of England, he was convinced that for the present both these countries were closed against him. He accordingly accepted a call from the English congregation at Frankfurt-on-the-Main, where, however, on account of a dispute regarding the use of the Book of Common Prayer, he remained only a few months. At Geneva he found a congregation of his own way of thinking; but, eager to be an apostle in his own country, he once more returned to Dieppe (August 1555), whence he ventured into Scotland in September.

He remained in Scotland till July of the next year, residing chiefly in Edinburgh, but making preaching journeys into various parts of the country. The new doctrines were steadily spreading in Scotland, but as yet their supporters were not strong enough to present a confident front against the government. It was at his own risk, therefore, that Knox remained in the country; and at the prayer of the congregation in Geneva he returned to that town in July 1556. It was probably during this visit to Scotland that he married his first wife, Marjory Bowes, to whom he seems to have been engaged during his sojourn in Newcastle. For the next two years he remained in Geneva, ministering to his congregation, and seeing much of Calvin, whose influence on Knox regarding all the great questions of the time was afterwards to bear fruit in the ordering of affairs in Scotland. To this period, also, belong several of his minor writings, and notably his *First Blast of the Trumpet against the monstrous Regiment of Women*, the publication of which he must afterwards have regretted in the interest of the cause he had most at heart.

Meanwhile, in Scotland the ground was being prepared for the great work in store for Knox. Under Mary of Lorraine as regent, the French influence had come to be regarded as a danger to the independence of the country, and a sense of this danger threw many into the party of reform. The unworthy lives of the old clergy, and the cupidity of many of the nobles, worked in the same direction. In 1557 the advocates of reform bound themselves by what is known as the *First Covenant* to do all in their power to effect a religious revolution; and by 1558 they felt themselves strong enough to summon Knox to their aid in the work he deemed the mission of his life.

In May 1559 Knox found himself again in Scotland, which he never again left for a prolonged period. He at once became the life and soul of his party. At the moment of his arrival the Lords of the Congregation, as the Protestant nobility termed themselves, were in open revolt against the regent. By his preaching at Perth and St Andrews Knox gained these important towns to his cause, and by his labours in Edinburgh, of which he was appointed minister, he also won a strong party against the government. But the Reformers of their own resources could not hold their ground against the regent, subsidised by France with money and soldiers. Mainly, therefore, through the efforts of Knox, who all through his public career was deep in the politics of the time, the assistance of England was obtained against what was now deemed the French invasion. The help of England proved effective; and by the treaty of Leith (1560), and the death of the regent the same year, the insurgent party became masters of the country. The Estates of Parliament having met on August 1st, the ministers were ordered to draw up a Confession of Faith which should embody the new teaching; and on August 17th Protestantism was formally established as the religion of the country. Having gained thus much, the ministers, desirous of practical results from their victory, drew up the first *Book of Discipline*—a document ever memorable in the history of Scotland, and admirable in itself for its wise and liberal suggestions for the religious and educational organisation of the country. These suggestions, however, were little to the mind of the majority of the Protestant nobles, who, 'perceiving their carnal liberty and worldly commodity to be impaired thereby,' sneeringly spoke of them as 'devote imaginationis.' In the revolution that had been accomplished Knox had been the leading spirit; but he saw that the victory was as yet only half gained, and that the deadliest struggle had still to be decided.

The return of the young queen to Scotland (August 1561) revived all the old dissensions, and introduced new elements into the strife of parties. By every opinion she held on religion, on the relations of prince and subject, on the fundamental principles of life, Mary was separated as by an abyss from the party represented by Knox. If we may judge from the language which each held of the other, Knox and she failed to find one point on which genial intercourse was possible. As the minister of St Giles (then the only Reformed church in Edinburgh), Knox believed that Mary was his special charge. Her personal conduct, therefore, no less than her public policy, was made the subject of his most stringent criticism; and during the six years of her reign his attitude towards her was that of uncompromising antagonism. The celebration of mass in Holyrood Chapel in defiance of the late religious settlement first roused his wrath; and a sermon delivered by him in St Giles led to the first of those famous interviews with Mary, the record of which makes such a remarkable portion of his *History of the Reformation*. The division of ecclesiastical property, by which those in actual possession received two-thirds, the Reformed ministers one-third, was a further ground of quarrel with the new government. The delay of Mary to confirm the late religious settlement also gave rise to the gravest anxiety on the part of Knox and his brother ministers. In view of the precarious interests of the great cause, Knox spoke out with such frankness as to alienate the most powerful noble in the country, and the one whom he respected most—Lord James Stuart, afterwards the Regent Moray. The marriage of Mary with Darnley (1565) again, however, led them to common counsels, as both saw in this marriage the most serious menace against the new religion. In the subsequent revolt, headed by Moray and the other Protestant nobles, Knox nevertheless took no part, and remained at his charge in Edinburgh. But after the murder of Rizzie he deemed it wise, considering Mary's disposition towards him, to withdraw to Kyle in Ayrshire, where he appears to have written the greater part of his *History*.

The events of the next two years—the murder of Darnley, Mary's marriage with Bothwell, and her subsequent flight into England—again threw the management of affairs into the hands of the Protestant party; and under Moray as regent the acts of 1560 in favour of the Reformed religion were duly ratified by the Estates of the Realm. As in the former revolution, Knox was still the same formidable force the nobles had to reckon with; and at Stirling at the coronation of James VI. (1567), and at the opening of parliament the same year, he preached in that strain which gave his sermons the character and importance of public manifestoes. The assassination of Moray in 1570, and the consequent formation of a strong party in favour of Mary, once more endangered the cause to which he had devoted his life, and the possession of the castle of Edinburgh by the queen's supporters forced him to remove to St Andrews for safety. He had already had a stroke of apoplexy, and he was now but the wreck of his former self, but his spirit was as indomitable as ever. The description of him at this period by James Melville can never be omitted in any account of Knox. 'Being in St Andrews he was very weak. I saw him every day of his doctrine go hulle and fear, with a furring of martirakis about his neck, a staff in the one hand, and good godly Richart Ballanden, his servant, holding up the other oxter, from the abbey to the parish church; and be the said Richart and another servant lifted up to the pulpit, where he behoved to lean at his first entry; but or he had

done with his sermon, he was so active and vigorous that he was like to ding that pulpit in blads, and fly out of it.'

It was the desire of his congregation of St Giles to hear him once more before he died. Accordingly, by short stages, he made his way to Edinburgh, and on the 9th November 1572, at the induction of his successor in office, he made his last public appearance. He died the same month, and was buried in the churchyard then attached to St Giles, behind which church a small square stone in the pavement of Parliament Square, marked 'I.K., 1572,' now indicates the spot where he is supposed to lie. The saying of the Regent Morton at his grave, 'Here lyeth a man who in his life never feared the face of man' (Calderwood), was the most memorable panegyric that could have been pronounced to his memory.

Knox was twice married. His first wife, Marjory Bowes, died in 1560, leaving him two sons. By his second wife, Margaret Stewart, daughter of Lord Ochiltree, whom (little more than a girl) he married in 1564, he had three daughters. His widow and all his family survived him.

In their broader features the character of Knox and of the work he achieved cannot be misread. In himself he stands as the pre-eminent type of the religious Reformer—dominated by his one transcendent idea, indifferent or hostile to every interest of life that did not subserve its realisation. He is sometimes spoken of as a fanatic; but the term is hardly applicable to one who combined in such degree as Knox the shrewdest worldly sense with an ever-ready wit and a native humour that declares itself in his most serious moments and in his treatment of the loftiest subjects. To blame him for intolerance or harshness is but to pass judgment on his age and on the type to which he belongs. It is his unquestionable tribute that the work he accomplished was the fashioning anew of his country's destinies. The revolution he was the main instrument in effecting was not merely the substitution of one set of dogmas for another: it was the transformation of the national ideals, the quickening of the national life, the victory of principles which eventually assured to Scotland the free and natural development of the life of her people. It has to be added that by his *History of the Reformation in Scotland* Knox holds a place of his own in the history of literature. His narrative, as was to be expected, is that of one who saw only a single aspect of the events he chronicles; but the impress of the writer's individuality, stamped on every page, renders his work possibly unique in English literature.

See M'Crrie, *Life of Knox* (1811; 7th ed. 1855); *The Works of John Knox*, edited by David Laing (6 vols. 1846-64); Carlyle, *Heroes and Hero-Worship*; works by Lorimer (1875), Mrs MacCunn (1895), Taylor Innes (1896), the present writer (1895), Cowan (1905), Macmillan (1905), and A. Lang (1905).

Knoxville, a city of Tennessee, stands amid picturesque scenery on the Holston River, at the head of steamboat navigation, 165 miles E. of Nashville. It is the centre of a rich coal and iron mining district, and zinc is also found near-by. Marble is quarried in large quantities, and there are car works, cotton and woollen mills, leather works, and marble mills. Here are the state university and the agricultural college, the state school for deaf-mutes, and an industrial school for coloured pupils. Pop. (1880) 10,917; (1920) 77,818.

Knur and Spell (called by Strutt 'Northern Spell'), an old English game played with a ball, which is 'risen' from a trap and hit with a bat made for the purpose. The ball, called the 'knur,' is made of wood, a little bigger than a walnut. The

bat, called a 'tripstick,' as it is also used to spring the trap or 'spell,' consists of a piece of hard wood, 6 by 4 inches, and 1 inch thick (the pommel), attached to a supple handle from 3 to 4 feet long, which the player grasps with both hands, giving the full swing of his body with the stroke. The game consists of the cumulative distance of a given number of strokes, the player who has the greatest number of yards being the winner.

Knutsford ('Cnut's ford'), a pleasant-looking town of Cheshire, 15 miles SW. of Manchester by rail, the Cranford of Mrs Gaskell's sketches; population, 5448. Henry Thurstan Holland (1825-1914), Secretary for the Colonies in 1887-92, the elder son of Sir Henry Holland (q.v.), was created Baron Knutsford in 1888, viscount in 1895.

Knysna, a forest tract and elephant-preserve, extending from the sea to the Outeniqua Mountains, 150 miles W. of Port Elizabeth.

Koala (*Phascolarctus cinereus*), a marsupial, restricted to eastern Australia, of the family Phalangeridae, and pretty nearly resembling the Phalangers in dentition, but having the molar teeth much larger. The toes of the fore-feet are in two opposable groups, of two or three, a character

Koala (*Phascolarctus cinereus*).

not found in any other quadruped, but well adapted to grasping the branches of trees, on which the koala often hangs with its back undermost, like the sloth. There is scarcely any rudiment of a tail. The general form is not unlike that of a young bear, whence the name of 'Native Bear.' The female carries her young on her back for a long time after it is capable of leaving her pouch.

Kobe, a port of central Japan, on the west shore of the Gulf of Osaka. Hyōgō is properly on the west side, and Kobe on the east of an unimportant river. Open to foreign trade since 1868, it has made remarkable progress. It has excellent harbour accommodation, where great liners can be berthed, while extensive shipyards, and spinning-mills, sugar, steel, and other works all contribute to its importance and wealth. Pop. of united town, 600,000. In 1923, after the great earthquake had destroyed Yokohama, Kobe became for a time at any rate the chief port of export for the very valuable silk trade. It exports silk, cotton, braids, matches, &c.; and imports raw cotton, wool, iron, &c.

Koblentz. See COBLENZ.

Koch. See COCCIEUS.

Koch, KARL (1809-79), botanist, born at Weimar, studied at Würzburg and Jena, travelled in southern Russia, Armenia, Kurdistan, &c., and was professor of Botany at Jena and Berlin. His chief work is his *Dendrologie* (1869-72).

Koch, ROBERT, an eminent bacteriologist, was born at Klausthal, in the Harz, 11th December

1843, studied at Göttingen, and practised medicine at Hanover and elsewhere. His investigations in connection with wounds, septicæmia, and splenic fever gained him a seat on the imperial board of health in 1880; and his further researches in microscopy and bacteriology led to his discovery in 1882 of the *Bacillus tuberculosis*. In 1883 he was made a privy-councillor, and appointed leader of the German expedition sent to Egypt and India in quest of the cholera germ (see BACTERIA, fig. 5; also CHOLERA). In 1885 he was appointed professor at Berlin, and in 1891 director of the new institute for infectious diseases. He made valuable investigations on rinderpest in South Africa, leading to a method of prophylactic inoculation; and in 1898 he began a two years' series of investigations on malarial fever in Italy, Greece, East Africa, India, and New Guinea. For Koch's postulates, see GERM; and for his tuberculin, see TUBERCLE. He published many works on bacteriology and on bacterial diseases. He died 28th May 1910.

Kock, CHARLES PAUL DE (1794-1871), born at Passy, near Paris, produced an endless series of novels, vivacious, piquant, and readable, but hardly reaching the dignity of literature. Here may merely be named *Georgette*; *Gustave*; *Le Barbier de Paris*; *La Femme, le Mari et l'Amant*; *Mœurs Parisiennes*. The collected edition of his works fills 56 vols. (1844-45). See his *Memoirs written by Himself* (1899).—HENRI DE KOCK, his son (1821-92), followed his father as closely as he could, with a series of far weaker novels. Another work is his *Souvenirs de Napoléon III. à Wilhelmshöhe* (1871).

Kodaikanal, on the Palni Hills in Madras Presidency, is famous for its observatory.

Kodiak. See KADIAK.

Kodok. See FASHODA.

Kohat, capital of a district in the North-west Frontier Province of India, is pleasantly situated in a mountain-valley, 37 miles S. of Peshawar. It is surrounded by a wall 12 feet high, and has cantonments to the east and a fort to the north. Population of town and cantonment (1921) 27,853.

—The district has an area of 2695 sq. m., and a pop. of 214,000.

Koheleth. See ECCLESIASTES.

Koh-i-nûr. See DIAMOND.

Kohistan, a name given to certain mountainous regions in Persia, Turkestan, and India.

Kohl, the name of the cosmetic used since early times by women of the East to darken the eyelids so as to increase the lustre of the eyes. It is made from powdered antimony.

Köhler, REINHOLD, a learned student of the history of literature, was born at Weimar, 24th June 1830, studied philology at Jena, Leipzig, and Bonn, and accepted in 1857 a post in the ducal library at Weimar, of which he became the head in 1881. Besides numerous contributions to the learned journals, such as his admirable notes on J. F. Campbell's tales, in Benfey's *Orient und Occident* (vol. ii. 1864), he published works on the *Dionysiake* of Nonnus (1853), on Kleist's Works (1862), on Herder's *Cid* and its sources (1867); and edited *Alte Bergmannslieder* (1858), four dialogues of Hans Sachs (1858), *Kunst über alle Künste* (a 1672 translation of Shakespeare's *Taming of the Shrew*), Dante and the German translations (1865), Wieland's *Oberon* (1868), and Schiller's *Ästhetische Schriften* (1871). His admirable notes to Kreuzwald's *Estnische Märchen* (1869) and Laura Gonzenbach's *Sicilianische Märchen* (1870) are known to all folklorists. He died 15th August 1892.

Kohl-rabi, a cultivated variety of the Kale or Cabbage (*Brassica oleracea*), distinguished by

the swelling of the stem just above the ground, in a globular form, like that of the turnip, but with the leaf-stalks springing from the swollen part, and adding to the peculiarity of its appearance. This is the part which is used, and its uses are similar to those of the turnip.

Koko-nor, or KUKU-NOR, a lake of Tibet, near the frontier of the Chinese province of Kan-su, fills a depression surrounded by mountains, and lies about 10,000 feet above the level of the sea. Its very salt waters, exquisitely blue in colour, cover 66 miles by 40. One of its islands has a Buddhist monastery.

Kok-ra Wood, or (trade name) *COCUS WOOD*, the wood of an Indian tree, *Aporosa Roxburghii*, which belongs to the Euphorbiaceæ. The generic name indicates its quality. It is imported into Britain in logs of 6 or 8 inches in diameter, having the heart-wood of a rich deep brown colour and very hard; and is much used for making flutes and clarinets.

Kokstad. See GRIQUANALAND EAST.

Kokum Butter, or GOA BUTTER, a greenish-yellow edible fat got in India from the seeds of *Garcinia indica*.

Kola, on the peninsula of Kola, was the most northern town of European Russia, and the capital of Russian Lapland until the founding of Alexandrovsk, with its naval harbour on Kola Bay, in 1895. The peninsula of Kola is a dreary expanse of forests and lakes, but has several ranges of mountains, one of which, the Umbek Mountains, on the east side of Lake Imandra, rising to 3300 feet, is the highest in Russia west of the Urals.

Kola Nuts, or GURU NUTS, the seeds of *Cola acuminata*, a sterculiaceous tree native to Africa south of 7° 30' lat. From the 17th century traders brought home marvellous stories of these nuts; but it was in 1865 that Dr Daniell discovered that they contained an alkaloid identical with that found in tea, coffee, maté, and guarana, and from that time they have received more attention. In the Sudan they are valued so highly that no greater honour can be given than the presentation of some of the nuts. In times of drought a single

nut has bought a slave, while a bride of the highest family has often been sold for a handful. They are said to be valued chiefly as an aphrodisiac. The natives chew the nuts, extracting the juice and spitting out the fibrous matter. By means of it they profess to withstand hunger, thirst, sleep, and exhaustion. Analysis reveals only about 2 per cent. of theine, tea and coffee containing from $\frac{1}{4}$ to 3 per cent., while there is also a small amount of volatile

Cola acuminata :
a, the nut.

oil; but this does not account for all its virtues, and the explanation given is that it is used in the fresh state, and, like coca, loses its powers on drying. In Africa these seeds are only transported when carefully wrapped in leaves resembling lotus,

and are frequently moistened. As imported into Europe they undoubtedly, like tea and coffee, possess a stimulant value, but beyond that their virtues are doubtful. In Africa they possess a reputation for purifying and clarifying muddy water, but it does not appear that they are superior to other mucilaginous seeds for this purpose. In certain forms of diarrhoea they are useful, and may be taken, like tea, as a decoction. They have been recommended for dipsomania, but their utility in this respect is small. The rotten nuts and those which had become dry began to be exported in 1877 to Germany and France, for the purpose of mixing with chocolate; and various preparations—kola paste, chocolate, aerated water, &c.—have since been introduced, the value of which is doubtful. Dilute alcohol extracts most colouring and extractive matter from the seeds, and this tincture or a decoction may be used for administering them; but the best and simplest way is to chew the seed by itself, or take the powder mixed with some sweetening material.

Kolapur (*Kolhapur*), the capital of a tributary state in Bombay, 144 miles S. by E. of Poona; pop. (1921) 55,594. The state has an area of 3217 sq. m., and a pop. of 833,000.

Kolar, a town and district in Mysore, east of Bangalore, with gold-mines; pop. of old town, 13,000; of the modern town (dating from 1887) of Kolar Gold Fields, 88,000.

Kolarians. See INDIA.

Kolberg. See COLBERG.

Kolchak. See KOLTCHAK.

Kolguef, or KALGUEF, an island of Russia, in the Arctic Ocean, is visited in summer by fur-hunters, walrus-hunters, and fowlers, who take eider-ducks, swans, &c., for their down. The only permanent inhabitants are a few Samoyedes. Area, 1350 sq. m.

Kolin, or KOLLIN, a town of Bohemia, on the Elbe, 38 miles by rail E. by S. from Prague, is a centre of the sugar industry of the country, and manufactures chemicals, oil, metal wares, &c.; pop. 17,000. A great battle was fought, 18th June 1757, in its vicinity between 54,000 Austrians under Marshal Daun and 31,000 Prussians under Frederick II. The latter were defeated with a total loss of 14,000 men; the Austrians lost 8000.

Kollar, JAN, Slavonic poet and scholar, was born 29th July 1793 at Mossocz, in Slovakia (then Hungarian), studied at Presburg and Jena, and in 1819 became pastor of a Protestant congregation at Pesth. His first work was a volume of *Poems* (1821); this was followed by an enlarged edition of the same entitled *The Daughter of Glory* (1824), his greatest work. He also published a collection of Slavonic *Folk-songs* (2d ed. 1832-33), and some books on the Slavonic peoples and languages. He was made professor of Archæology at Vienna in 1849, and died there, 24th January 1852. See the Autobiography included in his *Collected Works*.

Koller, RUDOLF (1822-1905), was a celebrated Swiss animal painter.

Kölliker, ALBERT VON (1817-1905), anatomist and embryologist, was born at Zürich on 6th July 1817; studied at Zürich, Bonn, and Berlin; and was professor at Zürich and Würzburg (from 1847). He was famous for his labours in microscopic anatomy and embryology. Among his principal works must be named his *Handbuch der Gewebelehre des Menschen* (translated by Busk and Huxley as *A Manual of Human Histology*; 6th German ed. 1889-1903), *Die Siphonophora oder Schwimmpolypen von Messina*, the *Challenger Report* on Pennatulida, and the *Entwicklungsgeschichte des*

Menschen. See Weldon in *Nature*, May 1898, and Kolliker's own *Erinnerungen* (1900).

Kolmar. See COLMAR.

Köln. See COLOGNE.

Kolokotronis, THEODOROS (1770–1843), a Greek who fought with distinction against the Turks, became commander-in-chief in 1823, was condemned to death for conspiring against the regency, but pardoned by King Otho after a short imprisonment. See his autobiography (trans. 1892).

Koloman, or COLOMAN. See HUNGARY.

Kolomea, a town of Eastern Galicia, on the Pruth, 45 miles NW. of Czernowitz, with great petroleum-wells and potteries; pop. 41,000, half of them Jews.

Kolozsvár. See KLAUSENBURG.

Koltchak, VLADIMIR VASILIEVICH (1875–1920), studied at St Petersburg naval college, entered the navy, took part in Toll's Arctic expedition and led another in a vain attempt to relieve him (1903). He played a part in the defence of Port Arthur and the reorganisation of the Russian Navy. In the Great War he served as captain in the Baltic; in 1916 was made rear-admiral, vice-admiral, and commander-in-chief of the Black Sea Fleet. After the revolution an anti-Bolshevik government at Omsk gave him the style of 'Supreme Ruler,' and with foreign help (chiefly Czechoslovak, with British and French encouragement) he moved westwards, at first victoriously. About May 1919 the tide turned. Omsk fell in November. A new government set up in Irkutsk was overturned next month by local Social Revolutionaries. Koltchak resigned in favour of Denikin, and was handed over by the Czechoslovaks to the Irkutsk government, whose Bolshevik successors had him shot, 7th February 1920.

Koltzoff, ALEXEI VASSILIEVICH (1809–42), a Russian poet of the people, left but few songs, yet those among the choicest lyrics of Russian poetry.

Kolyma, a river of eastern Siberia, flowing from the Stanovoi Mountains 995 miles north-east to the Arctic Ocean. Its waters, free from ice for only eleven weeks in the year, are full of fish.

Komati, a river of south-eastern Africa, rising in the Ermelo district of the Transvaal, flows north and east until after a course of 500 miles it empties into the Indian Ocean at Delagoa Bay.

Komati Poort, a town of the Transvaal on the Komati near Portuguese East Africa, where in 1900 3000 Boers surrendered to the Portuguese. It is on the railway line from Pretoria to Lourenço Marques.

Komenski. See COMENIUS.

Komorn (Czech, *Komárno*; Magyar, *Komárom*), a town and fortress in Czechoslovakia, situated on the island of Schütt, in the Danube, 48 miles NW. of Budapest; pop. 18,000. The fortress was greatly strengthened by Matthias Corvinus.

Konakry, capital of French Guinea, stands on the west coast, 50 miles N. of the Sierra Leone frontier, and has developed from a small negro village into a considerable port, the terminus of a railway to the Niger; pop. 9000.

Kong, a plateau of West Africa (Ivory Coast). The Kong Mountains, once supposed to be a great range, are merely isolated granitic peaks a few hundred feet above the plateau.

Konia, **Konieh**, **Koniya**. See ICONIUM.

König, FRIEDRICH, the inventor of the steam-press, was born at Eisleben, 17th April 1774. He became a printer, and at the same time eagerly

prosecuted scientific studies. Having devoted himself to the invention of means of printing by machinery, he applied in vain for the necessary pecuniary assistance in various quarters; but at last Thomas Bensley, a printer in London, came forward, and a patent was obtained in 1810 for a press which printed like the hand-press by two flat plates. A second patent was obtained in 1811 for a cylinder-press, and others in 1813 and 1814 for improvements upon it. The improved machine was adopted in 1814 by the proprietors of the *Times*. In the later part of his life König was a partner in a company for making steam printing-presses at Oberzell, near Würzburg, in Bavaria. He died 17th January 1833. See PRINTING.

Königgrätz (Czech, *Hradec Králové*), a town of Bohemia, on the Elbe, 73 miles by rail E. by N. from Prague. It is the seat of a bishop, and has a Gothic cathedral. Here Ziska was buried in 1424. Population, 13,000. A signal victory was gained here by 240,000 Prussians over 220,000 Austrians on 3d July 1866. The Prussian loss was 9000 men, the Austrian 21,000, with 22,000 prisoners. The Austrians name the battle *Sadowa* from an adjoining village nearer the centre of the battlefield.

Königsberg, a town and fortress in East Prussia, situated on the river Pregel, 4½ miles from the Frisches Haff and 366 by rail NE. from Berlin. The original nucleus of the place was the blockhouse built in 1255 by the Knights of the Teutonic Order, but, although founded so long ago, Königsberg is a modern town; scarce any of its old buildings now exist. The castle, which grew out of the blockhouse, belongs chiefly to the 16th and 18th centuries. It was the headquarters of the grandmaster of the Teutonic Order, and from 1525 to 1618 was the residence of the Dukes of Prussia. In the castle chapel (built in 1592) Frederick I. crowned himself first king of Prussia in 1701. The cathedral, now the Kneiphof parish church, is a Gothic structure, erected in 1333 and thoroughly restored in 1856; in an adjoining building Kant (q.v.) lies buried. The university was founded as a Lutheran institution in 1544, and rebuilt in 1844–65. Connected with it are an observatory (1811), a zoological museum (1819), a botanical garden (1809), a library, together with the usual laboratories and collections. The academy of painting, a music school, and a commercial school may be mentioned. Of the industries the foremost place belongs to the ironworks, casting and machinery-making; next come the manufacture of pianos, thread, tobacco, beer, marchpane, &c. Printing and the preparation of amber are also prosecuted. Königsberg is one of the chief continental centres for the tea trade, and ships immense quantities of corn. The exports consist mostly of grain, timber, flax, and hemp, with smaller quantities of wool, spirits, sugar, and rags; the imports embrace, besides grain, flax, and hemp for transport, tea, woven goods, metal wares, herrings, timber, chemicals, and coals. A canal enables ships to reach Königsberg from Pillau. In 1924 three new basins were opened, one for a free haven, one for timber, and one for general commercial purposes. The need for these had become pressing by the loss of Danzig and Memel to Germany. The first German aerial harbour was created at Königsberg in 1922. Pop. (1875) 122,636; (1910) 245,853; (1919) 260,895. The town was first fortified in 1626. Königsberg was occupied by the Russians in 1758 and by the French in 1807.

Königshütte (Polish, *Królewska Huta*), a rapidly growing centre of great coal, iron, zinc,

and copper works in Upper Silesia, 110 miles SE. of Breslau by rail. It was constituted a town in 1869 out of several mining villages, and passed from Prussia to Poland in 1921. Pop. (1891) 36,502; (1921) 72,641.

Königsmark, COUNT PHILIPP CHRISTOPH VON, a Swede by birth, born about 1662, who, having entered the service of the Elector of Hanover, was accused of carrying on a love intrigue with Sophia Dorothea, wife of the Elector George, afterwards George I. of England, and suddenly disappeared on 1st July 1694. It is believed that he was murdered. Sophia was confined in the castle of Ahlden until her death in 1726. See Vizetelly, *Count Königsmark* (1890); and Wilkins, *Love of an Uncrowned Queen* (1900).—His sister, COUNTESS MARIE AURORA, born at Stade in 1670, became in 1694 the mistress of Augustus II., Elector of Saxony, and by him mother of Marshal Saxe (q.v.), and ancestress of George Sand. When Augustus tired of her she entered Quedlinburg nunnery, and died prioress, 16th February 1728. See Burg, *Die Schöne Gräfin Königsmarck* (1925).

Königstein, a fortress of Saxony, once regarded as impregnable, but now of no military importance, stands on a rock 800 feet above the Elbe, 24 miles SE. of Dresden by rail. Here the Saxon army yielded to Frederick the Great in 1756.

Königswart, a small town of Bohemia, 14 miles by rail SE. from Eger, is situated in a romantic valley, has a fine castle, chalybeate and acidulated springs, and a bathing establishment.

Konkan, the name given to the strip of coast districts in Bombay Presidency. The breadth varies from 1 to 50 miles, as the Western Ghâts approach or recede from the sea. Konkan is rather a geographical than an administrative division, and includes, besides North Kanara, the British districts of Ratnagiri, Kolaba, and Thana, Bombay Island, three Indian states, and Goa.

Konrad. See CONRAD.

Koodoo. See ANTELOPE.

Kootenay, a river of British Columbia which rises in Canada, passes through corners of Montana and Idaho, but returns to Canada again, and, after a course of 450 miles (during which it forms a lake), falls into the Columbia River. Gold is found in its basin.

Kopar, Slovenian name of Capo d'Istria (q.v.).

Kopeck, a Russian bronze coin, the hundredth part of a Rouble (q.v.).

Kopparberg. See FALUN, SWEDEN.

Koraes (CORAIS), ADAMANTIOS (1748–1853), Greek scholar and patriot, who, born at Smyrna, turned from commerce to literature, and lived and died in Paris. He edited many Greek authors, worked for Greek independence, and endeavoured (with considerable success) to cleanse the Greek language of barbarisms. He is known in France as Diamant Coray.

Koran (QUR'ĀN, Arab. *Kor'ān*, a reading; *igra*, to recite). The Koran is a recitation both for the benefit of those gaining thereby instruction in divine revelation and as an expression of worship to the one God, Allah. To Moslems it is the utterances of Allah by the mouth of his Prophet Muhammad, and is their religious, social, civil, commercial, and legal code, by which their entire life is governed. The original text, according to the Moslem creed, is written on a gigantic tablet resting by the throne of the Almighty, and by a process of 'sending down,' sometimes by angels, sometimes by Gabriel, sometimes by the Holy Spirit, and sometimes by God himself, was, during a period of twenty-one years, told to Muhammad, who afterwards

revealed it to the world. The verses of the Koran are built up into chapters called *Sūrah*s ('courses,' as of bricks in a wall), which number 114. These are again broken up for devotional purposes into—*Rukū'* (how), a section of about ten verses—*Juz'* (portion), a section for recital on each day of Ramazan—and *Mawzū'* stages, of which there are seven to enable the devout reader to complete it in a week; and each *sūrah* except the ninth begins with the words, 'In the name of Allah, the Compassionate, the Compassioner.' The *sūrah*s are very uneven, and though at their best much poetic power is displayed, they do not reach the highest levels. However, to the follower of the Prophet the excellence of the Koran's style is in fact the supreme proof of its divine inspiration. It is written in rhymed prose, a medium which is especially suited to the Arab tongue; and when it is recited by an experienced reader in the peculiar sing-song tone necessary, it is undoubtedly impressive. The *sūrah*s are each named by some word which describes that particular *sūrah* or has some connection with it, as *Sūrah* 108 (abundance), 112 (unity), 78 (news), and 88 (overshadowing). The Koran may be divided into three portions, each portion coinciding with the time at which the revelations were given forth. The first, up to A.D. 615, includes the beginning of Muhammad's teaching at Mecca; the second, up to the Hegira A.D. 622 (A.H. 1), from Mecca to Medina, includes the later revelations given at Mecca; and the third, A.D. 632, when the Prophet had become the Apostle of God and the General and Ruler of his people. The 'Traditions' (judgments and sayings uttered by Muhammad or his followers, and as such held in great esteem by Moslems) make it quite clear that each revelation was written down as it was spoken, but whether by Muhammad or not is a moot point. Indeed, it is well-nigh impossible to believe that he could have been able to remember, without the written word before him, a particular verse of a particular *sūrah*.

At the death of Muhammad, more especially when in the civil wars many who knew the Koran direct from the Prophet were being killed, the Khalif Abū Bekr entrusted Zaid ibn Thābit of Medina, who had been amanuensis to the Prophet, with the task of collecting all the *sūrah*s into one volume. Having collected the scattered *sūrah*s from flat stones, pieces of leather, the ribs of palm-leaves, and such-like materials, Zaid completed the volume and presented it to the khalif, from whom it passed to Hafsa, a widow of the Prophet and daughter of Omar. Of course the order of the *sūrah*s in this volume can only be conjectured. However, as time went on many varied forms of the Koran came into use, and to settle this question the Khalif 'Uthmān entrusted Zaid and three leading Koreshtes to make four copies, which when completed he placed in the four principal cities of the Khalifate—Medina, Damascus, Basra, and Kufa—and thereupon ordered all other copies to be burnt. Thus it happens that the variations either in the text or the order of the *sūrah*s are entirely negligible and unimportant. The *sūrah*s are not in the order in which they were revealed by Muhammad, but, roughly, the longest come first and the shortest, which were in all probability the earliest, come last. Thus what was the first revelation and command from Allah, 'Recite in the name of thy Lord, who has created all things,' is placed under *Sūrah* 96.

The first, al-fātiha, which is recognised by every Moslem as the most exalted portion of the Koran, and which he recites five times a day, is a prayer; and 113 and 114 are magical incantations for the safety of the faithful, and so stand out as different from all the other *sūrah*s.

At the head of twenty-nine sūrahs are certain letters which are ununderstandable. Moslems have through many ages endeavoured to decipher these initials, but being unable have come to the very wise conclusion that God alone knows their meaning.

The Koran contains 77,934 words and 323,621 letters, which make it slightly longer than the New Testament. The joys of Heaven (70) and the pains of Hell (78) are pictured with great and sensuous imagery; God is held forth before men as the One, the All-powerful: sins are denounced (111), and the faithful receive general moral instruction.

At the beginning of his mission Muhammad had one great aim before him—to stamp out idolatry and form all his followers, and indeed all the people of Medina, into a brotherhood who would follow the will of God (Islam). At first he was mild and ingratiating towards the Jews, who were many and powerful in Medina; but later, as he gained in power and prestige, he unfalteringly condemned any who did not follow his creed.

His doctrine as set out in the Koran is no meek-and-mild endeavour to induce unbelievers to follow the doctrines of Islam by peaceful persuasion, but a fighting creed which demands the forcible conversion of all who do not belong to the faith. There are certain vacillations in the Koran, to account for which it is admitted quite frankly that Allah had changed his mind, and revoked concessions already made, or stiffened up portions considered by the Prophet too mild when he had reached the pinnacle of power and place to which he had attained. The behaviour of Muhammad towards women is one of the blotches which have left their imprint even on the leaves of the Koran, for in it appear the so-called oracles 33 and 24, wherein he proclaimed lawful for himself things which in any other man would not have been tolerated. Many of the old stories of Jewish history contained in the Koran are set down wrongly, showing that Muhammad had made mistakes through relying on second-hand information. Nevertheless the Koran, as probably the most widely read book in the world (for it must be remembered that the devout Moslem—and most are devout—prays at least five times a day), remains a very striking work, which shadows forth a monotheistic doctrine strangely suitable to those for whom it was first developed.

Many of the ancient hand-written copies of the Koran are exquisite works of art, only comparable to the work produced by the mediæval illuminators of the sacred books of Europe. In European libraries there are fragments of great antiquity, dating probably from the 1st century A.H.

The Koran has been commented upon so often that the names of the commentators would fill many volumes. Thus the library of Tripoli, in Syria, is reported to have once contained 20,000 different commentaries. A very famous commentary is that of Umar al-Zamakshair, edited by W. N. Lees (Calcutta, 1856–59), while another is by Baidhāwī (ed. by Fleischer).

Flügel's *Korani Textus Arabicus* (Leipzig, 1858; often reprinted) is an excellent work, as are Gerok's *Christologie des Korans* and Pautz's *Mohammeds Lehre der Offenbarung*. Other works are: Sir Wm. Muir, *The Koran* (1878); W. St Clair Tisdall, *The Original Sources of the Qur'an* (1905); Leone Caetani, *Annali dell'Islam* (1907); Th. Nöldeke, *Geschichte des Qurāns* (1860; ed. 1908); D. S. Margoliouth, *The Early Development of Mohammedanism* (1914); and Muhammad Ali, *The Holy Qur'an* (1917). Of English translations and works on the subject the following may be taken as examples: G. Sale (1734; often reprinted), J. M. Rodwell (many editions), E. H. Palmer (1908), and H. U. W. Stanton, *The Teaching of the Qur'an* (1919).

Kordofan, or the White Land, an outlying province of Anglo-Egyptian Sudan (q.v.), is separ-

ated from Dar-Fūr on the W. by a strip of desert. Its area is about 130,000 sq. m., and its population about 500,000. The province is traversed by no rivers; but water is found almost everywhere at no very great depth. The surface is undulating. The chief produce of the soil is millet, the principal food of the inhabitants. Gum-trees of the finest quality grow well. Cotton (grown in large and ever-increasing quantities), gums, hides, ivory, ostrich-feathers, and gold are exported. Cattle and camels are bred in great numbers. Three-fifths of the population are settled; the rest are nomadic. The aborigines belong mainly to the Nuba stock, but use a negro tongue. There is a large element of Moslem 'Arabs,' with Egyptian and Turkish blood. The capital is EL-Obeid, with about 25,000 inhabitants, situated in the centre of the country. It was connected by rail with Khartum in 1912. In the end of the 18th century Kordofan was conquered by the ruler of Sennaar, then by the sultan of Dar-Fūr; in 1821 it was annexed by Mehemet Ali of Egypt, but was lost to the Egyptians by the Mahdī's revolt in 1883. Since 1899 it has been part of the reconstituted Anglo-Egyptian Sudan (see SUDAN).

Korea, or COREA, a territory on the east coast of Asia, lying between the Sea of Japan and the Yellow Sea, and separated by the Strait of Chōsen from the Japanese Islands. Formerly, in name at least, an independent kingdom, it was annexed by Japan in 1910, and re-styled CHŌSEN ('Morning Calm'), an ancient native name; thereafter it became an integral part of the Japanese Empire.

Physical Features.—The country consists of a peninsula fringed on its southern and western coasts by numerous picturesque islands. The peninsula, about 150 miles in width, stretches southwards for some 660 miles; its land frontier on the north, formed by the rivers Yalu and Tumen, is with Manchuria, and for some 11 miles along the last reaches of the Tumen, with the Far Eastern Region of the Russian Socialist Federal Soviet Republic. The islands, most of which are inhabited, vary from mere rocks to mountain-crowned islands of considerable size; the largest is Quelpart (q.v.); the Nan Hau group forms Port Hamilton (q.v.); and at the mouth of the Han is Kang-wa, memorable in Korean history. The total area of Korea is some 85,000 sq. m., and the whole extent of its coastline about 2000 miles. The east coast is high, monotonous, and but slightly indented. The south and west shores are deeply and manifoldly scooped, and here in consequence are the principal harbours; from these shores, especially on the west coast, mud-banks extend out to sea beyond sight. While the tide on the east coast is very slight—only 2 feet at Gensan—it increases on the south and west coast in a north direction, rising to 33 feet at Chemulpo. The rapid rise and fall of tides, and the vast area of mud left bare at low-water, cause frequent fogs, and render the partially charted Korean archipelago highly dangerous for navigation. Occupying about the same latitude as Italy, Korea is also like Italy hemmed in on the north by alpine ranges, and traversed from north to south by a branch chain, which follows in the main the east coast. Precipitous on the east, the chain throws out feelers and slopes towards the broader west side, which is accordingly the more developed region, though Kyeng-sang province on the south-east is one of the richest in Korea. Taken as a whole the country is distinctly mountainous, and there are really no plains. At the same time there are few lofty peaks. In the north, however, the much-revered Paik-to-san ('Ever White Head'), an extinct volcano with water-filled crater, attains a height of 8700 feet; it holds the headsprings of the Yalu and Tumen

ivers. Hien-fung, lying between the 40th and 41st parallels, is said to reach 8100 feet. Owing to the configuration of the country the rivers of Korea are rapid, shallow, and crooked, and often difficult or impossible of navigation. The course of the more important lies mainly towards the west; thus the Yalu (Am-nok), Tai-tong, and Han all enter the Yellow Sea. The Yalu, the longest river of the country and the Rubicon of Korean history, flows through beautiful, well-timbered mountains, has many affluents, and in the summer floods rises to full 40 feet; it is navigable to above Wi-wŏn, 175 miles from the sea. The Tai-tong is navigable to Phyong-yang, 75 miles. The Han, on which stands Seoul, is frozen in winter, but at other seasons is navigable for some 170 miles, and is a great highway of transportation. In the south-west is the Mok-po, and in the south-east the Nak-tong, both navigable for considerable distances. In the extreme north-east is the Tumen, navigable for part of its course, but frozen for five months of the year.

Climate.—The climate of Korea is colder in winter and hotter in summer than in corresponding European latitudes, but, except for the summers, which are hot and, especially in July and August, wet, is exceedingly fine for nine months and healthy the whole year through. The winters are dry, clear, and crisp, with temperatures sufficiently low in parts to freeze the rivers for several months.

Geology.—Korea is occupied mainly by crystalline schists, and from these all the higher mountain-ranges are formed; the mountains of Hwang-hai-do are, however, Mesozoic; and towards the centre of the country are lava and volcanic rocks. The schists are always strongly folded, and therein lies the mineral wealth of the peninsula. Gold, silver, copper, graphite, iron, coal, galena, crystal, talc, and chalk are found, some of these of excellent quality and in extensive deposits.

Flora.—The pine, fir, oak, maple, lime, birch, juniper, mountain-ash, walnut, Spanish chestnut, hazel, willow, hornbeam, hawthorn, plum, pear, peach, &c., are the chief indigenous trees of Korea. Rhododendrons and other flowering shrubs and creepers are abundant. Ginseng, growing wild in the Kange Mountains, though cultivated elsewhere, and tak-pul (*Hibiscus Manihot*), used in the manufacture of paper, are the only indigenous economic plants of worth.

Fauna.—The fauna is very considerable, and includes tigers, leopards, deer, boars, bears, antelopes, beavers, otters, badgers, tiger-cats, marten, sable, striped squirrels, &c.; the number of tigers, formerly a peril to man and beast, is now rapidly diminishing. Among birds are eagles, peregrines, turkey bustards, pheasants, swans, geese, teal, mallards, mandarin ducks, ibis, cranes, storks, egrets, herons, curlews, pigeons, doves, nightjars, magpies, rooks, crows, orioles, kingfishers, jays, nut-hatches, redstarts, snipe, shrikes, hawks, kites, &c.

People.—The population of Korea approaches 18,000,000, and of this number about 400,000 are Japanese, while there are over 30,000 foreigners, most of these Chinese. The north is thinly, the south and west thickly, populated. Since the Japanese occupation emigration to Manchuria has been considerable. The rural population is not scattered, and the land is essentially one of villages. The principal towns are: Seoul, the capital (named Keijo by the Japanese), Chemulpo (Jinsen), Fusan (Fusan), Gensan, Phyong-yang (Heijo), Tai-Ku (Taikyū). Towns as well as villages, both often ill-situated, are generally composed of poor one-storied, mud-plastered houses, and present for the most part a peculiarly squalid appearance. Sanitation, though marked improvement has been made by the Japanese, continues generally at a

discount, and epidemics of cholera are recurrent. Of the aboriginal inhabitants of Korea nothing is known. The modern Koreans are, however, descendants of peoples who came from the region now known as Manchuria. They are mainly Mongolic in type, though in physiognomy they are distinct from both Chinese and Japanese; some assume that there is a Caucasian element in the stock; thus though dark straight hair, dark oblique eyes, and a tinge of bronze in the skin are generally present, hair not quite black, and even blue eyes, and an almost English style of face, are met with. Physically the average Korean is robust, and in height stands midway between the smaller Japanese and the taller Chinese. In character the Koreans as a whole lack the energy and ambition of the Japanese, the thrift, industry, and strength of the Chinese, and indolence is a national weakness; among more admirable qualities are those of peaceableness, patience, degenerating on occasion into apathy, and meekness, appearing at times as mere acquiescence. In former days Korea attained a high degree of material civilisation, but decadence later set in, and to-day poverty is all but universal; at the same time beggars are rare, and absolute distress is seldom encountered. Caste in Korea is very powerful, and there is strictly no well-to-do middle class, those who are not officials being hand-workers, generally cultivators. Among the official class are the yang-bans, or hereditary nobles; formerly powerful, they have now been largely superseded by the Japanese. The top-knot, horse-hair hat, and flowing white robe (blue for officials) were, before the days of japanisation, the distinctive features of Korean dress. The Korean woman is little better than a chattel, and her position is lower than in China or Japan. Until married, a man, no matter what his age, is treated as a boy, and assigned the lowest place. Monogamy is rigidly observed, but concubinage has a recognised status: the gesang corresponds to the geisha of Japan.

Economic Conditions.—The late 19th and early 20th century witnessed a new era in the economic development of Korea, the inauguration of which is to be attributed to the work of the Japanese.

Agriculture and Fisheries.—Korea is predominantly an agricultural country. The chief crops are rice, barley, wheat, beans, and grain of all kinds, together with cotton, tobacco, and an unrivalled quality of ginseng. Apples, chestnuts, pears, and grapes are grown. The live-stock industry is considerable, cattle of good size and quality, horses and ponies, asses and mules, pigs, and goats being raised. Silkworms are reared. Under the Japanese agriculture has been greatly stimulated, while the systematic reforestation of the country has been undertaken. Whale-fishing is carried on along the coasts, and fishing generally is a developing industry. Gensan and Fusan are its centres.

Mining.—The mineral resources of Korea have been actively developed by the Japanese. Gold, anthracite, iron, and copper are the principal minerals worked.

Manufactures.—The manufactures of Korea were formerly handicraft in character, and consisted mainly of silk, crinoline, grass-cloth, and hemp-weaving, and in the production of split-bamboo blinds, hats, mats, pottery, brass bowls, and excellent paper. Under the Japanese, however, manufacture has been organised on a large scale. The ginseng, salt, and tobacco industries, all government monopolies, have been greatly developed; while ore-smelting, pulp manufacture, cotton-spinning, rice-cleaning, brewing, &c., are other industries of importance.

Commerce.—The opening in 1876 and after of Korea's chief ports to Japan, the United States, and Europe, marked the beginnings, in a modern

sense, of Korean commerce. Since then trade has tended generally to increase, more rapidly since 1910. Cotton goods and yarn, kerosene, timber, machinery, grass-cloth, coal, sugar, paper, and silk goods are the principal imports; and rice, pulse, hides, cattle, and gold are the principal exports.

Communications.—Before annexation there were no roads worthy of the name, and land transport in the interior was necessarily by porters and by pack-animals (usually bulls). Now an extensive scheme of road construction has been undertaken, and over 9000 miles completed. Certain rivers are navigable to a limited extent. The old-fashioned Korean ports have been transformed by the Japanese into models of modern embarkation points. There are over 1400 miles of railways, almost all state-owned, and all built or completed by the Japanese. The several lines radiate from Seoul.

Government.—Korea was formerly an hereditary and absolute monarchy. Its government (remodelled 1895) was based on the government of China, and was traditionally inefficient. Under the Japanese a Japanese resident-general was appointed in 1905, and in 1910, at the time of annexation, the king ceded his sovereignty, was deprived of all political power, and was accorded the title of prince, while the new office of Japanese governor-general was created.

Religion.—Buddhism entered the country from China in 371 and flourished for a thousand years, but later fell into decay, and to-day, in spite of Japanese attempts at its rehabilitation, it is altogether discredited. Confucianism is the cult of the higher classes, and ancestor-worship is universal. But the popular cult is a modification of the Shamanism of northern Asia characterised by animal-worship, sorcery, and all manner of superstitious practices. There are many Christian converts. In 1694 De Cespedes, a Portuguese Jesuit, first preached Christianity in Korea, but the beginning of its spread must be dated really from the last quarter of the 18th century, when Korean students brought with them from Peking the teachings of Jesuit missionaries. A century of repression and periodic persecution followed, but progress was continuous, especially after the arrival in 1836 of French missionaries. Permanent Protestant missions were not established till after 1883, when the coming of toleration gave new stimulus. Antagonism to the rule of Japan would appear to have been at many points the outcome of Christian teaching, and in this way a political-missionary complication has arisen.

Education.—Till 1894 education was chiefly in Chinese, and consisted mainly in a knowledge of the classics of China. Thereafter, under a department of education, a system of public schools was introduced, but instruction was backward till under the Japanese the whole system was reorganised and extended on Japanese models. There are numerous Christian mission schools, in which in 1915 religious teaching was forbidden (after 1925). The institution of technical and industrial schools represents part of the economic policy of Japan in Korea.

Language.—The language belongs to the Turanian group, and is intermediate between Mongolo-Tatar and Japanese. There is a large admixture of Chinese words. The tongue is polysyllabic and agglutinating, and is written in somewhat modified Chinese characters, though among the common people it has an alphabet of its own, known as On-mun. This alphabet of twenty-five letters (11 vowels, 14 consonants) was invented in the 15th century, and is said to be one of the most perfect in the world. Formerly despised, in the later 19th century it came into use by missionaries, and before the Japanese occupation was rapidly

obtaining a recognised standing. Since the occupation the displacement of Korean by Japanese has been aimed at, and except with Korean provincial officials Japanese is the official language. The literature of the country is mostly in Chinese, but there are also works in the vernacular.

Literature.—The literature is small and of little note considering the veneration accorded to scholarship. In Chinese are works relating to the Chinese classics, and treatises on government, history, ethics, &c. In the long-contemned vernacular there is not much of value; there is no drama, and there are no ballads, but folk-songs and folk-tales are at times of worth, and there are writings on history and morals, and translations of standard Chinese works. Part of the vernacular writing is in On-mun.

History.—A Chinese councillor Ki-tze or Kija, who may or may not be an historical personage, is represented as coming in 1122 B.C. from China with 5000 followers to found a kingdom in Korea, or Chōsen, as he was the first to call it. The land lay in savagery, but the arts and politics of China were introduced. The dynasty endured for close on a thousand years, but its history is apocryphal. The boundaries of the kingdom, the capital of which was at Phyang-yang, are uncertain; in the north they would appear to have reached far beyond the limits of the Yalu; in the south they would seem to have stretched to the Tai-tong River, the remaining southern part of the peninsula being divided into three districts, 'the three Han'—Ma-han, Ben-han, Shin-han. In 193 B.C. Ki-jun, the last of the Ki-tze dynasty, was treacherously displaced by Wiman, a fugitive from the rebel tributary Chinese state of Yen. But in 108 B.C. under his grandson the country was annexed to China, and the ancient kingdom of Chōsen disappeared. The various tribes of the three Han combined to form two nations, Silla (Shinra), in 57 B.C., and Pekche, in 16 B.C. In 37 B.C. was founded by a tribe moving southwards from Manchuria the kingdom of Korai (Kao-Kaoli), into which in 36 A.D. were absorbed the lands of the old-time Chōsen. Onwards from this date for some six hundred years the history of Korea is the history of the three kingdoms of Korai, of Pekche, and of Silla, and for over three hundred more it is that of Silla, which surviving the other two became virtually the first unifier of the peninsula; the record of the period is one of constant internal and external wars, and of material progress, under the influence of China and of Buddhism, that enabled Korea to become the civiliser of Japan. But in the later days of Silla rebellions and contests for the throne became frequent, and in 935 the rebel general Wang Kien, a descendant of the old royal house of Korai, attained to mastery in the peninsula, and for the first time in its history ruled a peacefully united country; the kingdom was named as Korai, its capital was at Songdo, and its boundaries, thenceforth unchanged, were the boundaries of the Korea of to-day. Wang Kien himself was notable both as general and as administrator, and his dynasty survived for over four hundred years. Under its first rulers Buddhism achieved its greatest power, while under its later the land was ravaged by Genghis and Kublai, and became a virtual province of China. In 1392 the Wang dynasty was overthrown by the army leader Yi Taijo, who founded a line which endured till the extinction of the kingship. Under Taijo the ancient name of Chōsen was revived, Han-yang (Seoul) was built as the new *seoul* or capital, numerous reforms were introduced, and Confucianism displaced Buddhism as the recognised religion. Thereafter for several reigns peace ruled in the main, and outstanding advance was made in

civilisation. In 1592-98, however, Korea was twice ruthlessly overrun by the Japanese regent Hideyoshi, and a set-back was received from which the country never really recovered; but the Chinese bringing aid no permanent footing was secured by Japan, though recognition was promised to certain ancient Japanese tributary rights. Hard on the Japanese irruptions came the Manchu invasions of 1627 and 1637, when once more the country was wasted and plundered, its people being obliged thenceforth to pay tribute and allegiance to their Manchu conquerors, rulers from 1644 of China. Onwards from this time, for over two hundred and thirty years, Korea wrapped herself in studied isolation both from the eastern and from the western worlds, earning the title of the Hermit Nation. It was corruptly ruled, and for over two centuries no advance was apparent in its civilisation. In 1876, after war had been narrowly averted, Japan concluded a treaty with Korea, and the first breach was made in Korean exclusiveness. Other treaties with the United States and with various countries of Europe soon followed, and within a brief space the Hermit Nation had become the pivot of Far Eastern international politics. The treaty of 1876 had been inspired by the desire of Japan, then a new-born eastern empire, to find in Korea a field for continental expansion as well as a barrier against continental aggression, and in its terms the treaty terminated, in theory at least, Korean dependence on China. Thereafter Korea was divided by reform (pro-Japanese) and conservative (pro-Chinese) parties. In the end the issue was determined by war between China and Japan, and China, utterly beaten, was obliged in the Treaty of Shimonoseki (1895) definitely to renounce her ancient Korean suzerainty. Thereupon Japan proceeded to force upon the Koreans a whole series of national and domestic reforms, but soon found herself in opposition to Russia, whose aims in the peninsula corresponded to, and conflicted with, those of Japan. Russia, suffering defeat undertook in the Treaty of Portsmouth (1905) to recognise the preponderant interest of Japan in Korea. Thenceforth unhampered Japan gradually increased her power, and in due course a protectorate was established; finally in violation of agreements she encompassed in 1910 the end of the kingship, and definitely annexing the country, incorporated it into her empire. From the outset the aim of the Japanese had been to reform and develop Korea according to western models, and in consequence of this policy the country gained greatly in material welfare. But in spite of material progress—and to a non-materialistic people the benefits of western civilisation did not necessarily make strong appeal—the rule of Japan weighed heavily on Korea; the country was administered by a people traditionally execrated; government was stratocratic, and revealed from espionage to tortures the worst features of military repression; methods of spoliation, expropriation, and forced labour were practised; nationality, as in language, dress, &c., was suppressed. In these circumstances doctrines of self-determination thrown up by the Great War necessarily found ready acceptance, and in March 1919 demand for independence broke out in passive rebellion. This was quickly quelled, but in August an imperial rescript accomplished the part demilitarisation of government and made promise of more liberal rule.

There is a *Bibliographie Coréenne* (1894, &c.) by Courant. For description, see works by Lowell (1886), Carles (1888), Cavendish (1891), Landon (1895), Bishop (1898), L. H. Underwood (1904); for history, Griffiths, *The Hermit Nation* (1882, 7th ed. 1905); A. J. Brown, *The Mastery of the Far East* (1919); works by J. Ross (1880), Hulbert (2 vols. 1905), Ladd (1908), Longford

(1911), F. A. McKenzie (1920), Cynn (1920), and Dallet, *Histoire de l'église de Corée* (2 vols. 1874); for literature, H. N. Allen, *Korean Tales* (1889); Aston, *Korean popular literature* (1890); for language, H. G. Underwood, *Introduction to the Korean Spoken Language* (1890); Gale, *Korean-English Dictionary* (1897); and a comparative grammar by Hulbert (1906).

Körner, KARL THEODOR, a patriotic German poet, was born at Dresden, 23d September 1791. He wrote some light comedies, such as *Der Grüne Domino* and *Der Nachtwächter*, and some tragedies, of which *Zriny* was the most successful. The uprising of the German nation against Napoleon inspired Körner with patriotic ardour. He joined Lützow's celebrated corps, and encouraged his comrades by fiery patriotic songs. These, published in 1814 under the title of *Leier und Schwert* (Eng. trans. *Lyre and Sword*, 1839), are regarded by the Germans with a kind of sacred admiration, and have gone through a great number of editions. The most famous of these pieces is the *Schwert-Lied*, composed in a pause of battle, and only a few hours before the author fell in a skirmish, between Schwerin and Gadebusch, on 26th August 1813.

A biography of the poet, written by his father, was translated into English, 'with selections from his poems, tales, and dramas,' by Richardson (1845). See Lives by Lehmann (1819), Erhard (1821), Bauer (1883), and Peschel and Wildenow (1898).

Korolenko, VLADIMIR GALAKTIONOVICH, Russian writer, born at Jitomir in 1853. For some years he worked at the Forestry Institute, Moscow, and in 1879 published his first novel. Almost at once he was exiled to Siberia, but on his return his book, *Makar's Dream* (1885), attracted considerable notice, which *Memoirs of a Siberian Tourist* and *The Blind Musician* only helped to accentuate. The standard of his work reaches a high level, while the purity of his language is almost unequalled in Russian literature.

Körös, NAGY ('Great Körös'), a town of Hungary, 55 miles SE. of Budapest by rail; population, 30,000.—KIS KORÖS ('Little Körös'), a small town, 70 miles by rail S. by E. of Budapest, is the birthplace of Petöfi.

Korsör, a port on the west coast of Zealand, terminus of the railway across the island from Copenhagen; pop. 9000.

Korvel. See CORVEL.

Kosciusko (KOSCIUSZKO), TADEUSZ, a Polish general and patriot, was born on 12th February 1746 in Lithuania. He chose the career of arms, and was trained in France. In 1777 an unhappy love affair drove him to the United States, where he fought for the colonists and advanced to the rank of brigadier-general. He returned to Poland in 1786. When Russia attacked his country in 1792, Kosciusko held a position at Dubienka for five days with only 4000 men against 18,000 Russians. In spite of this the pusillanimous King Stanislaus submitted to the Empress Catharine, whereupon Kosciusko resigned his command and retired to Leipzig. After the second partition of Poland he put himself at the head of the national movement in Cracow, and was appointed dictator and commander-in-chief (1794). His defeat of a greatly superior force of Russians at Racławice was followed by a rising of the Poles in Warsaw. He established a provisional government, and took the field against the Prussians, but, defeated, fell back upon Warsaw and maintained himself there valiantly, until the approach of two new Russian armies induced him to march to meet them. He was overpowered by superior numbers in the battle of Maciejowice, 10th October 1794; and, covered with wounds, he himself fell into the hands of his enemies—it is then that De Ségur falsely makes him exclaim, 'Finis Poloniae!' Two years later the

Emperor Paul restored him to liberty. He spent the remainder of his life chiefly in France, prosecuting agricultural pursuits. When Napoleon, in 1806, formed a plan for the restoration of Poland, Kosciusko refused to lend himself to the French monarch's designs. The address to the Poles, which Napoleon published in Kosciusko's name in the *Moniteur*, was a fabrication. In 1814 he besought the Emperor Alexander to grant an amnesty to the Poles in foreign countries, and to make himself constitutional king of Poland. He settled at Solothurn in Switzerland in 1816, and died on 15th October 1817, by the fall of his horse over a precipice. His remains were removed to Cracow (q.v.) by the Emperor Alexander, and were laid side by side with those of John Sobieski. See the biographies by Falkenstein (2d ed. 1834), Chodzko (1837), Choloniewski (1902), and Monica Gardner (1920).

Kosher (Heb., 'right,' from *yashar*, 'to be right'), pure, according to the Jewish ordinances. Thus 'Kosher meat' is meat killed and prepared by Jews after the Jewish manner, and so fit to be eaten by Jews.

Košice. See KASCHAU.

Köslin, a town of Prussia, 5 miles from the Baltic Sea and 85 N.E. from Stettin. There are iron-foundries and manufactures of cement, machinery, soap, &c. Pop. 28,000.

Kosovo Polje, the 'Field of Blackbirds,' a plain in Yugoslavia, west of Prishtina, on which two sanguinary battles were fought—(1) between Sultan Murad I. and the Serbs under their Tsar Lazar on 15th June 1389; both sovereigns fell, and the Serbs lost their independence in consequence of their defeat; (2) between the great Hungarian general Hunyady and Sultan Murad II., on 17th to 19th October 1448, when the former was defeated. In October 1912 the Serbs reconquered the district, which had been a Turkish vilayet.

Kossæans. See KASSITES.

Kossuth, LOUIS, the leader of the Hungarian revolution of 1849, was born in 1802 at Monok, in the county of Zemplin, in Hungary. His family was of noble rank, but his parents were poor. He studied law at the Protestant college of Sarospatak, and practised for a time. In 1832 he commenced his political career at the diet of Presburg as the deputy of absent magnates, and as editor of a journal which, owing to the state of the law, was not printed, but transcribed and circulated. The subsequent publication of a lithographed paper led, in May 1837, to Kossuth's imprisonment. He was liberated in 1840, and became the editor of the *Pesti Hírlap*, a newspaper in the modern sense of the word, in which he advocated views too extreme for many of the liberals amongst the nobles, but which took strong hold of the youth of the country. In 1847 he was sent by the county of Pesth as deputy to the diet, and soon became the leader of the opposition. He advocated the emancipation of the peasants, the abolition of all feudal rights and privileges, the freedom of the press, &c., and, after the French revolution of 1848, openly demanded an independent government for Hungary and constitutional government in the Austrian hereditary territories. To his speeches must in great part be ascribed not only the Hungarian revolution, but the insurrection in Vienna in March 1848. On the resignation of the ministry in September 1848 he found himself at the head of the Committee of National Defence, and prosecuted with extraordinary energy the measures necessary for carrying on the war. As a reply to an imperial decree, dated 4th March, abolishing the Hungarian constitution, he induced the

National Assembly at Debreczin, in April 1849, to declare that the Hapsburg dynasty had forfeited the throne. He was now appointed provisional governor of Hungary; but being disappointed in his hopes for the intervention of the Western Powers, and finding the national cause jeopardised by the interference of Russia, he endeavoured to arouse the people to a more desperate effort. The attempt was vain. Finding that the dissensions between himself and Görgei (q.v.) were damaging the national cause, he resigned his dictatorship in favour of the latter. After the defeat at Temesvar on 9th August 1849 he found himself compelled to flee into Turkey, where he was made a prisoner; but, though his extradition was demanded both by Austria and Russia, the Porte resisted their claims. In September 1851 he was liberated by the influence of England and the United States, and, the Republican government of France refusing him a passage through its territory, he sailed in an American frigate to England, where he was received with every demonstration of public respect and sympathy. In December of the same year he landed in the United States, where he met with a most enthusiastic reception. He returned in June 1852 to England, and there he chiefly resided, until Sardinia and France prepared for war with Austria; when, on condition of something definite being done for Hungarian independence, he proposed to Napoleon to arrange a Hungarian rising against Austria. He secured England's neutrality in the event of the war extending to Hungary. The peace of Villafranca bitterly disappointed Kossuth, but did not dishearten him. He made two other attempts (in 1860-61, in conjunction with Cavour and with the help of Napoleon; in 1866, with the aid of Victor Emmanuel) to bring about a rising against Austrian rule in his native country, but without final success. When in 1867 Deák effected the reconciliation of Hungary with the dynasty, and initiated a *modus vivendi* between the two parts of the Austro-Hungarian monarchy, Kossuth retired from active political life. He afterwards lived mostly in Turin, and, although never tired of denouncing the political and economical alliance between Hungary and Austria, abstained from conspiring or agitating against it; but he refused to avail himself of the general amnesty (1867), and to return to his native land to take the oath of fealty to the dynasty he had once dethroned. In 1880-82 he published *Memories of my Exile*. He died in Turin, 20th March 1894, and on 1st April was buried at Budapest. See his letters (1862 and 1872), and works on him (in German) by Horn (1851), Frey (1849), and Somogyi (1894).—His son, FRANCIS (1841-1914), became a leader of the extreme independence party in 1898.

Kostendil. See KYUSTENDIL.

Kostnitz. See CONSTANCE.

Kostroma, capital of a Russian government, stands near the junction of the Kostroma with the Volga, 216 miles by rail NNE. from Moscow, trades in timber, tar, and resin. A university was founded in 1819. Population, 57,000.—The government of Kostroma has on the west the government of Yaroslavl and on the east that of Vyatka. Area, 32,490 sq. m.; pop. 1,200,000.

Kotah, the chief town of an Indian state of the same name in Rajputana, standing on the right bank of the Chambal, is a hot, unhealthy city, with a pop. of 32,000. The area of the state is 5700 sq. m.; pop. 630,000.

Köthen, a town in the German state of Anhalt, down to 1853 capital of the duchy of Anhalt-Köthen, stands by rail 22 miles N. from Halle and 31 SSE. from Magdeburg. The castle of the former dukes

(the line became extinct in 1847) was rebuilt in 1597-1606 after a fire. In the cathedral of St James there are some antique glass windows. The industries embrace iron-foundries, sugar-factories, &c. Pop. (1875) 14,403; (1885) 17,473; (1900) 22,092; (1910) 23,417; (1919) 22,898.

Kotka, a port of Finland on an island in the Gulf of Finland, at the mouth of the Kymijoki River, has a good harbour, open 10 months in the year, timber exports, sawmilling and other industries; pop. 12,000.

Kotow, the ceremony of prostration, with striking of the forehead on the ground nine times, performed before the emperor of China. The British envoy, Lord Amherst, in 1816 refused to perform the degrading ceremony, and the point was finally conceded by the Chinese in the treaty of 1857.

Kotzebue, AUGUST FRIEDRICH FERDINAND VON, a German dramatist, was born at Weimar on 3d May 1761, filled various offices in the public service of Russia, and from an early age was a facile writer of plays, tales, satires, historical works, &c.; he was stabbed to death at Mannheim, 23d March 1819, by Sand, a Jena student, because he had ridiculed the *Burschenschaft* movement. Besides quarrelling with Goethe, Kotzebue satirised the leaders of the Romantic school. Among his dramatic performances, the chief merit of which consists in their knowledge of stage-effect, their lively dialogue, and clever but superficial character drawing, may be mentioned *Menschenhass und Reue* (known on the English stage as *The Stranger*), *Die Hussiten vor Naumburg*, *Die beiden Klingsberge*, *Der arme Poet*, *Armuth und Edelsinn*, *Die Kreuzfahrer*, *Oktavia*, &c. Kotzebue wrote no fewer than two hundred dramatic pieces, which have been collected in editions of 28 (1797-1823) and of 44 vols. (1827-29).—His son, OTTO VON KOTZEBUE, born on 30th December 1787 at Revel, accompanied Krusenstern round the world in 1803-6, and afterwards made two long voyages of exploration in the Pacific, discovering amongst others the Krusenstern Islands, Kotzebue Sound, and the Suwaroff Islands during his first voyage (1815-17); during the second expedition (1823-26) he visited the Samoa group, the Philippines, the Sandwich Islands, &c. He died at Revel on 15th February 1846. His two books, descriptive of his voyages, were both translated into English (1821 and 1830).

Koumiss is an intoxicating beverage made by the Kalmucks from fermented mares' milk; and artificial koumiss made of ass's and cow's milk has been used in cases of consumption.

Kovalevsky, ALEXANDER (1840-1901), embryologist, was born at Düna, and became professor at St Petersburg. He is known for his researches on the embryology of invertebrates which led to Haeckel's *Gastraea* theory; for his discovery of the life-history and true position of the Ascidians; and for investigations of the development of the Amphioxus, *Balanoglossus*, *Sagitta*, and *Brachiopoda*. See ASCIDIANS, EMBRYOLOGY.—His brother, Woldemar (1843-83), professor of Palæontology at Moscow, became bankrupt, and died by his own hand.—Woldemar's wife, SONJA or SOPHIE (1850-91), daughter of a Moscow artillery officer, made a brilliant name for herself throughout Europe as a mathematician, was professor of Mathematics at Stockholm, and left a brilliant series of novels, of which *Vera Barantsova* was translated in 1895. See Leffler's monograph on her (trans. 1895).

Kovno, or (*Lith.*) KAUNAS, temporary capital of Lithuania, stands near the confluence of the Vilja and the Niemen, 94 miles ENE. of Königsberg. The town, founded in the 11th century, was made

a stronghold of the Teutonic knights. Long the chief commercial town of Lithuania, it had lost nearly all its trade when it was annexed by Russia in 1795, but has long since recovered its commercial importance. For its honey, see LIME. A university was opened in 1922. Pop. 92,000, about one-half Jews.

Koweit, an Arab sultanate, at the north-west angle of the Persian Gulf, is dependent on Britain to some extent. Pearl fishing is the chief industry. Pop. 50,000. Capital, Koweit (30,000).

Kowloon, the Chinese peninsula opposite Hong-kong (q.v.), of which 2½ miles were ceded to Britain in 1861, and nearly 200 square miles more were leased for ninety-nine years from 1898.

Koyunjik. See ASSYRIA, NINEVEH.

Kozlof, a town in the Russian government of Tambov, is the meeting-place of the railways from the Caspian, the Sea of Azov, and Moscow (123 miles NW.); pop. 33,000.

Kra, or KRAO, ISTHMUS OF, the narrowest part of the Malay Peninsula (44 miles). Most of the schemes for a ship-canal propose to utilise the estuary of the Pakshan, which separates British from Siamese territory, and penetrates 17 miles inland. A ridge of land 7½ miles wide and 150 feet high is all that then separates the Pakshan from the head-waters of the Chumpon, which flows eastwards to the Gulf of Siam. A canal here would shorten the journey from Ceylon to Hong-kong by 300 miles, and that from Calcutta to Hong-kong by 540 miles. A railway across the same narrow belt of land has also been suggested. The main line from Bangkok to Singapore has already branches to both coasts farther south.

Kragujevac, a town of Serbia, 61 miles S. of Belgrade, has an arsenal, a cannon-foundry, and a small-arms factory. Till 1842 it was the residence of the Serbian princes. Pop. 16,000.

Krain. See CARNIOLA.

Krait, a very venomous Indian rock-snake (*Bungarus caeruleus*), related to the cobra. Purplish or brown with cross bars or specks, it may reach four feet in length. To the same genus belongs the larger king-snake (*B. fasciatus*), yellow with black rings.

Krajova, a town of Rumania, 154 miles by rail W. of Bucharest. In the neighbourhood are productive salt-mines and vineyards. Pop. 50,000, mostly engaged in commerce. Here the woiwode of Wallachia defeated Sultan Bajazet in 1397.

Krakatao, or KRAKATAU, a volcanic island in the Strait of Sunda, between Java and Sumatra, was in 1883 the scene of one of the most tremendous volcanic disturbances on record. From May the volcano on the island had been ejecting its contents in showers of ashes; during 26th, 27th, and 28th August the crater walls fell in, together with a part of the ocean bed, carrying with it two-thirds of the island (total area before the eruption 13 sq. m.), and creating two small islands, which subsequently disappeared. At the same time a gigantic ocean-wave inundated the adjoining coasts of Java and Sumatra, causing a loss of 36,500 lives, and the destruction of 300 villages, and then careered round the entire globe. The noise of the eruption was heard for a distance of 2000 and even 3000 miles. The occurrence likewise set up a series of concentric atmospheric waves, which travelled at least three times round the earth. The dust cast up gave rise during three years or more to sun-glows of wondrous beauty, those seen in Great Britain in November 1883 being especially grand. See *Report of the Krakatao Committee of the Royal Society* (1888); Ernst, *New Flora of Krakatao* (1908).

Krakau. See CRACOW.

Kraken, a fabulous animal, first described by the Norwegian bishop Pontoppidan in 1750, and from time to time said to have been seen in the Norwegian seas. Its back is described as about a mile and a half in circumference; it rises from the sea like an island, stretches out mast-like arms capable of dragging down the largest ships, and when it sinks again into the deep causes a whirlpool in which large vessels are involved to their destruction. It makes the waters round it thick and turbid, and thus is able to devour the shoals of fishes that swim to the place attracted by the musky scent.

Krakow. See CRACOW.

Krameria. See RHATANY.

Kranach. See CRANACH.

Kranganur. See CRANGANORE.

Krasinski, COUNT ZYGMUNT (1812-58), Polish poet, was born and died in Paris. One of his principal works is the strange poem *Nieboska Komedya* ('The Undivine Comedy') (1834). See Monica M. Gardner, *The Anonymous Poet of Poland* (1919).

Krasnodar, a new name for Ekaterinodar (q.v.).

Krasnovodsk, a railway terminus and port, on the east side of the Caspian Sea, in the Transcasian territory (Turkoman republic).

Krasnoyarsk, the chief town of the Siberian government of Yeniseisk, on the upper Yenisei and on the Siberian railway, 370 miles E. of Tomsk, is the centre of the gold-washings of the province; pop. 60,000.

Kraszewski, JOSEPH IGNACY (1812-87), historical novelist and poet, born in Warsaw, was the most prolific of all Polish authors, his works exceeding 300. His best-known novel is *Jermola the Potter* (1857). In 1884 he was imprisoned at Magdeburg for treason.

Krause, KARL CHRISTIAN FRIEDRICH, a German philosopher, born 6th May 1781 at Eisenberg, studied philosophy at Jena under Fichte and Schelling, qualified as a *privat-docent* in that university in 1802, but removed in 1805 to Dresden, where he lived till 1813. His learned work on the doctrines of Freemasonry (1810), advocating their rational reform, drew upon him the resentment of the German Freemasons. After residing for a time in Berlin, lecturing in the university, he settled in Göttingen, where he lectured on all the branches of philosophy (1823-30), and drew around him a number of enthusiastic disciples, including the philosophical jurist, H. Ahrens. He never obtained a professorship, notwithstanding his success and popularity as a *docent*, his incessant industry, and the versatility and fertility of his genius. In 1831, after an amelioration in his circumstances, he removed to Munich, where Baader befriended him, but Schelling treated him with coldness, and in the midst of further disappointments and struggles, he suddenly died there of apoplexy, 27th September 1832. Krause is deservedly ranked with Fichte, Schelling, Hegel, Herbart, and Schopenhauer, as one of the masters of the German philosophical movement inaugurated by Kant. His earlier works (1803-14) are written in an elegant and flowing style, but he limited the circulation and popularity of his later writings by the excessive purism of his German terminology, which eschewed all foreign terms and revelled in the most elaborate native compounds. This literary idiosyncrasy has made Krause for the novice the most unreadable of all philosophical writers, and even Zeller declares his German to be at times 'as unintelligible to Germans as if it were Sanskrit.' The most popular of his writings is his sketch of the Ideal of

Humanity (*Das Urbild der Menschheit*, 1812). His system of philosophy is expounded in various sketches and outlines of the philosophical sciences (Logic, 1803, 1828; Ethics, 1811; Philosophy of Right, 1803, 1828; Sketch of the System of Philosophy, 1828), and most fully and definitely in his 'Lectures on the System of Philosophy' (1828) and his 'Lectures on the Fundamental Truths of Science' (1829). After his death many of his works were edited by Leonhardi, Ahrens, Röder, Wünsche, and Hohlfeld. Krause's view of the relation of the world to God he called *Panentheism* ('all-in-God'), in contradistinction to the Pantheism of the other schools and the Dualism of the deistic tradition. Froebel, the founder of the Kindergarten system, followed Krause's doctrines. There are monographs in German by Hohlfeld (1879), Procksch (1880), and Martin (1881).

Krefeld, or CREFELD, an important manufacturing town of Germany, stands about 4 miles from the left bank of the Rhine and 12 NW. of Düsseldorf. It owes its importance to the settlement in the 17th and 18th centuries of refugees from Jülich and Berg and the neighbouring countries, compelled to leave their homes by religious persecution; they established the silk and velvet manufactures for which Krefeld is now noted. Krefeld has good railway communication, a light railway to Düsseldorf, and a harbour on the Rhine. There are large railway repair shops, iron-foundries, dye-works, and works for making machinery, as also manufactures of chemicals, soap, sugar, spirits, &c. The town possesses a technical school of weaving. Pop. (1875) 62,840; (1919) 125,201.

Kreisler, FRITZ, born 2d February 1875 in Vienna, was a precocious violinist. After studying at the Conservatoria of Vienna and Paris he took for a time to medicine and art, and became an Uhlan officer, but returned to the concert platform in 1899. He was wounded in the early part of the Great War when fighting against the Serbs, but afterwards resumed his place as the first among the violinists of his time.

Kremenchug, a town of Ukraine, on the Dnieper, 74 miles by rail SW. of Pultowa. From 1765 to 1789 it was the chief town of New Russia; it afterwards became the seat of great industrial activity, especially in wool, timber, and tobacco, and of factories for agricultural machines, leather, tobacco, candles, &c.; pop. 75,000.

Kremlin. See MOSCOW.

Kremnitz, an old town of Czechoslovakia (Hungary till 1920), lies in a deep, gloomy valley, 83 miles N. from Budapest. It is famous for its gold and silver mines, now less productive than formerly, and its mint. The inhabitants are almost entirely of German origin.

Krems, a town of Lower Austria, at the confluence of the river Krems with the Danube, 47 miles by rail W. by N. of Vienna; pop. 14,000.

Kremsier (Czech, *Kroměříž*), one of the prettiest towns of Moravia, on the March, 35 miles E. by N. of Brunn. It is the summer residence of the Archbishop of Olmütz, whose fine palace contains a picture-gallery, a numismatic collection, and a library. From 22d November 1843 to 7th March 1849 this town was the seat of the Austrian Constitutional Diet. Pop. 17,000.

Kreuzer—from the cross (*kreuz*) formerly conspicuous upon it—is a small copper coin once in use in Austria, 100 making a florin or gulden (nominal value, 2s.). Till 1876 it was current also in southern Germany as the 60th part of a gulden (see FLORIN). The kreuzer was first coined in the 13th century in Tyrol, and was originally of silver

Kreuznach, a town of Rheinland, dating from the 9th century, on the Nahe, 35 miles by rail SSE. of Coblenz. Its chief manufacture is champagne, its principal trade in wine and corn; but it is most notable for its salt springs, discovered in 1478. Their temperature ranges from about 50° to 90° F. Pop. 23,000.

Kreymborg, ALFRED, American poet, born at New York, 10th December 1883, became a book-keeper, professional chess-player, dramatist, editor, and experimenter in free verse.

Kriegsspiel ('war-game') was introduced in 1824 by Lieutenant von Reiszwitz of the Prussian army, after several years spent in perfecting the game as originally designed by his father. It aims at giving interesting representations of military manœuvres on a contoured map of sufficiently large scale to show all the features of the ground, and enable their effect for cover, command, or concealment to be duly allowed for. It was widely used at one time, but is now superseded by the 'sand game,' where a plan of a stretch of country is built up in sand in large shallow trays. Counters represent troops, and, sides being taken, all the phases of a battle are gone through.

Kriemhild. See NIBELUNGLIED.

Krilof, IVAN ANDREEVICH, the La Fontaine of Russia, was born at Moscow, 14th February 1768, the son of a penniless infantry captain. At fourteen he lost his father, next filled for some time a post in a public office at St Petersburg, but gave it up after his mother's death in 1788, to try in turn writing dramas and the joint editing and publishing of literary magazines. For some years he found shelter at the country seats of Prince Sergius Galtzin, acted till 1804 as his secretary when military governor of Livonia, and next wandered aimlessly about the towns of Russia, finding his amusement in card-playing. About the close of the year 1805 at Moscow he showed some of his fables to the poet Dmitrief, who printed them in the *Moscow Spectator*. They were at once successful, and thus Krilof, at forty, found where his strength really lay. The first collection of his fables (twenty-three in number) appeared in 1809; the second, containing twenty-one more, in 1811. He returned to St Petersburg in 1806, and soon after obtained a government appointment which in 1821 he exchanged for a congenial post in the Imperial Public Library under his friend Olenine. Beloved by all ranks of society, no less for his kindness and good-nature than for his carelessness in dress, his laziness, his excessive smoking, and a thousand amiable eccentricities, he died 21st November 1844.

Krilof was careless of fame, but could not help being a consummate artist, and the Horatian *curiosa felicitas* is one of the most characteristic marks of his versification. His shrewd humour and keen though genial satire are all his own, no less than that insight born of sympathy which has given such reality and truth to his glimpses of Russian men and manners. His slightest fables, however light and merely humorous they seem, are stamped throughout by broad humanity and intense although enlightened patriotism. Yet he is never dull or tedious, and his moral never lacks the saving grace of spontaneity. Withal he is a genuine fabulist, with rich measure of that shrewdness wrapped in simplicity, that sense of the varied individuality veiled in the dumbness of the brute-world, and that mastery of the art of compressing the essentials of a story into a few concise and straightforward lines, which mark only the greatest masters of the art.

See Russian memoirs by Pletnef and by Grot; the sketches prefixed to W. R. S. Ralston's prose translations (1868-83); and to Dr Coxwell's translation of eighty-

seven in the original metres (1920). There are good translations into French verse by Charles Parfait (1867); into German by Ferdinand Törney (1842), and an anonymous lady (1863). See also Sutherland Edwards, *The Russians at Home* (i. 1879).

Krimmitschau, a town of Saxony, 45 miles S. of Leipzig by rail, manufactures buckskin and vicuña wool, machinery, &c.; pop. 25,500.

Kris, a dagger or poniard, the universal weapon of the inhabitants of the Malay Archipelago.

Malay Kris.

It is made of many different forms, short or long, straight or crooked. The hilt and scabbard are often much ornamented. Men of all ranks wear this weapon, and those of high rank when in full-dress sometimes carry three or four. In Java women sometimes wear it.

Krishna. See VISHNU; also KISTNA.

Krk. See VEGLIA.

Krnov. See JÄGERNDORF.

Kronos. See SATURN.

Kronstadt (Rumanian, *Braşov*; Magyar, *Brassó*), an important trading and iron-manufacturing town, in the extreme south-east of Transylvania; it is 261 miles SE. of Budapest by rail, near the Carpathians, and 1850 feet above the sea. The pop. (45,000) includes Saxons, Szeklers, Magyars, Rumanians, Greeks, Armenians, and Gypsies.—For the Russian Kronstadt, see CRONSTADT.

Kroomen, or KROOBOYS (also spelt *Krumen* and *Kruboys*), a Negro people inhabiting for the most part the Pepper Coast of Guinea, West Africa. They belong to two divisions, the Grebo or Gedebo and the Kroomen proper. The Grebo are agriculturists and traders; the Kroomen are bold and skilful boatmen, and are employed for the surf-boats all along the coast of that part of Africa. Their language is closely related to the Mandingo tongue.

Kropotkin, PRINCE PETER, Russian Nihilist and geographer, was born at Moscow in 1842 of one of the noblest houses in the empire. At fifteen he entered the Corps of Pages at St Petersburg, whither, after five years' service and exploration in Siberia, he returned in 1867 to study mathematics for four years at the university, whilst acting as secretary to the Geographical Society. In 1871 he explored the glacial deposits of Finland and Sweden; in 1872, whilst on a visit to Belgium and Switzerland, he associated himself with the anarchist section of the International. Two years after his return to Russia he was arrested (March 1874), but in July 1876 escaped to England. From Switzerland he was expelled in 1881; and at Lyons he was condemned in 1883 to five years' imprisonment. Released in 1886, he settled in England. He returned to Russia after the revolution, and died on 8th February 1921. He wrote on his own experiences, on anarchism, Russia and Russian politics, on Russian literature, on the geography of Asia, and on mutual aid in evolution.

Krüdener, BARBARA JULIANA VON (1766-1824), daughter of Baron von Vietinghoff, was born at Riga. Married to Baron von Krüdener, a Livonian nobleman who was Russian ambassador

at Venice, she for years lived apart from him in Riga, St Petersburg, and Paris. In 1803 she published a novel, *Valerie*, edited by Sainte-Beuve in 1855, supposed to be partly autobiographical. Next her thoughts turned to religion. She came in contact with Jung-Stilling, and ultimately gave herself up to exaggerated religious mysticism. She appeared as the herald of a new religious era, and impressed the Emperor Alexander I. of Russia. Obligated to withdraw from France, she retired to her paternal estates near Riga. See Krug's *Conversations with Madame von Krüdener* (1818), and *Lives by Eynard* (1849), *Lacroix* (1880), *Clarence Ford* (1893), and *Mühlenbeck* (1909).

Kruger, STEPHANUS JOHANNES PAULUS, born 10th October 1825 at Colesberg, Cape Colony, with his fellow-Boers 'trekked' to Natal, the Orange Free State, and the Transvaal, and in the war against England (1881) was appointed head of the government. In 1883 he was elected president of the Transvaal Republic, and again in 1888, 1893, and 1898. On the failure of negotiations to remedy the Outlanders' grievances he, with Mr Steyn, president of the Orange Free State, on 9th October 1899 presented an ultimatum which was virtually a declaration of war. This was followed by the invasion of Natal and Cape Colony, the war (1899-1902), and the British annexation of the Transvaal and Orange Free State (see TRANSVAAL, CAPE OF GOOD HOPE). After the occupation of Pretoria by the British troops Kruger came to Europe seeking (in vain) European intervention, lived for a year in Utrecht, and died at Clarens, in Switzerland, 14th July 1904. See *Statham*, *Paul Kruger and his Times* (1898); his own *Memories* (1902); and the histories of the war.

Krummacker, FRIEDRICH WILHELM (1796-1868), chaplain to the Prussian court, wrote books on *Solomon* and *Elijah the Tishbite*, and an Autobiography (1869). His father, Fr. Adolf Krummacker (1768-1845), wrote the well-known *Parabeln*.

Krupp, ALFRED, head of the gigantic iron and steel works at Essen in Prussia, was born in humble circumstances there in 1812. He succeeded his father, who had founded a small iron forge there in 1810, and took control of the works in 1848, when he found 'three workmen and more debts than fortune.' Almost simultaneously with the introduction of the Bessemer steel process in 1857 and the use of the steam-hammer came the demands from artillerymen for larger guns, and from railway companies and shipbuilders for more durable materials of construction. Krupp established at Essen the first Bessemer steel works erected in Germany, and the first forging-hammer as well. The first steel gun manufactured at Essen (1847) was a 3-pounder muzzle-loader. Krupp showed in the International Exhibition of 1851 a 6-pounder steel gun. To Krupp undoubtedly belongs the credit of introducing steel as a material for gun construction, and of pioneering that material for many years when it was disregarded by the governments. At the Düsseldorf Exhibition of 1880 he showed a steel gun of 100 tons weight, being the first to demonstrate the possibility of producing a piece of ordnance of such enormous size. The manufacture of cast-steel axles was begun in 1852, and of tires from solid forged pieces in 1853. The subsequent history of the Essen works is an epitome of the records of the German iron and steel industry. In all matters of technical and industrial development Krupp took a leading part. He acquired mines and collieries, and every year saw additions made to his establishment at Essen (q.v.). The works cover about 2000 acres, and at the centenary in 1912 71,239 persons were employed there. Krupp was a man of much decision of character and great pene-

tration. William I. frequently visited him, and it was probably to this circumstance that the popular rumour of his partnership in the works was due. Krupp supplied artillery to almost every government in Europe. He died 14th July 1887, and sixty thousand people attended his funeral.—His son succeeded him, then that son's daughter (Bertha Krupp von Bohlen und Halbach, after whom was named the Big Bertha, the gun that shelled Paris from 70 miles' distance) and her husband. The expansion of the German navy had the effect of greatly extending the Essen works, which after the Great War were adapted to the peaceful purposes of making machinery and dredgers. See a *Life of Alfred Krupp* by Baedeker (1912).

Krusenstern, ADAM JOHANN, BARON VON, a Russian voyager, was born 8th November 1770 at Haggud in Esthonia. After serving for some time in the British navy he was commissioned by Alexander I. of Russia to command a naval expedition for exploring purposes in the North Pacific. In the course of a three years' voyage (1803-6), the first made round the world by a Russian navigator, he discovered the Orloff Islands, and explored the Marquesas and Washington groups, the west coast of Yezo, the coast of Sakhalin, and the northern Kurile Islands. But he failed in the second object for which he was sent out—the opening of Russian trade with Japan. He published an account of his voyage (3 vols. Petersburg, 1810-12), which was soon translated into the principal languages of Europe (Eng. ed. 1813); and to this he subsequently added *Contributions to the Hydrography of the Pacific Ocean* (1819), *Atlas of the Pacific Ocean*, with *Recueil des Mémoires Hydrographiques* (1824-27), and other works on the same subject. Krusenstern died on 12th August 1846 at his estate in Esthonia. See *Memoir* by Bernhardt (Eng. trans. by Sir John Ross, 1856).

Krylov. See KRILOF.

Krypton. See ARGON, ATMOSPHERE.

Kshatriya. See CASTE.

Kuala-Lumpur, a town in Selangor, capital of the Federated Malay States, about 200 miles NW. of Singapore. Picturesquely situated, it is a modern, well-laid-out town, the centre for a considerable trade in tin and rubber. Pop. about 80,000.

Kuban, a river of the Caucasus (q.v.), and a Cossack province of Russia, which in November 1918 became a republic. It co-operated at first with Koltchak and Denikin, but the Rada declared against them in July 1918. Later it became an autonomous region. It coincides approximately with the river-basin, with stretches of coast on the Black Sea and the Sea of Azov. Area, 37,000 sq. m.; pop. 3,000,000; capital, Ekaterinodar, renamed Krasnodar.

Kubelik, JAN, violinist, born 5th August 1880 near Prague; studied there with Sevcik, and achieved extraordinary popularity as a concert performer. In 1903 he married a Hungarian, and acquired Hungarian citizenship. He has made tours all over the world, and his virtuosity is considered unrivalled.

Kublai Khan (posthumously called by the Chinese SHI-TSU, or 'First Ancestor'), more properly KHUBILAI KHAN, the Grand Khan of the Mongols and emperor of China, was the grandson of Genghis Khan through his fourth son Tuli. During the reign of his brother Mangu (1251-59) Kublai assisted in completing the conquest of the northern Chinese (Kin) empire (begun by Genghis), and took possession of south-west China. On the death of Mangu, when engaged in an attack upon the present treaty-port of Chung-king in

Sz-ch'wan province, Kublai hastened to Peking by way of Hankow, and was both there and at the northern capital of Shang-tu (Xanadu) proclaimed emperor; this was in the spring of 1260. But he had a formidable rival in his own brother Arikbuka, who had meanwhile proclaimed himself at Karakoram; and after he had suppressed him, in Kaidu, son of Kashi, a descendant of Genghis Khan's third son Oghotai. Kaidu struggled against Kublai throughout the whole of his reign. Kublai, who was an able and energetic prince, adopted the Chinese mode of civilisation, greatly encouraged men of letters, made Buddhism the state religion, creating the office of Great Lama in Tibet, and manifested an enlightened care for the welfare of his Chinese subjects, who, however, only numbered 1,500,000 households at the end of 1262, distributed over ten *tu* or provinces. But he was also an ambitious sovereign and a prince who loved magnificence. He overthrew the Sung dynasty of southern China in 1276, and by 1280 the whole empire was under his uncontested rule. At different times he compelled Korea, Cochinchina (Champa), Burma (Mien), Java, and some Malabar states in India to acknowledge his supremacy. An attempt to invade Japan in 1281 ended in disaster. He established himself at Tatu ('great capital') or Khanbaligh (Cambaluc, 'city of the khan,' the modern Peking), and there founded a new dynasty—that of Yuen—the first foreign race of kings that ever ruled over south as well as north China. Including the western Mongol states of the Golden Horde on the Volga and the Ilkhans in Persia, Kublai's nominal dominions, though by no means always his effective influence, extended from the Arctic Ocean to the Strait of Malacca, and from Korea to Asia Minor and the confines of Hungary—an extent of territory the like of which had never before, and has never since, been governed by any one monarch in Asia. The splendour and pomp of his court inspired the graphic pages of Marco Polo (q.v.)—who spent some time at the residence of the Mongol emperor of China—and at a later date the imagination of Coleridge. See Yule's *Marco Polo* (1875), Henri Cordier's revised edition (1903), Henri Cordier's *Ser Marco Polo* (1920), and Howorth's *History of the Mongols* (part i. 1876).

Kuch Bihar, or COOCH BIHAR, a native state of India, in northern Bengal, near Bhotan, with an area of some 1300 sq. m., and a population of about 600,000. Much jute is grown. The capital is now called Kush Bihar.

Kuching, capital of Sarawak (q.v.).

Kudu. See ANTELOPES.

Kuenen, ABRAHAM, an eminent Dutch theologian, was born at Haarlem, 16th September 1828, studied at Leyden, and became in 1855 a professor there. He was rector of the university, 1861-62. His *Historisch-Critisch Onderzoek naar het Ontstaan en de Versameling van de Boeken des Ouden Verbonds* (3 vols. 1861-65; trans. in part by Colenso, 1865), had a great influence on Old Testament scholars both in England and Germany. The result of the critical movement which he inaugurated, although it was first suggested by Graf, was entirely to reconstruct the history of Israel, the Priestly Code and the historical portions connected with it being made the latest element in the Pentateuch. This view was developed further by Kuenen in his best-known book, *De Godsdienst van Israel tot den Ondergang van den Joodschen Staat* (1869-70; Eng. trans. 3 vols. 1873-75), and in the carefully revised and considerably fuller second edition of his *Onderzoek* (1885). Only less important are *De Profeten en de Profetie onder Israel* (1875; Eng. trans. 1877) and *National Religions and Universal Religions*, the

Hibbert Lectures for 1882. He died at Leyden, 10th December 1891. In critical insight and constructive ability he stood at the head of the Old Testament critics of his time. His firm grasp of historical method gave an unusual lucidity and force to his argument, and enabled him to bring almost for the first time the history of Israel into line with the history of other peoples of the ancient world.

Kuen-Lun, a great mountain-chain of central Asia, which forms the northern wall of the Tibetan plateau, as the Himalayas do the southern. Starting from the Pamir plateau (82° E. long.), the Kuen-Lun extends eastward as far as 94° E. long., forming an arc to the north. The entire region, which varies from 100 to 150 miles in width, is covered with snow, and in many places with gigantic glaciers. Between the chains lie narrow valleys of a very steep inclination. Storms of sand and of snow, often of both commingled, rage violently in winter. The peaks of this region measure from 18,000 to 22,000 feet in height, and the passes from 13,000 to 18,000 feet. These mountains were almost unknown until the explorations of the Russian General Prjevalski, 1876-78.

Kufic Coins are the early Mohammedan coins engraved with inscriptions in the Kufic or epigraphic Arabic character, as distinguished from the Neskhi or cursive writing (see ARABIA); but the term is often applied erroneously to Arabic coins in general. In the early years of the khalifate the gold and copper coinage of the Byzantine emperors and the silver coinage of the Sassanians were used and imitated. In the years 76 and 77 A.H. (695-96 A.D.) the Khalif 'Abd-el-Melik issued gold coins with his own image instead of that of the Byzantine emperor; but, the representation of living creatures being considered to be idolatrous, this coinage was discontinued, and a reformed gold currency, engraved solely with Kufic inscriptions, was inaugurated in 77 A.H. This was supplemented with a silver currency on similar lines. The earliest coins present chiefly religious formulas and the year of issue, to which the silver and some of the copper added the name of the mint-city. The names of the khalifs first appear on gold and silver under the 'Abbāsids; but with this addition, and sometimes the names of governors and viziers, the gold and silver currency of the Moslem empire remained practically unchanged until the 10th century, when certain local peculiarities begin to appear, and various styles are developed, which may be termed *transitional Kufic*. Examples of these are seen in the coinage of the Ghaznavids of North-west India, and still more marked in the issues of North Africa and Spain, such as those of the Fātimī khalifs. Occasional idiosyncrasies, in the introduction of Roman and Byzantine images, and even of the figures of Christ and the Virgin, are seen on the coins of the Mesopotamian dynasties of Turkoman race in the 6th century of the Hegira (12th A.D.), which also present beautiful examples of highly-decorative transitional Kufic. In the 7th century (13th A.D.) the Kufic was generally superseded by the Neskhi character throughout the coinage of the Mohammedan world, and attained its greatest perfection on the currency of the dynasts of Granada and Fez, the shahs of Persia, and the rulers of Delhi. Mongol and Sanskrit inscriptions are incorporated with Arabic in the legends of coins struck by the descendants of Genghis Khan in Persia and the Indian kings. Kufic coins are of inestimable value to the historian, for they supply him generally with the names of kings, governors, and khalifs, and those of their liege-lords, heirs-apparent, and viziers, and often a short pedigree of their ancestry, together

with the city where they struck the coins, and the year, and sometimes even the month, of issue. A complete list of Mohammedan coins is a skeleton history of the Moslem empire in all its ramifications.

Kufra, an oasis in the Libyan desert SSE. from the gulf of Sidra, in which the cities of Taj (the sacrosanct), Jof, and Buma are situated. It is the centre point from which radiates the power of the great Senussi (q.v.) confraternity. The valley is fertile, with several lakes, around which grow large plantations of date-palms. It is almost inaccessible, but was visited by Rohlf's (1879) and Mrs Forbes with Hassanein Bey (1921). See Rosita Forbes, *Secrets of the Sahara*, *Kufara* (1921).

Kugler, FRANZ, a German historian of art, was born at Stettin, 19th January 1808, studied at Berlin and Heidelberg, and in 1833 became a professor in the Academy of Art and a docent at the university of Berlin. He died 18th March 1858. His most valuable work is a *Handbuch der Geschichte der Malerei, von Konstantin d. Gr. bis auf die neuere Zeit* (2 vols. 1837). His other principal works are a *Handbuch der Kunstgeschichte* (1841-42), an unfinished *Geschichte der Baukunst* (1855-60), and a Life of Frederick the Great. He is also favourably known as a poet and dramatist.

Kuh-horn, ALPHORN, or ALPHORN, a simple musical instrument made of wood or bark with a cupped mouthpiece, formerly employed by the mountaineers of Switzerland and other countries to convey signals or alarms in war-time, but now only used by cowherds—hence the name. It is variously made from 3 feet to about 8 feet long, nearly straight, curving at the end, and widening into a bell, and has the peculiarly tender sound produced by the cupped mouthpiece in conjunction with the wooden tube. It has the open harmonics of the tube; and its melodies, which among the mountains have a charm all their own, are played on the notes C, G, C, E, G.—A similar instrument, called *Lure*, is used in Sweden, and kindred ones in the Himalayas and among the Indians in South America.

Kuilenburg. See CULENBORG.

Kuka, or KUKAWA. See BORNU.

Kukenam Falls, situated on the slopes of Mount Kukenam, on the borders of British Guiana and Venezuela, are amongst the highest in the world, having a sheer plunge of about 1500 feet.

Ku-Klux Klan, a secret organisation which, said to have been founded in 1866 at Pulaski, Tennessee, originally for purposes of amusement only, soon developed into an association of 'regulators,' and became notorious for the lawless deeds of violence performed in its name. The proceedings of the Ku-Klux Klan in the southern states are only one feature of the determined struggle to withhold from the emancipated slaves the right of voting. The negro bogey fell gradually into a minor place; and in 1916 the Ku-Klux Klan was re-born as the great engine of '100 per cent. Americanism'; the hammer of the Jews, the Catholics, and, needless to say, of any sort of radical, or member of a troublesome minority. It has spread its tentacles far beyond the confines of the south which gave it birth, and crimes of all sorts, but more especially of assault by negroes, are punished by the 'Knights of the Invisible Empire' with great severity. Certain states have, indeed, been almost swamped by this very wealthy society.

Kuldja, a town of Sin-kiang (see TURKESTAN, EASTERN), stands on one of the great highways leading from China to west Turkestan, and on the Ili. This river rises on the northern slope of the Tianshan Mountains, and flows north and north-west into Lake Balkhash, after a course of about 750

miles. Kuldja is the chief town of a fertile district that produces excellent corn, rice, cotton, tobacco, wine, and fruits, whilst its pastures support large herds of horses, camels, cattle, and sheep. The district (Kuldja or Ili) revolted against China in 1865, was occupied by Russia in 1871, but ten years later restored to the Chinese. Russia, however, retained 4357 sq. m. of the western part. The inhabitants of the district are of Turki stock. There is good coal, and silver and copper occur. The town of Kuldja has about 12,500, mostly Chinese, inhabitants. New Kuldja, 25 miles to the west, was destroyed by the rebel Dungsans in 1866; it had then 75,000 inhabitants, but has since lain in ruins.

Kulm, a village of Bohemia, 3 miles NE. of Teplitz, was the scene of a bloody conflict between the French and the allied Prussians and Russians on 29th and 30th August 1813. The French, numbering 40,000 men, were commanded by General Vandamme; the Russians, during the first day's conflict, were 15,000 strong, and were commanded by General Ostermann. During the night the latter were heavily reinforced, and on the second day Barclay de Tolly assumed the command. The result was the complete wreck of the French army, which lost in these two days little short of 20,000 men; Vandamme capitulated with 10,000 men.

Kulturkampf. See GERMANY.

Kulturkreis Theory, an account of the origins of human culture which finds its chief support in Germany. Its chief feature is the axiom that where similarities occur in mental or material culture they are due to the spread of one or more elements of a complex, not to independent invention. The founder of the school was the geographer Ratzel, with an article on the distribution of types of bow and arrow in Africa (1887); he was followed by Frobenius; but the first real popularity of the theory dates from 1904; when Ankermann and Graebner developed the theory on the basis of the African and Oceanic collections of the Berlin Museum für Völkerkunde. A central point of the theory is that a complex of material and mental culture spreads as a whole, with or without accompanying migration, from its centre of origin. At the outset the opposing view was that of Bastian, with a theory of 'Elementargedanken,' which assumed that similarities in culture were due to the similar working of the human mind at all points of the globe. Subsequently the biological term 'convergence' was pressed into service, and a theory of later adaptations leading to resemblances between independent inventions was adopted by opponents of the historical school. The English view has, with a few notable exceptions, been opposed to that of the historical school, and remained true to 'evolution,' but no systematic attempt has been made to defend this view.

There is at present no complete agreement among the historical school as to the number or even the names of the 'cultures.' Frobenius, in particular, has abandoned his former views, which distinguished in Africa (1) a Nigritic substratum, (2) Malayo-Nigritic (later West African), (3) Indo-African, and (4) Semito-Asiatic cultures. These were revised in 1904 by Ankermann, who added a Proto-Hamitic culture, and the Neo-Semitic culture introduced by the Arabs, &c. The following are the main 'Kulturkreise,' alternative names being placed in brackets: I. Urkultur (Primitive, Tasmanian); II. Boomerang; III. West Papuan (East African, Totemic); IV. East Papuan (Dual Organisation); V. Melanesian (Bow Culture) [these last two combined form the well-known West African culture already mentioned]; VI. Polynesian; VII. Sudan.

The principle of the historical school was accepted by W. H. R. Rivers, but his working out of Oceanic data (*History of Melanesian Society*, 1914) led him to very different conclusions.

The literature of the subject is exclusively in German. The principal writers are: Graebner (*Zts. f. Ethnologie*, 1905; *Anthropos*, iv., 726, &c.), Ankermann (*Z. f. E.*, 1905; *Anthropos*, 1906, &c.), W. Schmidt (*Z. f. E.*, 1913; and numerous articles in *Anthropos*, esp. 1919-20, 1911), and L. Frobenius (*Atlas Africanus*, *Das Unbekannte Afrika*, 1922). B. Struck gives a brief critical survey (*Koloniale Rundschau*, 1922, pp. 56-60) with references to literature.

Kum, next to Meshed the most sacred city of Persia, is a straggling, half-ruined, uninviting town on the commercial road between Isfahan and Teheran. Its many shrines and tombs dedicated to Mohammedan (Shiite) saints, especially the reputed tomb of Fatima, the daughter or sister of the great Imam Riza, annually attract several thousands of pilgrims. Pop. 20,000.

Kumamoto, a town on the west coast of the island of Kyushu, Japan; pop. 70,000.

Kumania. See CUMANIA.

Kumasi, or COOMASSI, capital of the Protectorate of Ashanti, Gold Coast, British West Africa. The palace and other buildings destroyed in 1874 when Kumasi was taken have not been rebuilt, but it is the centre of an area where much rubber and palm-oil are produced, and is connected with Sekondi on the coast by rail. Population estimated at 30,000, of whom only a few are Europeans.

Kumaun, a division of the United Provinces of Agra and Oudh; area, 13,722 sq. m. It lies chiefly on the south slope of the Himalayas, and its three districts (Naini Tal, Almora, Garhwal) comprise a number of summits over 20,000 feet. At their foot a great waterless forest, 10 to 15 miles in breadth, fills the country with wild jungle. Mines of iron, copper, and lead exist, but few have been worked. There are some tea-gardens. Rice and wheat are the most important crops. Fruit-growing is increasing. Almora (q.v.) and Naini Tal (q.v.) are headquarters. Pop. 1,300,000, nearly all Hindus.

Kumiss. See KOUMISS.

Kummel. See LIQUEUR.

Kumquat. See ORANGE.

Kun, BÉLA, a communist leader born in Transylvania in 1886. From journalism he became a soldier, and was taken prisoner by the Russians. In 1919 he returned to Hungary, set up a Soviet republic, which was overthrown in August, whereupon he escaped to Russia.

Kunduz, a river and state of Afghan Turkestan. See AFGHANISTAN.

Kunersdorf, a village in Prussia, 4 miles E. of Frankfurt-on-the-Oder, was the scene of one of the most remarkable battles of the Seven Years' War, fought on 12th August 1759, in which Frederick the Great with 43,000 men, after gaining a half victory, was completely defeated by the Russians and Austrians, 78,000 strong. The Prussian loss was 18,500 men, with almost all their artillery and baggage, while their opponents lost 16,000.

Kunigunde, St. daughter of Count Siegfried of Luxemburg, and wife of Duke Henry of Bavaria, who was crowned king of the Germans in 1002, and emperor in 1014. According to legend, she vindicated her chastity by walking barefoot over hot ploughshares. After her husband's death in 1024 she retired into the convent of Kaufungen, near Cassel, which she had founded, and there she died,

3d March 1030. Pope Innocent III. canonised her in 1200.

Kuopio, a town of Finland on Kallavesi Lake, founded in 1783, is the commercial and intellectual centre of the Finnish midland region, and a tourist resort; pop. 19,000.

Kupferschiefer, one of the series of strata which make up the 'Dyas' type of the Permian System (q.v.) as it is developed in Germany. The bed consists of black bituminous shale, about 2 feet thick, abundantly charged with well-preserved remains of various fish, coniferous leaves, fruits, &c. The organic remains are abundantly coated and even replaced by copper ore (hence the name of the bed), which has been extensively worked along the flanks of the Harz.

Kuprin, ALEKSANDR IVANOVICH, Russian novelist, was born in 1870. As a teller of short stories he ranks next to Tchekhoff, and has attained great popularity. His stories are vivid and arresting, and cover a wide range of subjects, humour, sentiment, and pathos, but one ever-present characteristic runs through them all—verbosity. *The Duel*, *The River of Life*, *The Slav Soul* were translated in 1916, *The Bracelet of Garnets* in 1919, and *Sasha* in 1920.

Kura, a river of the Caucasus (q.v.).

Kuram, a river rising in Afghanistan near the northern end of the western Suliman range, and flowing through British territory into the Indus near Isakhel. Its valley affords a famous pass into Afghanistan.

Kurdistan ('the Country of the Kurds'), an extensive region of Asia, including ethnographically, though not politically, most of the country within a line drawn from Sivas in Asia Minor by way of Diarbekr, Sulimanieh, Kermanshah, and Urmia (in Persia), Mount Ararat, and Erzerum, back to Sivas. Kurdistan thus comprises, besides that part of Turkey which was to become autonomous by the peace treaty of 1920, portions of Iraq, Armenia, and Persia, and contains about 50,000 sq. m., with a population estimated at more than 2½ millions, thus distributed—over 1½ millions within the old limits of the Turkish Empire, 800,000 in Persia, 100,000 in Transcaucasia, and about 5000 on the Afghan-Persian frontier (transplanted thither by Nadir Shah). The country embraces the mountain-chains that abut upon the Armenian plateau on the south, and upon the Iranian plateau on the east. Thus its surface ranges from 5000 up to 15,000 feet in altitude. Between the mountain-chains, the summits of which are generally densely wooded, lie grassy plateaus. Numerous rivers force their way through the mountains at right angles to the directions of their main axes, and go to feed the Tigris and the Euphrates; chief of these tributaries are the two Zabs, the Batman-su, and the two branches of the Euphrates. The principal products of the soil and of native industry are wool, butter, sheep, gum, gall-nuts, hides, raisins, and tobacco. The bulk of the inhabitants are Kurds (the ancient *Kardouchoi* or *Carduchi*), a race partly nomad and pastoral, and partly settled and agricultural. The Kurds, who speak a language called Kermanji, derived from an old Persian dialect, have from time immemorial stood on the same level of civilisation. They are predatory and impatient of political subjection, but the Turks have exploited these characteristics. They recognise a code of rude chivalrous honour, and are hospitable and brave. They live under chiefs of their own, but are nominally subject to Turkey and Persia. Their women are unveiled, as free as Europeans, and ride and shoot like men. Their origin is traced back to the Turanian Gutu or Kurdu, who were a powerful people in Assyrian times. After the

fall of Nineveh they gradually became merged in the Medes and were Aryanised. Kurdistan, having been ruled successively by the Persians, Macedonians, Parthians, Sassanians, and Romans, is exceedingly rich in antiquarian remains, most of which are still unexamined. The great Saladin was of Kurdish descent. In 1880 an extensive Kurdish rising against Persia took place, apparently in the hope of securing independence. The Treaty of Sévres (1920) with its scheme of autonomy was abandoned; but the Kurds in 1925 rose against the Turks. With the exception of certain peculiar and esoteric sects, and the Nestorians (q.v.), they profess Mohammedanism. They have cruelly plundered and slaughtered their Armenian neighbours. The chief towns are Bitlis, Van, Urumia, Diarbekir, and Kermanshah. The Yezidis, separatist Kurds, are not 'devil-worshippers', though they treat the fallen angel with some reverence and show traces of Zoroastrian influence.

See Millingen, *Wild Life among the Koords* (1870); Creagh, *Armenians, Koords, and Turks* (1880); *Armenia, her Christians and her Kurds*, by a special correspondent (1892); works by Houssay (1888) and Chantre (1898); Lynch's *Armenia* (1901); Earl Percy's *Highlands of Asiatic Turkey* (1901); Sir Mark Sykes's *The Caliph's Last Heritage* (1915); and for the language, Jaba (1879).

Kurfürst. See ELECTOR.

Kuria-Muria Islands, a group of five barren islands, 21 miles from the south-east coast of Arabia, ceded to England in 1854 by the Imâm of Muscat for a Red Sea telegraph station; area, 30 sq. miles.

Kuriles, a sparsely-populated group of islands, numbering over thirty in all, and extending like a chain from Kamchatka to Yezo. In 1875 Russia ceded the northerly Kuriles to Japan in exchange for the southern part of Sakhalin. The latter was restored to Japan after the war in 1905. The largest islands of the group are Iturup and Kunashiri, frequently visited by seal-hunters. With the exception of a few Japanese and Ainu families on the southern isles, the population remains only during the summer fishing season. See R. Torii, *Les Anou des Îles Kouriles* (Tokyo, 1919).

Kurisches Haff. See HAFF.

Kurland. See COURLAND.

Kuroki, COUNT (1844-1923), distinguished in the Chino-Japanese war, 1894-95, and as commander of one of the Japanese armies in Manchuria in 1904-5, was born in Satsuma. See JAPAN.

Kuropatkin, ALEXEI NIKOLAIEVICH, born in 1848, distinguished himself at the great military schools, served in the Kashgar campaign, and was chief of the staff under Skobelev in the Turkish war of 1877-78. He was commander-in-chief in Caucasia in 1897, Minister of War in 1898, and was appointed to the chief command of the army in Manchuria at the outbreak of the Japanese war in 1904. In a series of defeats he was driven gradually northward, but skilfully managed successive retreats, till the disastrous flight from Mukden in March 1905 (see JAPAN) led to his resignation of the chief command. In the Great War he commanded the Russian armies on the northern front, February to August 1916, and afterwards was governor of Turkestan till the 1917 revolution. He died 29th January 1925.

Kurrach'ee. See KARACHI.

Kursk, the chief town of the Russian government of Kursk, 312 miles by rail S. by W. of Moscow. The chief industry is tanning; but soap, tobacco, candles, and spirits are also manufactured. Kursk is celebrated for its fruits and vegetables, and has an observatory. Pop. 78,500.—The government of Kursk, in the middle of south Russia,

contains 18,000 sq. m., three-fourths fertile arable land (black earth). Pop. 2,700,000. The province is watered by numerous feeders of the Dnieper and the Don.

Kuruman, a mission-station of the London Missionary Society in Bechuanaland, about 130 miles NW. from Kimberley. It was the scene of the labours of Dr Moffat and of Livingstone.

Kushk, an Afghan tributary of the Murghab, which crosses the frontier into Russian Turkestan; gives name to an Afghan town and to the terminus of the branch railway from Merv, connecting with the Transcaspien system.

Kusi, a considerable tributary of the Ganges, rises in the Nepal Himalayas, to the north-west of Mount Everest, and flows generally south, in a rapid stream, with a great body of water, to the main river. Its length is about 325 miles, and it is navigable, although with difficulty, by boats of 10 tons, to the Nepal frontier. Its bed is constantly shifting to the westward, and its floods have turned wide tracts into sand and jungle.

Kus'koquim. See ALASKA.

Kusso. See CUSO.

Küstendil. See KYUSTENDIL.

Kustendji. See CONSTANZA.

Küstenland, a division of the Austrian empire, lost by the Great War, included Görz (Gorizia), Gradisca, Istria, and Trieste.

Küstrin, a town of Prussia and formerly fortress of the first rank, is situated in the midst of extensive marshes at the confluence of the Warthe with the Oder, 51 miles E. of Berlin by rail. It was first fortified in 1535-43, and was held by the French from 1806 to 1814. Küstrin is an important railway centre. Pop. 18,000.

Kutahia, or KUTAYA (the ancient *Cotacurum*), a town of Turkey, in Anatolia, stands 70 miles SE. of Brusa, and is connected by a branch line with the Anatolian railway; pop. 25,000.

Kutais, a town of Georgia, on the Rion, 65 miles E. of Poti, was in ancient times the capital of Colchis and of Imeritia; pop. 60,000. See TRANSCAUCASIA.

Kut el-Amara, a town of Iraq, on the Tigris. General Townshend, besieged there by the Turks in 1915-16, surrendered after 143 days.

Kuttenberg, a mining and manufacturing town of Bohemia, 185 miles NNW. of Vienna. Its silver-mines were worked in the 13th century. Pop. 16,000.

Kutusoff, MICHAEL ILARIONOVITCH, Prince of Smolensk, a Russian field-marshal, was born 16th September 1745, entered the Russian army at the age of sixteen, and in 1784 became major-general. He distinguished himself in the Turkish war, and was appointed in 1805 to the command of the first army corps against the French. In 1812, as commander-in-chief, he fought Napoleon obstinately at Borodino (q.v.), and obtained a great victory over Davout and Ney at Smolensk. He died 28th April 1813.

Kutzo-Vlachs, TZINTZARS, or AROMANI, Rumanians living in scattered areas in the Balkan peninsula, especially Macedonia, Acarnania (q.v.), parts of Albania and Yugoslavia. Probably Latinised Thracians, they are mostly nomad shepherds, and speak the Macedo-Ruman dialect. See RUMANIA.

Kuweit. See KOWEIT.

Kuyuk, son of Ogotai. See MONGOLS.

Kvaethi. See FAEROE ISLANDS.

Kvas. See RYE.

Kwang-chow, a coaling station in the Chinese province of Kwang-tung, on the peninsula which projects towards Hainan. It was secured on lease by France in 1898, extended in 1915 for 99 years.

Kwang-tung, the southern Chinese province of which Canton (q.v.) is the capital. For it and the adjoining provinces of Kwang-si and Kwei-chau, see CHINA.

Kwanza. See COANZA.

Kwilu, a river of French Equatorial Africa (French Congo), reaching the sea at Kwilu, 30 miles N. of Loango. See GABUN.

Kyanising, a method of preserving ships from Dry Rot (q.v.), by injecting into the pores of the wood a solution of corrosive sublimate, was invented by John H. Kyan (born at Dublin, 1774; died in New York, 1850).

Kyanite (Gr. *kyanos*, 'blue'), DISTHENE, or SAPPARE, a mineral composed of silicate of aluminium. It often occurs crystallised, and generally in broad prisms. It is sometimes colourless, gray, green, &c., but more frequently of a fine sky-blue slightly tinged with violet; it is transparent, and sometimes beautifully opalescent.

Kyd, THOMAS, dramatist, born in the autumn of 1558, seems to have been educated at Merchant Taylors' School, and was most likely brought up as a scrivener under his father. His bloody and bombastic tragedies of the *Titus Andronicus* order early brought him reputation. Of the two popular plays having for their hero Jeronimo, marshal of Spain, the first, dealing with the hero's earlier history, is probably not by Kyd; the second was licensed in 1592 as *The Spanish Tragedy*. The earliest extant dated copy is of 1594. The production of both may perhaps be dated between 1584 and 1589. Kyd published, in 1594, a tedious tragedy on Pompey's daughter Cornelia, translated from the French, almost certainly produced the lost original of *Hamlet* ('Ur-Hamlet'), and perhaps *Solymán and Perseda* (c. 1592), and *Arden of Faversham*, and has been credited with a greater or less share in other plays. He was perhaps a close friend of Marlowe, was associated with him in a charge of 'atheism' (Unitarianism) in 1593, and died in poverty in 1594. F. S. Boas edited him in 1901.

Kyffhäuser, a hill of Thuringia, south of the Goldene Aue. Under it Barbarossa and his knights are supposed to sleep, awaiting the time when they are to come again.

Kyle, the central district of Ayrshire (q.v.).

Kyōto, or MIAKO, for over a thousand years the capital of Japan (q.v.), is situated on a flat plain about 26 miles inland from Osaka. A high range of hills to the east separates this plain from Lake Biwa, and on these some of the finest temples connected with the city are built. The city is rectangular in form, the longer streets running north and south, parallel to the Kamo River, which flows along the base of the ridge. At the northern end

are situated, in an enclosure, the plain wooden buildings where the emperors of Japan dwelt so long in seclusion. The Honganji temples of the Monto sect of Buddhists, fine structures of their kind and the centre of the Buddhist faith in Japan, rise at the southern end of the city. The streets, though narrow, are clean and attractive, and the whole city has an air of refinement. The singing-girls of Kyōto are noted for their graceful dances. The pottery, porcelain, crapes, velvets, and brocades of Kyōto are highly esteemed; its embroideries, enamels, and inlaid bronze-work are marvels of skilful handicraft. Pop. 600,000.

Kyrenia. See CYPRUS.

Kyrie Eleison (Gr. *Kurie eleison*, 'Lord, have mercy'), a form of prayer which occurs in all the ancient Greek liturgies, and is retained in the Roman Catholic mass. It follows immediately after the introit, the priest and the server saying alternately 'Kyrie eleison' thrice, 'Christe eleison' thrice, and again 'Kyrie eleison' thrice; the triplets are understood to be addressed to the three Persons of the Trinity. The Greek words have always been left untranslated in the Latin liturgy. In their translated form they are known to Anglican churchmen as the 'lesser litany,' and occur in the order for morning and evening prayer, and also in the Litany: processional litanies in the early church began with the phrase, and sometimes included as many as a hundred repetitions. The First Prayer-book of Edward VI. (1549) retained the 'lesser litany' after the introit; but in 1552 it was embodied in the short petition that follows each of the commandments, which were then inserted in the communion office.

Kyrle, JOHN (1637-1724), philanthropist, was styled the Man of Ross by Pope, having resided for the greater part of his life in the small town of Ross, Herefordshire. He spent his time and fortune in building churches and hospitals, on an income amounting to £600 a year. Pope celebrated his praises in his third *Moral Epistle*, and Warton said that he deserved to be celebrated beyond any of the heroes of Pindar. The Kyrle Society is a modern association named after him, and was started by Misses Miranda and Octavia Hill in 1875, and founded in 1877 by Prince Leopold and others. The society seeks to bring the influences of natural and artistic beauty home to the lives of the people by means of the decoration of workmen's clubs, of hospital wards, and of dwelling-houses; by the encouragement of window-gardening; providing concerts for the people; and by securing open spaces, both in town and country, to be laid out as public gardens.

Kyushu, or KIU-SIU, is the southernmost of the greater islands which constitute Japan (q.v.).

Kyustendil, or KÜSTENDIL, a town of Bulgaria, near the Struma, 43 miles SW. of Sofia, has gold and silver mines and warm baths; pop. 15,000.

L

the twelfth letter of our alphabet, descends from the twelfth letter of the ancient Semitic alphabet. The Semitic name of the letter, *lamda* (represented by the Hebrew *lamedh*, the Syriac *lōmadh*, and the Greek adopted form *lambda* or *labda*), is believed to mean 'ox-goad',

on the ground that the Hebrew *malmadh* (from the same root *l-m-d*) has this meaning. The earliest known form is , which seems to bear no resemblance to any known Eastern kind of goad. The Phœnician forms are , , ; the square Hebrew form is . In Greek inscriptions the letter has several forms. One of these, Δ, ultimately prevailed in Greece, and is represented by the printed capital Δ; another form, Λ, was adopted unchanged by the Romans. The modern minuscule *l* descends from Roman cursive handwriting, in which the upright stroke of Λ (like that of some other letters) was prolonged above the line, and the horizontal stroke, being made to serve as a link in joined writing, was omitted when the letter was written separately.

The letter has always stood for a sound produced by the escape of breath (either with or without voice) along the sides, or one side of the tongue, the passage above the tongue being closed. This general description leaves room for considerable diversities of articulation; there is, for instance, a perceptible acoustic difference between the French and the English sound of *l*. The *l*-sound, in all its varieties, is most commonly voiced—i.e. pronounced—with vibration of the vocal chords; but in some languages it occurs unvoiced. The voiced *l*, like the voiced nasals and *r*-sounds, is intermediate between vowel and consonant; it has chiefly the consonantal function, but is capable of serving like a vowel to form a syllable.

In some languages, an altered form or a combination of the letter is used to express some variety of *l*-sound different from that denoted by the ordinary *L*. Thus in Polish the barred forms *Ł*, *ł*, represent the so-called 'thick' *l*, which to an English ear suggests a mixture of *l* and *v*. The Welsh *Ll* (which is treated as a single letter) is pronounced as a voiceless one-sided *l*, which is mistaken by Englishmen for *tl* when initial, and for *lt* when final. The so-called palatal *l*, which may be described as a mixture of *l* and *y*, is expressed in Spanish by *ll*, in Portuguese by *lh* (the digraphs being in those languages accounted as single letters), and in Italian by *gli*, *gli*. This sound formerly existed, non-initially, in French, and is still heard in some dialects; but in modern standard pronunciation a *y* sound is substituted for it. As the spelling has not been altered, the *y*-sound descended from palatal *l* is expressed in writing by *ll* (or, at the end of a word, by *l*), preceded by a written *i*, which after a vowel is silent. In many words, however, as *mille*, *ville*,

village, the *ll* preceded by *i* is pronounced as the ordinary *l*.

In English a silent *l*, which was formerly sounded, occurs in the spelling of certain monosyllables, preceded by *a*, *au*, *o*, and followed by certain consonants; e.g. in *balm*, *calf*, *salve*, *talk*, *caulk*, *harim*, *holm*, *folk*. The *l*-sound in its vocalic function is in received spelling expressed by a combination of *l* with a silent vowel-letter, as in *table*, *evil*.

The Roman name of the letter, *el* (formed like *ef*, see the article *F*), is preserved in the modern languages, but has become disyllabic in Italian (*effe*) and in Spanish (*efe*).

Laaland, a Danish island in the Baltic, at the southern entrance to the Great Belt, 36 miles long, with an area of 445 sq. m. The surface is flat, and the soil fruitful, with forests of beech and oak.

Labadie, JEAN DE (1610–74), born near Bordeaux, was successively Jesuit, Oratorian, and Jansenist; but, joining the Protestant church in 1650, was a pastor at Montauban, then at Geneva, and later in Holland, whence in 1670 he was banished as a sectary, having founded a school of mystic Labadists.

Lab'arum, the famous standard of the Roman emperor Constantine, designed to commemorate the miraculous vision of the cross in the sky, which is said to have appeared to him on his way to attack Maxentius, and to have been the moving cause of his conversion to Christianity. It was a long pike or lance, with a short transverse bar of wood attached near its extremity, so as to form something like a cross. On the point of the lance was a golden crown sparkling with gems, and in its centre the mysterious monogram of the cross and the initial letters of the name of Christ, the letters *X* and *P*—Greek for *CH* and *R*—being combined (see *CROSS*, *MONOGRAM*). From the crossbeam depended a square purple banner, and surrounded by a rich border of gold embroidery. The cross was substituted for the eagle, formerly perched on the Roman standards, and there were sometimes other emblems of the Saviour. Between the crown and the cross were heads of the emperor and his family, and sometimes a figure of Christ woven in gold.

Label. See *HERALDRY*, and *CADENCY*.

Labiata, a natural order of dicotyledons, containing almost 3000 known species, mostly natives of temperate climates. They are herbaceous, or more rarely half-shrubby, and have 4-cornered stems and opposite leaves, without stipules, abounding in receptacles of volatile oil. The flowers are often in cymes or heads, or in whorls, or sometimes solitary. A general characteristic of this order is an aromatic fragrance, which in many species is very agreeable, and makes them favourites in our gardens; but some are weeds with an unpleasant odour. Many are natives of Britain. Some are used in medicine, and others in cookery for flavouring. Mint, Marjoram, Rosemary, Lavender, Sage, Basil, Savory, Thyme, Horehound, Balm, Patchouli, Germanander, and Dead Nettle are examples of this order.

Labiche, EUGÈNE MARIE, a French dramatist, was born at Paris, 5th May 1815, studied at the Collège Bourbon, and next travelled in Italy. His first dramatic piece was the popular farce *M. de Coyllin* (1838), which was followed during the next forty years by a long series of over a hundred comedies, farces, and vaudevilles. These, despite the usual dull improbability of the plots, were all marked by rare mastery of stage technique, intimate knowledge of human nature, crisp and sparkling dialogue, and a lambent humour that is often caustic but never unkindly. He collaborated at one time or another with Gondinet, Delacour, Legouvé, Augier, and other dramatists. His *Frisette* (1846) was the original of Morton's *Boz and Coz*. Labiche was elected to the Academy in November 1880, and died 23d January 1888.

Lablache, LUIGI, operatic singer, was born in Naples on 6th December 1794; his father was a Frenchman who had fled from Paris during the horrors of the Revolution, his mother an Irish-woman. His first engagement as a singer was at the San Carlino Theatre, at Naples, in 1812. He afterwards sang with much success at Palermo (until 1820), at Milan, Rome, Turin, and Vienna. From 1830 to 1852 he sang nearly every winter at Paris, and annually made visits to London, St Petersburg, and various cities in Germany. He died on 23d January 1858. His voice, a deep bass, has hardly ever been equalled either in volume or quality; and his acting, particularly in the characters of Figaro, Bartolo, Don Pasquale, Leporello, &c., was almost as remarkable.

Labouchere, HENRY (1831-1912), nephew of the first Baron Taunton, educated at Eton, was first a diplomat, then financier, M.P. (in 1880-1906 for Northampton), and founder and editor of *Truth*. A somewhat irresponsible Radical, he was a witty, trenchant, and candid critic of men and things, an indefatigable exposé of abuses and impostures. See *Life* by Thorold (1913).

Laboulaye, ÉDOUARD RENÉ DE, a distinguished French jurist, was born in Paris 18th January 1811, became an advocate, and in 1849 was appointed professor of Comparative Jurisprudence in the Collège de France. He wrote on French law, produced an *Histoire Politique des États-Unis*, edited a historical review, and attained some distinction as an essayist and story-writer; some of his tales, including the humorous *Paris en Amérique*, have been translated into English. He took up a consistently moderate position in politics, and in consequence gained the enmity of extremists on both sides. He was elected to the National Assembly in 1871, and in 1876 became a life senator. He died 25th May 1883.

Labour, in Political Economy, may be defined as effort for the satisfying of human needs. It is one of the three leading factors in production, the other two being land (or natural objects) and capital; and it is more fundamental than capital, which originally is the result of labour. In the vast circle of industry labour has a great variety of functions, which may be thus classified: (1) Producing of raw materials, as in mining and agriculture; (2) manufacturing in the widest sense of the word, or transformation of raw materials into objects serviceable to man; (3) distribution, or transference of useful objects from one place to another, as determined by human needs; (4) personal services rendered by physicians, teachers, &c.

A distinction insisted on by many economists is that into productive and unproductive labour. The former consists of those kinds of exertion which produce utilities embodied in natural objects. Unproductive labour, like that of the musician, while both useful and honourable, does not add to

the material wealth of the community. Though it has the appearance of undervaluing some of the highest services that can be rendered to the community, the distinction has a general validity. Labour directly employed in rendering natural objects serviceable to man may in the language of political economy be distinctively called productive. But in order to obviate a too narrow and abstract view of the subject it is hardly necessary to point out that the labour of the physician or teacher may be indirectly most productive, inasmuch as it increases the efficiency of the workman by promoting his health and intelligence. And apart from the special services rendered by great teachers and artists, which cannot be measured in material wealth, they raise the general level of production, and even of material civilisation, by inspiring men with finer tastes and higher needs. For the wants to which productive labour ministers vary at different stages of social development, and grow more refined as the human race advances.

The social and legal forms in which labour has appeared have also varied with the progress of civilisation. In early stages the labour of the chase, fishing, &c. was performed by the men, while the drudgery devolved on the women and slaves. Ancient civilisation was based almost entirely on compulsory labour. The pyramids and other great works of Egypt and Babylonia were possible only because governments could command forced labour on a colossal scale. The more highly developed societies of Greece and Rome rested on the same basis.

The mediæval organisation of society, where definitely constituted, rested on serfdom—i.e. the mass of the workers were attached to the soil, and rendered fixed services in labour, in kind, and latterly in money. While the condition of serfdom greatly varied, there can be no doubt that its tendency was to depress the free and raise the servile cultivators to something like a common level. The free workers of the towns organised themselves in Guilds (q.v.). In the course of the 14th century serfdom began to pass away in England. Its disappearance was followed by enactments for the regulation of labour in the interest of the ruling classes. The *Statute of Labourers* (1349), fixing the rate of wages which had increased owing to the Black Death, was superseded by a statute of Elizabeth which was not repealed till 1814.

The effect of the industrial revolution of the 18th century was to organise labour in large factories and similar undertakings; and in the 19th growing ideas of freedom had made other great changes in the condition of the workers. The right of combination received in 1824 was utilised in the formation of trade-unions and co-operative societies, and the admission of the working-men to the franchise has given them a share in the political life of the country. Laws for the regulation of labour are now intended to protect the weaker class of workers (see *FACTORY ACTS*). Another great result of social evolution has been the more or less conscious constituting of the labouring class as a separate class, with interests at variance with those of the possessors of land and capital.

Modern labour legislation has dealt with Arbitration and Conciliation, Compensation, and the Liability of Employers, and includes the Eight Hours Act of 1908, the Old Age Pensions Act (1908), and National Insurance, established in 1911-12, the establishment in 1909 of labour exchanges in the chief towns and districts of Britain, to bring workmen seeking work and employers seeking workmen into communication. The progress of the great trade-union movement is dealt with in a separate article. The upheaval that began with the outbreak of war in 1914 has placed

labour questions in a new light. Not only have revolutionary experiments on a large scale been performed or conceived, but the League of Nations in its Covenant has affirmed the urgency of improvement of conditions, and has made some attempt at international organisation for that purpose. It suggests regulation of hours, of labour supply, prevention of unemployment, a living wage, protection against sickness and injury, protection of children, of young persons, and of women, provision for old age and injury, protection of workers' interests when employed in foreign countries, freedom of association, and vocational and technical education.

For further information, see the articles on SOCIALISM, LEAGUE OF NATIONS, MASTER AND SERVANT, CO-OPERATION, DIVISION OF LABOUR, POLITICAL ECONOMY, TRUCK SYSTEM, VALUE; Thorold Rogers, *Six Centuries of Work and Wages*; Archdeacon Cunningham's works on industrial history; Gilman, *Industrial Peace* (1904); L. T. Hobhouse, *Labour Movement*; and for the history of the English labourer, works by Hasbach, F. E. Green, and J. L. and B. Hammond.—For labour in another sense, see OBSTETRICS, PREGNANCY. For 'hard labour,' see PRISONS.

Labour Day is a legal holiday in some parts of the United States, as in New York (the first Monday in September). Banks and government offices are closed, and the labour organisations parade the streets and hold meetings. For labour demonstrations the 1st of May is preferred in Europe.

Labourdonnais, BERTRAND FRANÇOIS MAHÉ DE (1699–1753), a famous French naval officer, born at St Malo, was in 1723 captain in the naval service of the French Indies. Next year he distinguished himself so greatly at the capture of Mahé on the Calabar coast that he was permitted to add its name to his own. In 1734 he was appointed governor of the islands of Mauritius and Bourbon. From 1740 to 1745 in command of a squadron in East Indian waters, he inflicted great loss upon England. In September 1746 he compelled Madras to capitulate, but failed to push his success in consideration of a contribution of nine million livres. Accused by Dupleix of betraying the interests of the company, he returned to Paris in 1748, where he languished three years in the Bastille, but was set free and declared guiltless in 1752. Like most Frenchmen he wrote *Mémoires* (1750), but his name best survives from its mention in *Paul et Virginie*. A monument was erected in 1859 at Port Louis, Mauritius. See Life by Pierre Crepin (1923). His grandson, Bertrand François Mahé de Labourdonnais (1795–1840), was a famous chess-player, and wrote a Life of his grandfather (1827).

Labour Party. See SOCIALISM; also HARDIE (J. KEIR), &c.

Labrador is the north-eastern peninsula of the North American continent, lying between Hudson Bay and the Gulf of St Lawrence. The coasts were probably visited by the Norsemen about the year 1000; they were again sighted by Cabot in 1498. In 1500 a Portuguese navigator, Cortereal, seems to have visited it. Labrador extends from 49° to 63° N. lat., and from 55° to about 79° W. long. The greatest length from the Strait of Belle Isle to its northern cape, Wolstenholme, is 1100 miles; its area, 500,000 sq. m., or about six times the area of Great Britain. The Atlantic coast is stern and precipitous (1000 to 4000 feet high), entirely destitute of vegetation, deeply indented with narrow fjords, and fringed with chains of rocky islands. The inner parts of Labrador have been but very imperfectly explored; the greater part consists of a plateau, some 2000 feet above sea-level, and mostly covered with fine forest trees, firs, birches, &c. Numerous lakes, including Mistassini (q.v.), also exist inland, and,

connecting with the rivers, afford in summer continuous waterways for great distances. The only inhabitants of this interior plateau are Cree Indians, nomads. There are numerous rivers, 200 to 300 miles long and 2 and 3 miles wide at their mouths, flowing towards the Atlantic and Hudson Bay. The Grand Falls, on Grand or Hamilton River, are 316 feet in perpendicular height, but from 4 miles above, to the sea, there is a magnificent, almost continuous fall of 2000 feet. These rivers abound in fish, especially salmon and white-fish. The principal fur-bearing animals are bears, wolves, foxes, martens, otters, beavers, lynxes, &c. Of the mineral resources little is known; but iron and Labradorite (q.v.) are certainly abundant, and apparently coal. The climate on the coast is very rigorous, owing mainly to the ice-laden Arctic current which washes the shores. The short three-months' summer is marred by the swarms of mosquitoes and black flies. The mean annual temperature at the missionary stations varies from 22° to 28° F. The winter is dry, bracing, and frosty. The part draining to the St Lawrence belongs to Quebec; that draining to the Atlantic belongs (since 1809) to Newfoundland; the rest, the former territory of Ungava, was added in 1912 to Quebec. The Canadian-Newfoundland boundary question was referred to the Judicial Committee of the Privy Council in 1920. The great wealth of Labrador is its fish, especially cod; but its 16,000 square miles of fishing-ground are far from being fully utilised. The spruce forests are suitable for pulp; and water-power is abundant. There are some 4000 permanent settlers in the coast region.

See A. S. Packard, *The Labrador Coast* (1892); Hind, *Explorations of the Labrador Peninsula* (1863); Gosling, *Labrador, its Discovery, Exploration, and Development* (1910); and *Labrador, the Country and the People* (revised, 1922), an encyclopædic work by Dr Grenfell and others. For Labrador Tea see LÉDUM.

Labradorite is one of the group of the Felspars (q.v.), and a very important rock-forming mineral. Thus, it is a principal ingredient in many diorites, basalts, gabbros, and andesites. It is met with also in certain volcanic tuffs (Étna). As a rule it is colourless or gray, and seldom transparent. Here and there it occurs in large masses associated with gabbroitic rocks, as on the coast of Labrador. This massive kind (Labrador stone) often shows a beautiful play of rich colours, takes a fine polish, and is cut into snuff-boxes.

Labridæ. See WRASSE.

La Bruyère, JEAN DE, was born at Paris in 1645. He belonged to a middle-class family, and was educated by the Oratorians, the rivals of the Jesuits. After leaving the Oratory he was chosen to aid Bossuet in educating the dauphin, and in 1673 was appointed treasurer of France for the city of Caen, a post which he resigned through disgust at the rapacity of his fellow-officials. He became tutor to the Duc de Bourbon, the grandson of the Great Condé, and spent much of his time at Paris and Chantilly with the Condés, from whom he received a pension until the date of his death. His *Caractères* appeared in 1688, ran through eight editions in seven years, and gained for its author a host of implacable enemies as well as an immense reputation. The book consisted of two parts, the one being a translation of Theophrastus, the other a collection of maxims, reflections, and character-portraits of the men and women of the time. To these portraits has been mainly due the wide and lasting popularity of the *Caractères*. La Bruyère, his editor Walckenaer has truly said, 'made mirrors on which by some magic property the reflected faces of a whole generation of men and women have become indelibly impressed.' Bitterly assailed

for his personal satires, La Bruyère found a powerful protectress in the Duchesse de Bourbon, a daughter of Louis XIV., who is said, with what truth cannot be determined, to have aided him in the composition of the later sketches which he embodied in his work. His enemies, headed by Fontenelle and Thomas Corneille, were twice able to secure his rejection when he tried for a chair in the Academy. In 1693, however, he was elected, his success being greatly due to the energetic efforts made on his behalf by his patroness, who is said to have resorted to a stratagem by which certain Academicians were prevented from voting against him. La Bruyère—who never married—died on May 11, 1696, his death being caused by a decoction of tobacco administered to him by the king's physician with the view of relieving him from an attack of apoplexy. Reports that he had been poisoned by his enemies were at one time current, but have since been thoroughly disproved. His *Dialogues sur le Quétisme* were issued in 1699. They were directed against Fénelon, and show none of the literary power so conspicuous in the *Caractères*.

Though he cannot rank with Montaigne or Pascal, La Bruyère is a moralist of high standing and a writer of the highest excellence. Sainte-Beuve affirmed that his book should be at the hand of every author, and that to read parts of it daily would be no less helpful to every critic than the study of the *Imitatio* to every one of a tender and devotional spirit. In his style the clearness, precision, and classic elegance of the Louis XIV. men are united with a pithiness, a freshness of phrase, and a richness of colour suggestive of the prose of a later epoch. Like most workers in apothegm and epigram, he falls at times into triteness and exaggeration; but he has singularly few dull pages. His book is built on no regular plan, and to this its peculiar charm is in no small measure due. The writer perpetually varies his subject and his manner. You have here a pregnant maxim, a clear-cut epigram, a piquant anecdote, an old truth reset with novel felicity of phrase—here a page of acute literary criticism—here a bit of dialogue as crisp and bright as the talk in a sparkling comedy—here a character-sketch, racy with ironic malice, and humour, and wit—there a passage glowing with a sombre repressed indignation which proves how deeply the author resented his countrymen's wrongs. A great writer rather than a great thinker, his insight into character is shrewd rather than profound. It has been truly remarked by Suard that, while Montaigne has painted man as he is in all times and in all places, La Bruyère has only painted the courtier, lawyer, financier, and *bourgeois* of the days of Louis XIV.

Editions are by Servois, in 'Les Grands Écrivains' series (1864-82), Asselineau (1872), Chassang (1876), Rébelliau (1893). See books on him by Fournier (1866), Pellissier (1905), Morillot (1904), and Lange (1909); and translations in Miss Lee's *La Bruyère and Vauvenargues* (1903).

Labuan, an island 30 sq. m. in area, lying 6 miles from the north-west coast of Borneo. Besides possessing a good harbour (Victoria), it has an extensive bed of excellent coal, which has been worked, though not with commercial success. Labuan is an active market for the products of the neighbouring islands (Borneo and the Sulu Archipelago)—sago, edible birds'-nests, camphor, gutta-percha, india-rubber, rattans, pearls, tortoiseshell, and beeswax. Sago-flour is manufactured. The island, British from 1846 onwards, was in 1905 made a deputy-governorship under the Straits Settlements, in 1907 attached to Singapore, and in 1912 made a separate settlement. Pop. 6000, mostly Malays and Chinese.

Laburnum (*Laburnum vulgare*), a small tree, a native of the Alps and other mountains of the south of Europe, much planted in shrubberies and pleasure-grounds in Britain on account of its somewhat glossy foliage and its large pendulous racemes of yellow flowers, which are produced in great abundance in May and June. It is often mixed with lilac, and when the latter preponderates the combination has a fine effect. In favourable circumstances laburnum sometimes attains a height of twenty or even forty feet. It is very hardy, and nowhere flourishes better than in the north of Scotland. It is of rapid growth, yet its wood is hard, fine-grained, and very heavy, of a dark-brown or dark-green colour, and used for some varieties of inlaying. The leaves, bark, and particularly the seeds, are nauseous and poisonous, containing *Cytisine*, an emetic, purgative, and narcotic principle. Accidents to children from eating laburnum seeds are not unfrequent; but to hares and rabbits laburnum is wholesome food. A fine variety of laburnum, called Scotch Laburnum, by some botanists regarded as a distinct species (*L. alpinum*), is

Laburnum alpinum.

distinguished by broader leaves and darker yellow flowers, which are produced later in the season than those of the common or *English* laburnum. The form known (from the gardener who produced it) as Adam's Laburnum (*L. Adami*), occasionally seen in British gardens, originated in the Jardin des Plantes at Paris about 1840, and is peculiar in producing the ordinary flowers of the common laburnum and those of *Cytisus purpureus* in an irregular and indiscriminate way over its branches. This so-called 'graft-hybrid' or 'chimæra' is the result of grafting *Cytisus purpureus* on *Laburnum vulgare* (see GRAFTING).

Labyrinth, the name of some celebrated buildings of antiquity, consisting of a series of intricate chambers or passages. Of these the most celebrated were the Egyptian, the Cretan, and the Samian. The Egyptian was visited by Herodotus and Strabo, and was reckoned one of the wonders of the world, containing 3000 chambers. It was built on the shore of Lake Mœris, and its foundations were discovered by Lepsius (see FAYÛM). The Cretan labyrinth (see CRETE, KNOSSOS, MINOS) was built by Dædalus for King Minos, to contain the Minotaur. The only mode of finding the way out of it was by means of a hank or skein of linen thread, which gave the clue to the dwelling of the Minotaur. The Samian labyrinth was constructed in the age

of Polycrates (540 B.C.). Other inferior labyrinths existed at Nauplia, at Sipontum in Italy, at Val d'Ispica in Sicily, and elsewhere; and the name of labyrinth was applied to the subterranean chambers of the tomb of Porsena, supposed to be that now existing as the Poggio Gazella, near Chiusi. Labyrinths called mazes were at one time fashionable in gardening, being imitations, by hedges or borders, of the Cretan; the best known in modern times is the Maze at Hampton Court.

Maze at Hampton Court.

An ancient story told in Fabian's *Chronicle*, also in Higden and other early historians, and blindly followed by their successors, makes a maze at Woodstock the scene of Queen Eleanor's apocryphal vengeance upon Fair Rosamond. See W. H. Matthews, *Mazes and Labyrinths* (1922).

Labyrinthodonts, a race of extinct Amphibians, represented in Carboniferous, Permian, and Triassic strata. Some were of large size, thus

the skull of the largest, *Mastodonsaurus giganteus*, is over a yard long; some had an external armour of bony plates; the teeth show in cross-section a labyrinth-like infolding of the outer wall. Along with Branchiosa, Aistopoda, and Microsauria, they form the order Stegocephalia in the class Amphibia, and include the first animals to have lungs and digits. See A. Smith Woodward's *Vertebrate Palaeontology* (1898).

Transverse section of a Tooth of *Mastodonsaurus giganteus*, enlarged (after Owen).

Lac, best known in the form of shell-lac, is a coloured resinous substance of great importance in the arts. It is produced by a small insect—from 1/16th to 1/8th of an inch in length—called *Coccus lacca* (*Carteria lacca* of Signoret), belonging to the sub-order Homoptera of the Hemiptera, or Bugs.

Lac is produced chiefly in India. The lac-insect lives upon the young branches of about a hundred species of trees, whereof the most important are *Schleichera trijuga*, *Butea frondosa*, *Zizyphus jujuba*, *Z. xylopyrus*, and several Acacias and figs. As soon as the young are hatched they crawl about in search of sappy twigs. To these they fix themselves by their proboscides, and immediately begin to form their lac cells or cocoons. These have one anal aperture and two others for the admission of air, and in their cocoons the insects remain in a lethargic state for two and a half months. The females, which greatly outnumber the males, never leave the spot to which they attach themselves, but the males escape by a ventral opening in the cocoon. After impregnation the female feeds voraciously on the juice of the twig to which it is fixed, increases in size, and continues to form lac. The lac surrounds all parts

of the insect except the mouth and the three apertures already mentioned. When the young are perfectly formed they issue by the anal opening in the lac incrustation.

The appearance of the incrustation varies. It often takes the form of coalesced rounded prominences, at some places surrounding, at others scattered over, the branches; but in other instances it looks, superficially, more like a thick, irregular outer layer of bark roughened on the surface. The incrustation is cellular, each cell indicating the position of the insect which formed it. *Stick-lac* is the name given to it when the incrustation is still attached to the twigs. Crushed and washed, it forms *seed-lac*. The water left in the tubs is coloured red by the bodies of the insects, and, after evaporation, the red substance is made into cakes, forming lac-dye. Melted, strained through cotton bags, and spread in sheets, the seed-lac becomes the *shell-lac* of commerce. Another form is *button-lac*, which is made by letting the melted lac drop into rounded pieces from 1 to 1 1/2 inches in diameter.

In India a good deal has been done in the cultivation of lac by tying the encrusted branches to suitable trees about a fortnight before the young insects begin to move about.

Lac has many industrial applications. Shell-lac varnish is more extensively employed than any other spirit varnish. One variety of it is French Polish (q.v.) for furniture (see also LACQUER). Lac applied as an alcoholic solution is used to stiffen the calico frame of silk hats (see HAT). In fine sealing-wax it is the most important ingredient, and either alone or mixed with other bodies it forms a good Cement (q.v.). Personal ornaments, such as chains and bracelets, are largely made of lac in India, and, when mixed with sulphur and some colouring matter, it is used there for coating wooden toys. Another mixture of lac with vermilion, closely resembling red sealing-wax in appearance, is applied by the Chinese to the surface decoration of boxes, trays, vases, and other small articles.

Lac, or LAKH, from a Sanskrit word meaning 'one hundred thousand,' is generally employed in India to indicate 100,000 rupees.

La Calprenède. See CALPRENÈDE.

Laccadives (Sansk. *Laksha Dwipa*, 'the Hundred Thousand Islands'), a group of fourteen coral islands in the Arabian Sea, between 10° and 14° N. lat., and about 200 miles W. of the Malabar coast. Area, 7 sq. m.; population, 9500. They are low and flat, and all but two are comparatively barren. The coconut is the chief plant, and *coir* (coconut fibre) the staple product. This and jaggery, coconuts, copra, tortoiseshell, and cowries are carried over to the mainland by the men, who are brave and skilful sailors. The group was discovered by Vasco da Gama in 1499, and for administrative purposes is attached to the province of Madras. The population consists mainly of Moplahs of mixed Hindu and Arab descent, professed Mohammedans in religion; their language is a typical South-Indian tongue, Malayalam, except in Minikoi, which properly belongs to the Maldivé group and retains its language.

Laccolith, a mass of igneous rock intruded between the bedding-planes of existing rocks, typically dome-shaped. See MOUNTAINS.

Lace is an ornamental fabric of linen, cotton, silk, or gold and silver threads, made by looping, knotting, plaiting, or twisting the thread into definite patterns, of contrasted open and close structure. Three distinct varieties of lace are made, two by handwork, known respectively as *needle* or *point lace* and *pillow-lace*, and one by machinery. To hand-made lace the term real lace is sometimes applied, and, although it may be made

in all or any of the varieties of thread above enumerated, in general it is composed of white linen thread of exceedingly great delicacy and tenuity. Machine-made lace, on the other hand, usually consists of cotton thread of high counts, but it cannot be used of such fineness as linen; while with machines it is quite impossible to rival the combined grace, delicacy, and strength of ornamental structure obtainable by the skill and patience of the hand-worker. Nevertheless machine-made lace is a marvellous triumph of mechanical ingenuity, and more inventive genius has been devoted to its production than has been bestowed on any other branch of textile industry.

Lace on one side, as needle or point lace, is closely allied to embroidery; pillow-lace is derived from and merely an elaboration of plaited fringe-work; and machine-lace is a development of fancy weaving. Although we have these three distinct methods

of lace-making, combinations of the whole may be found in one piece of modern lace, and frequently the products are so similar that it requires both experience and close observation to distinguish what is made by the needle from the plaited product of the pillow, or even the twisted lace of the machine. Technically, lace consists of two elements, the pattern, flower, or gimp which forms the closer-worked and more solid portion of the fabric, and the ground or filling which serves to hold the pattern together and in its proper place. In some varieties of lace, however, the ground is almost entirely wanting, and the pattern holds together by joining at the edges where two portions of the design meet and touch. In other cases the ground consists of ties or brides, thin loops or plaits passing from the edge of one portion of the pattern to another contiguous, and thus tying them together. More frequently the ground consists of a delicate

Fig. 1.—Part of Liturgical Veil or Cover, in *punto a maglia* or *lacci* work.

Fig. 3.—Rose-point, Venetian 18th century.

filmy honeycomb called a *réseau*, of which the simplest form is the bobbin-net, now made by machinery. On the *réseau* the pattern is sometimes stitched down after being separately made, such lace being known as *appliqué* or applied; in other cases pattern and *réseau* are formed together by needle or bobbin or by both. Other technical terms are met with in the description of lace—as

Fig. 2.—Reticella Needle-point lace, Italian, 16th century.

cordonnet, a stout thread or several threads together employed to outline the pattern; *picot*, a minute loop worked on the edge of ties or flowers for their

enrichment; and *modes*, which are ornamental fillings, variations of the *réseau*, which is always a plain honeycomb mesh.

Point-lace is a fabric which appears to have been arrived at through the efforts to produce light, graceful, and airy effects in embroidery. It is not known to have been made earlier than the first half of the 16th century; and its original production, as well as its most varied triumphs, are associated with Venice. The stages by which it developed from embroidery-work can be traced from the illustrated pattern-books for embroiderers which were issued early in the 16th century. In these books we find two styles of work intermediate between embroidery and lace-making, one of which consists of patterns cut out of stuff, and having the cut edges sewn over with a button-hole stitch, such work being known to the Venetians as *punto tagliato*. The second method of producing a lace-like effect was by cutting the individual threads in any texture in accordance with a definite pattern, and drawing out the cut portions, the resulting design, partly open work and partly close, being

known as *punto tirato*. The converse of this consisted in darning in patterns on a gauze or other open woven texture, a class of work termed by the Italians *punto a maglia* (see fig. 1), and by the French *laci* or *lassis*—whence our ‘lace,’ which has taken the place of the earlier name *pasement* or *pasement*.

Fig. 1.

The earliest true needle-lace of Venice, known as *punto in aria* or *reticella*, was in its design similar to the cut work of the pattern-books, showing only rectilinear and geometrical forms, as in fig. 2. A gradual development can be traced from such simple forms into rich floral ornaments and scrolls, till

early in the 18th century, in the very delicate needle-point with meshed ground known as *point de Venise à réseau*, we come to the richest and most elaborate products of the north Italian needlewomen. The most characteristic and valuable of the laces of Venice is that known in Britain as *rose-point* (French *gros-point*) (fig. 3), which consists of patterns worked in relief like sculptured work, forming strong and solid flowers and scrolls, held in position by ties or brides enriched with picots. With such lace the robes of great ecclesiastics and wealthy nobles were adorned, and it was also

Fig. 3.

employed for the ornamentation of altar covers and other church textures. In the making of point-lace the design is first drawn on a piece of parchment, which is then stitched down to a backing of stout linen. Over the lines of the design one or more threads of linen are stitched lightly down, and the slow work of filling up the pattern with button-hole stitches proceeds on the thread outline so obtained. The methods of working are numerous, and some of the stitches indeed

have been lost, but commonly the pattern or cloth is obtained by laying down a series of threads parallel to each other, as in fig. 4, and over-stitching them as shown. For the brides or *réseau* a single thread may form the foundation, it also being closely stitched over, as seen in fig. 5. When pattern and fillings are finished, it remains only to cut the stitches which hold the

Fig. 6.—Portion of Alençon Lappet; French, late 17th or early 18th century.

outlining threads to the parchment and the linen backing, thus liberating the lace. From Venice the art of making point-lace travelled out to other Italian towns, and westward to France and Flanders. Principally owing to the efforts of the minister Colbert, who in 1665 chartered a company with exclusive privileges for ten years and

a subsidy of 36,000 livres, the art was firmly established in France, ateliers being established in several of the principal towns. Among these places was Alençon, where Venice lace of very fine quality was being made by a lady named Laperrière prior to the establishment of Colbert's company. Alençon lace and the closely-allied fabric made at the neighbouring town of Argentan attained great perfection during the 18th century. The designs employed were distinctively French in character, and the *réseau* and modes which formed the filling showed a minute and filmy delicacy unapproached by the products of any other district (fig. 6). Point-lace also formed one portion of the manufacture carried on at Brussels.

The ground of the old Brussels lace is sometimes, though rarely, of needle-point, but the flower, which is made separately and sewed on, or applied to the ground, is, in fine specimens, frequently needle-made.

Pillow-lace.—It is a question whether pillow-lace originated in Italy or in Flanders. From a picture attributed to Quentin Matsys, painted in 1495, we have evidence that the making of pillow-lace was known in Flanders at that early date; but about the same time it was also being worked in Venice under the name of *Merletti a piombini*. While point-lace making has always been the distinguishing character of

Fig. 7.

Fig. 8.

Fig. 9.

Fig. 10.

Italy and the south, the making of pillow-lace became and remains distinctively associated with the Flemish towns and with England. For the

Italy and the south, the making of pillow-lace became and remains distinctively associated with the Flemish towns and with England. For the

Fig. 12.—Valenciennes Pillow-lace, with *réseau* ground, late 18th century.

production of pillow-lace the pattern is first drawn in full size on a piece of parchment, which is then

fastened to a pillow or cushion made to rest in the lap of the worker, and into which pins may be easily and firmly stuck at any required point. The pattern is then pricked over with pin-holes at every point where pins require to be inserted in the subsequent work of twisting and plaiting. The lace-maker is also provided with a series of small bobbins, round the upper part of which the thread to be used is wound, and even for the

Fig. 13.—Portion of Honiton Lappet, 18th century.

production of a half-inch band of lace of simple pattern a vast number of pins and as many as fifty bobbins may be required, while for elaborate patterns twelve hundred bobbins may be brought into requisition on a single pillow. The whole work in pillow-lace is the result of twisting and plaiting, and the pattern is often outlined and sometimes filled up with thread of a stouter character than that used on the mesh and fillings. The simplest ground in the pillow-lace consists of the twisted net or bobbin-net, originally made on the pillow, but now entirely made by machinery (see fig. 7). More commonly the net is partly twisted and partly plaited; and the variations in the mesh so formed are characteristic of the different classes of pillow-lace. Thus, the mesh of Mechlin lace consists of four twisted and two plaited sides, as seen in fig. 8. The mesh of Brussels pillow-lace is similar to that of Mechlin, but the plaited sides are longer (fig. 9), while the Valenciennes mesh is plaited throughout. These differences in the form of the ground of pillow-laces give a different appearance to the reticulations. The flower or pattern of the lace is worked so as to give it the appearance of plain woven cloth (see fig. 10). The Valenciennes mesh renders that variety more solid and durable than any of the others. Much of the modern Brussels lace has now a machine-made ground instead of the ancient pillow-meshes, on which the separately-made flowers are applied or sewed by the imperceptible fine joining-stitch. The making of pillow-lace in Honiton and other localities in the south-west of England was begun towards the end of the 16th century by refugees from the Low Countries. In 1662 parliament, desirous of encouraging native lace-making, prohibited the importation of all laces of foreign manufacture. Lace-workers were thereupon encouraged to settle in England; but as the fine thread necessary for their work was not forthcoming they were forced to return to their native land. A vigorous smuggling trade between Brussels and England ensued, and the lace so introduced was freely sold as English point, whence Brussels lace came to be generally known as *Point d'Angleterre*. Honiton lace from the 17th century downwards has continued to be made in the same style as the Flemish laces, but at no time has it attained the celebrity acquired by the products of the great centres of the pillow-lace making in Belgium and the north of

France. Fig. 13 is a fine example of Honiton lace-work.

The successful imitation of hand-made lace by machine-work, and the consequent enormous cheapening of material which bears a superficial resemblance to the costly product, has proved almost fatal to the arts of needle and pillow-lace making.

Machine-lace.—The ground and simplest element of pillow-lace being a network of meshes, the earliest efforts of inventors were directed towards the producing of machinery for fabricating similar netting. The hosiery-frame, which had been invented by William Lee towards the end of the 16th century, was the first apparatus with which it was attempted to make a lace-net, and about 1764 a modification of the frame was devised by which an open loop-net was produced. By the various devices familiar to hand-knitters fancy patterns could be produced on this machine. The loop fabric, however, had the great disadvantage of unravelling

Fig. 14.

freely at any point where it was broken, as it was constructed of a continuous single thread. At a subsequent period what was known as the warp-lace machine was introduced, in the use of which a separate thread is supplied to each hooked needle employed in the production of the web. On these warp-threads loops are formed by mechanical means, and as they can be moved by the machine either to the right or to the left, neighbouring warps and loops are joined together, and in this way a solid web, which can be cut without unravelling, is obtained. Towards the end of the 18th century a great variety of figured lace began to be made on the warp-machine, and in a greatly improved form it still continues in use.

A new era, however, in machine lace-making was inaugurated when, in 1809, John Heathcoat patented his second bobbin-net machine, by which it was made possible to twist or wrap round each other an indefinite number of threads, and to cause any one thread to traverse, mesh by mesh, every other thread in the width of the fabric being netted. The bobbin-net machine of Heathcoat became the foundation of an enormous industry, and the inventor reaped both honour and ample pecuniary reward for his remarkable ingenuity. His frame has been modified by many inventors, but the most important improvements were effected by John Levers in 1813. Of the complicated structure of the Levers machine, it would be quite impossible to convey any clear conception within moderate limits. The structure of the simplest fabric produced by it is shown as it appears on the frame in fig. 14; and when dressed and finished this fabric has the appearance indicated in fig. 7, which is common bobbin-net. It will be seen that the texture is formed of a series of vertical parallel threads which may be taken to represent the warp of a common web, these being diagonally crossed and intertwisted with others which may be looked on as weft-threads. The frame or loom holds the warp-threads vertically, a space being left between each sufficiently wide to admit of a shilling being passed edgewise between them. Behind these threads, and corresponding to the interspaces, is a row of ingeniously constructed flat bobbins or reels resting in an arrangement called a *comb-bar* or *bolt-bar*. These are so placed that with the first movement of the machine each

bobbin, which carries its thread with it, passes through two of the parallel and perpendicular threads of the warp, and is lodged in another and similar bolt-bar in front of the warp. But this front bolt-bar, besides an advancing and receding motion, has another movement, called *shogging*—from right to left. When it receives a bobbin by its forward motion it draws back, bringing the bobbin and thread through two of the upright threads; then it *shogs* or moves to one side, and goes forward again, taking the thread through the next two warp-threads, and lodging the bobbin on the back bolt-bar again, one distance beyond its last space; this it recovers by the next movement, and it again passes through the first space, to be again received by the front bolt-bar. By these movements the bobbin-thread is twisted quite round one upright thread of the warp; another movement then shifts the bobbin, so that it will pass through the next pair of upright threads, and so carry on its work, the warp-threads moving at the same time, unwinding from the lower beam, and being rolled on the upper one. There being twice as many bobbins as there are threads in the warp, each bolt-bar having a set which it exchanges with the other, and all being regulated with great nicety, a width of lace is made in far less time than has been required to write this short description. The additions to and variations upon these operations (which only apply to bobbin-net), for the production of patterns, are numerous and complicated—each pattern requiring new combinations; but they all depend upon the variations which can be given to the movements of the flat disc-like bobbins.

Gold Lace and Silver Lace.—The so-called gold thread which is used in textiles consists of silver-gilt wire, or for commoner purposes copper-gilt wire, either round or flattened into a fine ribbon. These wires may be so used for weaving and embroidery purposes, but generally what is called gold thread consists of a yellow thread of cotton or linen round which the flattened gold wire is spirally wound so as completely to encase it. Silver wire is similarly prepared and used, being wound on a white instead of a yellow basis. Gold and silver threads may be used in ordinary lace-making, but what is generally termed gold and silver lace consists of braids, ribbons, and bands of these materials employed for embroidery and braiding, and for the ornamentation of uniforms and official robes, badges, &c. The use of gold and silver wire in textiles is of great antiquity, and sumptuous garments enriched with precious metals were used in Egypt for royal and priestly personages. The making of gold and silver lace is associated with the ribbon industry, and it is usually prosecuted in districts where that trade is located.

Lacépède, BERNARD DE LA VILLE, COMTE DE, French naturalist, was born on 26th December 1756, at Agen, and was appointed curator of

Natural History in the Royal Gardens at Paris in 1785. At the Revolution he became professor of Natural History in the Jardin des Plantes and at the university. He was made a senator in 1799, a minister of state in 1809, and in 1814 a peer of France. He died of smallpox at Épinay, near St Denis, 6th October 1825. Besides continuing Buffon's *Natural History* at Buffon's own request—in *Histoire des Reptiles* (2 vols. 1788-89)—Lacépède wrote *Histoire Naturelle des Poissons* (6 vols. 1798-1803), which, in spite of numerous errors, was long held in high esteem, and works on the Cetacea, the *Natural History of Man*, *Les Âges de la Nature*, and a *General History of Europe* (18 vols. 1826). Lacépède was likewise a highly-accomplished musician, and published *La Poétique de la Musique* (2 vols. 1785).

Lachaise, FRANÇOIS D'AIX DE, a Jesuit, born of a noble family, 25th August 1624, in the castle of Aix (dept. of Loire), studied at Rohan, and was already a provincial of his order when Louis XIV. selected him for his confessor on the death of Father Ferrier in 1675. His position was difficult, owing to the different parties of the court, and the strife between Jansenists and Jesuits. In the most important questions of his time Father Lachaise avoided extreme courses. A zealous Jesuit, and of moderate abilities, he yet sustained among his contemporaries the reputation of a man of mild, simple, honourable character. Madame Maintenon could never forgive him the little zeal with which he opposed the reasons urged against the publication of her marriage with the king; but during the thirty-three years that he filled his office of confessor he never lost the favour of the king. He died 20th January 1709.—Louis XIV. built him a country-house to the east of Paris, the large garden of which was in 1804 converted into a burial-place, and is known as the *Père-la-Chaise*, the resting-place of many famous men. See PARIS.

Laches, in English law, is a word used (from Fr. *lâcher*, 'to loosen') to denote negligence or undue delay, such as to disentitle a party to a particular remedy, or to relief. According to the common law this principle has no application as regards the crown; but various statutes, chiefly the so-called *Nullum Tempus Act* (9 Geo. III. chap. 16), have restricted the rights in this respect.

Lachesis, a genus of snakes belonging to the Crotalidæ (see RATTLESNAKE), including the very venomous bushmaster and fer-de-lance. See also FATE.

Lachine, a town of Quebec, Canada, 8 miles SW. of Montreal by rail, a favourite summer residence. There is a canal hence to Montreal to avoid the Lachine Rapids of the St Lawrence.

Lachlan, a river of Australia, a tributary of the Murrumbidgee, which itself, a little farther down, enters the Murray (q.v.).

Lachmann, KARL KONRAD FRIEDRICH WILHELM, a celebrated German critic and philologist, was born, 4th March 1793, at Brunswick, studied at Leipzig and Göttingen, became an extra-ordinary professor at Königsberg in 1818, at Berlin in 1825, and an ordinary professor there in 1827. He was admitted a member of the Academy of Sciences in 1830, and died 13th March 1851. Lachmann's scholarship was extraordinary alike in profundity and range. He was equally devoted to classical and German philology, and illustrated both by a singularly subtle and sagacious criticism evolved in strictly scientific method. Among his most important productions are his editions of the *Nibelungenlied*, the works of Walter von der Vogel-

weide, Propertius, Catullus, Tibullus, Babrius, Avianus, Gaius, and the Agrimensores Romani. In his *Betrachtungen über die Ilias* (supplemented by Haupt, 1847) he maintained that the *Iliad* consisted of sixteen independent *lays* enlarged and interpolated in various ways. The smaller edition of his New Testament appeared in 1831 (3d ed. 1846); the larger, in 2 vols., in 1842-50. The design of the last of these works was to restore the Greek text as it existed in the Eastern Church in the 3d and 4th centuries; and Lachmann attached the greatest value to the readings found in the old Latin and Greek western uncials, where he found differences in his oldest eastern texts. His latest undertaking was his edition of Lucretius (1850), which Monro styles 'a work which will be a landmark for scholars as long as the Latin language continues to be studied.' See the Life by Hertz (Berlin, 1851), and also J. Grimm in vol. i. of his *Kleinere Schriften*.

Lachrymal Organs. See EYE.

Lackawanna River, Pennsylvania, is a tributary of the Susquehanna, and its valley nearly coincides with the Wyoming and Lackawanna coal basin (55 miles long), which produces half the anthracite mined in the United States.

La Condamine, CHARLES MARIE DE, French geographer (1701-74), served in the army, travelled extensively, and was sent with others to Peru (1735-43) to measure a degree of the meridian there. On his return he explored the Amazon, and brought the first definite information as to india-rubber. He also brought Curari (q.v.) to Europe, and wrote in favour of inoculation.

Laconia. See SPARTA. The Spartans systematically endeavoured to confine themselves to a sententious brevity in speaking and writing; hence the term *laconic* has been applied to this style.

Lacordaire, JEAN BAPTISTE HENRI, was born at Recey-sur-Ource, in the department Côte-d'Or, March 12, 1802. He was educated at Dijon, and there began to study law. In 1822 he went to Paris, and practised successfully for two years as a barrister. His religious views were quite unsettled at this time. 'He was a deist, like all the youth of his day, and a liberal, like almost every Frenchman, but without any extreme views.' The spiritual change in him came suddenly, and then his true life began. He gave up his profession, entered the college of St Sulpice in 1824, and was ordained priest in 1827. In 1828 he became chaplain of the convent of the Visitation and in 1829 chaplain of the Collège Henri IV. Marked out by his Liberalism, he was asked to help the Abbé Lamennais and Montalembert in the establishment of the *Avenir*, the well-known High Church and Radical newspaper. In 1831 Lacordaire and Lamennais were summoned by Government, but acquitted, for writing in the *Avenir* against the appointment of three bishops by Louis-Philippe. Soon after this Lacordaire and Montalembert opened a free school in Paris, claiming as a right the liberty of teaching promised in the charter of 1830. The school was closed by the police, and Lacordaire and Montalembert were tried and fined one hundred francs. Thirteen months after its first appearance the publication of the *Avenir* was suspended, and, being condemned by the pope, was then finally given up. In 1834 Lacordaire gave a series of Conferences to the students of the Collège Stanislas which attracted great attention, and led the way to his famous Conferences in Notre Dame, delivered in 1835 and 1836. His audiences were immense, his success as a preacher was at its height, when he suddenly withdrew and went to Rome, feeling the need for himself of silence and solitude. In 1839 he entered

the novitiate of the Dominican order, and in 1840 reappeared in the pulpit of Notre Dame, clothed in the habit of a Dominican monk. The next three years of his life were spent partly in France and partly in Italy. In 1843 he resumed his Conferences in Notre Dame, and continued them till 1851. In the revolution of 1848 Lacordaire accepted the republic, and was elected to the Constituent Assembly, but resigned his seat ten days after his election, as he found he was unsuited for the storms of parliamentary life. His last Conferences, delivered at Toulouse in 1854, are the most eloquent of all. After finishing these Conferences he undertook the direction of the military school of Sorrèze, and at this post he remained till his death, which took place in 1861, a year after his election as Academician. Lacordaire was one of the greatest of modern preachers and orators. He laid hold of the thoughts of the day, he understood the difficulties he had to deal with, and he won men to the truth by his eloquent reasoning and by his love for their souls. See lives by Montalembert (1862; trans. 1863); Dora Greenwell (1867), Lear (1882), D'Haussonville (trans. 1913), Bézy (1910), Paulé (1912).

Lacquer. Ornamental or useful articles of brass, such as gas-fittings and some kinds of furniture, are usually lacquered to preserve the surface from discoloration or corrosion. Iron, tinplate, and other metals and alloys are also sometimes lacquered. The lacquer used is composed essentially of shell-lac or seed-lac, or both, dissolved in spirits of wine. But its composition varies considerably. One kind consists of 2 parts of shell-lac dissolved in 20 parts by weight of alcohol, less than 1 part of turpentine being mixed with it. It is customary, however, to add small quantities of one or more gum-resins, such as sandarach, amber, and anime, to the lacquer, which is coloured with gamboge, dragon's blood, and other substances. The brass, which is first heated till the hand can just safely touch it, generally receives two coats of lacquer; but sometimes the first coat is put on when the metal is cold. In the case of dark lacquering the brass is first bronzed and coated with black lead. Coal and tobacco smoke, as well as the vapour or fumes of some chemical substances, injure lacquered surfaces.

Lacquer-ware.—The lacquer used for the celebrated lacquer-ware of Japan differs entirely from the lacquer used for brass. The body of this ware is of wood, and the lacquer or varnish with which it is coated is the juice of the lacquer-tree (*Rhus vernicifera*), sometimes also called the varnish-tree. This remarkable lacquer not only forms a very hard surface, but, unlike other varnishes, it stands a considerable heat without injury, so that in Japan lacquered vessels are used for hot soups and hot alcoholic drinks. There are numerous kinds of Japanese lacquer-ware, the simplest kind being perhaps that with the grain of the wood seen, for which a fine transparent lacquer is used. For black lacquer-ware the juice or varnish is darkened with galls and a salt of iron, and for red it is mixed with about 20 per cent. of cinnabar; orpiment, oxide of iron, and Prussian blue being also used as colours. In the case of gold and silver lacquer-wares the varnish is mixed with about 30 per cent. of the powder of these metals in a fine state of division, so that when the surface is polished it shows a metallic lustre. Tin is used to imitate gold, the yellow hue being given by colour in the varnish.

The lacquered surface of the best ware is prepared by a very tedious process, owing to the number of coatings it receives. For the several preliminary ones crude lacquer is used, together with a single coating of powdered biscuit earthen-

ware and water, the surface being rubbed with a whetstone after each. Two or three more coatings of lacquer are next applied, each being rubbed with charcoal and water. For the finishing coat the best lacquer is employed, and this is polished with calcined deer-horn, finely powdered, the finger and a little oil bringing up the final gloss. The various articles made, such as boxes, vessels, trays, cabinets, &c., are decorated either by inlaying with metal, ivory, or mother-of-pearl, by speckling and gilding with gold or silver, by designs in colour, by relief paintings, or by carving. The art of lacquering is a very ancient one in Japan, and fine specimens of old work bring very high prices.

Lacretelle, JEAN CHARLES DOMINIQUE DE, journalist and historian, was born at Metz on 3d September 1766. He was attracted to Paris on the outbreak of the Revolution; but there, instead of following his profession, that of an advocate, he turned his abilities to journalism, and helped to edit *Le Journal des Débats* and *Le Journal de Paris*. He managed to escape the Reign of Terror by enlisting in the army; but soon procured his release and returned to journalistic work in the capital. In 1810 he was nominated censor of the press, having the year previous been appointed professor of History in the university of Paris. This post he held down to 1853. From 1811 a member of the French Academy, he became its president in 1816. Lacretelle died near Mâcon on 26th March 1855. He wrote a series of works, respectable, but of no very outstanding merit, dealing with the history of France from the time of the religious wars down to the middle of the 19th century. Of these the most useful are *Histoire du Dix-huitième Siècle* (6 vols. 1808), *Précis Historique de la Révolution* (3 vols. 1801-6), and *Histoire de France pendant les Guerres de Religion* (4 vols. 1814-16).—His elder brother, PIERRE LOUIS (1751-1824), distinguished himself as an advocate and journalist, and by his writings on law and other subjects.

Lacroix, PAUL, French miscellaneous writer, better known by his pen-name of P. L. JACOB, BIBLIOPELLE, was born at Paris, on 27th February 1806. Whilst still at school he began to edit editions of the old French classics, as Marot, Rabelais, &c. But it was in the field of the historical romance that he won his spurs as a writer. His industry was prodigious, and the number of works that issued from his pen immense. Besides actively assisting in more than one journalistic enterprise, he wrote romances, plays, books on history, on manners and customs, and on bibliography, and edited memoirs, biographies, &c. His most valuable productions were a series of works on the habits, manners, customs, costumes, arts, sciences, and intellectual condition of France from the middle ages down to the 19th century. His bibliographical works are also valuable, especially those in connection with Molière. He wrote two elaborate works on the *History of Prostitution*, published under the name of Pierre Dufour. From 1855 onwards Lacroix was custodian of the Arsenal library of Paris, and died in that city on 16th October 1884.

Lacroix, SYLVESTRE FRANÇOIS, a French mathematician, was born in Paris in 1765, taught mathematics from 1787 in different educational establishments connected with the army, then in the Normal School, the Polytechnic, the University of France, and the Collège de France successively. He died on 25th May 1843. He is not remarkable for original discovery in mathematical science, but deserves to be remembered for his *Traité du Calcul Différentiel et Intégral* (Paris, 1797; 7th ed. 1867), and its continuation, *Traité des*

Différences et des Séries (1800), which are complete compilations of the results of all previous research.

Lacrosse, a field game played with a ball and a stick known as a crosse. It is the national game of Canada. The crosse, usually of light hickory, is of any length, sometimes under sometimes over 5 feet, and is bent at the top like a bishop's crozier (Fr. *crosse*). Strings of gut or raw hide are stretched diagonally across the hooked portion of the crosse so as to form a fairly taut network. The ball, 8 to 8½ inches in circumference, is solid, and of sponge india-rubber. There are two goals, 6 feet high and 6 feet wide, placed, unless otherwise arranged, at not less than 100 yards and not more than 150 yards apart. The field of play is rectangular, and extends some distance beyond each goal; its boundaries, till agreed on before play, are indeterminate. The game is played by two teams, properly of twelve players a side. As distinct from association football, say, or hockey, each team extends the entire length of the field between the goals, and the players, excepting the goalkeepers, are in opposing pairs; the absence of an off-side rule, a characteristic feature of the game, makes this formation possible. The object of play is for one side to drive the ball through the goal of the other. The ball is scooped up from the ground with the bent end of the crosse, on which it is carried horizontally, while the player runs towards one of the goals, trying to dodge his antagonists, or to pitch the ball, which may be struck off his crosse only by the crosse of an opponent, to a more favourably placed member of his side, and the game is pre-eminently one of combined play. Except through the goal, the ball may be propelled with the foot or leg, but must not be wilfully handled except, with restrictions, by the goalkeeper. The body may be used to impede an opponent provided no force is exerted, and there are rules against striking, tripping, grasping, &c. The game originated in a tribal sport of the North American Indians, the Olympic beauty of which was extolled by Catlin. Subsequently it was taken up by the French and other European settlers in Canada, and in 1867 was founded the National Lacrosse Association of Canada. Thereafter it was introduced into Britain, and in 1868 an English Lacrosse Association was formed, but the game has never been widely played. It is played also in the United States, in South Africa, in Australia, and elsewhere.

La Crosse, capital of La Crosse county, Wisconsin, stands on the Mississippi, at the mouth of La Crosse River, and at the junction of six railways, 195 miles by rail WNW. of Milwaukee. It contains a Roman Catholic cathedral, a convent, an orphanage, hospitals, excellent schools, and a public library. The city has a large trade in lumber and grain. The manufactures include engines and boilers, &c., and there are several large lumber-mills and iron-foundries. Pop. (1880) 14,505; (1920) 30,421.

Lacryma Christi, a wine of a sweet but piquant taste, and a most agreeable bouquet, which is produced from grapes grown on Mount Vesuvius. The kind most esteemed is the light red, the dark amber-coloured coming next. But the genuine wine is very expensive, as only a small quantity is produced; and the name (derived from a monastery on the mountain) is commonly given in Naples to Capuan and other second-class wines. See WINE.

Lactantius, LUCIUS CÆLIUS (or CÆCILIUS) FIRMIANUS, an eminent Christian apologist who flourished in the early part of the 4th century. His Italian descent is more than dubious, but it is certain that he was brought up in Africa, although

it is very unlikely that he was a pupil of Arnobius. He seems to have settled as a teacher of rhetoric in Nicomedia in Bithynia, and most likely he was converted there by witnessing the marvellous constancy of the Christian martyrs under the tenth and most savage persecution of Diocletian. About the year 313 he was invited to Gaul by Constantine the Great, to act as tutor to his son Crispus, and is supposed to have died about 325. His principal work is his *Divinarum Institutionum libri vii.*, a production both of a polemical and apologetic character. His theology is somewhat crude, and he has been accused of error in his treatment of the doctrine of the Holy Spirit—his Chiliasm and his eschatology were not peculiar to himself. His treatise *De Ira Dei* was inscribed to his friend Donatus. (*De Mortibus Persecutorum*—new ed. Vienna, 1897—is not his work.) His style is remarkably pure, justifying his title of the 'Christian Cicero.' His character appears to have been elevated but austere, perhaps somewhat soured by the poverty and trials of his life.

Lactantius was remarkably popular in the middle ages, and MSS. and printed editions of his works are numerous. Dufresnoy in his edition (2 vols. 1748) enumerates as many as 86 editions of his entire works, besides separate editions of his different treatises, from 1461 to 1739 A.D. The best editions are those in vols. x.-xi. of the *Bibl. Pat. Eccl. Lat.* by Gersdorf (Leip. 1842-44), in Migne's *Patrologia* (vol. vi. 1844), and by Brandt and Laubmann (Vienna, 1890-97). There is a translation in Clark's Ante-Nicene Library.

Lactase. See FERMENTATION.

Lactation. See MILK, BREAST.

Lacteals. See DIGESTION.

Lactic Acid, $\text{CH}_3\text{CH}(\text{OH})\text{CO}_2\text{H}$, has three forms distinguished by their chemical properties and action on polarised light, the inactive variety contained in sour milk. In the pure state it is a colourless, transparent, syrupy liquid, of specific gravity 1.215. It is without smell, has a sharp acid taste, and is miscible with water, alcohol, and ether. It is formed in milk by the fermentation of the milk-sugar under the influence of an organised ferment. On a large scale it is usually prepared from cane-sugar in the following manner: 7 lb. of cane-sugar and $\frac{1}{2}$ oz. of tartaric acid are dissolved in 4 gal. of water and allowed to stand for a few days; then 4 oz. of rotten cheese rubbed up in a gallon of sour milk, and $2\frac{1}{2}$ lb. of zinc oxide (zinc white) are added, and the mixture is thoroughly stirred and kept at a temperature of about 105° F. for eight or ten days. The liquid is boiled to stop the fermentation, filtered, and evaporated till the zinc lactate which it contains crystallises; this is then re-dissolved in water, decomposed with sulphuretted hydrogen, the mixture filtered to free it from zinc sulphide, and evaporated on a water-bath. It is also made by the action of certain bacteria on starch.

Lactic acid occurs very widely distributed as a product of the natural fermentation of sour vegetable materials, such as sauerkraut; it is also found in the stomach and intestines. An isomeric acid of the same composition but slightly different properties, called sarco- or para-lactic acid, occurs as a product of waste of animal tissues, and is found in muscle of all kinds, especially after violent exertion or artificial tetanus. Sarco-lactic acid has been frequently detected in blood soon after its removal from the body, in quantities usually below 1 part per 1000, but it apparently does not occur in normal healthy blood while in the body.

The tests for lactic acid are not very satisfactory. On addition of lead acetate and alcoholic ammonia to a solution containing lactic acid an insoluble lead lactate, $3\text{PbO}_2\cdot 2\text{C}_2\text{H}_5\text{O}_2$, is precipitated as a white powder. The properties and amount of water of crystallisation of the zinc lactates are also

characteristic. Most of the lactates are crystalline and soluble in water.

Lactometer, or GALACTOMETER, a very simple instrument for testing the richness of milk; it consists of a glass tube graduated to 100 parts. New milk is poured in up to the top of the graduated part and allowed to stand; and when the cream has completely separated the value of its quantity is shown by the number of parts in the 100 which it occupies. Another form of instrument was invented by Doeffel, consisting of a small hydrometer with a scale 2 inches long divided into 20 degrees, the zero being placed at the point to which the instrument sinks in water, and the 20th degree corresponding with the density 1.0383. This instrument is preferred by the continental chemists; and 14° is held to show milk undiluted with water.

Lactucarium. See LETTUCE.

Ladakh, one of the frontier districts of the Kashmir State, in the valley of the Upper Indus, and behind the great central range of the Himalayas. The Ladakhis, some 30,000, are of Turanian stock and Buddhists in religion. The capital is Le (q.v.).—The district consists of the three *tehsils* of Ladakh, Skardu, and Kargil, and has (1911) a total population of 186,000, of whom 150,000 (mostly in Skardu and Kargil) are Moham-medans. See KASHMIR.

Lad'anum (Arab. *lādūn*; Gr. *lēdanon*), a curious, delicately-scented, resinous gum which exudes from certain kinds of Cistus, chiefly *C. creticus*, *C. glaucus*, and *C. laurifolius*, growing in Crete, Cyprus, and parts of Asia Minor. *C. ladani-ferus*, strange to say, does not produce the gum. Lad'anum, under the name of Labdanum, is alluded to by Browning in *Paracelsus*; and there are interesting articles under *Ladanum* and *Lēde* in the French *Encyclopédie*, ix. 172 and 336, in which the gum is said to be collected on fringes of leather attached to long poles, and drawn over the shrubs in the heat of the day. In Cyprus at the present time the gum is actually collected from the beards of the goats that browse among the bushes, a system mentioned by Herodotus, iii. 112. At one time lad'anum was used in medicine and as a perfume; it is now, in the form of small black balls, a costly toy fingered by soft-handed idlers in the Levant.

Ladin. See ENGADINE.

Lading, BILL OF. See BILL OF LADING.

Lado, a station on the left bank of the White Nile, in 8° 5' N. lat., established by Gordon in 1875. The Lado enclave, extending from the Nile on the east to 30° E. long. on the west, the Congo boundary on the south-west, and 8° 50' N. lat. on the north, was leased to Leopold II., king of the Belgians, but reverted on his death to Anglo-Egyptian Sudan. See GONDOKORO.

Lad'oga, LAKE, the largest lake of Europe, is situated a short distance N. and E. of St Petersburg, being crossed by the frontier-line between Russia and Finland. It is 129 miles in length, 78 in breadth, and 6998 sq. m. in area. The southern and eastern shores are low and marshy; but on the north-west the coast is broken, and rises into cliffs. There, too, are numerous islands. The lake receives the waters of Lake Onega and Lake Ilmen in Russia, and of Lake Saima and other lakes in Finland; and its own waters are carried off to the Gulf of Finland by the Neva (q.v.). The average depth of Lake Ladoga does not exceed 300 feet, except in the north-west, where over a limited area the depth is about 730 feet. In order to obviate the difficulties of navigation from shallows and sunken rocks, canals have been constructed to connect the mouths of the rivers that reach it along

the south and south-east shores. The principal is the Ladoga Canal (70 miles long and 60 feet wide). This canal system forms the thoroughfare for a very extensive traffic between the Volga and the Baltic, and a second canal parallel to the old Ladoga Canal has been constructed. A Finnish canal to the Baltic is projected. Communication by water subsists between Lake Ladoga and the White Sea as well as the Caspian. The fauna of the lake is arctic in character. Two of the islands in the north-west, Valamo and Konevets, are each the seat of a monastery, founded in 960 and 1393 respectively, and are visited by thousands of pilgrims yearly.

Ladrones, or **MARIANA ISLANDS**, a group of fifteen islands in the western Pacific, north of the Carolines, in 13°-21° N. lat. and 144°-146° E. long., disposed in a row almost due north and south; their united area is about 420 sq. m. They were discovered by Magellan (1521), whose sailors called them the 'Thieves' (*Ladrones*) Islands, from the thievish propensity displayed by the natives; in 1668 they received the name of Mariana Islands. In 1898 Guam was ceded by Spain to the United States, and in 1899 the remainder of the group were sold to Germany. They were assigned to Japan as mandatory power in 1919. A channel divides the islands into two groups. The five to the south are low and flat, those to the north mountainous; most are thickly wooded, and all are well watered, fruitful in coconuts, rice, maize, cotton, sugar, tobacco, and indigo. The area cultivated, however, is small, and the trade is of little consequence. The people are mostly indigenous Chamorros and Tagals from Luzon, besides a mixed race of partly Spanish descent. At the time when the islands were discovered the inhabitants were reckoned at 60,000, but the present population (including Guam) is about 20,000. Under Spanish rule their former gaiety and cheerful industry changed to dull, apathetic indifference and laziness. The largest island is Guam, with an area of 198 sq. m., and a pop. of over 13,000; on it is the only town, Agaña.

Lady, a woman of distinction correlatively to *Lord* (q.v.), used in a more extensive sense in common parlance correlatively to *gentleman*. As a title it belongs to peeresses, the wives of peers and of lords by courtesy, the word Lady being in all these cases prefixed to the peerage title. The daughters of dukes, marquises, and earls are by courtesy designated by the title Lady prefixed to the Christian name and surname; a title not lost by marriage with a commoner. 'Lady,' prefixed to their husband's surname is the usual title of wives of Baronets (q.v.) and knights. See **COURTESY TITLES**, **ADDRESS (FORMS OF)**.

Ladybird (*Coccinella*), a genus of pretty little beetles, generally of a brilliant red or yellow colour, with black, red, white, or yellow spots. The form is nearly hemispherical, the under-surface flat, the thorax and head small, the antennæ and legs short. When handled they emit a yellowish fluid, with a disagreeable smell. Adults and larvæ feed chiefly on aphides, and are thus most useful to hop-growers and other agriculturists. The eggs are laid under the leaves of plants, on which the larvæ afterwards run about in pursuit of aphides. In late autumn the surviving adults find safe corners,

Ladybird (*Coccinella ocellata*), magnified.

and hibernate till spring. Ladybirds occasionally occur in immense numbers, and from ignorance of their usefulness have sometimes been regarded with superstitious dread. The family of which the genus is type, Coccinellidæ, includes about 1500 species, of which forty or so are British. One of the commonest forms (*C. septem-punctata*) is found over all Europe, and in parts of Asia and Africa. The name is apparently a modification of *Ladybug*, lady referring to the Virgin Mary, as the German name *Marienkäfer* suggests.

Lady Chapel, a chapel dedicated to the Virgin Mary ('Our Lady'), and usually, but not always, placed eastwards from the altar when attached to cathedrals. Henry VII.'s Chapel at Westminster is the lady chapel of that church.

Lady-day, one of the regular quarter-days in England and Ireland, on which rent is generally made payable. It is the 25th of March in each year; but in some districts Old Lady Day (April 6) is still observed as the term day. See **ANNUNCIATION**.

Lady Fern (*Athyrium Filix-femina*, or *Asplenium Filix-femina*), a beautiful fern, common in moist woods in Britain, with bipinnate fronds sometimes 2 feet long. The whole plant has an extremely graceful appearance. It is said to possess the same anthelmintic properties as the male fern.

Lady's Bedstraw. See **BEDSTRAW**.

Lady's Mantle (*Alchemilla*), a genus of herbaceous plants, chiefly natives of temperate and cold climates, of the natural order Rosaceæ, sub-order Sanguisorbeæ; having small and numerous flowers, an 8-cleft calyx, no corolla, and the fruit surrounded by the persistent calyx. The name

Alpine Lady's Mantle (*Alchemilla alpina*):
a, a flower.

lady's mantle, signifying *Mantle of Our Lady*—i.e. of the Virgin Mary—is derived from the form of the leaves.—The Common Lady's Mantle (*A. vulgaris*) is abundant on banks and in pastures throughout Britain. Its root-leaves are large, plaited, many-lobed, and serrated; its flowers, in corymbose terminal clusters, are usually of a yellowish-green colour.—The Alpine Lady's Mantle (*A. alpina*) grows on Scottish mountains, and has digitate serrated leaves, white and satiny beneath.—A common plant in British pastures is the Field Lady's Mantle, or Parsley Piert (*A. arvensis*).

Lady's Fingers. See **KIDNEY VETCH**.

Ladysmith, a small town in Natal (named from a colonial governor's wife), 140 miles NW. of Durban by rail. On the outbreak of the Transvaal War in 1899 it, including the army of Sir George White, was invested by the Boer forces, and after a siege of one hundred and twenty days,

was relieved by Sir Redvers Buller on 28th February 1900. Pop. 6600.

Lady's Slipper (*Cypripedium*), a genus of orchids, of which one species, *C. Calceolus*, found in a few places in the north of England, is reckoned one of the most beautiful of British orchids. The genus is remarkable for the large

a, *Cypripedium spectabile*; *b*, flower and leaf of *C. barbatum*.

inflated lip of the corolla. Several very beautiful species are natives of the colder parts of North America. *C. spectabile* is a North American species; *C. barbatum*, a native of Java. Both are in cultivation, the former in hardy collections, the latter in hothouses.

Lady's Smock. See CRESS.

Laeken, a northern suburb of Brussels, with the crypt of the Belgian royal family in the Church of the Virgin, and a royal palace (built in 1782; burned 1890; rebuilt in the same style).

Laennec, RENÉ THÉODORE HYACINTHE, a distinguished physician, was born at Quimper, in Lower Brittany, 17th February 1781. He studied medicine under his uncle at Nantes, and at Paris under Corvisart, to whom the medical profession is mainly indebted for the introduction of percussion in the investigation of diseases of the chest (although the original discovery is due to Auenbrugger). In 1799 Laennec was an army-doctor in the field; in 1814 he became the chief editor of the *Journal de Médecine*; in 1816 he was appointed chief physician to the Hôpital Necker, and it was there that he soon after made the discovery of 'mediate' auscultation, or, in other words, of the use of the Stethoscope (q.v.). In 1819 he published his great *Traité de l'Auscultation Médiate*. He retired to die (of consumption) in his native province, 13th August 1826.

Lætare Sunday. See GOLDEN ROSE.

Lævulose. See SUGAR.

Lafarge, JOHN (1835-1910), born in New York, was the son of a French officer, studied art in Paris, visited Japan and the South Seas, and became one of the most eminent and versatile painters of his time—portraits, landscapes, religious subjects, book illustrations, and stained-glass windows being all among his triumphs.

Lafayette, capital of Tippecanoe county, Indiana, on the Wabash River, and on the Wabash and Erie Canal, 63 miles NW. of Indianapolis, at the intersection of five railways. It is a flourishing city, in the midst of a rich prairie country.

Laid out in 1825, it contains numerous churches, the Purdue state university, bridge, pork-packing, wagon, safe, and other works. Pop. 22,500 (with West Lafayette 26,000).

La Fayette, MADAME DE, the reformer of French romance-writing, was born in 1634, her father being a marshal and governor of Havre. She married the Comte de La Fayette in 1655, and was a member in her youth of the literary circle which met in the Hôtel de Rambouillet. She was the intimate friend of Mme de Sévigné, and in her thirty-third year formed a liaison with La Rochefoucauld, which lasted until his death in 1680. She died in 1693. Her novels *Zaïde* and the *Princesse de Clèves* led to a reaction in taste against the fantastic and long-winded romances of such writers as La Calprenède and Mdle de Scudéry. She had a genuine command of passion and knowledge of character, and in her *Princesse de Clèves* gave a vivid and faithful picture of the court-life of her day. She committed, however, a curious anachronism in transferring the men and women of Louis XIV.'s age to the court of Henry II.; for example, her Duchesse de Valentinois is Mme de Montespan, the Prince de Clèves is the Comte de La Fayette, and the Duc de Nemours is La Rochefoucauld. Her novels, says Gérusez, were more than a novelty, they were almost a revolution. Her works fill 5 vols. (1812; new ed. 1892); of her *Mémoires* the best edition is by Asse (1890). See books by D'Haussonville (1891) and Lilian Rea (1908), and Sainte-Beuve's *Portraits de Femmes*.

Lafayette, MARIE JEAN PAUL ROCH YVES GILBERT MOTIER, MARQUIS DE, was born in the castle of Chavagnac, in Auvergne, 6th September 1757. He belonged to an ancient family; came to his estates at thirteen; married three years later; entered the army, and sailed, in spite of the at least professed opposition of the court, for America in 1777, to offer his sword to the colonists in their struggle for independence. He became an intimate and admiring friend of Washington, who gave him the command of a division after his conduct at the battle of Brandywine. The treaty between the insurgents and France at once led to war between France and England, and Lafayette returned to his country early in 1779. Six months later he again crossed the Atlantic, was charged with the defence of Virginia, and had his share in the battle of Yorktown, which practically closed the war. On a third visit to North America in 1784, after the conclusion of peace, he was received in such a manner that his tour was a continual triumph.

Lafayette had imbibed liberal principles in the freer air of America, and was eager for reforms in his native country. He was called to the Assembly of Notables in 1787, and sat in its successor, the Assembly of the States General, and in that which grew out of it, the famous National Assembly of 1789. He took a prominent part in its proceedings, and laid on its table, on the 9th July 1789, a declaration of rights based on Jefferson's Declaration of Independence. He was soon appointed to the chief command of the armed citizens, whereupon he formed the National Guard, and gave it the tricolor cockade. Indeed, in the first stages of the Revolution, it seemed as if the 'Grandison-Cromwell-Lafayette' had the destinies of France in his hands. But the fever of revolution soon surged too hotly for the constitutional channels in which he would have had it flow. He struggled incessantly for order and humanity, yet was mortified to the heart by the furious violence of the mob which butchered Foulon and brandished the reeking heart of the commandant Berthier before his eyes. The Jacobins hated his moderation, while the court abhorred his reforming zeal,

and both combined to defeat him in his canvass against Pétion for the mayoralty of Paris. Along with Bailly he founded the club of the Fenillants, and he supported the abolition of title as well as of all class privileges. After the adoption of the constitution of 1790 he retired to his estate of Lagrange till he received the command of the army of Ardennes, with which he won the first victories at Philippeville, Maubeuge, and Florennes. But the hatred of the Jacobins increased, and at length Lafayette, who had come from the army to Paris publicly to denounce the Jacobin Club, finding on his return to the camp that he could not persuade his soldiers to march to Paris to save the constitution, rode over into the neutral territory of Liège. He was seized by the Austrians and imprisoned at Olmütz till Bonaparte obtained his liberation in 1797; but he took no part in public affairs during the ascendancy of Bonaparte. He sat in the Chamber of Deputies from 1818 to 1824 as one of the extreme Left, and from 1825 to 1830 he was again a leader of the opposition. In 1830 he took an active part in the revolution, and commanded the National Guards. In 1824 he revisited America, by invitation of Congress, who voted him a grant of 200,000 dollars and a township of land. He died at Paris, 20th May 1834.

See his *Mémoires et Correspondance* (8 vols. 1837-40); books by Regnault Warin (1824), Saranne (1832), B. Tuckerman (New York, 1839), Bardoux (1892-93), Crow (1916); Belloc, *Last Days of the French Monarchy* (1916); the *Diary and Letters of Gouverneur Morris* (1888); and Doniol's *Participation de la France à l'Établissement des États Unis* (1889-91).

Laffitte, JACQUES, a French banker and statesman, born at Bayonne, 24th October 1767, began life as a banker's clerk in Paris, and in 1805 began business on his own account. He soon acquired great wealth and in 1814 was made governor of the Bank of France. After the second restoration he joined the opposition in the Chamber of Deputies, and enjoyed the highest popularity in Paris; he was elected by all twenty sections in the city in 1817. In 1830 he made his house the headquarters of the friends of the revolution, and out of his private means supplied great part of the funds for carrying through the movement. In November he was entrusted with the formation of a cabinet, but he only held power until 12th March following. Meanwhile he was obliged to sell his property to pay his debts. A national subscription preserved him his hôtel in Paris; and from the ruins of his fortune he founded a new Discount Bank in 1837. As the government receded from the principles of the revolution of 1830 Laffitte became active in opposition, and in 1843 was elected president of the Chamber of Deputies. He died at Paris, 26th May 1844.

Laffitte, PIERRE (1823-1903), disciple and friend of Comte, and exponent of Positivism (q.v.).

Lafite. See BORDEAUX.

Lafitte, JEAN, pirate. See BARATARIA.

Lafontaine, JEAN DE, was born, 8th July 1621, at Château-Thierry, in Champagne. His early education was neglected. He was placed in a clerical seminary, which he soon quitted to undertake his father's duties as master of woods and forests. Early in life he devoted himself to the study of Rabelais, Marot, and other old writers, and set himself to the composition of verses—all of them more or less worthless. In 1654 he published a verse translation of the *Eunuchus* of Terence, and then went up to Paris, where he won the favour of Fouquet, who awarded him a pension of 1000 francs on condition that he furnished a piece of verse quarterly. The verses thus produced showed considerable originality, and their author became the darling of the ladies of highest distinction in Paris.

During six years he wrote little, abandoning himself to a life of gallantry and to social meetings with Molière, Boileau, and Racine. His *Contes et Nouvelles en Vers* appeared in 1665; his *Fables Choisies mises en Vers* in 1668; and his *Amours de Psyche et de Cupidon* in 1669. Among his chief patronesses were Marguerite of Lorraine and the Duchess of Bouillon, and for nearly twenty years he was maintained in the household of Mme de la Sablière. In 1684 he read an admirable *Discours en Vers* on his reception by the Academy, to which he was admitted much against the wish of the king. In her later years Mme de la Sablière became devout, but Lafontaine attached himself to the dissolute Prince de Conti, pursuing in his old age the follies and dissipations of his youth. She died in 1693, and for his two remaining years he was cared for by Mme d'Hervart, who maintained him until his death, which occurred at Paris on April 13, 1695. During an illness about two years before he had allowed himself to be converted in so far at least as to acknowledge the impropriety of the *Contes* and, it is said, destroy a new play. He was one of the idlest, the most reckless, the most frivolous and dissipated of men, but he was likewise one of the most lovable and charming, as he was assuredly one of the most gifted.

The subjects of the *Contes* are taken from Boccaccio, Ariosto, Machiavelli, Rabelais, the *Heptameron*, the *Cent Nouvelles nouvelles*, Apuleius, Athenæus, and other writers. The stories are retold with inimitable skill, Lafontaine surpassing in wit and in narrative dexterity the authors with whom he challenged comparison. Nothing could be easier, more sparkling, more ingeniously and gracefully turned than his verse. The language has a racy archaic flavour, the style combining the elegance of the 17th-century writers with something of the Rabelaisian richness. The subjects are nearly all of the grossest description, and their grossness is in most cases artfully heightened by Lafontaine. His story of Alaciel, for example, is a deeply-degraded version of the sombre though voluptuous tale told by Boccaccio. As for the *Fables*, their charm is undying, and they are free from the impropriety of the *Contes*. It has been truly said of them by Silvestre de Sacy that they supply three several delights to three several ages—'The child rejoices in the freshness and vividness of the story; the eager student of literature in the consummate art with which it is told; the experienced man of the world in the subtle reflections on character and life which it conveys.' Nevertheless the general verdict of French critics on Lafontaine can hardly fail to seem unduly high to his English readers. Théodore de Banville, for example, maintains that he is not merely an artist supreme in lyric comedy, but a great romantic poet, in whose work there is always a 'window open to heaven.' Such praise is hardly judicious. Lafontaine was a sparkling satirist, a brilliant versifier, a well-nigh incomparable master of the difficult art of telling a story in rhyme. He combined, as another critic has said, the flower of the *esprit Gaulois* with a perfume of antiquity. He was a great—not merely an amusing—writer, but he was not a great poet. With all its graces, his verse has not the melody, the passion, the power of suggesting a beauty and mystery beyond the meaning of the words, that mark high lyric work.

See Sainte-Beuve's *Portraits Littéraires*, vol. i.; Banville's *Petit Traité de Poésie Française*; Taine's *Essai*; and monographs by Lucas Collins (1882), Grouchy (1893), Lafenestre (1895), Faguet (1900), and F. Hamel (1912).

Lagerlöf, SELMA, Swedish romantic novelist, was born, the daughter of an army officer and landed proprietor, on the estate of Mårbacka in

Värmland, 20th November 1858. She taught for ten years in a girls' school in Stockholm, and was afterwards a governess at Landskrona, but from 1895 gave herself entirely to literature. The legends of her native district, scarce a century old, but with primitive elements in them, were the material upon which she experimented. In 1890 some chapters of her *Gösta Berlings Saga*, spun out of these materials, won a prize in a competition conducted by a Stockholm literary periodical, *Idun*. The complete romance was published next year. At once Miss Lagerlöf took rank as the foremost Swedish writer of her day, and one of the foremost in Europe. Others of her books have shown her genius under new aspects, and this or that has been preferred by critics, but *Gösta Berling* remains the most popular. After *Osynliga Länkar* (1894; trans. *Invisible Links*, 1899) came *Antikrists Mirakler* (1897; trans. 1899), which, inspired by the frescoes of Orvieto Cathedral, proved that her power was not inseparable from the Värmland scene. *En Herrgårdssägen* (1899) and *Drottningar i Kungahälla* (1899; *Queens of Kungahälla*, 1907) were followed by another masterpiece, *Jerusalem* (1901-2; trans. 1915-17), in which the scene shifts from Dalarne to the Holy Land; a profoundly imaginative tale of peasant religious enthusiasm. *Nils Holgerssons Underbara Resa* (1906-7; *The Adventures of Nils*, 1907-11) was written to furnish primary schools with a book about Sweden. Among later works *Kejsarn av Portugal* (1915; *Emperor of Portugal*, 1916) has been hailed as her best constructed novel. *Mårbacka* (trans. 1924) is autobiographical. Miss Lagerlöf was the first woman admitted to the Swedish Academy (1914), and the first Swede awarded a Nobel Prize (1909).

Lago Maggiore. See MAGGIORE.

Lagomys. See OCHOTONA.

Lagoon (Lat. *lacuna*, 'a hollow,' 'a pool') is a species of lake formed by the overflowing of the sea or of rivers, or by the infiltration of water from these. They are found only in low-lying lands, such as the coasts of Holland, Italy, the Baltic, and the east coast of South America; are generally shallow, and do not always present the same aspect. In some cases they are completely dried up in summer; in others, after being once formed, they preserve throughout the whole year the character of stagnant marshy pools; and in others again the sea, which reunites them to itself in winter, is separated from them in summer by a bar of sand or shingle.

Lagos, a seaport on the south coast of Portugal, 30 miles ENE. from the extremity of Cape St Vincent; pop. 8000, who fish for tunny and sardines. In the bay of Lagos Admiral Boscawen defeated the French Toulon fleet, 18th August 1759.

Lagos, a province, an island, and a town in the SW. of Nigeria. The island has an area of 3½ sq. m.; and at its western end stands the town, the principal commercial place on this part of the coast, with a safe harbour (improved since 1911). Pop. 40,000. Previous to the interference of the British, Lagos was one of the chief entrepôts for the export of slaves. Created a separate government in 1863, the colony formed part of the West African Settlements (from 1866) and of the Gold Coast (from 1874) successively. It was constituted a colony in 1886. In 1906 the Southern Nigeria Protectorate was placed under the administration of Lagos colony, and the whole area was named Colony and Protectorate. The latter was amalgamated in 1914 with the Protectorate of Northern Nigeria to form the Colony and Protectorate of Nigeria, in which Lagos is the capital of Southern Nigeria.

Lagosta (Slav. *Lastovo*), a Dalmatian island, Italian by the treaty of Rapallo (1920).

Lagostomus. See CHINCHILLA.

Lagrange, JOSEPH LOUIS, COMTE, the great algebraist, was born at Turin, 25th January 1736. His father, who, as well as his mother, was of French descent, was war-treasurer to the Piedmontese government. In later life Lagrange explained his first application to the study of mathematics by the fact that the family property had been lost in speculations. At the age of seventeen a paper of Halley's in the *Philosophical Transactions* turned him towards algebra and analytical geometry, and then his powers developed with striking precocity. In 1754 he was appointed mathematical professor in the Royal School of Artillery; at the same time he discovered a series for differential expansion analogous to the binomial theorem of Newton, and attracted Euler's attention by a letter on the general solution of certain isoperimetrical problems which had been proposed to the best mathematicians in Europe. He also corresponded with D'Alembert, then the leader of French scientific society. At Euler's suggestion Frederick the Great appointed Lagrange to succeed him as director of the Academy of Berlin. Before leaving Piedmont he did much original work in integration and partial differences, applying mathematical methods to physics and astronomy, and assisted, in 1758, to found the Turin Academy of Sciences. In 1762, by his completion of the Calculus of Variations, the main theory of which had been foreshadowed in his discussion of isoperimetricals, and his investigations of sound, harmonics, &c. by new analytical methods, Lagrange gained a European reputation, though at the expense of his health, which was never afterwards robust. His memoir on the moon's libration, which in 1764 obtained the prize of the French Academy, brought into prominence his great 'principle of virtual velocities,' which was presently to be so largely utilised in dynamical problems. Lagrange gave the first complete proof of Laplace's generalisation, that, so far as the laws of motion are concerned, our solar system is necessarily stable and permanent, because all the changes of the planetary orbits, caused by their reciprocal gravitation, are periodic. While in Prussia, from 1766 to 1787, Lagrange read before the Berlin Academy about sixty dissertations on the application of the higher analysis to mechanics and dynamics. From the leading results of these memoirs and of his previous work, fully marshalled and systematised, arose Lagrange's principal work, the *Mécanique Analytique*, which was published (1788) in Paris under the supervision of Legendre. The central theory, unifying the science of dynamics in all its developments, was the principle of virtual velocities which he had established in 1764.

Just before the issue of the *Mécanique Analytique*, Lagrange arrived in Paris, to be welcomed by the court and lodged in the Louvre with a pension of 6000 francs. In 1791 he was elected foreign member of the Royal Society of London. He commanded universal respect even in the crisis of the Revolution, and was appointed professor in the Normal and Polytechnic Schools, one of the first members of the Bureau des Longitudes, and was enthusiastically in favour of the new decimal and metrical system. He was appointed member of the senate under Bonaparte, who also bestowed on him the title of Count and the Grand Cross of the Legion of Honour. He did more than any other, except Euler, to develop the applications of the infinitesimal calculus.

Partly owing to his weak constitution, Lagrange

was extremely regular in his habits, abstemious in food, with his work ever most systematically distributed. His various treatises, read to the Academies of Turin, Berlin, and Paris, now fill seven quarto volumes. Other important works are *Théorie des Fonctions* (2d ed. 1813), *Leçons sur le Calcul des Fonctions, Résolution des Équations Numériques*. Lagrange died at Paris, 10th April 1813.

La Guaira. See GUAIRA.

La Hague, the north-west extremity of the peninsula of Cotentin, in the north of France, over against Alderney of the Channel Islands. It is crowned by a lighthouse, 158 feet high. This must not be confounded with La Hogue (q.v.).

La Harpe, JEAN FRANÇOIS DE, French writer, born at Paris, November 20, 1739, first attracted attention in 1763 by a successful tragedy, *Warwick*. His fame was further enhanced by a series of eloquent *Éloges*. But his other plays on the classic model, such as *Timoléon*, *Pharamond*, and *Gustave Wasa*, entirely failed. *Mélanie*, *Philoctète*, and *Coriolan* were more successful. His best-known works are, however, his critical lectures, published in 12 vols. (1799–1805) as *Lycée, ou Cours de Littérature*, which long remained a standard of literary criticism. That portion which relates to ancient literature is of little value, and that which treats of contemporary writers is entirely worthless, owing to the bitterness and pride of the critic; but the intervening portion gives a fairly complete critical history of French literature. His *Correspondance Littéraire*, published in 1801, by the bitterness of its criticisms rekindled fierce controversies. The Revolution, at its commencement, found no more ardent admirer than La Harpe; but after five months' imprisonment for refusing to countenance the extremes to which the immoderate zealots of the movement pushed matters his views entirely changed, and he became a firm supporter of church and crown. A posthumous work, *La Vision de Cazotte*, must be ranked amongst the best achievements of his pen. His graceful style and keenness of observation are perhaps more than counterbalanced by his partiality, vehemence of judgment, and superficiality. La Harpe died February 11, 1803. See Sainte-Beuve, *Causeries du Lundi*, vol. v.

Lahn, an important affluent of the Rhine (q.v.) in its middle course.

La Hogue, a roadstead on the east side of the peninsula of Cotentin, in the north of France (not to be confounded with Cape La Hague, q.v.). On May 19, 1692, the French fleet of forty-four sail under Tourville, which Louis XIV. had collected for the purpose of invading England in support of James II., was defeated here by the combined English and Dutch fleets of ninety vessels under the Jacobite Admiral Russell. Twelve large French line-of-battle ships which took refuge in the shallow roadstead of La Hogue were destroyed, under the eyes of King James, by boats' crews led by Admiral Rooke. See Macaulay's *History*.

Lahore, capital of the Punjab and of a district and of a division, stands near the left bank of the Ravi. Pop. (1868) 125,413; (1921, with cantonment) 281,781—149,000 of them Mussulmans. The native city covers 640 acres, and is surrounded by a brick wall 16 feet high, with thirteen gates. The fort occupies a commanding position to the north-east, and near it are the mosque of Aurungzebe and Runjeet Singh's tomb. The older portion of the European civil station is called Anarkalli, which is connected with the city by a fine road, the Old Mall. Anarkalli contains the government offices, university buildings, &c. To the south-east the Upper Mall stretches 3 miles to Government House

and the Lawrence Gardens. Three miles farther is the military station or cantonment of Lahore, formerly called Mián Mir. The Punjab University, largely endowed by native chiefs and gentlemen—Moslem, Sikh, and Hindu—is one of the most flourishing educational establishments in India. There are also the Oriental College, the Government College, Government Medical School, Mayo Hospital, the Roberts Institute, and the Aitchison College for the sons of native noblemen, founded on the plan of the English public schools. Lahore suffered severely from an earthquake in April 1905.

The origin of Lahore is uncertain, but is certainly not later than the 7th century A.D. Under the Mogul empire the city reached its greatest size and magnificence, and is said to have had a population of over 1,000,000 souls. Akbar and Jahangir lived at Lahore, and the remains of the beautiful and magnificent buildings erected by them and other great Mogul emperors are still considerable, as well as Jahangir's wonderful gardens at Shādra and Shālimār. Since the time of Aurungzebe nothing of importance has been constructed. In 1799 Ranjeet Singh, the Sikh ruler of the country, removed the seat of government to Amritsar, about 30 miles to the south; but in 1846 a British Council of Regency (of the Punjab) was established in Lahore, in 1849 the young Maharaja Dhuleep Singh transferred the government of the state to the East India Company, and Lahore became the capital of the new British province of the Punjab. It is an important railway centre.

The Lahore district has an area of 2691 sq. m., and a population of above a million. The Bari Doab Canal is an important government irrigation work, and nearly 1,000,000 acres in the district are cultivated by means of artificial irrigation of some sort.

Lahr, a town of Baden, on a small affluent of the Rhine, 20 miles SSE. of Strasburg by rail, with manufactures of cottons, pottery, &c., and printing establishments; pop. 14,000.

Laibach (Slovenian, *Ljubljana*), a town of Yugoslavia, capital of the former Austrian crownland of Carniola, and of the old kingdom of Illyria, lies in an extensive plain on the river Laibach, 7 miles above its junction with the Save, and 92 by rail NE. of Trieste. The streets of the old town, which goes back to Roman times, are narrow and irregular, those of the new suburbs wide and handsome. The town was fortified from 1416 down to the beginning of the 19th century. Laibach has been a bishop's see since 1461, and has a cathedral, castle (15th century), university (1920), national museum, &c. It is likewise a place of some commercial and industrial importance. Pop. 53,000. A congress met here in 1821 to regulate the affairs of Italy. To the south-west lies Laibach Morass, upwards of 80 sq. m. in extent, most of which has been brought under cultivation; the remainder affords a supply of turf. Interesting lake-dwellings have been discovered in it.

Laidlaw, WILLIAM, the friend and latterly amanuensis of Sir Walter Scott, was born at Blackhouse in Selkirkshire in November 1780. After farming with but little success at Traquair and Liberton, he settled in 1817 as a kind of factor and manager on the estate of Abbotsford, and was Scott's trusted counsellor in all his schemes of improvement. Here, with the exception of but three years after the disaster in Scott's affairs, he lived till Scott's death in 1832, his constant companion and household friend, honoured by an affection that his loyalty deserved. Laidlaw's acquaintance with Scott began in the autumn of

1802, and he supplied some of the materials for the third volume of the *Minstrelsy of the Scottish Border*. The sweet and simple pathos of his own ballad, 'Lucy's Flittin', would alone have kept the name of 'Willie' Laidlaw from being forgotten even were that name not safely enshrined in a hundred pages of Lockhart's *Life of Scott*. After his great master's death Laidlaw was factor successively on two Ross-shire estates, and died at his brother's farm at Contin in that county, 18th May 1845.

Laing, DAVID, a learned antiquary, was the son of an Edinburgh bookseller, and was born in April 1793. For thirty years he followed his father's trade, earning the esteem of all the antiquaries and scholars of his time by his remarkable knowledge and his readiness to communicate it. In 1837 he became librarian of the Signet Library, a post which he held till his death, 18th October 1878. Laing was honorary secretary of the Bannatyne Club throughout, and himself edited many of its issues; while his contributions to the *Transactions of the Society of Antiquaries of Scotland* were innumerable, yet all stamped with characteristic thoroughness. He left a private library of unusual value; a rich collection of MSS. was bequeathed to Edinburgh University.

Laing's more important works were his edition of Robert Baillie's *Letters and Journals* (1841-42), the works of John Knox (6 vols. 1846-64), and of the Scottish poets, Sir David Lyndsay, Dunbar, and Henryson. See *Life* by Gilbert Goudie (1914).

Laing, MALCOLM (1762-1818), born on the paternal estate in Orkney, was educated at Edinburgh, and called to the bar. He completed the last volume of Henry's *History of Great Britain*, and in 1802 published his own *History of Scotland from the Union to Queen Anne*. In the 1804 edition occurs his attack on Queen Mary for participation in Darnley's murder. His *Poems of Ossian* is a fierce onslaught on Macpherson.—His brother SAMUEL (1780-1868) wrote on his observations in Norway, Sweden, and Denmark, and translated the *Hemskringla* (not too accurately). He also published books on the German Catholic movement, and the events of 1848 and 1849. Samuel's son, SAMUEL (1812-97), chairman of a Brighton railway and M.P. for Wick, wrote pamphlets on the contradictions between science and revealed religion.

Laing's Nek. See COLLEY.

Lairesse, GERARD (1640-1711), a Dutch painter with classical sympathies, exercised an influence on art schools through his *Art of Painting*.

Lais, the name of one or, more probably, two Greek courtesans, celebrated for extraordinary beauty. The elder is believed to have been born at Corinth, and flourished during the Peloponnesian war. She was supposed to be the most graceful woman of her time in Greece, but in character she was capricious, and greedy of money, and in her old age she gave way to intemperance.—The younger appears to have been born in Sicily, but came to Corinth when still a child. She sat as a model to the painter Apelles, and is said to have been stoned to death by some Thessalian women whom she had made jealous.

Laissez Faire is a phrase which expresses the attitude towards the State of the school of political economists founded by Adam Smith. The phrase is usually traced to Gournay, merchant and economist of the Physiocratic school. But it is said first of all to have been the remonstrance of French merchants against the system of the great statesman Colbert, who established a minute regulation of industry by the State. They believed that the best thing the State could do for industry was to leave it alone. The phrase therefore embodied the protest of private industrial enterprise against

minute, vexatious, and oppressive regulation by a French state, which at that time represented only the court and a narrow privileged class, often incapable, and always engrossed in war, intrigue, and other pursuits alien to industry. But in England more than any other country it has been accepted as a watchword of free trade and free industry, as contrasted with the protective system and state regulation generally.

Laity, the general body of the people, opposed to the Clergy (q.v.), or to some other profession. The word (derived through French from Greek *laos*, 'people') has superseded *lewd*, which has developed a new meaning.

Lake, GERARD, Viscount, born 27th July 1744, served in Germany (1760), America, and at Vinegar Hill (1798). He defeated the forces of Gwalior at Aligarh and Delhi (1803), Sindia at Leswarree (1803), and Holkar near Furruckabad (1804). Created a baron (1803) and viscount (1807), he died in 1808. See *Memoir* by Pearse (1908).

Lake (Lat. *lacus*) is a portion of water surrounded by land. Lakes are of two kinds—fresh-water and saline—and have been formed in various ways. Taking first the *fresh-water lakes*, these may be grouped as follows: (1) *Obstruction Lakes*.—Some of these are more or less temporary sheets of water, such as the lake-like expansions of certain rivers, and the deserted loops of river-channels. Other temporary lakes are due to the operations of the beaver; to the choking of the narrower passages of a river-channel by drifted vegetable debris or river-ice; or to the advance of a glacier across the mouth of a lateral valley. Now and again rock-falls and landslips obstruct the drainage of valleys and give rise to lakes; and similar results have been brought about by the advance of lava across a valley. (2) *Crater Lakes*.—These occupy the craters of extinct or quiescent volcanoes. (3) *Sink Lakes*.—These lie in hollows caused by subsidence of the surface consequent upon the removal of underlying soluble rocks, such as rock-salt, and calcareous and gypseous rocks. (4) *Earth-movement Lakes*.—Unequal movements or warping of the earth's crust have occasionally originated hollows by direct subsidence. It is possible also that local elevation by affecting the lower ends of valleys may sometimes have obstructed the flow of rivers, and thus given rise to lakes. (5) *Glacial Lakes*.—These consist of (a) hollows of erosion or *rock-basins*, which have been excavated by glacier-ice, and (b) hollows caused by the unequal distribution or accumulation of glacial detritus during the glacial period. (6) *Subterranean Lakes*.—These are found chiefly in calcareous regions, where they occupy the underground channels which have been excavated by the chemical and mechanical action of water (see CAVES). They are met with also in volcanic regions, filling, or partially filling, the cavities which are sometimes seen in lava-flows (see LAVA).

Fresh-water lakes are very unequally distributed. They are most numerous in those regions which were overflowed by land-ice during the glacial period, as in the British Islands, Scandinavia, Finland, &c., Canada, and the adjoining United States. Lakes occur at all heights above the sea; the most elevated being Lake Tsana in Abyssinia (7500 feet), Lake Titicaca in the Bolivian Andes (12,500 feet), and Askal Chin in Tibet (16,600 feet). The largest lake in the world is Lake Superior, which covers an area of 31,200 sq. m., and has a mean depth of about 475 feet. Lake Baikal, in central Asia, is the largest and deepest mountain-lake, its area being 13,500 sq. m., and its mean depth 850 feet, but in places it reaches a depth of more than 4000 feet. Of the

mountain-lakes of Europe, Loch Morar is 1017 feet deep, the Lake of Geneva 1013 feet, Lago Maggiore 1220 feet, and the Lake of Como 1341 feet.

Salt Lakes.—Two kinds are recognised: (a) portions of the sea cut off from the general oceanic area by epigene or hypogene agencies; (b) lakes, originally fresh-water, which have been rendered saline by evaporation and concentration. Those of the first group range in size from mere pools and lagoons up to inland seas, such as those of the great Aralo-Caspian depression. The Dead Sea and the Great Salt Lake of Utah are good examples of the second group of saline lakes, which might be defined shortly as lakes which have no outlet to the ocean. The Caspian Sea is 97 feet below the level of the Black Sea, has an area of about 170,000 sq. m., and is from 2500 to 3000 feet deep in the deepest parts. A still more depressed area is that of the Dead Sea, the surface of which is 1292 feet below the level of the Mediterranean Sea.

Lake District, the name applied to the picturesque and mountainous region comprised within the counties of Cumberland, Westmorland, and a small portion of Lancashire, within which are grouped as many as sixteen lakes or meres, besides innumerable mountain tarns and streams, and a series of mountains rising in four points to a height of over 3000 feet. The district extends about 30 miles from north to south by about 25 from east to west, and contains within its compass the utmost variety and wealth of natural scenery, soft and graceful beauty ever alternating closely with grandeur and sublimity. Indeed nowhere else in the world perhaps is so much varied beauty to be

Hawes Water in the east; Bassenthwaite in the north; West Water, Ennerdale Water, Buttermere, Crummock Water, and Lower Water in the west; and Derwentwater, Thirlmere, Grasmere, and Rydal Water in the heart of the district. The highest mountain-summits are Scafell Pike (3210 feet), Scafell (3161 feet), Helvellyn (3118 feet), and Skiddaw (3060 feet), all easily accessible, in great part even on pony-back. Besides these there are hundreds of mountains and *pikes*, many clothed with the richest greenery. The lakes are fed and emptied by beautiful mountain-streams and *becks*, often forming noble waterfalls and *forces*, like Lodore Falls, near Derwentwater; Dungeon Gill Falls, near Grasmere; Stockgill Force, near Ambleside; Scale Force, near Crummock Water; Aira Force, near Patterdale; and Dalegarth Force, near Boot. Among the places most visited, besides these, are the towns or villages of Keswick, Coniston, Bowness, Hawkshead, Ambleside, Ulverston, Rosthwaite, Grasmere, and Patterdale; Borrowdale; the Langdale Pikes; the Duddon Valley, celebrated in Wordsworth's series of sonnets; Honister Pass and Kirkstone Pass; the Castle Rock of St John, celebrated in Scott's *Bridal of Triermain*; and such minor but imposing mountain-peaks as Blencathara or Saddleback (2847 feet), near Keswick; Coniston Old Man (2633), near Coniston; and the Great Gable (2950), near Westdale Head. To preserve a footing for nature and the public the National Trust has acquired property in various parts of the district—notably the central knot of mountains (1923-24) and Gowbarrow Park (including Aira Force) on Ullswater (1906).

But far more even than its romantic natural beauty is the rare interest that has been added to this district by the group of illustrious poets who made it their home about the beginning of the 19th century, and who were somewhat unintelligently grouped together by unsympathetic critics as forming the 'Lake School' of poetry. Of these the most illustrious was Wordsworth, who has interpreted for us with marvellous fidelity and force the life—animate and inanimate alike—of the country which he knew and loved. His *Excursion* is the best of all guide-books to the Lakes—*Wordsworthshire*, as Lowell aptly terms the district; and students of English poetry will never lose an interest in those hallowed scenes in which the modern High-priest of Nature first expounded the co-operative spiritual harmony between man and nature herself, and taught how the mute life in nature ever leads upwards to the conscious life in man and the creative force in God. He was born at Cockermouth; he had his education at Hawkshead school; he lived thirteen years in three houses at Grasmere, and thirty-seven at Rydal Mount; and he lies fittingly, with his wife, his children, and his gifted sister Dorothy, in Grasmere churchyard, in the midst of the scenery he has made enchanted. His first house at Grasmere, Dove Cottage or Town End, his home from December 1799 to May 1808, and of De Quincey for more than twenty years thereafter, was bought in 1890 by public subscription for permanent preservation as a memorial of Wordsworth. His lifelong friend and brother-poet, Southey, lived for forty years at Greta Hall, near Keswick, and rests in Crosthwaite churchyard hard by. Here also at Greta Hall Coleridge lived awhile, often visiting the Wordsworths; and here his children were brought up by Southey. The hapless Hartley Coleridge lived long at Nab Cottage, near Rydal

found within so narrow a space. The district is visited every year by thousands of tourists, who are able, from Keswick or Ambleside as a centre, to explore the whole region, and climb all its chief mountains within a week. But it must not be forgotten that many of the most lovely spots lie out of the ordinary routes, and that for those travellers who can afford the time there is ample occupation for a much longer period. The Lake District is fringed by such considerable towns as Penrith, Kendal, Lancaster, Barrow, Cockermouth, and Whitehaven; and already railways bring the traveller, from different points of the compass, to Keswick, to Windermere, to Coniston, and to Boot. The principal lakes are Windermere, Esthwaite Water, and Coniston in the south; Ullswater and

Water, and is buried beside Wordsworth in Grasmere. Christopher North lived at Elleray, near Windermere; Shelley lived some time at Keswick after his marriage. Harriet Martineau had her home at the Knoll, near Ambleside; and not far off is Fox How, where Dr Arnold found rest from the strain of Rugby, and where he died. James Spedding was born at Bassenthwaite, and here was visited by Edward FitzGerald and Tennyson; and the latter lived some time at Tent House on the east bank of Conistone Lake. At Brantwood, near Conistone Lake, Ruskin resided during the later years of his life. The poet Gray spent a fortnight of 1769 in traversing the Lake District, and his *Journal* shows that he looked before his time at nature with 'distinctness and unaffected simplicity,' in Wordsworth's phrase. Hither came in the summer of 1802 Charles Lamb with his sister Mary to spend three weeks with Coleridge at Keswick. He appears to have thoroughly enjoyed the new experiences, yet in a letter to his friend Manning (24th September 1802) he writes with a spirit worthy of Dr Johnson: 'After all, Fleet Street and the Strand are better places to live in for good and all than amidst Skiddaw.'

Wordsworth himself wrote a *Description of the Scenery of the Lakes in the North of England* (1822), in which the descriptions glow with recollected love, and his indignation is hot against all wanton attempts to artificialise the face of nature. See Professor Knight's *English Lake District, as interpreted in the Poems of Wordsworth* (1878), and his *Through the Wordsworth Country* (1887); Harriet Martineau's *English Lakes*, with illustrations by W. J. Linton (1858); T. G. Bonney's *English Lake Scenery* (1876); J. E. Marr's *Geology of the Lake District* (1916); H. R. Mill's bathymetrical survey of the lakes (1895); two books by Edwin Waugh (1861-80); Baddeley's *Thorough Guide*; Bradley's *Highways and Byways in the Lake District* (illus. by Pennell, 1901); and books on the region by Palmer (1902), Collingwood (1902), Canon Rawnsley (1899-1906, including his revised edition of Jenkinson's *Guide*), Brabant.

Lake-dwellings (Ger. *Pfahlbauten*, 'pile-dwellings'), habitations placed on platforms supported by piles, or other substructures, in the shallows around the margins of lakes, only in modern times became known to archaeologists, although the first notice of a lake-dwelling community was written by Herodotus in the 4th century B.C. He describes certain tribes on Lake Prasias in Macedonia as living in huts on platforms

Fig. 1.—Lake-dwelling restored.

supported on piles which were approached from the land by a single narrow bridge. It now appears that from the very earliest times down to the commencement of the historic period there were lake-dwellings of various descriptions in the lakes of central Europe, and that a similar custom continued in Scotland and Ireland to much later times. Owing to an extraordinary subsidence of the waters of the Swiss lakes in 1854 the remains of a lake-dwelling were discovered at Meilen in the lake of Zurich, and it was speedily found that similar remains of pile-dwellings, each indicating the site of a relic-bed in the mud of the lake-bottom, existed in proximity to the shores of most of the lakes in Switzerland. The relics of this singular phase of early civilisation disclose the condition of the industrial arts in the stone, bronze, and iron periods. There are several varieties of artificial lake-dwellings. The substructure is usually all that remains. It has been found in some instances to be a mass of stones, and in others a mass of brushwood, built up from the bottom of the lake. The more common form in Switzerland, however, is a substructure of piles, driven into the lake-bottom, and the heads brought level to support the platform for the huts. Where the water is deep and the bottom soft, the piles are driven only for a short distance, and stones accumulated around and

among them to keep them in position. In some cases the lower ends of the piles have been mortised into a kind of horizontal framework of logs, to give greater stability to the superstructure. The piles are usually tree-trunks with the bark on, and the platforms were frequently the same, though sometimes the trunks were split or roughly boarded. On this platform the huts were erected. Nothing usually remains of them, but in some instances the remains of the lower tiers of boarding have been detected. In all cases in which the form of the huts could be determined it has been rectangular. But it seems deducible from the curvature of some pieces of hardened clay, with the marks of interwoven branches upon them, that circular huts of wattles and daub were also constructed. They were doubtless thatched with straw and reeds. There were many huts on one platform, and a narrow gangway was generally carried on piles from the platform to the shore. Sometimes a dug-out canoe seems to have been used instead of a gangway, but as they seem often to have had horses, sheep, goats, and cattle on the platform, the gangway would be in such cases a necessary adjunct to a settlement, the piles of which have been occasionally found to indicate a superficial area of 100,000 square feet. It was therefore practically a village on piles. The lake-dwellers

early took to cremating their dead, but enough evidence remains to justify the conclusion that they not only were at first but remained throughout broad-headed, like the present-day inhabitants of the region (the 'Alpine race'). Probably they came, bringing with them some elements of their civilisation (such as agriculture), from Asia Minor. From the Alps movements can be traced through Germany to Denmark, Belgium, and Britain, and into Italy, where their culture developed into that of the Terremare (see TERRAMARA).

In the settlements of the stone age the cutting implements, such as axes, knives, saws, are made only of stone. As flint is not abundant in Switzerland, the larger implements, such as axes, are generally made of diorite, serpentine, and other hard and tough stones, and sometimes even of nephrite and jadeite. The smaller implements, such as knives, saws, arrow-points, and spear-heads, are usually made of chipped flint, but the axes are cut out of the block by a sawing process, the cuts being made to some depth on opposite sides, and the parts separated by a blow. Those axes or axe-hammers that

relic-beds underneath the dwellings, are the urus and bison, the elk, the ibex, and chamois, the wild-boar and stag; and they kept the domestic ox, the horse, swine, sheep, goats, and dogs. They stored nuts and dried apples cut in halves; and among the charred remnants of their food fragments of their cakes of bread have been discovered. To the same charring action of the fire which seems in several cases to have consumed the huts we owe the preservation of many specimens of their textile fabrics, woven of well-spun flaxen threads, and of their fishing-nets, and mats made of bast or fibre of the lime-tree, and ropes and lines of plaited twigs, or cords of flaxen thread.

The pile-dwellings of the bronze age appear to have been placed farther from the shore than those of the stone age. The settlements of the bronze age also exhibit an increase in the number of domestic animals, and a corresponding decrease in the number of wild animals used for food. The pottery, though not thrown upon the wheel, is finer in form and much more highly ornamented, often with patterns of great elegance, painted in black or red, and sometimes inlaid with strips of tin. In settlements founded in the bronze age, such as that at Morges in the lake of Geneva, bronze is almost the only material used in the manufacture of their implements and weapons; and consequently stone and bone implements are as rare in them as bronze implements are in the earlier settlements. But there are a number of settlements which seem to have existed during the transition period, in the relic-beds of which the implements of stone and bronze are found mingled together. The forms of the bronze objects found in the lake-dwellings do not materially differ from those generally found diffused over central Europe. One feature of the lake-dwellings is the abundance and variety of the bronze ornaments, and the extraordinary development of the pins with ornamental heads, which are found of all sizes up to 15 inches in length. The bracelets are penannular, or often hollow, or C-shaped in section, and decorated on the convex surface with a variety of sunk patterns composed of combinations of straight lines and circles. The principal varieties of the implements and weapons of bronze are axes, chisels, gouges, saws, sickles, knives, daggers, spear-heads, swords, hammers, and anvils.

The knives are very abundant, and there is one large variety, with a curved and almost scythe-shaped blade, having a thick back, which is characteristic of the lake-dwellings. There is a smaller knife with an oval or crescent-shaped blade, so thin and sharp that it has been taken for a razor. The swords are mostly of the broad-bladed and slightly tapering form found in central Europe, and often have their handles also of bronze. Moulds of stone for casting the different varieties of bronze implements, weapons, and ornaments have been found in the relic-beds, showing that the articles were manufactured in the settlements in which they were used. In the principal settlement of the bronze age at Morges the number of bronze articles found exceeds 500.

That of Marin or La Tène, in the lake of Neuchâtel, is the best known of the lake-dwellings of the iron age. As the area occupied by the piles is about 1200 feet long by 250 feet wide, the settlement was undoubtedly a large one. Several caldrons of thin bronze with iron ring-handles attached to the rim were found here; and a number of

Fig. 2.—Ground-plan of Crannog in Drumaleague Lough.

were perforated by a hole for the haft were bored by a drill of soft wood worked with sand. The stone axes were, however, for the most part mere wedges not perforated for the haft, but fixed in a socket in the end of a short piece of stag's horn, through which the perforation for the handle was made. Sometimes the handle itself was perforated, and one end of the stag's horn mounting, which carried the stone axe socketed into its other end, was mortised into the handle. Bitumen was used as a cement to fix the stone tools of all kinds in their handles of horn or wood. Arrow-points, notched or barbed, and harpoon-points for spearing fish were made of bone. The pottery of the stone age settlements was coarse but plentiful, and the cooking vessels were occasionally of large size. The lake-dwellers of the stone age were agriculturists, cultivating on the adjacent mainland their crops of wheat, barley, millet, and flax, and rearing flocks and herds, the cattle being sometimes stalled upon the platforms. They were hunters and fishers, and their food seems in consequence to have been both varied and plentiful. Amongst the animals they hunted, whose remains have been found in the

small articles of bronze were also found, none of which were of bronze-age types. The weapons were all of iron. They consist of short double-edged swords, the edges straight to within a short distance of the point, and large, broad, and thin-bladed spear-heads, sometimes oval or leaf-shaped, but usually with wavy or indented edges. Several of the sword-blades are damascened, after the ancient method of damascening by welding together strips of metal differently prepared, and some have makers' marks. The sheaths are of iron, beaten very thin, and are remarkable both for their elegance of form and the peculiar nature of their decoration. The other articles found at Marin are shield-mountings, fibulæ, buckles, bridle-bits, and hatchets, all of iron, a number of rings or bracelets, beads, &c., of coloured glass, playing dice and other small objects of bone, pieces of Roman pottery, and Roman and Gaulish coins down to the reign of the Emperor Claudius, 41 to 54 A.D.

Lake-dwellings have also been found on the Italian side of the Alps in the lake of Garda and the Lago Maggiore; in Savoy in the lakes of Bourget and Paladru; in Slovenia in the bed of a dried-up lake at Laibach; in Austria in several small lakes near Salzburg; and in Bavaria and Pomerania. In Scotland and Ireland, where they are numerous, they are known as Crannogs (q.v.), from the Celtic word *crann*, 'a tree.' The crannogs, however, are not constructed like the Swiss pile-villages. They are either palisaded refuges on small islets of natural formation, or artificial islets formed of brushwood, stones, and earth, and steadied and protected by piles driven through and around the mass. The problem presented to the crannog-builders was to construct, in a maximum depth of 10 or 12 feet of water, a solid, compact, and generally circular island, with a radius of 50 feet or thereby, capable of providing a permanent means of refuge and shelter for a considerable number of men and animals. The process is thus described by Dr Munro: 'Over the site chosen a circular raft of tree-trunks laid above branches and brushwood was formed, and above it additional layers of logs, together with stones, gravel, &c., were heaped up till the mass grounded. As this process went on, poles of oak were inserted here and there, the rough logs forming the horizontal layers were pinned together, and at various levels oak-beams mortised into one another were stretched across the substance of the island and joined to the surrounding piles. When a sufficient height above the water-line was attained, a prepared pavement of oak-beams was constructed, and mortised beams were laid over the tops of the encircling piles which bound them firmly together. The margin of the island was also slantingly shaped by an intricate arrangement of beams and stones, constituting a breakwater.' Frequently a wooden gangway stretched to the shore; in other cases the only means of access was by canoes, hollowed out of oak-tree trunks. Much the same system of construction appears to have been followed in Ireland. The plan (fig. 2, p. 487) of one of two crannogs in Drumaleague Lough, in the county of Leitrim, given on a scale of 1 inch to 20 feet, shows a circle of piles enclosing a space of 60 feet in diameter, with remains of supplementary circles at several points in the interior of the main or outer circle. In the centre is the log-pavement, A, about 35 feet by 25 feet, probably the floor of the log-house, which was the principal building on the crannog. In the centre of this pavement is a hearth-place, B, covered with flat stones, still showing traces of fire. On the outside of the pavement is another hearth-place, C, on a bed of stiff clay, while around a large tree-root, D, the top of which has

been dressed with a hatchet, and which may have served as a table, were found the refuse of the daily food in the shape of the broken and split bones of deer and swine. The crannogs are generally very much smaller than the Swiss lake-settlements, and from the nature of their construction there is no relic-bed. Those of Ayrshire and Galloway in Scotland have yielded objects dating from the time of the Roman occupation of Scotland to quite recent times. The most characteristic objects recovered from the Irish crannogs belong to the period of the Norse incursions, ranging from the 8th to the 10th and 11th centuries. There have been a few exceptional instances of the discovery of implements of stone and bronze age types in apparent association with the crannog structures, but so far as is yet known there is no crannog in Scotland or Ireland that can with any degree of certainty be assigned to the age of stone, or to the age of bronze. They seem to belong exclusively to the iron age and the historic period. There are frequent references to the use of crannogs as refuges and strongholds in the early Irish annals, and in Scottish and Irish historical documents of the 16th and 17th centuries. Although they are so abundant in Scotland and Ireland, there are comparatively few in England. Perhaps the most interesting is the marsh village at Glastonbury, in Somersetshire, excavated in 1842 and following years, when large numbers of dwellings were found with evidence of having been occupied again and again. It was most prolific in relics, which were all of the iron age.

Long before the date of the Swiss lake-dwellers, during the transition from Paleolithic to Neolithic, perhaps 12,000 to 10,000 B.C., there was a community living on a raft of pines anchored in the freshwater lake (now a bog) of Maglemose, near Mullerup, in Zealand. What race these people belonged to is yet unknown. They used deer-horn harpoons and flints, had no pottery, and no domestic animals but the dog.

The custom of living in wooden houses erected on piles over the waters of a lake, river, or inlet of the sea is still practised by barbarous tribes, and has been described by many travellers in the Malayan Archipelago, New Guinea, Venezuela, and in central Africa.

See Munro, *The Lake-dwellings of Europe* (1890); Keller, *The Lake-dwellings of Switzerland* (trans. by Lee, 2d ed. 1878); Boelsche, *Der Mensch der Pfahlbauzeit* (8th ed. 1911); Munro, *Ancient Scottish Lake-dwellings, or Crannogs* (1882); Wood-Martin, *The Lake-dwellings of Ireland* (1886); Gray and others, *The Glastonbury Lake Village* (1911-17).

Lake of the Thousand Islands, an expansion of the St Lawrence (q.v.) extending about 40 miles below Lake Ontario. It contains some 1500 rocky islets, the largest, Wolfe Island (54 sq. m.), measuring 21 miles by 7.

Lake of the Woods, a large lake of North America, studded with numerous wooded islands, mostly in Ontario, but touching also Manitoba and Minnesota. Gold was found about it in 1897. The lake is nearly 100 miles long, and about 300 in circuit. It is fed by the Rainy River, and drained by the Winnipeg.

Lakes (originally prepared from *lac*, whence the name) are pigments or colours formed by precipitating animal or vegetable colouring matters from their solutions chiefly with alumina or oxide of tin. Cochineal and madder lakes are the only ones used by artists. The former are prepared with Cochineal (q.v.) and alumina, and according to their shade of red, or purple red, are known as carmine, crimson lake, scarlet lake, purple lake, and Florentine lake. These were formerly much employed for

landscape-work by water-colour painters, and are still in request for flower-painting, but they have not much stability. The madder pigments of this kind, called rose madder or madder lake and madder carmine, are on the other hand quite permanent, both as water-colours and oil-colours, and are much prized by artists. There are several yellow lakes made, but they are fugitive, and consequently but little used.

Paper-stainers and decorators use several pink lakes prepared by saturating a strong decoction of Brazil-wood and other dye-woods with chalk, starch, and a little alum. To these such names as Venetian, Florence, and Berlin lakes are applied. The two best lakes used by decorators are crimson and morone lakes.

Lakh. See LAC.

Lakshmi, in Hindu Mythology, the name of the consort of the god Vishnu (q.v.), considered also to be his female or creative energy.

Lalande, JOSEPH JÉRÔME LE-FRANÇOIS DE, a French astronomer, was born at Bourg, 11th July 1732. Sent to Paris to qualify for an advocate, he was attracted to astronomy, which he studied under Delisle and Lemonnier. The latter persuaded the Academy of Paris to send Lalande to Berlin in 1751, to determine the moon's parallax, whilst Lacaille was sent to the Cape of Good Hope. On his return he was appointed one of the astronomers-royal, and in 1762 succeeded Lemonnier in the professorship of Astronomy in the Collège de France, a post which he held down to his death on 4th April 1807. He lectured with great success, and published several astronomical books of a popular kind, as well as works of greater scientific value. In 1795 he was appointed Director of the Paris Observatory. His character was marked by extreme vanity; nevertheless he contributed greatly to the general progress of astronomical science. His principal work is *Traité d'Astronomie* (2 vols. 1764; 3d ed. 3 vols. 1792). In 1802 he instituted the Lalande prize for the most notable astronomical book or observation of the year.

Lalita-Vistara is the name of one of the most celebrated works of Buddhistic literature. It belongs to the northern Buddhists, but is of unknown origin and antiquity, existing only in a debased Sanskrit version. It contains a narrative of the life and doctrine of the Buddha Sakya-muni.

Lally, COMTE DE, who was also BARON DE TOLLENDAL, was the son of Sir Gerard O'Lally, an Irish Jacobite who commanded an Irish regiment in the French service, and married a French lady of noble race, from whom the son inherited his titles. Born at Romans, in Dauphiné, he distinguished himself as a soldier in Flanders, especially at the battle of Fontenoy; accompanied Prince Charles Edward to Scotland in 1745; and in 1756 was appointed commander-in-chief in the French East Indian settlements. He commenced vigorous hostilities against the British, took many towns, and besieged Madras itself; but, having sustained a severe defeat, he was compelled to retreat to Pondicherry, which was attacked in March 1760 by land and sea by a greatly superior British force. Lally, however, held out for ten months; then, capitulating on 16th January 1761, he was conveyed as a prisoner of war to England. But, hearing that he had been accused of treachery and cowardice in India, he obtained leave to proceed to France for the vindication of his character. There he was thrown into the Bastille, and kept two years before his trial took place. The parliament of Paris at last condemned him to death for betraying the interests of the king and the Indian Company, and

the sentence was executed on 9th May 1766. But his son, supported by the powerful assistance of Voltaire, procured a royal decree on 21st May 1778 declaring the condemnation unjust, and restoring all the forfeited honours.

Lally-Tollendal, TROPHIME GÉRARD, MARQUIS DE, son of the above, born in Paris, 5th March 1751, was one of those nobles who in the States General of 1789 united with the Third Estate; but, alarmed at the democratic tendencies of the National Assembly, he afterwards allied himself with the court. He laboured to procure for France a constitution with two chambers and a privileged aristocracy; and earnestly sought to protect the king, but was himself obliged to flee to England. After the Revolution of 18th Brumaire he returned to France. Louis XVIII. made him a peer. He died at Paris on 11th March 1830. He was author of a famous *Defence of the French Emigrants* (1794), and a *Life of Strafford* (2d ed. 1814).

Lalo, ÉDOUARD VICTOR ANTOINE (1823-92), composer, born at Lille, studied there, and made his *début* as a viola-player in Paris. His compositions include the operas *Le Roi d'Ys* and *La Jacquerie* (unfinished), a *Symphonie Espagnole*, a symphony in G minor, and concertos.

Lama. See LLAMA.

Lamaism (from *bLama*, the superior one, a term technically confined to the higher ranks of priesthood, but popularly extended to mean any kind of priest) is the name given to the type of Buddhism prevailing in Tibet and Mongolia, in Sikkim and Bhutan, among the Russian Buriats, and appearing sporadically in China.

The heart of Lamaism is Tibet, and more particularly its capital, Lhasa (q.v.). Its canonical language is Tibetan, though certain charms (*mantras* and *dharanis*) are still recited in Sanskrit, from which language most of the more important Tibetan religious works were translated. Lamaism is by no means homogeneous, as it includes a large number of conflicting sects and sub-sects, but all the groups may be placed together in contrasting Lamaism with the three principal other forms of Buddhism still extant—viz.: (1) Buddhism prevalent in Ceylon, Burma, and Siam, which is probably most in accord with primitive Buddhism; (2) Buddhism in Nepal, the decaying remnant of Indian Buddhism; for, as is well known, though Buddhism originated in India, it gradually died out in the land of its birth (about the 12th century A.D.); and (3) Buddhism in China (apart from a few Lama temples), Korea, and Japan. Lamaism differs from the other forms of Buddhism both as regards doctrine, organisation, and religious customs; but Lamaism, group 2 (Nepalese) and group 3 (Chinese, &c.), are classed together as Mahāyāna (lit. great vehicle) or Developed Buddhism, as contrasted with Ceylonese, &c., Buddhism, generally called Hīnayāna (lit. inferior vehicle) or undeveloped Buddhism.

Mahāyāna Buddhism developed in India about the 1st century A.D., so that most of the theoretical or philosophical doctrines of Lamaism may be traced back to this time and place. The official philosophy of Lamaism, particularly of the Geluk-pa sect, the largest and most powerful branch of Lamaism, is the Madhyamika system, founded by the famous Indian metaphysician Nāgājuna (probably 2d century A.D.), and elaborated by his subsequent followers. The fundamental doctrine of this school is *Śūnya* (lit. the Void), meaning that the phenomenal world and everything contained therein has no real or absolute existence, and is a mere illusion or chimera. The illusionism

of the Madhyamika-Lamaistic philosophy is based on a sceptical phenomenalism having points of resemblance to the ideas expressed by the English philosopher Hume. In both systems the external world, causality, the 'soul,' are rejected from the absolute and accepted from the relative standpoint. It is surprising that such a negative system should have won such widespread acceptance, but it was obvious to the Lamaistic fathers that in order to appeal to the masses other more popular elements must be introduced. The theory of transmigration, and the elaborate scheme of heavens and hells (though life in neither heaven nor hell was considered permanent), was taken over from the older Buddhism, though, of course, relegated to relative as opposed to absolute truth. According to this system each sentient being is bound to the wheel of existence. According to the good or bad done, a person on dying will be reborn either in one of the hells, as an animal, as a ghoul or spirit (*preta*), as a man, or in one of the numerous heavens, only to die there and be reborn once more, and so on indefinitely. This seemingly perpetual cycle of existence may be broken by securing 'salvation' in one of three ways: either by becoming an Arhat, a saint who has rid himself of the passions which lead to rebirth, but who is not omniscient; a Pratyeka (lit. private) Buddha, who has won not merely salvation but omniscience as well, though he keeps his knowledge to himself and does not instruct his fellow-creatures; or finally as a perfect, all-saving Buddha, who, having won salvation and omniscience for himself, sets out to lead all men into the way that leads to salvation. All forms of Mahāyāna Buddhism, including Lamaism, have exalted the Buddhas, including the historical Buddha Śākyamuni, to a point where he appears a god, possessed of all the generally-accepted powers and attributes of divinity, and the worship of various mythological Buddhas and Bodhisattvas (saints who are approaching Buddhahood) plays a very important part in Lamaism. Confessions of sin, and appeals for grace and assistance to the Buddhas and Bodhisattvas of the ten quarters of the universe, are frequently recited both by priests and laymen. Sometimes these appeals are for material benefits, for health, wealth, and prosperity; sometimes for rebirth in a 'Buddha-land.'

The Buddha-land doctrine was a significant development. Older Buddhism had known only of the ordinary heavens, impermanent and leading to no permanent bliss. The new doctrine adopted by Lamaism was that each Buddha prepared a special paradise more wonderful than all the ordinary heavens, and in which he prepares his disciples for ultimate salvation. Theoretically, as there are innumerable Buddhas, so are there innumerable 'Buddha-lands'; but the paradise 'lying in the West,' prepared by the Buddha Amitābha (Tib. *Ö-pa-me*), attracted particular attention, and it is the desire of most pious Lamaists to be reborn in this western paradise at death. This may be secured by 'good works,' more particularly of an ecclesiastical variety—e.g. reciting of prayers, and charms, turning of prayer-wheels, and erecting of prayer-flags, &c. The doctrine of incarnation is another interesting point of doctrinal development unknown, even though latent, in primitive Buddhism. The Buddhas and Bodhisattvas are beings possessed of miraculous powers, who strive to aid all mankind. Quite natural was it, therefore, to suppose that one of their miraculous powers was to make themselves visible to worthy persons needing and imploring their help. These appearances may be entirely miraculous, wherein the Bodhisattva appears for a moment from the sky and then disappears; or it may be that a Bodhisattva, or occasionally even a

Buddha, reincarnates in the world as a man, in order to guide or govern his fellow-creatures.

Lamaistic theology has postulated several degrees of incarnation, ranging from a case where the divinity in question merely overshadows an ordinary mortal, using and speaking through him, to a complete incarnation. This doctrine of incarnation is shared with other forms of Mahāyāna Buddhism, but only in Lamaism has the dogma reached such an extreme development. This is the only one point on which Lamaism has shown any originality, for whereas nearly all of its other ideas may be traced directly to Indian sources, it was only in Tibet, and that at a comparatively late date, that the early incarnation doctrine was first made use of. It is to be noted that the lack of metaphysical originality in Lamaism or Tibetan Buddhism is in marked contrast to the long line of philosophical evolution which took place in Chinese and Japanese Buddhism.

Lamaism believes that the abbots of its larger and more important monasteries are incarnations (*tru-ku*) of various Buddhist divinities. For example, the Tashi-lama of Shigatse is supposed to be the incarnation of the above-mentioned Amitābha Buddha. The even more powerful Dalai Lama of Lhasa, who may claim to be the Pope of Lamaism, is considered the incarnation of Avalokiteśvara Bodhisattva (Tib. *Chenresi*). There are several hundred such incarnate divinities in Lamaistic monasteries, though in many cases they are supposed to be incarnations of minor saints. When such an incarnate deity dies (and even they are mortal), the soul, instead of retiring to Paradise, is supposed, out of love for humanity, to reincarnate in human form almost immediately, and through oracles and omens a search is made for the divine child, who, when found, is immediately regarded as the abbot of his monastery and worthy of worship, though during his minority temporal affairs are regulated by a regent.

Another curious aspect of Mahāyāna which plays an important part in Lamaism is the doctrine of the Trikāya (lit. three bodies), a sort of Buddhist trinity. Each Buddha is considered possessed of three bodies: one, the Dharmakāya or Essence Body, is the true Buddha, but formless, non-material, and beyond space and time. The second is the Sambhogakāya, the body of Compensation, a sort of miraculous, spiritualistic body, in which a Buddha manifests himself in his paradise, and is the guise in which the Buddha is worshipped by his devotees. The third is the Nirmanakāya, the Body of Transformation or Incarnation, or the body in which the Buddhas are incarnated in the material world. Theoretically, a Buddha may have several Nirmanakāyas at the same time, so that there may be numerous simultaneous incarnations of the same divinity.

The above may be said to represent the most important phases of Lamaism taken as a whole, but Lamaism has partially or wholly absorbed a number of other elements. Beginning with the 5th century A.D., a curious pseudo-esoteric, mystic, and occult movement known as Tantra sprang up in India, and was destined to have an important effect both upon Buddhism and upon Hinduism. Buddhism had reached and firmly planted itself in China before Tantra had a strong hold on Buddhism, and so the Tantra phase plays only a subsidiary rôle in Chinese and Japanese Buddhism; but as Buddhism was not introduced into Tibet until the 7th century A.D., and secured a strong hold only in the course of the subsequent two centuries, and remained in direct contact with Indian Buddhism until the latter died out, it was only natural that Tantra principles made a deep and lasting impression upon Lamaism. It is impossible to go into

all the details here, but one or two points deserve attention. A mystic significance was given to certain sounds, colours, numbers, and geometrical figures. Consequently the mere repetition of certain sounds was supposed to have a most potent effect, whence arose the thousands of charm phrases (*mantra* and *dhāranī*) with which Lamaistic liturgies are overlaid. Elaborate symbolic charts of the spiritual universe were drawn (*Mandala*), with various Buddhas and Bodhisattvas drawn in different colours, and with peculiar symbolic positions of the fingers (*mudras*).

Up to the Tantra period the Buddhas and Bodhisattvas retained their human origin. No matter how great and powerful the Buddha in question might be, or how blissful his paradise, he was once a man like ourselves, but under the symbolising influence of Tantra the more important and best-known divinities came to be regarded as personifications of certain ideas, as aspects of some ill-defined spiritual whole. The Bodhisattva Mañjuśrī was the personification of Wisdom, Avalokiteśvara the personification of Compassion, &c. The human origin was ignored, and the divinities regarded as eternal principles, or even as divine emanations. Later a definite classification was given them. Corresponding to five states of mystic trance (*Dhyāna*), there were supposed to be five transcendental—i.e. non-human—Dhyāni Buddhas, and as active counterparts five Dhyāni Bodhisattvas. As a logical development of these theories, there arose about the 10th century A.D. the Kālachakra school of Tantric Buddhism, which taught an eternal primordial Ādi-Buddha, who emanated the Dhyāni Buddhas and Dhyāni Bodhisattvas, and the Kālachakra system soon found a place in the teaching of the Lamaistic monasteries. There was always an unhealthy spirit in the Tantra movement. This spirit was soon to show itself most markedly in the introduction of sex-symbolism into religion, and the later stages of Tantra developed into a sort of phallic worship. Nirvāna (salvation) was symbolised as union with the bride, and sexual orgies were indulged in on the plea of exciting certain mystic trances. As an outgrowth of this phase, each Dhyāni Buddha and Bodhisattva was supposed to have a feminine counterpart, who was duly symbolised and pictorially represented.

It is difficult to state precisely how far Lamaism has accepted the Tantra doctrines. The Tantra books form a part of the Tibetan canon, and in the larger monasteries there is usually a section or college which devotes itself to the study of Tantra principles, but it can still be regarded as an excrescence in Lamaism and not a necessary part of the system. Particularly in the Geluk-pa sect, the established church of Tibet, has the sexual side been reduced to a purely symbolic fiction, and strict celibacy enforced on the monks.

One final factor in Lamaism cannot be overlooked. Before Buddhism was introduced most of the Lamaistic countries were adherents of a primitive cult generally called Shamanism (in Tibet called *Bon* or *Pön-pa*), animism strongly imbued with demon-worship. Buddhism found it very difficult to stamp out this cult. Even to-day in Tibet, in the more isolated parts, the Bon religion persists, and there can be no doubt that Lamaism absorbed a great many features from Bon, even where it nominally triumphed, particularly as a similar demon-worship, in which wine and blood sacrifices to the angry deities had a place, was an important part of one aspect of Tantra, and thus made no great step from the old faith to the new, though the official cult now prohibits blood sacrifice and the use of wine. Even more strict is the prohibition of the use of tobacco, smoking in any

form being considered a most outrageous offence against religious morality.

The different sects of Lamaism differ considerably as regards details of organisation, and as regards certain points of doctrine as well as regards strictness in observance of the old canon law (*Vinaya*). These sectarian differences can best be understood through a study of the history of Buddhism in Tibet.

Buddhism was introduced into Tibet from China in 640 A.D., when the Tibetan King Srong-tsang-gampo secured a Chinese princess, who was a pious Buddhist, as a bride, but it was some time before the new religion made any great headway. It was not long before the Tibetans preferred to go to India instead of China for further religious stimulus, and a number of Indian Buddhist missionaries found their way to Tibet. The most notable of these was Padma Sambhava, who began his activity about 749 A.D. The influence of Padma Sambhava was enormous. He may be considered the founder of Lamaism. Images of him are found all over Tibet, and in practice he is worshipped quite as much as the historical Buddha, being regarded as one of the highest saints. Padma Sambhava, however, seems to have been more than a doubtful character. He was undoubtedly an exponent of Tantra principles in their rather more objectionable form, and although a priest vowed to celibacy, he is credited with two wives, and was a noted wine-bibber as well.

It was only natural, therefore, that the religious organisation which he founded should be somewhat lax in its observances, and with a more superstitious than philosophic background, although nominally Padma Sambhava belonged to the Yogācāra school, the great rival of the Madhyamika system.

A later Indian missionary, the saintly Atiśa (1038), pointed out the evils of the existing order, and under his influence a number of reforming sects sprang up, of which the Geluk-pa (or virtuous) sect is the most powerful. This sect was founded by Tsongkhapa in the 15th century, and is now the most powerful organisation in the country. Tsongkhapa not only tried to insist upon an observance of the old moral code, but tried to do away with much current superstition, and the more unpleasant aspects of Tantra, and in revulsion against Padma Sambhava's supposed Yogācāra principles, Tsongkhapa chose the Madhyamika system as his philosophical foundation-stone.

Although the reformed order flourished at the expense of the unreformed sect, or rather sects, the others were never eradicated. At the present time, therefore, there are numerous sects and sub-sects, which may be grouped as follows:

1. The Nyingma-pa, the old unreformed sect founded by Padma Sambhava.

2. A number of semi-reformed sects, such as the Karma-pa and the once powerful Sakya-pa.

3. The reformed sects, of which the most important is the Geluk-pa.

Unfortunately the reforming spirit of the later movements soon lost its vigour, and in many cases the old abuses have once more set in—and one of the most important differences between the Geluk-pa and the Nyingma-pa is that the priests of the latter wear red hats and of the former yellow hats.

Two final points regarding Lamaism call for consideration. One is the huge size of many of the Lamaistic monasteries. Several of these contain five or six thousand monks, and Drepung, near Lhasa, is credited with having more than ten thousand monks. It is estimated that in Tibet one man out of four is a priest. There are also a number of convents for nuns, but the number of nuns is much smaller than that of the monks. The other is the temporal power possessed

by the monks. The head of the Geluk-pa sect (the Dalai Lama) is also the secular sovereign of Tibet, and most of the important offices of state, including the provincial governorships, are generally held by two persons, of whom one is commonly a priest.

Several of the larger monasteries serve as universities, or rather theological colleges, in which monks are taught Buddhist lore, and grant degrees, the chief of which is the coveted Ge-she or Doctor's degree; but the training is medieval and uncritical, the teaching even of Sanskrit is very superficial, and most of the study consists of learning certain books by heart. There is nothing like the modern scholarship shown in the Japanese Buddhist monasteries.

Lamaism has a very extensive literature, mostly translations from Sanskrit, though most of the original works have long been lost. The *Kagyur* (usually printed in 100 volumes) contains the translation of the Vinaya (canon law), and large numbers of Sūtras or religious discourses fictitiously attributed to the Buddha.

The *Tengyur* (usually printed in 250 volumes) contains commentaries on the Sūtras and original Abhidharma (metaphysical) works by the famous Indian Buddhist scholars such as Nāgārjuna, Vasubandhu, &c. and a certain number of books composed by Tibetans.

Lamantin. See MANATEE.

Lamarck, JEAN BAPTISTE PIERRE ANTOINE DE MONNET, CHEVALIER DE, evolutionist, born at Bazentin in Picardy, 1st August 1744, was educated for the church at the Jesuit College of Amiens, which he left at the age of seventeen to join the French army then warring in Germany. Having gained rapid promotion to officer's rank, he was sent in 1763 to the garrisons at Toulon and Monaco, where he became impressed with the Mediterranean flora. Accidental injuries led him to resign his position, and brought him to Paris, where he was forced to work in a banker's office, while his spare energies were devoted to the study of plants. In 1773, thanks in part to Buffon, he published a *Flore Française*, in which he applied a new analytical method of classification. As tutor to Buffon's son, he had the opportunity of visiting Holland, Germany, and Hungary. In 1774 he became a member of the French Academy and Garde de l'Herbier du Jardin du Roi—the nucleus of the famous post-revolutionary *Jardin des Plantes*. In one of the twelve chairs associated with this 'Jardin' Lamarck remained for twenty-five years as professor of what we would now call Invertebrate Zoology. In 1801 or earlier he had begun to think actively about the relations and origin of species, expressing his conclusions in 1809 in his famous *Philosophie Zoologique*. Of his other great work, *Histoire des Animaux sans Vertèbres*, he published seven volumes between 1815 and 1822. Hard work and illness enfeebled his sight and left him for the last ten years of his life not only blind but poor. To one of his two daughters he dictated the last volume of his Invertebrate Zoology, while to keep himself alive he was forced to part with some of his treasured collections. Greater than his contemporaries and immediate successors dreamed, Lamarck died in comparative obscurity, 18th December 1829, aged eighty-five.

Apart from his contributions to classification and descriptive zoology, Lamarck had a twofold import-

ance, as an expositor of the now accepted theory of descent, and as an inquirer into the still debated factors in evolution. It is easy to find in his *Philosophie Zoologique* passages which foreshadow many modern suggestions in regard to evolution, including the theory of natural selection; but the gist of his thinking is fairly expressed in the following propositions: (1) Every considerable and sustained change in the conditions of life produces a real change in the needs of the animals involved; (2) change of needs involves new habits; (3) altered function evokes change of structure, for parts formerly less used become with increased exercise more highly developed, other organs in default of use deteriorate and finally disappear, while new parts gradually arise in the organism by its own efforts from within (*efforts de son sentiment intérieur*); (4) gains or losses due to use or disuse are transmitted from parents to offspring.

There can be no doubt that Lamarck, though beyond doubt an independent thinker, was influenced by Buffon, and also perhaps by Erasmus Darwin, whose *Loves of the Plants* had been translated into French in 1799. On his contemporaries he exercised little influence—in fact it was not till the Darwinian revival of ætiology that the worth of Lamarck began to be justly appreciated. To those who deny the transmissibility of all characters individually acquired in direct response to changed functions and surroundings, the theory of evolution according to Lamarck seems to be based on an undemonstrated if not erroneous hypothesis; to those, on the other hand, who believe that individually acquired characters are transmissible from parents to offspring, Lamarck's theory is part of the solution of the evolutionist's puzzle.

La Mar'mora, ALFONSO FERRERO, MARQUIS DE, Italian general and statesman, born at Turin, 17th November 1804, who, entering the army, became known as a zealous reformer. He was decorated for distinguished conduct in the national war of 1848, and promoted to general of brigade. In 1849 he entered the cabinet as Minister of War. In 1855 he withdrew from the ministry to assume the command of the Sardinian troops in the Crimea, and at the close of the war was invested with the Order of the Bath and the Grand Cross of the Legion of Honour, and re-entered the ministry in his former capacity. He took part in the war of 1859, by which Lombardy was acquired by Italy; and was appointed commander-in-chief of the Italian army in 1861, and in 1864 prime-minister. In the campaign against Austria in 1866 he lost the battle of Custoza, and had to sustain unpleasant controversy as to his management of the campaign. Latterly he was intrusted with several diplomatic missions; he preferred the French to the Prussian alliance; and his publication (1873) of the secret negotiations between Prussia and

Italy incurred the censure of Prince Bismarck. La Marmora died 5th January 1878. See a monograph by Massari (1880).

Lamartine, ALPHONSE MARIE LOUIS DE, French statesman and author, was born at Mâcon, 21st October 1790. He came of an ultra-royalist stock, and was educated in royalist principles. Up to 1815 a considerable portion of his time was spent in Italy, a country for which he had a deep affection. On the fall of Napoleon and the establishment of the Bourbons, Lamartine proceeded to Paris and entered the ranks of the Garde Royale. He soon returned to Italy, however, which he traversed on foot; and here, as his *Elvire* and *Julie* testify, he experienced a passion that kindled into energy those poetic gifts which ultimately made him one of the great singers of France. His first *Méditations* were published in 1820, and at this period he was appointed First Secretary of Legation at Naples. He subsequently became *chargé d'affaires* at Florence, where he remained for five years, acquiring a wide knowledge of international politics. Lamartine married an English wife, Marianne Birch, who shared in her husband's labours and aspirations. In 1829 Lamartine, foreseeing impending difficulties, declined the post of Secretary of State for Foreign Affairs in the Polignac ministry. He accepted a mission to the new king of Greece. At the same time he published his *Harmonies Poétiques et Religieuses*, which excited such enthusiasm that he was unanimously elected to the Academy. Lamartine, still a royalist in principle, disapproved of the revolution of July 1830. His friends nominated him at Dunkerque and Toulon for election to the Chamber of Deputies, but he was defeated at both places, and went on a tour to the East. He wrote an account of his travels, entitled *Souvenirs d'Orient*. Recalled to France in 1833, he was returned for both Mâcon and Bergues, and elected to sit for the latter place. But Mâcon being his native place, his fellow-townsmen would not be denied, and re-elected him almost unanimously in 1837. Between 1834 and 1848 Lamartine wrote and published his *Jocelyn*, *La Chute d'un Ange*, and the celebrated work, the *Histoire des Girondins*, which the Conservatives erroneously alleged was the cause of the revolution of 1848. The historian merely saw further into the future than most of his contemporaries. The Orleanist régime was repugnant to him because of its duplicity, and when the monarchy fell he accepted the inevitable. It was he who insisted upon an appeal to the people. He was a member of the Provisional Government which formally proclaimed the Republic at the Hôtel de Ville. The new order having been established on the basis of liberty, equality, and fraternity, the ministry was constituted with Lamartine as Minister of Foreign Affairs. Lamartine, who was the presiding genius of the government, endeavoured to rule the country according to the principles of constitutional liberty, but there was an extreme party, headed by Louis Blanc and Ledru Rollin, which sought to establish national workshops and to effect social changes of a sweeping character. A formidable outbreak on the 15th of May, resulting from the refusal of the Assembly to appoint a Minister of Labour, which eventually led to the expulsion of Louis Blanc, was suppressed by the vigorous efforts of Lamartine. In June, however, a more serious rising occurred, upon which the executive committee resigned their functions, and conferred the command of the forces on General Cavaignac. After a terrible conflict the insurrection was suppressed. Lamartine had already stepped down from power, and from the time when Louis Napoleon acquired the ascendancy through unscrupulous means his political career practically

closed. He now devoted himself to literature, publishing in the order named the two series of the *Confidences*, his *Raphaël*, *Geneviève*, the *Tailleur de Pierres de St-Point*, and that valuable contribution to the study of continental politics, the *Histoire de la Restauration*. He likewise edited several *Collections* of his former writings, *Discours divers*, and issued monthly his *Entretiens Familiers*. Lamartine continued to take a keen interest in public affairs, but his patriotic spirit revolted against the iron rule of Napoleon III. In consequence of his straitened circumstances, the chambers voted Lamartine a pension. He died 28th February 1869.

Lamb, CHARLES, essayist, critic, and humorist, was born on the 10th of February 1775, in Crown Office Row, in the Temple, London, where his father was clerk and confidential servant to Samuel Salt, a wealthy bencher of the Inner Temple. For this, as for many other details of Lamb's private and domestic life, we are indebted to his essays, which form the best of all commentaries on his biography. (His father, John Lamb, is the Lovel of the essay on the 'Old Benchers of the Inner Temple.') There were seven children born to John Lamb and his wife in the Temple, of whom three only survived their early childhood—Charles Lamb, his sister Mary, ten years older than himself, and a yet older brother, John. Charles received his first schooling at a humble academy, out of Fetter Lane, but at seven years of age he obtained, through Samuel Salt, a presentation to Christ's Hospital, where he remained for the next seven years. His school experiences, and the friendships he formed, notably that with Samuel Taylor Coleridge, three years his senior, are again familiar to all readers of the *Essays of Elia*. At the age of fourteen he left school with a fair amount of scholarship, and an intensified love of reading. He might have stayed and become a *Grecian*—as the highest-class boys were denominated—and so proceeded to the university. But the exhibitions were given on the understanding that the holder was to take holy orders, and Lamb's unsurmountable stammer barred him from that profession.

Lamb left Christ's Hospital in November 1789. At that time his brother John held a post in the South Sea House, of which Samuel Salt was a deputy-governor, and Charles was soon presented through the kind offices of this friend to a humble situation in the same company; but early in 1792 he obtained promotion in the shape of a clerkship in the accountant's office of the India House, where he remained for more than thirty years. In this same year Samuel Salt died. The occupation of his old clerk and servant was at an end; and with his legacies from his employer, Charles's salary, and whatever Mary Lamb could earn by needlework, in which she was proficient, the family of four (for John Lamb was living a comfortable bachelor life elsewhere) retired to humble lodgings. In 1796 we find them in Little Queen Street, Holborn, and it was there that the terrible disaster occurred, destined to mould the career and character of Charles Lamb for the whole of his future life. There was an inherited strain of insanity in the children of John and Elizabeth Lamb. The father, who had married late in life, was growing old and childish; the mother was an invalid, and the stress and anxiety of the many duties devolving on Mary Lamb began to tell upon her reason. In an attack of mania, induced by a slight altercation with a little apprentice girl at work in the room, Mary Lamb snatched up a knife from the dinner-table and stabbed her mother, who had

interposed in the girl's behalf. Charles was himself present, and wrested the knife from his sister's hand. It was a critical moment in the young man's history. The father was all but imbecile; the mother was dead; and the whole direction of affairs for the sister's future remained with Charles. The inquest resulted in a verdict of temporary insanity. Mary would in the natural course have been transferred for life to a public asylum; but, by the intervention of friends, the brother's guardianship was accepted by the authorities as an alternative. To carry out this trust Charles Lamb from that moment devoted his life, sacrificing to it all other ties and ambitions, and never flagging in duty and tenderness for thirty-eight years. It was inevitable that the family should leave the scene of this 'day of horrors'; the old father with his son Charles removed to Pentonville, where at successive lodgings they remained until the father's death. Mary Lamb remained subject to attacks of temporary aberration for the rest of her life. The attacks were usually foreseen, and at such seasons she was removed to some suitable asylum. The length and frequency of these periods of absence increased, until the closing years of her brother's life, when she was exiled from him during the greater part of each year. In the meantime Charles Lamb had fallen in love, but renounced all hope of marriage when the duty of tending his otherwise homeless sister had appeared to him paramount. The history of his brief attachment, to which there is frequent pathetic allusion in his writings, is obscure. The girl, who appears in his earliest sonnets as Anna, and in his essays as Alice W., was in fact named Anne Simmons, and resided with her mother in the village of Widford, in Hertfordshire—the scene of Lamb's early romance of *Rosamund Gray*. Lamb's grandmother, Mrs Field, was housekeeper at Blakesware, a dower-house of the Plumer family, closely adjoining Widford; and during Lamb's frequent visits to Blakesware (immortalised in one of the loveliest of his essays as 'Blakesmoor, in Hertfordshire') he had made the girl's acquaintance. She afterwards married a Mr Bartram, a London silversmith, and is referred to under that name in the essay *Dream Children*.

Lamb's earliest poems, written in 1795, were prompted by this deep attachment. Two sonnets on this theme, with two others on different topics, were included in S. T. Coleridge's earliest volume of poems, issued at Bristol in 1796. In the following year a second edition of Coleridge's poems appeared, 'to which are now added poems by Charles Lamb and Charles Lloyd.' The latter was a young man of kindred poetic tastes, whose acquaintance Lamb had made through Coleridge. Here, as before, the poetic influence under which Lamb wrote was the same that had so strangely moved Coleridge, while still at Christ's Hospital—the graceful and melancholy sonnets of W. L. Bowles. In the following year Lamb and Lloyd made a second venture in a slight volume of their own (*Blank Verse*, by Charles Lloyd and Charles Lamb, 1798); and here for the first time Lamb's individuality made itself felt in the touching and now famous verses on the 'Old Familiar Faces'—like so many of his memorable utterances in prose and verse, full of autobiographical allusion, and yet gaining rather than losing in permanence of charm through the circumstance. It was, however, in prose, not in verse, that he was to find his true strength.

In the same year as the *Blank Verse* just mentioned he published his little prose romance, *The Tale of Rosamund Gray and Old Blind Margaret*; and four years later his *John Woodvil*—the fruit

of that study of the dramatic poetry of the Elizabethan period, in the revived study of which he was to bear so large a part. Lamb had little or no dramatic faculty. The little play was crude and valueless as a drama, but with detached passages reflecting much of the music and quaintness of Fletcher and Jonson. Meantime, Lamb and his sister were wandering from lodging to lodging, too often forced to leave through the rumour of Mary Lamb's malady which followed them wherever they went. They had lived at more than one house in Pentonville—they were in Southampton Buildings in 1800 and 1801—and then removed to Lamb's old familiar neighbourhood, where they continued for sixteen years. The early years of their residence in the Temple were among the hardest and saddest of their lives. They were very poor; Charles's experiments in literature had as yet brought him neither money nor reputation; and the gradual accession of new friends that might have brightened their path had the drawback of bringing Charles face to face with social temptations which he could not resist. A very moderate indulgence in wine or spirits seems to have speedily affected him, and his shyness and his impediment of speech made him eagerly resort to what for the moment made him forget both. 'We are very poor,' writes Mary Lamb in 1804; and again in 1805, 'It has been sad and heavy times with us lately.' In Lamb's anxiety to raise a few pounds, rather than from any confidence in his dramatic faculty, he began to write a farce, which the proprietors of Drury Lane accepted, and produced in December 1806. It was the now famous farce *Mr H.*—famous, however, not for its success, but for its failure. His love for things dramatic soon found a more profitable outlet in a commission from William Godwin to contribute to his 'Juvenile Library,' then in course of publication. For this series Charles and Mary wrote in 1807 their well-known *Tales from Shakespeare*—Mary Lamb making the version of the comedies, Charles that of the tragedies. This was Lamb's first success. It brought him sixty guineas, and what was more valuable, hope for the future, and the increased confidence and recognition of his growing circle of friends. As one consequence of the success, the brother and sister composed jointly two other children's books—*Mrs Leicester's School* (1807) and the *Poetry for Children* (1809). Charles also made, single-handed, a prose version of the *Adventures of Ulysses*. Another more important consequence was a commission from the Longmans to edit a volume of selections from the Elizabethan dramatists. The volume at once exhibited Lamb, to those who had eyes to see, as one of the most profound, subtle, and original of English poetical critics. Three years later a conviction of the same fact would be deepened in those who knew that the unsigned articles in Leigh Hunt's *Reflector*, on Hogarth and the tragedies of Shakespeare, were from the same hand, and that a prose writer of new and unique quality was showing above the dull level of the conventional essayist.

In 1817 Lamb and his sister left the Temple for rooms in Great Russell Street, Covent Garden. Next year an enterprising young publisher induced him to collect his scattered verse and prose in two neat volumes, as the *Works of Charles Lamb*, and this publication naturally paved the way for his being invited to join the staff of the *London Magazine*, then newly started. Lamb was required to contribute light prose essays, and was wisely allowed a free hand. His first essay appeared in August 1820, 'Recollections of the old South Sea House,' the public office in which his first small salary was earned, and where his elder brother had remained a high-placed and prosperous

clerk. Lamb signed his first paper *Elia*, borrowing for a joke the name of a foreigner who had been fellow-clerk with him in the office. The signature was continued through Lamb's successive contributions to the magazine; and as he placed it on the title-page (without his own) of the first collected edition of the essays in 1823, it became indissolubly connected with the work. The series came to an end, as far as the *London Magazine* was concerned, in 1825. *The Last Essays of Elia* were collected in a second volume in 1833.

In August 1823 Charles and Mary quitted their rooms over the brazier's in Russell Street, and made their first experiment as householders in a cottage in Colebrooke Row, Islington, with the New River (into which George Dyer walked in broad daylight) flowing within a few feet of their front door. Moreover, they were now on the eve of making a pleasant addition to their household in the form of a young friend, the orphan daughter of an Italian teacher of languages at Cambridge. Charles and Mary Lamb virtually adopted Emma Isola, and she was treated as a member of their family until her marriage with Edward Moxon the publisher, in 1833.

Early in 1825 Lamb, who had been for some time failing in health, was allowed to resign his post in the India House, the directors liberally granting him as pension two-thirds of his then salary. Having now no tie to any particular neighbourhood, the brother and sister were free to wander. They took lodgings—and subsequently a house—at Enfield; but Mary Lamb's health becoming gradually worse and necessitating constant supervision, they parted with their furniture and gave up housekeeping. They finally removed to the neighbouring village of Edmonton, where in a small cottage, hard by the church, they spent the last year of their joint lives. It was a melancholy year. Lamb's own health was suffering. They had lost their young friend Emma Isola. The absence of settled occupation had not brought Lamb all the comfort he had looked for: the separation from his London friends, and the now almost continuous mental alienation of his sister, left him companionless, and with the death of Coleridge in the summer of 1834 the chief attractions of his life were gone. In December of the same year, while taking one day his usual walk on the London Road, he stumbled and fell, slightly injuring his face. The wound was in itself trifling, but erysipelas ensued, under which he rapidly sank, and he passed quietly away, without pain, on the 27th of December. He was buried in Edmonton churchyard. His sister survived him nearly thirteen years, and was buried by his side in May 1847.

Lamb's place in literature is unique and unchallengeable. As a personality he is more intimately known to us than any other figure in literature, unless it be Samuel Johnson. He is familiar to us through his works, which throughout are composed in the form of personal confidences; through his many friends who have loved to make known his every mood and trait; and through his letters, the most fascinating body of correspondence in our language. It is a dangerous thing to say, but it may be doubted whether, outside a necessarily limited circle, his works are read so much for their own sakes as for the light they throw upon the character of their author. It is the harmonious concord of dissonances in Lamb that is the secret of his attraction. The profound and imaginative character of his criticism, which at its best is unerring, and with it the reckless humour of the Bohemian and the *farceur*; the presence of one lamentable weakness serving to throw into stronger relief the patient strength of his life-struggle; his loyalty

and generosity to his friends, even when they abused it most; and all this flowing from one of the most beautiful acts of devotion in the records of self-sacrifice: the wild fun of Trinculo and Stephano, alternating with the tenderness of Miranda and Ferdinand, or the profound philosophic musings of Prospero—and all these, like Ariel, now 'flaming distinctly,' now 'meeting and joining'—it is this wondrous blending of opposites that has made Lamb, save to the 'sour-complexioned' and matter of fact, one of the most dearly loved among English men of letters, and with every sign that this love is one which no changes of taste are likely to diminish.

The chief authorities for Lamb are his own writings, and the *Life and Letters* (1837) and *Final Memorials* (1848), by Talfourd; enlarged by Percy Fitzgerald and W. C. Hazlitt. There is a distinct memoir by B. W. Procter ('Barry Cornwall'; 1866). Another memoir (1882) and an edition of Lamb's works and correspondence (1883-88) were published by Canon Ainger. Fuller editions were published in 1903-5 by W. Macdonald (12 vols.) and by E. V. Lucas (works, 7 vols.; the admirable life, 2 vols.; revised 1921). And see a French monograph by Deroquigny (1905).

Lamb, WILLIAM. See MELBOURNE.

Lamballe, MARIE THÉRESE LOUISE OF SAVOY-CARIGNAN, PRINCESSE DE, was born at Turin, 8th September 1749, the daughter of the prince of Carignan. Beautiful and charming, she was made by Marie Antoinette superintendent of the royal household, and her own intimate friend and companion. Princess Lamballe proved her devotion to her royal mistress by returning to France (whence she had escaped to England) after the unsuccessful flight from Versailles, by sharing the queen's imprisonment for a week in the Temple, and finally by refusing to take the oath expressing detestation of the king, queen, and monarchy (3d September 1792). As she stepped out of the courtroom on that fatal day she was cut to the ground; her body was given up to the fury of the populace, whose barbarities have been much exaggerated. See Lives by Lescure (1865), Bertin (1894), Montefiore (1896), and Miss Hardy (1908).

Lambayeque, a province of Peru, with a pop. of 124,000, is mostly a rainless, barren region, with some fertile valleys; capital, Chiclayo.—The old capital, Lambayeque, situated 7 miles from the mouth of the river Lambayeque, lies 128 miles NW. of Trujillo, and has manufactures of woollen and cotton fabrics; pop. 8300.

Lambert, DANIEL. See OBESITY.

Lambert, JOHANN HEINRICH, philosopher and mathematician, was born 29th August 1728 at Mülhausen in Upper Alsace. He was successively clerk, secretary, and private tutor, studied assiduously all the time, and at last lived the life of a private gentleman. In 1764 Frederick the Great made him a member both of the Council of Architecture and of the Academy of Sciences. He died at Berlin, 25th September 1777. Lambert was the first to lay a scientific basis for the measurement of the intensity of light, in his *Photometria* (1760); and he was especially skilful in applying the analytical methods of mathematics. A work on analytical logic from his pen, *Neues Organon* (2 vols. 1764), was greatly valued by Kant, with whom Lambert kept up a correspondence. Of his other works we may mention *Kosmologische Briefe* (1761) and *Anlage zur Architektonik* (1771). See Huber's Life of him (1829) and Baensch's monograph on his philosophy (1902).

Lambert, JOHN, one of the chief soldiers in the great Civil War, was born in the parish of Kirkby Malham, in Yorkshire, 7th September 1619, studied at the Inns of Court, but on the outbreak of the war became a captain under Fairfax, and

thereafter showed such conspicuous capacity and courage that he rose rapidly in rank. At Marston Moor he led Fairfax's cavalry on the right wing, was commissary-general of the army in the north after the formation of the 'new model' (1645), major-general of the northern counties (1647), helped Cromwell to crush Hamilton at Preston, captured Pontefract Castle in March 1649, after a three months' siege, and was thus absent from London during the trial of the king. In 1650 he went with Cromwell to Scotland as major-general, led the van at Dunbar, next traversed Fife and defeated the opposing army at Inverkeithing, followed Charles through the western shires to Worcester, and on the day of Cromwell's 'crowning mercy' commanded the troops on the eastern bank of the Severn. He took a prominent part in the installation of Oliver as protector, but actively opposed the proposition to declare him king. He was unable to take the oath of allegiance to the Protector, and became completely estranged from him. After his death he became the head of the cabal of malcontent officers which overthrew the feeble administration of Richard Cromwell. Lambert was now looked upon as the leader of the Fifth Monarchy or extreme republican party; suppressed with considerable vigour the royalist insurrection in Cheshire, August 1659; and two months afterwards, dismissing the remnant of the Rump Parliament, virtually governed the country along with his officers under the title of the 'Committee of Safety.' Monk frustrated his designs; he was sent to the Tower, tried in 1662, and banished to Guernsey. He died in 1683.

Lambessa, or **LAMBÈSE**, an Algerian village, 65 miles SSW. of Constantine, stands amidst the imposing ruins of the ancient *Lambesis*, capital of Numidia.

Lambeth, a metropolitan and parliamentary borough within the county of London (pop. 1921, 302,960), has since 1885 returned four members to parliament. The divisions are now Brixton, Kennington, North, and Norwood. Lambeth Bridge dates from 1862. Lambeth Palace has been the official residence of the archbishops of Canterbury since 1197. It contains a splendid series of portraits of the archbishops, and a valuable library, with many fine MSS. The Lollards' Tower, so named in comparatively modern times from the notion that heretics were here imprisoned, was really a water tower. It dates from 1434, but has been restored and modernised. For the Lambeth or Pan-Anglican Congresses, see **ENGLAND (CHURCH OF)**. For Lambeth Degrees, see **DEGREES**. The Lambeth Articles, drawn up in 1595 by Archbishop Whitgift and others, were nine in number, and pronouncedly Calvinistic in doctrine. They were disapproved by Queen Elizabeth, and were never in force.

Lamb's Lettuce. See **CORN SALAD**.

Lamb's-wool, an old English beverage, composed of ale and the pulp of roasted apples, with sugar and spices.

Lamellibranchiata. See **BIVALVES**.

Lamellicornes, a very numerous family of beetles, for illustration of which see **COCKCHAFER**, **DUNG-BEETLE**, &c.

Lameness is commonly due to some abnormal condition either of the joints or of the muscles and fasciæ of the lower limbs: mere difference in length between the two limbs, even to the extent of an inch or more, is not necessarily incompatible with a natural gait. It is generally one of the earliest symptoms of disease in the joints; and permanent stiffness of any of these, whether the result of disease or of injury, always involves some degree

of lameness. The weakness and imperfect development of the muscles which usually follows infantile paralysis is one of the commonest muscular causes. Severe wounds or rupture of any of the important muscles must also be mentioned. Unnaturally shaped or ill-fitting boots, with the corns, bunions, distortion of toes, and other ill effects they produce, are a fertile source of lameness; but conditions thus produced are generally in some degree amenable to treatment. Among the causes most apt to be overlooked are the slighter degrees of flat-foot, of contraction of the calf-muscles, or other muscles whose tendons are inserted into the bones of the foot, and of the plantar fascia. See also the articles **LEG**, **ARTIFICIAL LIMBS**, **CLUB-FOOT**, &c.

Lamennais, **FÉLICITÉ-ROBERT DE**, was born at St Malo, 16th June 1782, son of a merchant and shipowner, to whom, by the personal intervention of Louis XVI., were granted the letters of nobility which the States of Brittany had in vain applied for on his behalf. He had supplied cheapened corn to the poor during a time of scarcity. His mother was a saintly woman of remarkable ability and of Irish descent, who died when he was but five years old. He grew up slender and small in stature, nervous and weak in health, but lively and restless in temperament, and from a very early age he took to books, and read widely at his will in his uncle's library. He loved music, and became expert in swimming, riding, and fencing, and fought a duel with credit in 1803, probably with Surcouf the corsair. But the dominant passion of his youth was solitary study, and his earliest companions were doubt and melancholy. It is a fact not without significance that his first communion was deferred till he was twenty-two, at the time when his eldest brother Jean was ordained a priest. The pair retired about the end of 1805 to the solitude of their joint estate of La Chesnaie, two leagues from Dinan, and there, amidst almost savage surroundings, but in an ample library, the real education of Lamennais began. In 1807 he translated the *Guide Spirituel* of Louis de Blois: Napoleon's police suppressed his *Réflexions sur l'État de l'Église* (1808). He received the tonsure in March 1809, and his letters of that period reveal a vein of lofty and somewhat mystical devotion and an inward joy of which he was to taste but little in later years. But study, prayer, and meditation could not satisfy all the cravings of his nature, and this exaltation of mind soon gave place to the malady of genius, that vague unrest and distaste for the present which was the fundamental undertone in the constitution of Lamennais. The years from 1806 till 1814 he spent in a narrow range of studies, shut out from the world, the vultures of vague unrest tearing at his heart, while he remained forging the weapons of controversy. He taught mathematics in his brother's seminary, shared his quarrel with the new university, and wrote together with him the ultramontane and anti-Gallican *Tradition de l'Église sur l'Institution des Evêques* (1814). In 1815, during the Hundred Days, he took refuge in London, where he was befriended and much influenced by the Abbé Carron. In November he returned to Paris, and with sore misgivings both before and after he was ordained priest at Vannes. At Paris in March 1816 he wrote the first volume of his famous *Essai sur l'Indifférence en matière de Religion* (1818-24), a magnificent, if paradoxical, denunciation of the right of private judgment and the doctrine of toleration—itself but a virtual unbelief, 'a new kind of persecution against the church.' The whole is a polemic against the individual reason on which certitude cannot rest; its conclusion that the unity of society depends ultimately on the unity of truth, and that all systems but the Catholic destroy one another and lead to scepticism.

Three different systems of indifference are in turn examined and refuted: (1) that of those who, repudiating religion for themselves, believe that it is necessary for the people—atheism, and the organised religious polity of the empire; (2) that of those who believe religion to be necessary for men, but that God has not given any special revelation of how He would be worshipped—natural religion, and 18th-century deism; (3) that of those who believe in a divine revelation through a book, but hold that God has left men to interpret it for themselves—Protestantism. In the *Défense de l'Essai* he answered opponents of the most opposite camps, advocates of freedom in thought, Gallican monarchists who refused to admit that the source of all authority was the holy see, and Ultramontanes themselves, who took fright at a bold attempt to find support for the Christian revelation in an analysis of human tradition.

In 1824 Lamennais received a flattering reception at Rome, and it is said that Leo XII. was anxious to give the new Bossuet a cardinal's hat. But soon after this other dreams than those of a pure theocracy enthroned in the Vatican began to fill his mind, and already notions of popular liberty appear in the *Progrès de la Révolution* (1829). The revolution of July (1830) quickened his pulse, and in the famous journal *L'Avenir*, founded in September, with his young friends Lacordaire, Montalembert, and the Abbé Gerbet, ideas strange to Ultramontanism were eagerly advocated. But the old *climæra* refused to be rejuvenised, the Jesuits and bishops took fright at the new doctrines of liberty of the press, of instruction, and of discussion, and the journal was suspended by spiritual authority in 1831. Lamennais, Lacordaire, and Montalembert set out for Rome to lay bare their hearts to the Holy Father. The disastrous story is told in *Les Affaires de Rome* (1836), one of the most interesting of all the writings of Lamennais. His Holiness Gregory XVI. gave the ardent tribune but a quarter of an hour's audience, talked to him of art, pointed out the claw in a lion of Michelangelo's, and, according to the Abbé Ricard, offered him a pinch of snuff. After waiting in vain for an opportunity of conference, they returned doubtful and disheartened at the cowardly chicanery and worldliness of Rome. A severe condemnation reached them at Munich, 30th August 1832, the date of the beginning of the second life of Lamennais. He signed obedience, but the iron had entered his soul. He retired to La Chesnaie, and there watched with sinking heart a more shameful betrayal still of his Master by the Vicegerent of Christ in the final extinction of Polish nationality, crushed to death by Russia with the sympathy of Austria and before the approving eyes of Rome. Here, in one week of restless walking under the oaks, he poured out the prophetic inspirations of his whole heart in the *Paroles d'un Croyant* (1834), a glowing poem rather than a treatise, expressed in rhythmical prose arranged in short verses like those of the Bible, under forms now parabolic, now direct, at one moment recalling the gloom of the *Inferno*, at another the tenderness of the *Imitation*. The apocalyptic empyrean is a region far above the rules of logic, and it is impossible to set forth precisely the doctrine of this strange book further than to describe it as an illusion of a perfect society, ideal, Paradisaic, governed by love, hindered awhile by the wickedness of despots, but ultimately to be effectuated by perfect liberty. The book made an extraordinary sensation; Sainte-Beuve tells us how he found the compositors gathered round while one of their number read the MS. aloud, his voice trembling with emotion. To churchmen it was 'the apocalypse of Satan,' 'the *bonnet rouge* planted upon a cross.' It brought about the complete

rupture of the apostle with his old associates; repulsed by the pope, he had made his appeal to the people against Rome, itself become faithless to its mission, and henceforth he belonged to the people alone. His further books, *Le Livre du Peuple*, *Une Voix de Prison*, *Du Passé et de l'Avenir du Peuple*, were but weaker echoes of his masterpiece. For one he got a year's imprisonment in Sainte Pélagie. In the revolution of 1848 he started paper after paper, and poured forth a succession of pamphlets while struggling on bravely against broken friendships, ill-health, and poverty. His piety survived the shipwreck of his faith; he had the gift of attaching friends who still loved the man whatever his opinions, and to these he poured forth his thoughts in impetuous swiftness as he paced up and down, his limbs trembling with emotion. George Sand describes his austere and majestic face, the brow an unbroken wall, furrowed between the eyebrows with those perpendicular wrinkles which, Lavater says, belong exclusively to those of high capacity who think justly and nobly—its rigid austerity ever lightened and humanised by the sudden smile of tenderness. To the last he remained a Breton even to his accent. His ideas and emotions alike ever tended towards excess and to absoluteness of conviction; his temperament was framed for suffering, and his passionate devotion to truth, the foundations of which yet slipped from under him, made his intellectual life a very martyrdom. Lamennais sat in the Constituent Assembly till the *coup d'état* ended his dreams of popular liberty. At his death, which occurred February 27, 1854, he refused to make his peace with the church, and was buried, by his own desire, without religious rites, in an unmarked grave among the poor at Pere-la-Chaise.

In his letters, of which collections were edited by Émile Forgues, Eugène Forgues, A. Roussel, A. Laveille, and others, we see the ebb and flow of his stormy emotions for twenty years. His brother and sister kept back from publication many of his papers, but five posthumous volumes appeared under the care of Forgues (1855-58), of which at least one volume, that entitled *Mélanges philosophiques et littéraires*, was quite worthy of his name. M. Blaize, the nephew of Lamennais, edited his *Œuvres Inédites* (2 vols. 1866). Amid the storms of his later life he found consolation in writing his serene and large-minded *Esquisse d'une Philosophie* (4 vols. 1840-46), perhaps the most really remarkable of all his works.

See Blaize's *Essai Biographique* (1868); Sainte-Beuve, in *Portraits Contemporains*, vol. i., and *Nouveaux Lundis*, vols. i. and xi.; Guizot, in vol. iii. of his *Mémoires*; E. Scherer, in vol. iv. of his *Études sur la Littérature Contemporaine*; Renan, in *Essais de Morale et de Critique* (1889); E. Dowden, in *Studies in Literature* (1878); Janet, *La Philosophie de Lamennais* (1890); and books by Mercier (1894), Boutard (1905-8), Maréchal (1907-13), and especially Duine (1922, &c.).

Lamentations, BOOK OF, a canonical book of the Old Testament which, in the present arrangement of the Hebrew Bible, occupies the sixth place among the Hagiographa (between Ruth and Ecclesiastes), and bears the superscription 'Echa' ('Ah, how'; see chaps. i. 1; ii. 1; iv. 1). In the Talmud and elsewhere it is called the book of *Kinoth* ('elegies' or 'dirges'), a name which reappears in the Septuagint title *Thrēnoi* (Lat. *Lamentationes* or *Lamenta*). The fuller title, *Lamentations of Jeremiah*, is found in the Syriac and in some MSS. of the Septuagint, but is not so old as the shorter form. The book consists of five dirges or laments, the first four of which are alphabetical acrostics (like Ps. cxix.); each of the five consists of twenty-two verses, except the third, which has sixty-six. In general character the first four are very similar, each beginning with a representation of the great calamity that has befallen the city and people, and then rising through the

thought of Jehovah's righteousness to the hope of his just vengeance on the enemies of his people. The fifth differs from the others in that it takes the form of a prayer and is throughout pervaded by a sense of Jehovah's wrath, which is spoken of as having been long continued. The tradition, which attributes the authorship of Lamentations to Jeremiah, can be traced to a note prefixed to the Septuagint translation, where, as in the Syriac, it is now attached to the book of that prophet. Perhaps, indeed, this tradition is already implied in 2 Chron. xxxv. 25, in which case the supposed reference to Josiah must be sought in Lam. iv. 20. The internal evidence is rather against the attribution of the Book of Lamentations to the prophet; in spite of various resemblances, there are significant differences. The style differs from that of Jeremiah; some of the indications that were at one time supposed to make for his authorship disappear on closer examination; and the anticipated restoration of Israel is somewhat dissimilar in the two works.

See the commentaries of Nägelsbach (1868; Eng. trans. 1871 with the older literature), Löhr (1891), Peake (1910), and Streane (1913); and Ball's article in the *Ency. Brit.*; also G. A. Smith, *Jerusalem*, ii. 271 sqq.

Lametttrie, JULIEN OFFRAY DE, French philosopher, born at St Malo on Christmas-day 1709, studied first for the church, but subsequently went over to medicine, and was trained by Boerhaave at Leyden. He entered the French army as surgeon in 1742; but the publication in 1745 of a thorough-going materialistic work, *L'Histoire Naturelle de l'Âme, traduite de l'Anglais de Sharp* (a fictitious name), roused such a feeling of odium against him that he was compelled to seek refuge in Leyden (1746). The work was, of course, Lametttrie's own. But in Leyden the fear of persecution still dogged his footsteps: he published *L'Homme Machine* (1748), and was glad to escape a threatened arrest by accepting an invitation from Frederick the Great of Prussia to settle in Berlin. In Germany Lametttrie continued his materialistic studies in *L'Homme Plante* (1748), *L'Art de Jouir* (1751), *La Volupté*, and other works. A good deal of the enmity excited against him was occasioned by cynical and satirical books which he published against the medical men, including such great authorities as Boerhaave, Linnæus, Astruc, Winslow, &c. Lametttrie died at Berlin on 11th November 1751. Frederick himself wrote a memoir, which he caused to be prefixed to the philosophical works of Lametttrie (2 vols. 1774). There is a good account of him in Lange's *History of Materialism* (1878-81). See also the studies by Quépat (Paris, 1873), Du Bois-Reymond (Berlin, 1875), and Poritzky (1900).

Lamia. DEMONOLOGY.

Laminaria. See SEAWEEDS.

Lamination, the arrangement of rocks in thin layers or laminae, the condition of a large proportion of the earth's strata. Shale deposits exhibit this structure very plainly, being frequently easily separable into the thin laminae in which they were originally deposited. Shale is the fine sediment that settles down at the bottom of some tranquil or slightly-moving water. The laminae indicate interruption in the supply of the materials, which may have been occasioned by successive tides, by frequent or periodical floods, or by the carrying medium having access to a supply of different material, passing, e.g., from mud to sand, and back again to mud. The laminae of the brick-clay deposits are separated, in many places, by the finest sprinkling of sand, which is almost invisible in the vertical sections. The layers are occasionally obvious, from their being of different shades of colour, often produced by the bleaching of the

layers when they were deposited; but frequently the various laminae of a bed are so united, and the bed so homogeneous, that except when the face is exposed to weathering, the laminated structure is not visible. This condition seems to have resulted from the shortness of the interruptions in the deposit not permitting the solidification of any of the layers until all was deposited, when the whole set cohered together as a single bed.

Lammas-day, the 1st of August, is one of the cross quarter-days, or half-quarter days, in England. On this day, which is the feast of St Peter ad Vincula, it was customary in early times to make offerings of the first-fruits of the harvest, and hence the feast took the name of *Hlaf-mæsse* (lit. 'loaf-mass'), afterwards shortened into Lammas. In Scotland it was an ancient practice with farmers to pay the half-year's rent due at Whit-sunday on Lammas-day.

Lämmergeier (*Gypaëtus barbatus*), a large bird of prey, also called the Bearded Vulture or Bearded Griffin. The full-grown bird is of a shining brownish-black colour on the upper parts, with a white stripe along the shaft of each feather; the head is whitish, with black stripes at the eyes; the neck and under part of the body are rusty yellow. It is the largest bird of prey in the Old World, measuring almost 4 feet high when sitting, nearly 5 feet in length, and from 9 to 10 feet in expanse of wing. Though by no means brave, it is bold and rapacious, swooping down on hares and the

Lämmergeier (*Gypaëtus barbatus*).

new-born young of sheep, goats, and chamois. It feeds largely on dead animals, and this bird of majestic flight does not disdain offal. It drops bones from a height to break them, and it is said by Pliny to have killed the poet Aeschylus by letting a tortoise fall on his bald head, mistaken for a stone. There is no proof of the tales which discredit the Lämmergeier as an infant-snatcher. Its feet do not seem up to that. It is now very rare, if not extinct, in the Alps, but is found in Sardinia, the Pyrenees, Sicily, Crete, Greece, Palestine, the North African mountains and the Himalayas, where it often soars high above the loftiest peaks. The Lämmergeier is said by some to be the original of the fabulous 'roc.'

Lammermoors, a broad range of moorish hills in Haddington and Berwick shires, extending east-north-eastward from the vale of Gala Water to the German Ocean at St Abb's Head, and culminating in Meikle SAYS LAW (1749 feet).

Lamond, FREDERICK, pianist and composer, born 28th January 1868 at Glasgow, studied there and at Frankfurt. He made his debut in Berlin in 1885, and became famous especially as an interpreter of Beethoven. His compositions include a symphony, overtures, sonatas, &c.

Lamoricère, CHRISTOPHE LÉON LOUIS JUCHAULT DE, a French general, was born at Nantes, 6th February 1806, entered the army as an engineer in 1826, and saw active service in Algeria, taking part in nearly all the military events which occurred in that country between 1833 and 1847. It was through his energy chiefly that the war against Abd-el-Kader was brought to a successful end by the capture of that chief in 1847. In June 1848 Lamoricère commanded the attack on the barricades in Paris, and quelled the anarchic tumults of the Socialists. He was war-minister during the government of Cavaignac; but was arrested on the occasion of the *coup d'état* of 2d December 1851, and banished from France. When the Italian war of independence threatened the safety of the pope, Lamoricère proceeded to Rome in 1860, and was appointed by Pius IX. commander of the papal troops. He was, however, defeated at Castelfidardo by the Sardinian general, Cialdini, on 18th September, and on the 29th capitulated at Ancona. He died near Amiens on 10th September 1865. See Lives by Keller (2 vols. Paris, 1873; new ed. 1891) and Rastoul (1894).

La Motte Fouqué. See FOUQUÉ.

Lamoureux (1834-99), conductor, born at Bordeaux, studied at Paris, and there in 1881 began the famous concerts associated with his name.

Lampblack is the soot or amorphous carbon obtained by burning bodies rich in that element, such as resin, petroleum, and tar, and some of the cheap oily products obtained from it. The supply of air is limited or controlled so as to produce a smoky flame, and the smoke passes into a chamber with some arrangement for receiving the abundant deposit of soot. For some of the finer qualities of lampblack this soot or carbon is purified by heating it in closed vessels. A large quantity of lampblack has been made in the United States by the imperfect combustion of natural gas. Lampblack is a useful pigment for artists both in oil and water colour, a coarser kind being employed by house-painters. It is the chief ingredient in Indian ink (see INK), and along with boiled linseed-oil forms printing-ink. Of it is formed the pigment for the carbon paper used in the Autotype (q.v.) process. Lampblack is also employed in the preparation of some kinds of leather, and for other purposes.

Lampedusa, a small island of the Mediterranean, 150 miles S. of Sicily, and 80 E. of Tunis. Belonging physically to the African continent (though the flora is more Sicilian), it has since 1843 been reckoned part of the Sicilian commune of Licata. It has 19 miles of coast, and a small harbour. Fruits are grown, and some grain.

Lampeter, a municipal borough of Cardiganshire, 27 miles by rail NNE. of Carmarthen. It is the seat of St David's College (1827), which has the power to grant B.A. and B.D. degrees. Pop. 3500.

Lamprey (*Petromyzon*), a genus of round-mouths (Cyclostomata, q.v.), nearly allied to the Hag (q.v.), and like it differing markedly from true fishes in the absence of jaws, paired fins, and scales, and in the presence of peculiar gill-pouches. An eel-like form, a slimy skin, a gristly skeleton, a primitive brain imperfectly roofed in, a single median nostril, a suctorial mouth with numerous horny teeth on the lips and on the large piston-like tongue, seven pairs of gill-pouches (whence the German name *Neun-auge* ('nine-eyes')) opening by as

many apertures to the exterior, and connected internally with a tube lying beneath and communicating with the adult gullet, and the striking differences between young and mature forms are among the less technical characteristics. They differ from hags in the development of a dorsal fin, in the fact that the nasal passage ends blindly without opening into the pharynx, and in several peculiarities of the respiratory and other systems. Along with *Petromyzon*, there are several genera—e.g. *Mordacia* and *Geotria* from the coasts of Chile and Australia—differing only in detail. Lampreys occur both in the rivers and seas of the north and south temperate regions, and at least some of the marine forms spawn and pass part of their long larval life far up rivers. They seem to represent an ancient race, more primitive than fishes, and, though their gristly skeletons are unknown as fossils, certain structures called 'conodonts' from very early strata are identified by some as lamprey teeth.

The habits of lampreys are in many ways curious. Thus, though they will eat worms, larvæ, small crustaceans, and dead animals, they have also learned the audaciously aggressive habit of fixing themselves to fishes, and scraping holes in the skin. The mouth sticks like a vacuum sucker, the toothed tongue works like a piston, and both flesh and blood are thus obtained by a sort of parasitism which reminds one at once of leech and hagfish. 'When engaged in sucking they are carried about by their victims, and salmon have been captured in the middle course of the Rhine with the marine lamprey attached to them' (Günther). As the name *Petromyzon* suggests, they also attach themselves, as if to rest, to stones in the bed of the stream, or it may be even to the bottom of boats. Some species are able to move stones of considerable size to form nests, and their grip is so firm that it is occasionally difficult to detach them from their hold. When the mouth is occupied in its suctorial work, water passes in as well as out by the respiratory apertures. The spawning occurs in spring, usually far up rivers, and according to some the mature forms die after reproduction. From the small eggs young develop which live wallowing in the sand or mud of the streams, and feed on minute animals. They are so different from the parents that in the case of the small lampern (*P. branchialis*) they were for long referred to a distinct genus *Ammocetes*. The head is small, the upper lip semi-circular, the lower lip small and separate, the mouth toothless and not suctorial, the eyes rudimentary and hidden, the future gullet (as distinguished from the above-mentioned respiratory tube) not yet developed, and so on. There is in fact a metamorphosis in the history of the lamprey, as was discovered 200

Lamprey (*Petromyzon marinus*).

years ago by a Strasburg fisherman Baldner, but overlooked till August Müller worked out the curious story in 1856. In the small river lampern

—and analogous facts are probably true for the others—the change to the adult form is frequently postponed until the August of the fourth or fifth year, when it completes itself rapidly.

There are three British species—the sea-lamprey (*P. marinus*), over 3 feet in length, mottled greenish brown; the river-lamprey (*P. fluviatilis*), nearly 2 feet, dark bluish with silvery sides; the sandpiper, pride, stone-grig, or small lamprey (*P. branchialis* or *planeri*), hardly one foot in length, like the preceding species in colour. The marine and river lampreys, though despised in Scotland, have been esteemed as good eating since Roman times, being especially palatable in pies and potted preserves. They are caught in baited baskets or traps, and their eel-like tenacity of life makes them useful bait stores.

Lamps. The Upper Palæolithic artists could not have executed their cave-paintings without artificial light; and some of their lamps have indeed been found, at least one of them (of sandstone, with an ibex carved on the base) still containing carbonaceous matter. Probably broken skulls or other bones were most used, or certain kinds of sea-shells. The principle of these natural lamps was long retained in the ancient earthenware and metal lamps of Egypt, Greece, and Rome, and in the stone cups and boxes of northern nations. Such lamps were called *lychna* by the Greeks, and *lucernæ* by the Romans. Specimens obtained from the excavations of the ruins of Carthage, Tarsus, Pompeii, and Herculaneum, and from other sources, show that they were made in considerable variety. Similar lamps are still in use in Malta and Gozo, and (with an added stem and foot) among the Arabs of Tunis. A very primitive form of lamp, called a 'crusie,' was in use in Scotland until mineral oils were introduced by James Young about 1850. Animal fats and fish oils were the principal substances used in all parts of the world for burning in lamps till vegetable oils were introduced—viz. colza or rape, and other seed oils and nut oils of various kinds. The vegetable oils, being more limpid in character, admitted of improved and more complex means of burning them. Progress in this direction began in France with Leger, who in 1783 adopted flat ribbon wicks in place of the old round, thick, and smoky wick. He was followed in 1784 by Aimé Argand (q.v.), who introduced round burners; and round burners, whether for oil or gas, are still known by his name.

In the use of fatty oils the ordinary capillary attraction of the wick was insufficient to maintain a uniform flow of oil to the flame, and various contrivances were used to keep the oil as nearly as possible at one level. In 1803 M. Carcel introduced an excellent mechanical method of forcing the oil up by means of clockwork. His lamp, however, was too easily disarranged, and too expensive to come into general use. It was not till 1836 that Franchot invented the 'French Moderator.' Its main feature is a cylinder or oil-container with a tubular piston resting on the surface of the oil. This piston, acted upon by a spiral spring placed between it and the top of the cylinder, forces the oil up through the piston. The spring was wound up by rack and pinion. The unequal tension of such a spring, and the correspondingly unequal flow of oil, was counteracted (or 'moderated'—hence the name) by placing a tapering iron rod in the ascending tube. This lamp was simple and effective, and soon supplanted all other mechanical arrangements for controlling the flow of oil to the burner.

Mineral oils are known under various names, such as paraffin, petroleum, kerosene, crystal oils, for the lighter sorts; and for the heavier mineral sperm and mineral colza. These oils, being much

more limpid and volatile than the fatty oils, rise freely in the wick, and, being rich in carbon, need a plentiful supply of oxygen for perfect combustion. The main problem, therefore, to be solved in the construction of a good paraffin or petroleum lamp was to secure a current of air powerful enough to consume the carbon contained in the oil, and so prevent it passing off in the form of smoke.

Before the introduction of mineral oils, camphine, which is a volatile hydrocarbon spirit distilled from turpentine, was burned in Young's 'Vesta' lamp, introduced in 1834. His lamp was constructed on the round or Argand principle, with a button or deflector over the central air-tube, and a constricted chimney. The leading features of this lamp were followed in many of the later developments of mineral oil lamps with circular wicks. But the common flat-wick paraffin lamps were first made by Stobwasser in Berlin, and introduced into Great Britain in 1854. For mineral lamps continental countries generally preferred a circular wick, Great Britain a flat wick. A flat wick burner is more easily trimmed, and its flame more easily controlled. It gives a better supply of oxygen to all parts of the flame than an ordinary round burner. The great difficulty with round-wick burners was to get oxygen enough for the inside of the flame, so that it should not smoke after burning for a short time. This was done by means of an air-channel passing up from the base of the lamp through the reservoir and through the burner.

Messrs Ross and Atkins applied to oil illumination the regenerative inverted Argand principle so successfully employed by Siemens in gas-lighting. Many forms of petroleum lamps with incandescent mantles have been devised.

Mineral oils are now extensively used for heating and cooking, and the burners employed for these purposes are generally adaptations of the flat-wick type. Captain Doty in 1868 patented a lighthouse lamp for burning mineral oils (see LIGHTHOUSE). These lamps consist of one or more concentric wicks, and are capable of producing a very powerful light.

COMPARATIVE TABLE.

Type of Lamp.	Candle-power.	Consumption of oil per hour, in grains.	Consumption of oil per hour per candle-power, in grains.
1-in. flat-wick burner.....	134	650	48
Duplex " ".....	25	1250	50
Triplex " ".....	39	1750	45
Defries' circular burner, 1½-in. diameter.....	49	2290	47
Wanzer down-flame burner, 2½-in. diameter.....	90	3050	34

To burn mineral oils successfully both theory and experience teach the absolute necessity of keeping all parts of the burner perfectly clean, so that the ingress of air to the flame may not be lessened or impeded by deposits of carbonised wick, which accumulate unless removed from time to time when lamps are in use, and which moreover become a source of danger from their liability to ignite. The greatest care should be taken to keep the oil and the lamps perfectly free from water, and new wicks should be carefully dried before being inserted in the burner. See also ELECTRIC LIGHT, GAS (LIGHTING), SAFETY-LAMP, LUCIGEN, MINING.

Lamp-shell, a genus (*Terebratula*) of Brachiopoda (q.v.), or a popular name for the whole class.

Lam'pyris. See GLOW-WORM.

Lanark, the county town of Lanarkshire, on a slope near the right bank of the Clyde (q.v.), 33 miles by rail SW. of Edinburgh, and 31 SE. of Glasgow. It has an interesting ruined church, sheriff court houses, town and county buildings, a good race-course, golf-course, memories of

Wallace, and some hosiery and other industries. A royal burgh since the 12th century, it united till 1918 with Falkirk, &c., to return a member to parliament. Pop. (1921) 6268.—NEW LANARK, $1\frac{1}{2}$ mile S. by W., is a manufacturing village, founded in 1783 by David Dale, and for twenty-eight years the scene of the social experiments of his son-in-law, Robert Owen. Pop. (1921) 1305.

Lanarkshire, or **CLYDESDALE**, a Scottish county, enclosed by Stirling, Dumbarton, Linlithgow, Edinburgh, Peebles, Dumfries, Ayr, and Renfrew shires. Its length is 50 miles, its greatest breadth 34 miles, and its area 880 sq. m. Drained almost entirely by the Clyde (q.v.) and its numerous affluents, Lanarkshire is subdivided into three wards, of which the upper or southern comprises about three-fifths of the whole, and the lower three-fortieths. These offer a striking diversity of aspect—lonely uplands, smiling orchards, busy coalfields, and manufacturing district. The principal hills are Green Lowther (2402 feet) and far-seen Tinto (2335); whilst the mining-village of Leadhills (1300–1400 feet) is the highest in Scotland. The predominant rocks are Silurian, Old Red Sandstone, and Carboniferous, and the county possesses great mineral wealth—coal, ironstone, fireclay, shale, and lead, with some silver, and even gold. The coal alone in the Lanarkshire coalfield is estimated to exceed 2000 million tons. The soil is as various as the scenery; and barely one-half of the whole area is in cultivation, whilst woods occupy over 20,000 acres, orchards 500, and small fruit 2000. The orchards of Clydesdale were famous as early as the time of Bede, and yielded into the 19th century £8000 per annum; but now the ground is more profitably employed in producing strawberries, gooseberries, tomatoes, vegetables, &c., for Glasgow. The climate is moist, mild, and genial in many of the lower districts, but often cold and boisterous on the uplands. Lanarkshire is not a great grain county; but much of it is excellently adapted for the rearing of stock and for dairy purposes. The sheep are Cheviots and black-faced, the cattle Ayrshires; and the celebrated Clydesdale cart-horses issue from a Flemish cross (about 1720). The mineral, textile, and other industries are very extensive, and are noticed under the towns—Glasgow, Rutherglen, Lanark, Hamilton, Airdrie, Coatbridge, Motherwell, Wishaw, &c. Besides prehistoric and Roman remains, Lanarkshire contains the castles of Bothwell, Douglas, and Craignethan (Scott's 'Tillietudlem'), the priories of Blantyre and Lesmahagow, and the battlefields of Langside, Drumclog, and Bothwell Brig. Among its worthies have been Allan Ramsay, Dr Cullen, the Hunters, Joanna Baillie, Dr John Brown, Sir Colin Campbell, Thomas Campbell, J. G. Lockhart, Lord Dundonald, David Livingstone, and Sir John Moore. Though only the tenth in size, Lanarkshire is far the most populous and wealthy of all the thirty-three Scottish counties. Pop. (1801) 147,692; (1841) 426,972; (1881) 904,412; (1911) 1,486,081—an increase due largely to the transference of portions of Renfrewshire and Dumbartonshire to Glasgow; (1921) 1,539,307.

See works by Hamilton of Wishaw (1831), Irving and Murray (1861–64), and others cited at GLASGOW, CLYDE, &c.

Lancashire is a county palatine of England, ranking sixth in area, and first in population. It forms the north-western division of England, stretching along the shore of the Irish Sea from the river Duddon and the mountains of Cumberland on the north to the river Mersey on the south. It is bounded on the E. by Yorkshire, on the W. by the Irish Sea, on the N. by Cumberland and Westmorland, and on the S. by Cheshire. The

extreme length from N. to S. (including the hundred of Furness) is 75 miles, and the greatest breadth at the south end 43, and at the north end 10 miles. The circumference is 240 miles, and the area 1866 sq. m., or 1,194,555 statute acres. Pop. (1801) 673,486; (1821) 1,052,948; (1841) 1,667,054; (1861) 2,429,440; (1881) 3,454,441; (1891) 3,926,760; (1921) 4,923,359.

The coast is level, free from rocks, and has numerous estuaries stretching far into the mainland. Its ports are the only ones accessible to large vessels between Milford Haven, in South Wales, and the estuary of the Clyde. This, with the ease with which the coast is approached from the interior, has made the county the principal outlet for the commerce of the country in a westerly-direction, one-third of the whole foreign trade of Great Britain being carried on from its ports. The chief rivers are the Mersey, Ribble, Lune, Wyre, Kent, Leven, and Duddon. The rainfall in Lancashire is sometimes twice as great as on the east coast; the climate is mild. The lofty hills on the east shelter it from the land winds, while the prevailing winds, those from the south and west, are rendered mild from the effect of the Gulf Stream. This humidity of climate is said to contribute to the superiority of the finer kinds of cotton threads manufactured in Lancashire. An outlying portion of the county, called Furness, 25 miles long by about 20 wide, is separated from the main portion by Morecambe Bay, and seems properly to belong to the Lake District. Coniston and Esthwaite Waters lie within, Windermere along, the borders. The highest point here is 'Coniston Old Man'—'alt maen,' or the 'high rock'—2633 feet above the sea. The larger division is intersected in the north and east by branches of the hill-system which runs southward through the counties of York and Derby, the chief eminences being Pendle Hill (1831 feet), Bleasdale Moor (1709), Boulsworth Hill (1669), and Rivington Moor (1545). The soil is peaty in the upland districts, but for the most part a fertile loam in the flats. Oats and potatoes are general crops; wheat grows well in the southern division. Coal is the chief mineral product, the coalfields being estimated at 217 sq. m. in extent. A recent estimate of the quantity raised in one year amounted to 25,000,000 tons. Limestone and iron are common in the north. Lead, copper, sulphur, and fireclay are also found. The whole surface of the county is covered with a network of canals and railways which connect the principal manufacturing and commercial centres (see MANCHESTER, LIVERPOOL, PRESTON, BLACKBURN, &c.). Lancashire is the great centre of the cotton manufacture of the world, having about two-thirds of the entire trade (see COTTON). The other textile manufactures, such as woollens, silk, carpets, are likewise of considerable importance. It is pre-eminent in the manufacture of engineers' tools; and the making of all kinds of iron and steel machinery is extensively carried on. Ship-building, the manufacture of boots and shoes, hosiery, and kindred trades are also in a flourishing condition. The county returns, since 1918, eighteen members to parliament (formerly eight), besides forty-eight for the boroughs. The phrase, 'Lancashire Witches,' which is now used as an expression of admiration for the young maidens of the county, arose from the prevalence of the crime of witchcraft in Lancashire in the reign of James I. So many as twenty witches were tried and executed at the Lancaster Assizes of 1612. Twelve of these were the witches of 'Pendle Forest,' and eight belonged to the witches of 'Samlesbury.' A few years previously, Ferdinand, fifth Earl of Derby, was supposed to have been murdered by witchcraft. At the time of the Reformation the Roman Catholic

party was extremely strong in Lancashire, and religious houses of great wealth and influence existed in every district, twenty-two being suppressed by order of King Henry VIII.; this included the abbeyes of Furness and Whalley (see FURNESS). An unusually large proportion of the land-owners still adhered in the reign of James I. to their old faith, and in 1604 six priests were tried at the Lancaster Assizes and executed. Those connected with the Gunpowder Plot expected to rouse the Catholics of Lancashire, but entirely failed to do so. The whole of the district was continually unsettled and full of discontented recusants, some of them of Roman Catholic and others of Puritan opinions. The people of Lancashire have long been noted for their love of music and natural history, there being amongst them many working-men who are botanists and entomologists of repute; while their politics and opinions have had such influence in the country that the proverb has arisen that 'What Lancashire thinks to-day England says to-morrow.' Amongst eminent names connected with Lancashire are those of Mrs Gaskell, Mrs G. L. Banks, Miss Martineau; of Roscoe, De Quincey, Sir Robert Peel, Horrocks, Dalton, Hodgkinson, Joule, Greg, Bamford (the weaver poet, 1788-1872), William Henry, the chemist, Sir W. Fairbairn, Sir J. Whitworth, James Martineau, Gladstone, Francis Thompson; and names connected with the success of the cotton trade, as John Kay (inventor of the fly-shuttle), Crompton, Arkwright, Hargreaves. The Lancashire dialect, renowned for terseness and vigour, is illustrated in works by J. Collier ('Tim Bobbin'), Ben Brierley, Edwin Waugh.

See Baines, *Lancashire* (1836; new ed. by Croston, 1888); Espinasse, *Lancashire Worthies* (1873-77); works by Butterworth, Grindon, Axon, Evans; and the 'Victoria History' (1906-13); and for place-names Wyld and Hirst (1911), Ekwall (1922).

Lancaster, the capital of Lancashire, is picturesquely situated on an eminence on the left bank of the Lune, 7 miles from its mouth, 51½ NNW. of Manchester and 231 NW. of London by rail. The ancient castle, which overlooks the town, was built on the site of a Roman castle, and was restored by John of Gaunt, 'time-honoured Lancaster'; it includes the Shire Hall. The church of St Mary (15th century) contains some good oak-carvings and stained glass. The Ripley Hospital for orphan children and the Royal Albert Institution for the feeble-minded are at Lancaster. The houses are built of the freestone quarried in the vicinity. The Lune is here crossed by a bridge of five arches, erected in 1788, and by an aqueduct carrying the Lancaster Canal across the river. Owing to the sanding of the Lune large vessels have to unload at Glasson, 5 miles distant. The chief manufactures are furniture, cotton, silk, oil-cloth, table-covers, and there are dye-works. A public park was presented in 1881. Henry Cort, inventor of iron puddling, Owen and Turner the anatomists, and Dr Whewell were born at Lancaster. In 1698 the town was nearly burnt to the ground. A very ancient municipal borough, it returned two members to parliament from 1547 to 1867, when it was disenfranchised for corrupt practices at elections. Pop. (1881) 20,663; (1901, as extended in 1900) 40,329; (1921) 40,212.

Lancaster, (1) capital of Fairfield county, Ohio, on the Hocking River and Canal, 32 miles SE. of Columbus, with machine-works and railway shops. Pop. 15,000. — (2) Capital of Lancaster county, Pennsylvania, 69 miles W. of Philadelphia. Besides a large court-house and numerous churches, it contains the Franklin and Marshall (German Reformed) College, and a reformed theological

seminary. There are large silk, cork, cigar, and other manufactories; and extensive warehouses for tobacco. Founded in 1730, Lancaster was the capital of the state from 1799 to 1812. Pop. (1870) 20,233; (1890) 32,011; (1920) 53,150.

Lancaster, DUCHY OF, was created in the reign of Edward III., the dignity of county palatine being at the same time conferred. The heiress marrying John of Gaunt, son of the king, the duchy was settled upon him and his heirs for ever by royal charter in 1362. Henry IV., third Duke of Lancaster, on his accession to the throne, passed a law in which it was provided that the inheritance of the house of Lancaster should be held by him and his family separate from the crown-lands. Edward IV. in 1461 ordained, with the consent of parliament, that the duchy of Lancaster should be annexed to the crown, but 'held separately from all other hereditaments.' This arrangement has continued until the present time, and the affairs of the duchy have thus enjoyed an independent administration, and formed no part of those hereditary revenues in view of which the Civil List was granted. These proceeds are wholly exempted from parliamentary control, except that the annual account for receipt and expenditure is presented to parliament. The chancery of the duchy of Lancaster is still a crown-office, and was at one time a court of appeal for chancery of the county palatine, but is now merely nominal. The administration of justice has since 1873 been assimilated to that of the rest of England. The office of chancellor is a political appointment; it is the practice to confer it on a statesman of eminence, frequently a member of the cabinet, who is expected to devote his time to such larger questions occupying the attention of government as do not fall within other departments. For the House of Lancaster, see HENRY IV., V., VI., JOHN OF GAUNT, ENGLAND.

Lancaster, SIR JAMES, an English navigator who commanded the first fleet of the East India Company that visited the East Indies in 1600-3, and on his return home was knighted. He had previously been a soldier and a merchant in Portugal, had visited the East Indies on his own account in 1591-94, and in 1595 had captured Pernambuco in Brazil. He was one of the original board of directors, and afterwards did much to promote the voyages of Waymouth, Hudson, and Baffin in search of the North-west Passage to India. The strait leading westwards from the north of Baffin Bay was in 1616 named Lancaster Sound by Baffin. Lancaster died in May 1618. See Sir Clements R. Markham's *Voyages of Sir James Lancaster* (Hakluyt Soc. 1877).

Lancaster, JOSEPH (1778-1838). See BELL (ANDREW), EDUCATION.

Lancaster Sound, a western outlet of Baffin Bay, in 74° 20' N. lat., connected with Boothia Gulf on the south by means of Prince Regent Inlet. Though this opening into the Arctic Ocean was discovered by Baffin in 1616, it was first navigated by Parry in 1819.

Lance, GEORGE, painter of fruit and still-life, was born at Little Easton, near Dunmow, in Essex, on 24th March 1802. He studied under Haydon, but discovered that his strength lay in painting fruit, game, and similar subjects. Specimens from his brush in this line were exhibited year after year at the Royal Academy and British Institution. His admission that he had 'restored' parts of Velazquez's 'Boar Hunt' caused a stir of controversy in 1853. Lance died at Sunnyside, near Birkenhead, on 18th June 1864.

Lancelet. See AMPHIOXUS.

Lancelot of the Lake, the most famous of Arthur's knights, brought up by the Lady of the Lake, rescues Queen Guinevere from King Meleagant and becomes her secret lover. The name of Walter Map (q.v.) is early associated with the story. If he did not write the great French prose romance he may nevertheless have been the author of the lost French work upon which Ulrich of Zatzikhoven founded his *Lanzelet* about 1200. Another important early form of the story is seen in Chrétien de Troyes's *Chevalier de la Charrette*. See Jessie L. Weston, *Legend of Sir Lancelot* (1901); O. Sommer, *Vulgate Version of the Arthurian Romances*, iii. (1910-12); F. Lot, *Étude sur le Lancelot en Prose* (1919).

Lancers, a branch of Cavalry (q.v.) introduced into the British service in 1816.

Lancet-window. See EARLY ENGLISH.

Lancewood, a wood valuable for its great strength and elasticity. It is produced by the small West Indian tree *Bocagea virgata* (Anonaceæ). Another species, *B. Dalzielii*, in Travancore, yields the wood called White Lancewood, which is not much used. Lancewood is especially fitted for shafts and carriage-poles. The part used is the main trunk of the tree, which is very straight, and rarely more than 9 inches in diameter with the bark on. It comes in small quantities from the West Indies, chiefly from Jamaica.

Lanciani, RODOLFO AMEDEO, archaeologist, was born at Rome in 1846, studied there under De Rossi, and became director of excavations and professor of Roman Topography at the university. He has written much on his special topic.

Lancing College, a High Church school for boys, was founded in 1848, on the Sussex Downs near North Lancing and Shoreham.

Land. See CONTINENT, EARTH, GEOGRAPHY, GEOLOGY, UPHEAVAL, WATER; also LAND LAWS, AGRICULTURE, SOILS.

Landau, a town of the Bavarian Palatinate, 11 miles W. of the Rhine and 17 SW. of Spire. Founded and made an imperial city in the 13th century, it has some interesting old churches, and played a prominent part in history as a fortress. During the Thirty Years' War it was taken eight times; in 1688 it was fortified by Vauban for Louis XIV., but surrendered four times during the war of the Austrian Succession. In 1816 Bavaria became mistress of it; and in 1870-71 its fortifications were levelled to the ground. Pop. 14,000.—There is another Landau, a small town of Bavaria on the Isar, 72 miles NE. of Munich.

Landaur, a hill cantonment and (since 1827) convalescent station in British India, in Dehra Dûn, United Provinces, forms part of Mussooree (Masuri). On the Himalayas, 7459 feet above the sea, it was ruined by the earthquake of April 1905.

Land-crab. See CRAB, HERMIT-CRAB.

Land Court. See CROFTER.

Lander, RICHARD, the discoverer of the mouth of the Niger, was born at Truro on 8th February 1804, and in 1825 accompanied Clapperton as his servant to Sokoto. There Clapperton died, and Lander, returning to England, published an account of the expedition. The British government then entrusted to him and his brother John (1807-39) the prosecution of further researches along the lower course of the Niger. In 1830 they proved that the Quorra, or Niger, falls by many mouths into the Bight of Benin. They published a *Journal of an Expedition to Explore the Niger* (3 vols. 1832). In the course of a third expedition in the same quarter, Richard Lander was wounded by the Niger natives, and died in consequence at Fernando Po on 2d or 7th February 1834. The story of this

third journey is contained in Laird and Oldfield's *Narrative of an Expedition into the Interior of Africa by the River Niger* (2 vols. 1837).

Landes, a maritime department of southern France, one of the largest and most thinly peopled in the country, is bounded on the W. by the Bay of Biscay. Area, 3598 sq. m.; pop. (1876) 303,508; (1921) 263,937. The chief river is the Adour (navigable). The greater portion of the department consists of the *landes*, tracts of barren sand, interspersed with marshes and forests of pine and oak, once one of the dreariest regions in Europe. The inhabitants are mostly of Gascon race, small and the reverse of robust in appearance, yet capable of great endurance. They herd sheep (no longer requiring to traverse the marshes on stilts), grow wine, and extract the products of the forests (timber, resin, cork, charcoal, &c.). Fowling and fishing also yield good returns. The Bayonne hams are obtained from pigs bred and fed in the *landes*. Besides wine, the soil is made to yield rye, maize, wheat, &c., especially in the hilly district called Chalosse, to the south of the Adour. By means of draining operations and the planting (since 1787) of forest trees rapid progress has been made in the reclamation of the soil and its cultivation. Although it has a coast-line of 75 miles long, the department does not possess a single harbour. A belt of sand-dunes, 2½ miles wide and reaching 300 feet in height, fringes the seashore from north to south. Iron is smelted. The mineral springs of Dax were known to the Romans. The railway from Bordeaux to Bayonne passes through the district from north to south. The department is divided into three arrondissements, Mont-de-Marsan, St Sever, and Dax. Capital, Mont-de-Marsan.

Landgrave, a title of superior distinction borne by certain counts—e.g. of Thuringia and Hesse—in the old German empire. They were the constitutional successors of the old rulers (counts, *Grafen*) of the original counties (*Gau*) of the German empire, and as such claimed the rank of princes (of the first class) of the empire.

Landguard Fort. See HARWICH.

Land Laws. The customs and rules which governed the use and possession of land in bygone times have in recent years formed the subject of much patient investigation. The comparative or ethnographic method—which consists in looking upon existing backward races as being representatives of our early ancestors—has been fruitful of results. The usages of people who are to-day living under primitive conditions afford—in the absence of historical records, or in supplement of such historical records as are available—valuable evidence of forms and customs which are characteristic of, and supply samples of, the successive stages of economic development through which civilised peoples have passed. In the words of Sir Henry Maine, direct observation thus comes to the aid of historical inquiry, and historical inquiry to the help of direct observation. While, however, the examination of facts and customs still existing among the more backward peoples has thrown much light on the evolution of forms of property in land, it is necessary to observe caution in drawing inferences from parallel usages.

At the stage of pure nomadic life the tribes, wandering from place to place, and remaining in one spot only so long as it afforded food for their cattle, were in no way attached to the land. The tribe and its members made a common use of the soil where they happened to be. Land was at their disposal in a quantity exceeding their wants. For them it had no more exchangeable value than the air, and among them ownership of the soil, in

any proper sense, was unknown. With the growth of population and the transition from nomadism to the cultivation of the soil and to settled life, customs and regulations with regard to the possession of land became necessary to keep in check the antagonistic interests of the members of the community. The view most generally held is that property arose entirely out of possession, and that, to avoid perpetual struggles for possession, the community gradually came to recognise the title of the possessor. There has been a good deal of rather vague speculation as to whether individual ownership, or possession having the character of a right of property, preceded common ownership. However that may be, when the shifting cultivation, which marked the first stage from pastoral to agricultural life, gave way to intensive cultivation, and when land in the territory occupied by the community ceased to be so abundant that it could be had for the taking, the community intervened to restrict the rights of individuals, and from a very early period the control and powers of disposal and distribution exercised by the community in relation to the land became so stringent and complete as in effect to establish a system of common ownership. Very generally recourse was had to periodic allotments of the land among the families of the community—the usufruct of a particular portion being granted to each family for a variable period of time.

The village community as a collective unit owning the land, and permitting no one to monopolise what belongs to all, represents a form of social organisation and land ownership which dates back to the beginnings of settled agriculture. It sprang from the earliest social organisation—the primitive clan. When agricultural industry became established social welfare depended chiefly on the distribution of the land and its advantageous cultivation. The social form generally spoken of as a village community has the double aspect of a group of families united by the assumption of common kinship and of a company of persons exercising joint ownership over land. This system remains, substantially unchanged, in India and among the Aryan peoples of Asia. The Indian village community is, indeed, the most perfect surviving sample of this ancient institution. It is the proprietary unit of the land, which it cultivates on a joint system. The minute and complex customary rules which govern every detail of the tillage of the land have for their object to reconcile a common plan and order of cultivation on the part of the whole brotherhood with the holding of distinct lots in the arable land by separate families. Generally speaking, under existing conditions, the common life of the group or community has been so far broken up as to admit of private property in cultivated land, but not so far as to allow departure from a joint system of cultivating that land. The community is a little social organism, self-governing and complete in itself. It comprises not only the cultivating families, who form the major part of the group, but also families hereditarily engaged in crafts, e.g. blacksmiths, harness-makers, shoemakers, which furnish the community with the articles necessary to enable them to continue their collective life without external assistance. The community itself is the source of the laws which define the relations to one another of the various sections of the group, and of the community itself to other similar communities. Its affairs are managed and its customs interpreted by a headman or a village council, exercising quasi-judicial and quasi-legislative powers. There exists in India another type of village, usually called *raiayatwari*, and prevalent in Central and Southern

India, in which the holdings are separate. There is no evidence that these holdings were ever otherwise than separate and independent, and some authorities are of opinion that the type of village, in which the villagers have joint or communistic interests, followed, and did not precede, the village of separate holdings.

The system of village communities either exists, or is known to have existed, among nearly all the peoples of Asia and Europe. Its main features are preserved to this day in China, and in the rural community—the *mir*—in Russia. The *mir*, though in time it became chiefly a co-operative association, was in origin a community of kinsmen, occupying a fixed territory, and exhibiting close resemblances to village communities elsewhere. A system, fundamentally similar, prevailed among the Teutonic tribes, among the Celtic tribes and, indeed, everywhere in Western Europe. In Germany the Teutonic township, the *vicus* described by Tacitus, was a group of families owning a common tract of land, the 'mark.' The cultivated land—that is to say, the arable mark as distinct from the common mark not appropriated to cultivation—appears almost invariably to have been divided into three large fields, and to have been periodically distributed among the families composing the group. So widespread is the actual or historic existence of the system of village community that it may reasonably be inferred that it represents a stage and form of social organisation through which most peoples, more or less civilised, are passing or have passed.

In Greece and Rome, at the dawn of authentic history, the era of common ownership of land by the clan or *gens* had already passed, and the land had been portioned out among families. But both in Greece and in Rome there remained traces of the older system of communal land ownership. In Sparta we are told by Plutarch that Lysurgus persuaded the citizens to restore the land to common use, and to divide it into equal parts, one of these parts being allotted to each household—a proceeding which suggests that the Spartan lawgiver was only going back to an ancient custom of allotments, of which the memory had not been lost. In Rome, at the earliest era of which there are historical records, the families were grouped in clans or *gentes*, of which all the members were supposed to be descended from a common ancestor; but the arable lands of each *gens* had already been parcelled out among the families composing the *gens*. The head of each family, the *paterfamilias*, was absolute owner of the family land (*heredium*). There were, however, plain survivals of an earlier period when the land of the *gens* was the common property of the *gens*. Thus, if a family died out, its land reverted by inheritance to the *gens*. Under the republic, private property in land as in movables was fully developed. The agrarian laws (*leges agrariae*) of that period had reference solely to the *ager publicus*, consisting of lands acquired by conquest, which were the property of the Roman people, and administered by Roman magistrates. These lands were to a large extent held by the wealthier citizens in consideration of annual payments to the state, and the object of the long series of agrarian laws was to secure for the poorer citizens a juster participation in the enjoyment of this state domain. The Roman law recognised a distinction between land and things attached to it (*res immobiles*) and all other property (*res mobiles*); but this distinction was of very subordinate importance. The word land, in Roman law as in modern law, includes not only the surface of the earth, but everything over it and under it. Hence no man may erect any building to overhang another man's land, and everything under the land belongs

in general to the owner of the surface. Where a movable subject is annexed to land, it becomes, in law, part of the land, and the property in it passes to the owner of the land—*Omne quod inædificatur solo cedit*. The uses of land by the owner, however, were limited, in the interests of the public or of neighbours, by the various applications of the maxim—*Sic utere tuo ut alienum non lædas*. In the classical period of Roman law there was an important distinction between land in Italy (*solum italicum*) and land in the provinces (*solum provinciale*). The ownership (*dominium*) of the *solum provinciale* was in the state. The actual holders were not *domini*, but held permanently at a fixed tribute. This distinction, however, had disappeared in the time of Justinian.

In England under the Saxons the system of ownership of land was fundamentally the same as that which had obtained among their Germanic ancestors (*vide supra*). Many details remain obscure but, speaking generally, the soil was cultivated by groups of villagers. The village or township was a group of joint owners acknowledging no superior except for military service and other purposes of public order and justice, and regulating its own internal affairs. Each villager had a share or lot in the common arable, meadow, and waste land of the village or township, but not necessarily an equal share. The ordinary villager's share in the arable fields consisted, not of a single, permanent block, but of a 'shifting severalty', probably reallocated periodically, and consisting of a large number of half-acre strips, scattered in apparently arbitrary fashion, over the three great arable fields of the village. The right of the villager in the meadow and waste lands was merely a right to graze on them a limited number of cattle, sheep, horses, pigs, or goats, according to the extent of his arable holding. The operations of tillage, the choice of crops, the periodical allotments, and other matters of common interest, were governed by customary law.

Even before the Norman conquest the old English land law was tending in the direction of feudalism, and the coming of the Normans accelerated the definite reception of feudal rules. The Norman rulers, while making no serious attempt to uproot the old system, imposed the feudal system upon it. Under the feudal theory the whole land of the realm was deemed to be vested in the sovereign. The country was divided up into districts, which were granted by the king to trusted followers, responsible to him for the peace of their districts, for military service, and for a share of taxation. The greater lords, repeating this process, granted out parts of their lands to under-lords, retaining merely the 'seignory' or superiority over such parts. The effect was to create a new and distinct tenure by subinfeudation, the under-lord or vassal becoming answerable to his over-lord for the services and dues to be rendered in respect of the part granted to him. Thus arose the principle of tenure upon which substantially the whole of English land law is based. The fundamental distinction, at common law, between property in land and property in goods is that ownership of land is never absolute, while the ownership of goods is never anything but absolute. However great the interest of any English subject in any parcel of English land may be, he is still regarded not as an absolute owner but as merely a tenant or holder of his land from the crown or from someone who himself holds from the crown in which the ultimate ownership of the land resides. Practically, indeed, the distinction between the fee-simple of land and the ownership of it is a matter of form rather than that of substance. In fact, if not in legal theory, the right of a tenant in fee-simple is permanent and, dis-

regarding the technicality of real property law, may be called a right of ownership. The multiplication of under-tenures by subinfeudation was struck at by the statute *Quia emptores* in 1290, which enacted that thenceforth it should be lawful for every freeman to sell, at his own pleasure, his lands and tenements or part of them, so that the purchaser should hold of the same chief lord and by the same services as the vendor had held them. The purchaser thus became the direct tenant of the chief lord, and liable to him, and to him only, for a proportionate part of the services due in respect of the original holding. The statute was expressly confined to estates in fee-simple; and, after it was passed, it became impossible to create a new feudal tenure of a fee-simple estate. The ancient feudal incidents of wardship, knighthood, &c., were all abolished by the Statute of Tenures, 1660 (12 Car. II. chap. 24). That statute also provided that all tenures held of the king or others be turned into free or common socage—the tenure in socage being the least burdensome of all the tenures known at that date. From that time feudalism in any real sense ceased to exist in England (see FEUDALISM). The form of estate, since known as 'estate tail', was established by the statute *De Donis* in 1285. But methods and proceedings of a fictitious or collusive character, called fines and recoveries, were devised for breaking through the statutory restraint on alienation and, in effect, converting an estate tail into an estate in fee-simple. The Fines and Recoveries Act of 1833 substituted a simple disentailing assurance for the clumsy collusive actions formerly necessary to bar an entail (see ENTAIL). The peculiar incidents of the tenures, gavelkind and copyhold are described in separate articles.

Parliament passed acts forbidding alienation of lands in mortmain, chiefly in order to prevent the aggrandisement of the church. But these were defeated by the Court of Chancery giving effect to trusts for religious corporations. Parliament by the Statute of Uses, 27 Henry VIII. chap. 10, annulled such trusts. But again the chancellors defeated the statute by declaring that it did not apply where a trust was created to hold for another, who again was to hold for a third person. At last a device was hit upon by the ingenuity of lawyers, under which the effect of entails has been attained by means of what are called settlements, under which each successive owner is restricted. A series of acts culminating in the Settled Land Act of 1882 has enabled the limited owner, whether tenant in tail or tenant for life, to convey to the purchaser of his land an estate in fee simple, and has annulled by anticipation every contrivance for depriving him of this power. The act has rendered useless the expedients formerly employed to keep land in the possession of one family for an indefinite period. The act of 1882 also has enabled a tenant for life to grant agricultural, building, or mining leases for long terms, and to expend money derived from the sale of part of the settled land in executing certain permanent improvements upon the land which he retains. The Allotments Act, 1887, and the Small Holding Act, 1892, have given the labourer facilities for cultivating land on his own account. The enclosure of commons has been regulated not merely in the interest of those who have rights in the common land, but to provide for the healthy recreation of the general public.

At common law, as modified by statutes prior to the Law of Property Act, 1922, the order of intestate descent in land is that land descends lineally to issue, that the male issue is admitted before the female, and that among sons primogeniture prevails, but daughters inherit together. The principle of primogeniture grew fast in mediæval times at the expense of other rules of descent. Its most

formidable competitor, the rule of equal division among all sons, held its ground only in Kent.

The main object of the Law of Property Act, 1922, 12 and 13 Geo. V. chap. 16, is to simplify the law relating to the ownership, settlement, and devolution of land, and to lessen the difficulty and expense of investigating the title on the occasion of sales, mortgages, and other transactions. It makes provision for the abolition of Copyhold (q.v.), and manorial incidents and customary tenures like Gavelkind (q.v.) and Borough English (q.v.), while compensating lords and stewards of manors. It abolishes primogeniture, and provides a new system of intestate succession, applicable alike to land and personal estate. It abolishes all 'legal estates' in freehold except fee-simples and estates for years. It repeals the Statute of Uses, and enacts that the provisions in any statute or other instrument requiring land to be conveyed to uses shall take effect as directions to settle the land on corresponding trusts.

The early settlers of the American colonies brought with them the common and statute law of England as regards land tenure. In many of the states, however, constitutional provisions were adopted declaring all lands to be allodial, and prohibiting feudal tenures. Even where feudal tenure continues to exist in theory, the land is held in effect on allodial tenure.

In Scotland the system of land rights is based on feudalism. Land is held either directly under the crown, or indirectly either as vassal to someone who holds immediately from the crown, or as sub-vassal in a more subordinate degree. The grantor of the feudal right is called the superior. The interest retained by the superior is styled the *dominium directum*, or the superiority; the interest acquired by the vassal is termed the *dominium utile*. The vassal, when infeft, becomes owner of the feu, with all the powers of ownership, subject to the conditions of tenure. In ancient times a vassal could not alienate so as to substitute a stranger in his place without the consent of his superior; but this rule was first modified and then abolished. Subinfeudation has never been prohibited by Scots law. Formerly it was not unusual to insert in feu charters conditions against subinfeudation; but by the Conveyancing Act, 1874, all conditions made after the commencement of the act to the effect that it should not be lawful to the proprietor to sub-feu the lands to be holden of himself as immediate lawful superior were declared to be null and void. All persons, including aliens, may hold feudal rights. There are no Mortmain Acts in Scotland. The old feudal tenure of ward-holding, with the services, chiefly military, and casualties peculiar to it, was abolished in 1747. The most usual tenure now is feu-farm, in which the vassal is bound to pay a feu-duty annually in money or in kind. Other tenures still existing are burghage-holding, by which royal burghs hold their lands of the sovereign; and blench-holding, in which the vassal is bound to pay some elusory duty, merely in acknowledgment of the superiority. It is to be noted that in Scotland—unlike England—certain lands are allodial, that is to say, are not held on any feudal tenure, but in absolute property. These include manse and glebes, lands held on statutory title, and udal lands in Orkney and Shetland. Orkney and Shetland formed part of greater Scandinavia, and the old Norse land laws prevail in these islands—the land remaining udal except such portions of it as have been directly feudalised by charter. Entails in all their strictness were recognised as lawful and valid in Scots law by the statute 1685, chap. 22, which continues to be the foundation of the existing law of entail. Since 1848 the operation of

entails has been restrained by statutes. An heir of entail in possession now has statutory power, subject to certain consents, to disentail and acquire the estate in fee-simple on paying to the next heirs the estimated value of their expectancies and interests. He has also wide powers under the statutes to sell, to grant feus and leases, to charge improvement expenditure, and to grant family provisions. The Entail (Scotland) Act, 1914, struck at the creation of entails by providing (sect. 2) that the Entail Act, 1685, shall not apply to any deed relating to land in Scotland after the passing of the act, the effect of which would be to entail such land, and that any prohibition of alienation, contracting debt, or altering the order of succession in any such deed shall be null and void (see ENTAIL). The distinguishing features of the succession to land in Scotland on intestacy are found in primogeniture, by which the eldest son or his descendant is preferred to younger sons, and in the preference of males to females in the same degree of relationship. Recent legislation affecting the tenure of land in Scotland by small holders is dealt with in the article CROFTER.

Feudalism held sway in France down to the Revolution. The introduction of modern ideas of taxation even aggravated its hardships, for the great nobles secured exemption from these imposts, which thus fell the more heavily on their vassals. Both in France and Germany the vassals were also grievously burdened with the obligation of forced labour, partly due to the state for the maintenance of roads, &c., but chiefly to the immediate lord, who thus obtained the advantage of gratuitous cultivation for his own lands, while the peasantry were left to devote more inconvenient seasons to the work of their small farms. In France this system was swept away by that Revolution to which it had so largely contributed. The *Code Napoléon*, which now regulates the law, on death makes equal division of land among all the children of the deceased owner compulsory. A similar rule has obtained from time immemorial in the Channel Islands. In Germany the feudal system disappeared under the celebrated legislation of Stein and Hardenberg. To purchase their relief from the duty of forced labour and other exactions of the lords the peasantry surrendered a portion of their lands to the lords, and were declared to hold the remainder free from any service. Land banks were at the same time established, which made advances to those who desired to buy up rights of common affecting their lands, or to commute rents for a payment in money.

In Scandinavian countries feudalism took no root, and land has generally been held by small freeholders who were the cultivators.

From the foregoing sketch it may be seen that the fundamental idea of ownership in land, in the leading systems of village communities and of feudalism, is that it is ultimately vested in the state or nation. But it is equally apparent that individual ownership, subject to such services or other equivalent as the state may demand, is universally recognised. It applies the stimulus of individual profit and enjoyment to the culture and improvement of the soil. Under this influence an enormous amount of capital has in all countries, but in the most marked degree in Great Britain, been invested in the reclamation of the land from its original state of nature, whether as forest, prairie, or swamp. The fee-simple value of the land as it at present exists, in the majority of cases, represents not the original value, but little more, very often considerably less, than the mere expenditure of capital within the last century on erection of farm-houses and farm-buildings, cottages and fences, on making roads, on draining,

levelling, embanking, warping, or such other improvements as the situation demands.

The cultivation of land may be either by the owner or by a tenant. The former is the natural, and almost always the most advantageous method, in the interests of the community, for it tends to induce the largest outlay on improvements which bring enhanced returns. The first departure from this idea takes the form (unknown in Britain, but common on the Continent, and frequent in the United States) of cultivation on shares, or *métairie*. Under this arrangement the landlord furnishes land and generally stock, the tenant gives the labour, and the produce is shared in certain proportions, frequently in moieties. It involves a close superintendence by the land-owner or his steward. The next stage of the arrangement forms the system, once universal in Scotland, of 'grain rents,' where the tenant binds himself to pay annually the value of a fixed quantity of different species of grain according to the market prices then prevailing, these being annually ascertained in Scotland by the 'striking of the Fairs' (q.v.). The last stage is the agreement to pay a fixed money rent irrespective of crops or prices. See LANDLORD AND TENANT.

Land League, in Ireland, founded by Davitt (q.v.) in 1879, to purchase land for the tenants, was suppressed in 1881 as illegal. See IRELAND, PARNELL.

Ländler, a Styrian peasant-dance in slow 3-4 time, similar to the waltz.

Landlord and Tenant. In Roman law the relation of landlord and tenant arose from a contract, *locatio-conductio*, by which the one party (*locator*) undertook to give the other (*conductor*) the use and possession of land or a house or other *prædium* for a stipulated period, in consideration of the payment of rent. The *locator* was bound to maintain the *prædium* in such a condition as to make it fit for the purpose for which it was let. The position of the tenant of a house (*inquilinus*) or of land (*colonus*) under an ordinary contract of letting and hiring was somewhat precarious in respect that his rights rested solely on the contract, which was binding only on the parties and their representatives. If therefore the lessor sold the property, the purchaser was not bound by the lease and could turn out the lessee, whose only remedy was a right to damages from the lessor. If, after the expiry of the stipulated term, the tenant was allowed to continue in possession, this

was construed as an implied renewal of the lease. Where the subject let was a farm (*prædium rusticum*) the period of implied renewal was from year to year. The tenure of land known in the later period of Roman law as *emphyteusis* had its origin in a system under which land was let in perpetuity or for an indefinite period, subject to the payment of an annual rent (*vectigal*). The persons holding such *ager vectigalis* had their possession protected by interdicts and, subsequently, by an *utilis actio in rem* (*actio vectigalis*) available even against the owner of the land when non-payment of rent was not alleged. When the right of the tenant thus ceased to be a mere contractual right giving only a *jus in personam* against the landlord, and became a *jus in rem* entitling him to defend his possession against all the world, the question arose whether the transaction should not be regarded as a sale, rather than a hire, of the land. By a constitution of the Emperor Zeno, it was finally determined that this mode of dealing with land was neither sale nor hire but a special form of tenure (*emphyteusis*) governed by its own rules. The landlord retained the *dominium*, and the right to receive the rent (*canon* or *pensio*). The tenant (*emphyteuta*) could sell his right, but the landlord, in case of a sale, had the privilege of pre-emption—i.e. had the option of buying the tenant's right at the price at which the tenant was prepared to sell it to the third party. *Emphyteusis* is of great importance in the history of land tenure, as it marked a stage in the development which led ultimately to feudalism.

In English law the relation of landlord and tenant is created whenever a person, being possessed of an interest in real property, grants to another, generally in consideration of a recompense in the shape of rent, an estate or interest less than he himself possesses therein. Tenancies are usually classified under the following heads: (1) Tenancies at will; (2) tenancies from year to year; (3) tenancies for years. A tenancy at will is determinable at any time at the will either of the landlord or of the tenant. In other words, it endures only at the will of both the parties. A tenancy from year to year is one in which the tenant is regarded in law as having an interest for one year certain from the date of its commencement, with a growing interest during every year thereafter springing out of the original contract and parcel of it. Instead of a yearly tenancy the parties may agree on a tenancy for a shorter period—e.g. from quarter to quarter, from month to month, or from week to week. Yearly and other periodic tenancies have this feature in common that the tenancy, while the holding continues, repeats itself from period to period. A tenancy for years is one in which premises are let for a certain term of years. In addition to these three varieties of tenancies, what is called a 'tenancy at sufferance' arises by implication of law where any tenant 'holds over' or continues in possession after the expiration of his term without the landlord either assenting or dissenting.

The relation of landlord and tenant is most commonly created by a lease or by entry under an agreement for a lease. The word 'lease' is generally used to denote an instrument of demise under seal; but any instrument containing all the material elements of the letting, by which it appears that one party is to give possession and the other to take it, is a lease. It is necessary that a lease should identify the parties; should contain words of demise—that is to say, words showing that the parties have finally determined that one is to give and the other to take possession; should describe with reasonable certainty the demised premises; should set forth, expressly or by clear inference,

the time of the commencement of the term and the duration of the term; and should specify the rent. Leases of land, houses, and other corporeal hereditaments for a term not longer than two years, at a rent of not less than two-thirds the full annual value, may be made by a verbal letting or by writing not under seal. On the other hand, the rule based on statutes which restricted the ancient common law right of making leases for any length by parol, is that leases of corporeal hereditaments for more than three years, or reserving less rent than two-thirds of the improved value of the premises, must be by deed. But this rule is at the present day practically of no effect where possession has been given. For, under the equitable rules which, since the Judicature Acts, prevail in all the courts, a tenant in possession under a lease not under seal for a term exceeding three years, or an agreement for a lease, which is such that specific performance would be granted, is, as between himself and the landlord, in the same position as if a formal lease had been granted to him in pursuance of the agreement. Very often the parties are content to enter merely into an agreement for a lease, without embodying their contract in a formal lease. In order that an agreement for a lease be specifically enforceable and so be equivalent to an actual lease, it is necessary (1) that the contract between the parties be complete, and (2) that (in the absence of part performance) the agreement, or some memorandum or note thereof, be, in the words of sect. 4 of the Statute of Frauds, 'in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorised.' The writing—or, it may be, two or more writings read together—must contain or disclose all the material terms of the contract—the parties, the property to be leased, the time from which the term is to run, the length of the term, and the rent. To the general rule, that specific performance of an agreement for a lease will only be decreed if the requirements of the Statute of Frauds have been satisfied, there is an important exception in cases where there has been part performance of the agreement. An agreement for a lease—even where the agreement is merely oral—may, if its terms are definite, be specifically enforced where there has been sufficient part performance. The acts of part performance must be unequivocally referable to, and must be consistent with, the alleged agreement. The most common instance of part performance, sufficient to take the case out of the operation of the Statute of Frauds, is where the intending lessee enters into possession under the agreement. A definite agreement, though verbal only, if it has been followed by delivery of possession, creates a tenancy on the terms of the agreement, and the rights and liabilities of the landlord and tenant are the same as if a formal lease had been executed.

The rights and liabilities of the parties during the continuance of the tenancy are, as a rule, regulated by the provisions of the lease or agreement for a lease. The covenants vary with the nature of the property demised. They may be either expressed or implied. Any words importing an agreement to do something will be construed as a covenant. An express covenant excludes an implied one upon the same matter. In the absence of express covenants, the law implies what are called 'usual' covenants. Thus the law implies, on the part of the landlord, a covenant for quiet enjoyment. The 'usual' covenants implied by law on the part of the tenant are to pay rent, to pay tenant's taxes, to keep and yield up the premises in repair, to allow the landlord to enter and view the state of repair, and, in the case of an agricultural tenancy, to cultivate the land in

accordance with good husbandry. The express covenants on the part of the tenant commonly contained in leases are to insure the premises, not to use the premises in particular ways or for carrying on particular trades, and not to assign or sublet without the landlord's consent. A covenant against assignment strikes only at voluntary assignments, and therefore is not broken if the tenant becomes bankrupt so that the term vests in his trustee, or if the term be sold under an execution, or if the premises be acquired by a public company under their compulsory powers. On an assignment of the tenancy the assignee becomes liable in such covenants of the lease as affect the premises demised or the mode of enjoying these premises, but does not become liable in such covenants as are merely personal. Covenants of the former kind are spoken of as 'running with the land,' as distinguished from covenants of the latter kind, which are spoken of as 'collateral.'

There is, as a general rule, no implied warranty that the demised premises are fit for the purpose for which they are let, and no implied obligation on the part of the landlord to do repairs. To this rule there are two important exceptions: (1) In the letting of furnished houses and apartments an undertaking is implied on the part of the landlord that they are reasonably fit for habitation; (2) Under the Housing of the Working Classes Act, 1890, extended by the Housing, Town-planning, &c., Act, 1909, in the case of the letting of a house, or part of a house, for habitation by persons of the working classes, where the rent does not exceed a certain limit—viz. £40 in the county of London, £26 in a borough or urban district with a population of 50,000 or upwards, and £16 elsewhere—there is an implied condition not only that the house is fit for habitation at the commencement of the term, but also that the house shall, during the holding, be kept by the landlord in all respects reasonably fit for human occupation.

The rent must be certain, or capable of being rendered certain by computation. The mere fact of its being fluctuating in amount does not render it uncertain if the amount is definitely ascertainable. Royalties, reserved in mining leases and usually charged upon the quantity of minerals got out of the mine, are rent. The time at which the rent is payable must also be certain. The rent must be reserved to the lessor, and not to a third party. Payment of rent can be enforced by action, and the landlord also has, as incident to his reversion and without any stipulation, the right to distrain for arrears of rent (see DISTRESS).

Where a lease is for a definite term, expiring on a fixed day, the tenancy comes to an end on the expiry of the term without notice of any kind. A tenancy from year to year and other periodic tenancies, such as half-yearly, quarterly, monthly, or weekly tenancies, may be determined by a notice given by either landlord or tenant; but such a tenancy, if not determined by proper notice, continues from period to period. In a tenancy from year to year the notice requisite to determine the tenancy is, in the ordinary case—apart from express stipulation—a half-year's notice, expiring with a completed year of the tenancy. In periodic tenancies for a shorter period than a year, such as a quarter, a month, or a week, the notice necessary and sufficient to terminate the tenancy is—in the absence of special stipulation—a notice equal to the length of the period; that is to say, in a quarterly tenancy, a quarter's notice; in a monthly tenancy, a month's notice; and in a weekly tenancy, a week's notice. A tenancy may also terminate by surrender—that is, by the tenant yielding up the estate or interest to the landlord, and the landlord accepting it back from him. Surrender may be

express, i.e. by deed or by express words; or by operation of law, i.e. where the one party does, and the other assents to, an act which is inconsistent with the continuance of the tenancy. Again, a tenancy may be brought to an end by forfeiture. A landlord has a right, subject to statutory provisions for relief against forfeiture, to determine a tenancy and re-enter for forfeiture when the tenant has broken a condition subject to the observance of which the lease was granted, or is in breach of a covenant if the lease contain a provision that the landlord shall have a right to re-enter on the tenant committing a breach of that covenant. Under the Conveyancing Act, 1881, as amended by the Conveyancing Act, 1892, a right of re-entry or forfeiture for a breach of a covenant or condition in the lease cannot—except in certain specified cases—be enforced by action or otherwise, unless and until the landlord serves on the tenant a notice specifying the particular breach complained of, and, if the breach is capable of remedy, requiring the tenant to remedy the breach, and, in any case, requiring him to make compensation in money for the breach, and the tenant fails, within a reasonable time thereafter, to remedy the breach and make reasonable compensation. No such notice is necessary where the ground of forfeiture is non-payment of rent. If one half-year's rent be in arrear, and no sufficient distress be found on the premises countervailing all the arrears due, the landlord may bring an ejectment; but the court has wide powers to grant relief from a forfeiture for non-payment of rent on such terms as it deems equitable.

At the end of the lease the tenant must yield up complete possession of the demised premises to the landlord. Articles, though annexed to the soil or to the fabric of a building so as, in a legal sense, to become thenceforth part of it, are removable by the tenant where they have been annexed by him for the purpose of carrying on some trade, business, or manufacture, or for purposes of ornament and convenience, provided they can be removed without being themselves destroyed and without material injury to the freehold. (See *FIXTURES*.) The ordinary right of a tenant to remove fixtures may be either enlarged or diminished by express contract.

In agricultural tenancies the common law as to the respective rights of the landlord and the tenant has been greatly altered by the Agricultural Holdings Acts. There has been a long series of these acts; but the statutory law on this subject is now consolidated in the Agricultural Holdings Act, 1923 (13 and 14 Geo. V. chap. 9). In the case of agricultural tenancies commencing on or after 1st January 1921, for a term of two years or upwards, the tenancy does not terminate on the expiration of the term for which it was granted, unless, not less than one year nor more than two years before the date fixed for the expiration of the term, a written notice has been given by either party to the other of his intention to terminate the tenancy. If no notice is given the tenancy will continue as a tenancy from year to year. A wide freedom is conferred on the tenant as regards the method of cropping and the disposal of crops. At common law a farm tenant had no right to remove fixtures put up by him for agricultural purposes; but, as the law now stands, 'any engine, machinery, fencing, or other fixture' affixed by the tenant, and any building erected by him, for which he is not entitled to compensation and which is not affixed or erected in pursuance of an obligation or instead of some fixture or building belonging to the landlord, is removable by the tenant. This right of removal is subject to the provisos that the tenant shall, before the removal, pay all rent and satisfy all other

obligations to the landlord in respect of the holding; shall, in the removal, not do avoidable damage, and shall make good damage occasioned by the removal; and shall not remove any fixture or building without a month's previous notice in writing to the landlord, who may elect to purchase on paying the fair value thereof to an incoming tenant. Elaborate provision is made as to the compensation to be paid by the landlord in respect of certain definite classes of improvements made by the tenant on the holding. The improvements in respect of which compensation is to be paid by the landlord under the act are divided into three classes. The *first* class comprises improvements of a permanent character, such as the erection, alteration, or enlargement of buildings. To entitle the tenant to compensation for improvements of this class it is necessary that the landlord, previously to the execution of the improvement, consent in writing to the making of the improvement. The *second* class relates to drainage. Compensation is not payable for drainage improvements unless the tenant has, not more than three months and not less than two months before beginning to execute such improvement, given the landlord written notice of his intention, and of the manner in which he proposes to do the intended work. Upon such notice being given the landlord and tenant may agree on the terms as to compensation or otherwise, and the agreed compensation is substituted for that provided by the act. The *third* class includes improvements which add to the fertility of the soil, such as the application of manures, the consumption on the holding of cake and corn, as well as certain other improvements, including repairs of the kind specified in Part III. of the First Schedule of the Act of 1923. No notice is necessary (except as to repairs) before doing improvements of this class. The basis of compensation is the value of the improvement to an incoming tenant. Against the tenant's claim for compensation the landlord has a right to set off any benefit which he has given or allowed to the tenant in consideration of the tenant executing the improvement and—in the case of manures—the value of the manure required by the contract of tenancy or by custom to be returned to the holding in respect of any crops grown on and sold off or removed from the holding within the last two years of the tenancy. A tenant is not entitled to compensation for improvements, other than manures, executed during the last year of a tenancy, unless the landlord either assents to them or fails to dissent within a month after receiving notice from the tenant of his intention to execute them. If the landlord and tenant cannot agree as to the amount of compensation, the matter is referred to arbitration. The arbitration is before a single arbitrator appointed, where agreed upon, by the parties, and in default of agreement on the nomination of the Minister of Agriculture upon the application in writing of either party. The Act of 1923 also makes provision for giving compensation for disturbance to tenants who are required to quit without any fault on their part.

In the law of Scotland, as in Roman law, a lease is a contract of location, by which the use of land or other heritable subjects is let for a certain rent. A lease for more than one year should be in a probative writing. But where an agreement for a lease for a term of years, though not embodied in a probative writing, is proved by writing or oath, and has been followed by actings of the parties on the faith of there being a binding agreement for more than a year, the agreement becomes binding for the whole term of years. A probative obligation to grant a lease is as effectual against the granter as a formal lease. By the statute, 1449,

chap. 17, a lease of heritable subjects was made effectual to the lessee for the full term of its endurance, into whose hands soever the property in the subjects might come, provided it is in writing, is followed by possession, is for an ascertainable term, and specifies the rent payable. When the term of a lease expires, the relation of landlord and tenant may be continued by 'tacit relocation.' This occurs when neither of the parties intimates an intention that the lease shall terminate at the term fixed for its expiration. The stipulations and conditions of the original contract are presumed to remain in force by tacit consent. Where the original tenancy was for a year or more, the implication is that the renewed tenancy is for one year, and so on from year to year. Leases of unfurnished houses for any period are assignable, unless assignees are expressly excluded in the lease; but leases of furnished houses cannot be assigned without the landlord's consent. When a house is let there is an implied obligation on the landlord to put the house in tenantable and sanitary condition at the date of entry, and to maintain it in that condition during the term of the lease. In leases of houses, shops, or other buildings, the landlord has, in security for each year's rent as it falls due, a hypothec over the furniture and other goods on the premises. The landlord's right of hypothec for rent was, by an Act of 1880, abolished in leases of land, exceeding two acres in extent, let for agriculture or pasture. The Agricultural Holdings Act, 1923 (13 and 14 Geo. V. chap. 10), applicable to Scotland, proceeds on lines substantially identical with those of the corresponding English statute.

The House Letting and Rating Act, 1911 (1 and 2 Geo. V. chap. 46), regulates the letting of 'small dwelling-houses,' and introduced in Scotland a system of 'short lets' of such houses similar to that in use in England. No agreement for the let of such a dwelling-house is binding if made more than two months before the date of the let. The notice necessary to terminate a tenancy under the act is forty days, if the tenancy is for more than three months; one-third of the period of let, if the tenancy is for a period of from one to three months; and five days, if the tenancy is for less than a month. The owners of small dwelling-houses are made liable for the payment of assessments imposed on the occupiers—the occupiers paying directly to the owners the assessments proportional to the length of their occupation. The act applies, in burghs or 'special districts' with a population of less than 20,000, to houses of a yearly value of £10 or under; in burghs or districts, with a population of more than 20,000 and less than 50,000, to houses of a yearly value of £15 or under; in burghs or districts with a population of more than 50,000, to houses of a yearly value of £21 or under. By sect. 16 (1) and sect. 18 (1) of the Rent Restrictions Act, 1920, the limits of value to which the House Letting Act applies were increased by 25 per cent.

The statutes, commencing with the 'Crofters' Holding Act, 1886, and culminating in the Small Landholders (Scotland) Act, 1911, and the Land Settlement Act, 1919, by which a new tenure for small holdings has been established in Scotland, are dealt with in the article CROFTER.

The statutes, known as the Rent Restrictions Acts—the first of which was passed on 23d December 1915—are a consequence of the inadequate provision of housing accommodation. The statutes are based on the principle that, in the public interest, the rent of the dwelling-houses to which the acts apply is not to be left to the higgling of the market. Their main object and effect is to restrict the right of landlords to raise rents or recover possession of dwelling-houses, except in

certain specified cases. The statutes of this series which are now in force are the Act of 1920 (10 and 11 Geo. V. chap. 17), now called the principal act—which repealed, and at the same time extended, the provisions of the earlier acts—and subsequent amending and continuing statutes, including the Prevention of Evictions Act, 1924. These acts apply to a house or a part of a house let as a separate dwelling, where the annual amount of the 'standard rent'—the rent at which the premises were let on 3d August 1914, or if not let on that date at the rent at which they were last let before that date, or if first let after that date the rent at which they were first let—or the rateable value does not exceed (a) in the Metropolitan Police District, including the City of London, £105; (b) in Scotland, £90; and (c) elsewhere, £78. A house or part of a house partly used for business, trade, or professional purposes is included, as is also a house let together with land or premises when the rateable value of the land or premises if let separately would be less than one-quarter of the rateable value of the house. A limited permission to increase the rent is granted under certain conditions. Where, after the passing of the Act of 1923—31st July 1923—the landlord grants or agrees to grant to the tenant a lease for a term of not less than two years ending at some date after 24th June 1926, the parties are free to make what arrangements they please regarding rent and other conditions of the tenancy; but if at the beginning of the term a part of the house is sub-let, and is a dwelling-house within the act, that part will continue to be within the act. The grounds upon which a landlord may recover possession of a dwelling-house are set out in sect. 5 (1) of the 1920 Act as amended by sect. 4 of the 1923 Act. A tenant who is retaining possession in virtue of the provisions of the acts thereupon becomes a 'statutory' tenant. Such a tenant is bound to observe, and is entitled to the benefit of, all the terms and conditions of the original contract of tenancy, so far as the same are consistent with the provisions of the statutes.

See for English Law, Woodfall, *Landlord and Tenant* (21st ed. 1923); Foa, *Landlord and Tenant* (6th ed. 1924); Redman, *Landlord and Tenant* (8th ed. 1924). For Scots Law, Rankine on *Leases* (3d ed. 1916).

Landolphia, a tropical and South African genus of Apocynaceae, some of them lianas with hooks. Several species yield India-rubber (q.v.).

Landor, LETITIA ELIZABETH, was born in Chelsea, 14th August 1802. At an early age she contributed short poems to the *Literary Gazette*. Between the years 1824 and 1838 she published several volumes of poems, and three novels, besides contributing to 'Annals,' the *New Monthly Magazine*, and the *Literary Gazette*. In 1838 she married Mr Maclean, the governor of Cape Coast Castle, and went out there with her husband at once. Two months after her arrival she died suddenly from an overdose of prussic acid. Her poems and novels, written under the initials 'L. E. L.,' were in their day exceedingly popular. See *Life and Literary Remains*, by Laman Blanchard (1841).

Landor, WALTER SAVAGE, was born at Warwick, 30th January 1775. He was the eldest son by a second marriage of Dr Landor, a medical practitioner in that town. His mother was Elizabeth Savage, of a well-known Warwickshire family. At the age of ten he was sent to Rugby School, from which he was expelled for insubordination. After two years spent with a private tutor, Landor, now in his eighteenth year, entered Trinity College, Oxford. At the university he gave further proof of his impracticable temper—pursuing his own independent course of study, and flaunting his

political opinions so ostentatiously as to gain for himself the name of 'mad Jacobin.' For firing a gun into the room of a Tory undergraduate, and absolutely refusing to make any statement to the president, he was rusticated in 1794. He published a volume of *Poems* in 1795. Returning home, he shortly afterwards quarrelled with his father, and left the house 'for ever.' A reconciliation having been effected, Landor retired to South Wales on an allowance of £150 a year, with the liberty to live as he pleased. As the result of a diligent study of Milton and Pindar he published his *Gebir* in 1798. The poem found a few ardent admirers, and was the occasion of his lifelong friendship with Southey; but it failed, as it has done ever since, to find acceptance with the majority of those interested in poetry.

On the death of his father in 1805 Landor settled in Bath, where his style of living went beyond even his now considerable income. In 1808, with a band of volunteers raised at his own expense, he went to Spain to assist in the emancipation of that country from the yoke of Napoleon Bonaparte. The following year he purchased the estate of Llanthony in South Wales, where he mainly lived till 1814. Landor had bought the estate with the intention of doing all in his power for the good of his tenants and the neighbourhood in general. Before long, however, he quarrelled all round with his neighbours and his tenantry alike, and administered his affairs with so little judgment that ruin stared him in the face. In 1811 he had married Miss Thuillier, a step he took in the true Landorian manner, after a casual meeting with the lady at a ball. The union proved an ill-assorted one, and in 1814 he quitted her and crossed to France. Throughout all his domestic troubles Landor, who had in singular degree the faculty of forgetting the actual cares of life, had never ceased to occupy himself with literature. The most notable production of this period is his tragedy of *Count Julian*, which De Quincey has praised in the strongest terms, but which the majority even of Landor's admirers find defective in all the qualities indispensable to a successful drama.

After a short sojourn in Tours Landor, accompanied by his wife, who had rejoined him, proceeded to Italy, where, living in succession at Como, Pisa, and Florence, he remained till 1835, with the exception of a short visit to England. To this period belongs the best known of all his works, the *Imaginary Conversations*, the various instalments of which were published in 1824-46. A second quarrel with his wife in 1835 led to his return to England, where he settled in Bath till 1858. During these years Landor wrote much in prose and verse. As the most solid contributions to his fame should be specially mentioned the *Examination of Shakespeare* (1834), the *Pentameron* (1837), *Pericles and Aspasia*, and his *Hellenics*. The writing of Latin verse had from Landor's youth been one of his serious occupations, and in 1847 he published a collection of his Latin poems under the title of *Poemata et Inscriptiones*. In 1858 an unhappy scandal (see *Dry Sticks Fagoted*, by W. S. Landor), which involved him in an action for libel, again forced him to make his home in Italy. After an unsuccessful attempt to live with his family in Florence, by the advice and assistance of friends, chief among whom was Browning, he took rooms by himself in that city. Here, with health and faculties in wonderful preservation, visited by men who afterwards became famous in literature and art, Landor lived till his death on 17th September 1864, assiduously composing to the last both in prose and verse.

By his singularly imposing personal appearance, his imperious will, and his massive intelligence, this

'unsubduable old Roman,' as Carlyle called him, was one of the most original figures among his contemporaries. A brief record of Landor's life perhaps unduly emphasises the least attractive aspect of his character. Irrational in the highest degree in the everyday conduct of life, he yet inspired affection and esteem in men whose opinions cannot be disregarded. Southey and Francis and Julius Hare were his friends of many years' standing, and in the latter part of his life, John Forster (afterwards his biographer), Charles Dickens, and others all testify to the essential nobility of his character. By a narrow circle of admirers Landor is ranked with the great names of English literature. In the sculptresque severity of his verse they find a perfect reproduction of the finest work of the ancients. His prose they place even higher than his verse, asserting that a judicious selection from the *Imaginary Conversations* would be 'one of the most beautiful books in the language—that is to say, in the world.' For the majority even of cultivated readers, however, Landor holds by no means so supreme a place either as a poet or writer of prose; and the very subordinate place assigned to him in every history of literature clearly marks where he stands in the aggregate opinion of his countrymen. While it is admitted that there are 'shining elevations' in all his work, the general impression seems to be that his form, alike in his prose and verse, is essentially artificial and factitious, and that the subject-matter of both is largely vitiated by the same irrationality which displayed itself so grotesquely at every period of his life.

See Forster, *Life and Works of Landor*; Sidney Colvin, *Landor* ('English Men of Letters' series); Mrs Lynn Linton, *Reminiscences of Landor* (*Fraser's Mag.*, July 1870); Lord Houghton, *Monographs*; S. Wheeler, *Letters and Unpublished Writings of Landor* (1897); Swinburne, *Miscellanies*. Mr Boythorn, in *Bleak House*, embodies Dickens's impressions of Landor 'with his intellectual greatness left out.'

Landrail. See CORN-CRAKE.

Landsberg, a town in the Prussian province of Brandenburg, on the Warthe, 80 miles by rail NNE. of Berlin. Its industrial establishments include sawmills, machine-works, breweries, distilleries, &c.; there is a large trade in timber. Pop. 40,000.

Landscape-gardening deals with the disposition of ground, water, buildings, trees and other plants which go to the composition of verdant landscape. Such in a broad sense is the definition of the art; for it may be employed to create a beautiful and harmonious scene where only nature in barren wildness reigned before, or to merely improve and adapt existing natural beauties and resources to the requirements of taste and convenience. Landscape-gardening has been practised from the earliest dawn of civilisation, but little of a reliable kind is known of the style or features of the gardens of the Jews, the Phœnicians, Assyrians, or even those of the ancient Greeks. All that we learn from Greek writers respecting the character of their gardens is that they afforded shade, coolness, repose, freshness, and fragrance. The Greeks cultivated the sister art of architecture so well as somewhat to neglect gardening: hence Lord Bacon's remark in his *Essay on Gardens*, that 'when ages grow to civility and elegance, men come to build stately sooner than to garden finely,' as if gardening were the greater perfection.

The Romans introduced landscape-gardening into Britain; but the art was lost when the country was abandoned by them to the Saxons. As, however, it had meantime been fostered in France, it was probably reintroduced by the Normans. Henry I., according to Henry of Hunt-

ington (*Hist. lib. vii.*), had a park (*habitationem ferarum*) at Woodstock, and it is conjectured that this park may have surrounded a magnificent Roman villa, the ruins of which—covering about 6 acres in extent—were discovered on the Blenheim estates early in the 19th century. If the conjecture is well founded, Blenheim may be regarded as the most ancient site as well as the grandest example of landscape-gardening in Britain—according to many, it is the grandest in Europe. William Kent (1684–1748) and Lancelot Brown (1715–83), better known as ‘Capability Brown,’ may be considered as the founders of modern English landscape-gardening. See works by Loudon (1822), Repton (1840), F. R. Elliott (1878), and H. E. Milner (1890).

Landseer, Sir Edwin Henry (1802–1873), an English animal-painter, born in London, began exhibiting at the Royal Academy at an early age, and down to about 1823 was content to reproduce the natural expression and character of animals; after that date his animal pieces are generally made subservient to some sentiment or idea, without, however, losing their correctness and force of draughtsmanship. Dogs and deer were his favourite and best subjects. In 1826 he was elected an A.R.A., in 1830 an R.A., and in 1850 was knighted. He painted many well-known pictures, such as ‘The Cat’s Paw,’ ‘Bolton Abbey,’ ‘Dignity and Impudence,’ and ‘The Monarch of the Glen.’ His paintings are full of that sentiment which makes subject of the greatest importance, and he may be said to represent very fully the Victorian taste in such matters. The bronze lions at the foot of Nelson’s Monument in Trafalgar Square, London, were modelled by him. Landseer was elected president of the Royal Academy in 1866, but declined the honour.

Land’s End. See CORNWALL.

Landshut, a picturesque town of Upper Bavaria, on the Isar, 44 miles by rail NE. of Munich. Of its eleven churches, St Martin’s (1477) has a steeple 436 feet high. The castle of Trausnitz (c. 1232) was partially restored in 1872–74. Landshut has several breweries, manufactories of tobacco, wagons, hats, &c., and an active trade in corn. The Dominican monastery (1271) was the seat of the university, removed hither from Ingolstadt in 1800, and transferred to Munich in 1826. During the Thirty Years’ War and the war of the Austrian Succession Landshut was several times captured; and there on 16th April 1809 the Austrians drove back the Bavarians, but were defeated by Napoleon five days later. Pop. 25,000.

Landsknecht. See FREE-LANCES.

Landskrona, a seaport of Sweden, stands on the Sound, 16 miles NNE. from Copenhagen. It has a good harbour, carries on sugar-refining, ship-building, and the manufacture of tobacco and leather, exports corn and butter, and imports raw sugar, coal, and grain. Pop. 20,000. The town was a fortress down to 1870. Opposite Landskrona in the Sound lies the island of Hven, on which Tycho Brahe built his observatory of Oranienborg.

Landslips, large portions of land which from some cause have become detached from their original position, and slid down to a lower level. They are especially common in volcanic districts, where the trembling of the earth that frequently accompanies the eruption of a volcano is sufficient to split off large portions of mountains, which slide down to the plains below. Water, however, is the chief agent in producing landslips. It operates in various ways. The most common method is when water insinuates itself into minute cracks, which are widened and deepened by its freezing in winter. When the fissure becomes sufficiently deep, on

the melting of the ice a rock-fall or landslip is produced. Sometimes, when the strata are very much inclined, and rest on an impermeable bed like clay, the water which percolates down through the more porous rocks above softens the clay, which becomes slippery, whereupon the superincumbent mass slides over it to a lower level. This took place on a large scale in Dorsetshire between Lyme and Axminster in 1839, an unusually wet season; a mass of chalk and greensand here slid over the slippery surface of a bed of liassic clay down into the sea. Of a like kind were the slip of the Rossberg, in Switzerland, in 1806 (see GOLDAU), and that which overwhelmed the village of Elm, in Glarus, in September 1881, when about 200 lives were lost. Another notable landslip was that of the Bocca di Brenta in south-west Tyrol in the year following; and at Zug in 1887 a landslip carried twenty-seven houses, with eleven persons, into the lake. Landslips of a different kind have been produced in peat-mosses, which, becoming by heavy rains thoroughly saturated with water, have burst their natural boundaries and discharged themselves on a lower level. The most remarkable case of this kind is that of the Solway Moss, which in 1772, owing to rains, spread itself in a deluge of black mud over 400 acres of cultivated fields. In 1880 a most destructive landslip occurred at Naini Tal, a health-resort on the southern slopes of the Himalayas. The town was partly built on a great sloping terrace of shaly deposit overhanging the lake, and this becoming saturated with the heavy autumn rains, it suddenly slipped forward, burying many houses in its débris. Forty Europeans and from 100 to 200 natives lost their lives. See BOG.

Land-surveying. See SURVEYING.

Landwehr (‘Land-defence’) was a military force in the German and Austrian empires, forming an army reserve, but not always retained under arms. Its members, although care was taken that they were sufficiently exercised, spent most of their time in civil pursuits during peace, and were called out for military service only in times of war or of commotion. (During the agrarian disturbances in Galicia in 1890 the Landwehr was employed for the first time against the peasant labour movement.) The Prussian system of land-defence was called into existence in 1813, when the Landwehr was organised according to Scharnhorst’s plan. At first it was designed solely as a land-defence, properly so called, and not, what it became, an integral part of the regular army. Every German capable of bearing arms, after serving in the standing army for seven years, had to enter the Landwehr, and remain in it for other five years (three in the cavalry and horse-artillery). In exceptional cases the Landwehr might be filled up from the *Land-sturm*, which was called out only in the event of invasion; in Germany it embraced men up to the age of forty-five, in Austria forty-two. For the period of service generally, see ARMY, and the sections on the army in the articles on the various countries.

Lane, Edward William, the most eminent of English Arabic scholars, and a well-known translator of the *Arabian Nights*, was born at Hereford in 1801. He began life, like his brother Richard (q.v.), as an engraver; but the need of a warmer climate took him to Egypt, and with that country the whole of his subsequent work was connected. The result of his first (1825–28) and second (1833–35) visits to Egypt was his *Manners and Customs of the Modern Egyptians* (1836), a work immediately recognised as of unrivalled accuracy and completeness, and still a standard authority on the subject. This was followed by the translation of the *Thousand and One Nights* (1838–40),

one of the standard translations. The numerous and instructive notes on Mohammedan life, literature, and superstition were separately issued as *Arabian Society in the Middle Ages* (1883). *Selections from the Koran* appeared in 1843 (ed. S. Lane-Poole, 1879). Lane's third visit to Egypt (1842-49) was devoted to laborious preparation for the great work of his life, the *Arabic Lexicon*, for which his extraordinary familiarity with the Arabic language and literature and his intimacy with the learned of Cairo peculiarly fitted him. He toiled without cessation for twenty years before he began printing his first five quarto volumes, which were published in 1863-74. The *Lexicon* was instantly accepted throughout Europe as the supreme authority. He died, 10th August 1876, before completing it, but the publication of the remaining portions was carried on (1876-90) by his grand-nephew, S. Lane-Poole, professor of Arabic at Trinity College, Dublin, in 1898-1904, who has written much on Oriental subjects, and contributed to this Encyclopædia. See *Life* by Lane-Poole (1877).

Lane, RICHARD JAMES, engraver and lithographic artist, elder brother of the preceding, was born in 1800, and became A.R.A. in 1827. Lithography, however, was just then coming in, and Lane abandoned engraving in favour of the new art, in which 'he displayed a dignity and refinement of expression and an instinctive sympathy with his originals which has never been equalled.' His pencil was so delicate that his lithographs have often been mistaken at the first glance for line engravings. As a draughtsman in pencil or chalk he was very successful. His best lithographs (which number more than a thousand) include Lawrence's cycle of George IV., his own grand-uncle Gainsborough's sketches, and many works of Leslie, Landseer, and G. Richmond. He also did some sculpture. He died 21st November 1872.

Lanercost, an Augustinian priory, founded about 1169, lies in the valley of the Irthing, 16 miles NE. of Carlisle. It is partly in ruins; but the nave has been restored, and is now used as a parish church. The *Lanercost Chronicle, 1201-1346*, a valuable source for Border history, was edited in 1839 by Father Stevenson; and translated in 1913 by Sir H. Maxwell. Naworth Castle, 1 mile S. of the priory, is associated with the 'Belted Will Howard' of Scott's *Lay of the Last Minstrel*; it contains old armour, tapestry, &c.

Lanfranc, the first archbishop of Canterbury after the Norman Conquest, was born at Pavia, about 1005, and educated at Pavia for the law. About 1039, however, he left Italy, and founded a school of law at Avranches, which soon became one of the most popular in France. Three years later he took the monastic vows at the Benedictine monastery of Bec, and in 1046 was chosen its prior. He figured prominently in the Berengarian controversy as to the real presence, ranging himself against Berengarius. About 1053 he came into close contact with William of Normandy. Although he at first condemned this prince's marriage with his cousin, he afterwards (1059) went personally to Rome to procure the papal dispensation for it. As a reward for this service William made him prior of his new foundation, the abbey of St Stephen at Caen (1062), and in 1070 Archbishop of Canterbury in place of the deposed Stigand. Lanfranc still continued to be William's trusty adviser, helping him both to fill the English sees with Normans and to make the royal power supreme above that of the church. He died in May 1089, leaving commentaries, sermons, letters, and a work against Berengar (ed. 1648 and 1844). See Hook's *Lives of the Archbishops*.

Lanfrey, PIERRE (1828-77), author, born at Chambéry, wrote on the church and the philosophers (1855), essays on the Revolution, and a history of the popes; but is best known for his famous (hostile) *Histoire de Napoléon I.* (1867-75; trans. 1872-80). He was successively moderate republican deputy, ambassador to Switzerland, and senator.

Lang, ANDREW, a remarkably versatile writer, was born at Selkirk, 31st March 1844, and was educated at Edinburgh Academy, St Andrews University, and Balliol College, Oxford. He took a classical first-class, and was elected Fellow of Merton College in 1868. Ere long he plunged into the sea of literature, and soon became one of the busiest as well as the brightest writers in the world of London journalism. He treated the most varied subjects with the same light, humorous touch, and he touched nothing which he did not adorn. He took a foremost part in the controversy with Max Müller and his school about the interpretation of mythology and folk-tales. Among his books were *Ballads and Lyrics of Old France* (1872), *Ballades in Blue China* (1880), *Helen of Troy* (1882), *Rhymes à la Mode* (1884), *Grass of Parnassus* (1888), and *Ballades of Books* (1888), volumes of far more than merely graceful verse; *Custom and Myth* (1884), *Myth, Ritual, and Religion* (1887), *The Making of Religion* (1898), and *Magic and Religion* (1901), solid contributions to the study of the philosophy and religion of primitive man. Admirably clever and entertaining volumes, on subjects ranging from pure literature, as well as folklore and primitive religion, down to the by-ways of bibliographers and gossip of the day, are *The Library* (1881), *In the Wrong Paradise* (1886), *Books and Bookmen* (1886), *Letters to Dead Authors* (1886), *Letters on Literature* (1889), *Lost Leaders* (1889), *Old Friends: Essays in Epistolary Parody* (1890). He translated with exquisite skill *Aucassin and Nicolette* (1887), produced the faultless edition of Perrault's *Popular Tales* (1888), and selected the fairy-tales forming the *Blue Fairy Book* (1889), the *New Fairy Book*, &c. He himself translated *Theocritus*, *Bion*, and *Moschus* (1880); and shared (with Butcher, Leaf, and Myers) in brilliant translations of the *Odyssey* and the *Iliad*. He wrote a series of important works on Homer and the Homeric Question, a history of St Andrews, and a standard history of Scotland (4 vols. 1900-7), books on Knox and the Reformation, Queen Mary, Prince Charlie and the Jacobite rebellions, lives of Lockhart, Bloody Mackenzie, and Lord Iddesleigh, a defence of Joan of Arc, and a history of English literature (1912), not to speak of *The Monk of Fife*, a novel, *The Valet's Tragedy*, &c. He edited Burns and Scott, contributed BURNS and SCOTT to this Encyclopædia in 1888-92, and had rewritten TOTEMISM and HOMER just before his sudden death, 24th July 1912. Mrs Lang edited his *Poetical Works* (4 vols.) in 1923.

Lange, FRIEDRICH ALBERT (1828-75), born at Wald, near Solingen, was professor at Marburg, and wrote a *History of Materialism* (Engl. trans. 1878-81).

Lange, LUDWIG (1825-85), philologist and archæologist, born at Hanover, studied at Göttingen, and was professor at Prague, Giessen, and Leipzig. His great work was his *Handbuch der römischen Altertümer* (1856-71).

Langeland (i.e. 'long land'), a low, fertile Danish island, 33 miles long by 5 broad, situated at the southern entrance to the Great Belt, between Fünen and Laaland. Area, 106 sq. m.; chief town, Rudkjöbing, on the west coast.

Langenbielau, a new town of Lower Silesia, 3 miles SSW. of Reichenbach, with spinning and weaving industries; pop. 20,000.

Langensalza, a small town of the Prussian province of Saxony, 13 miles by rail N. by W. of Gotha, with woollen and cloth manufactures. Here occurred, on 27th June 1866, an encounter between 19,000 Hanoverians and 8200 Prussians; the latter were at first defeated, but being reinforced compelled the former to capitulate two days later. Not far from the town is a sulphur spring.

Langholm, a police burgh of Dumfriesshire, at the junction of Ewes and Wauchope Waters with the Esk, 23 miles SSW. of Hawick, and 22 N. of Carlisle. Near the town-hall is a statue of Admiral Sir Pulteney Malcolm (1768-1838), and on Whita Hill an obelisk to his brother, General Sir John Malcolm (1769-1833). The staple industry is woollen manufacture. On its site the Douglasses were defeated in the battle of Arkinholm (1455). Mickle was a native. Pop. 2600.

Langhorne, JOHN (1735-79), for a time rector of Blagdon in Somerset, devoted most of his life to literature, and published a long series of poems, tales, translations, &c. He is best known as having, with his brother, WILLIAM (1721-77), produced the standard translation of Plutarch.

Langkat, or LANKHAT, a port on the east coast of the NW. part of Sumatra, near the borders of Aitchin, is famed for its petroleum.

Langland, or LANGLEY, WILLIAM, the supposed name of the author of *Piers the Plowman*, of whose life some few facts have been constructed from the internal evidence offered by the poem, mainly by the industry of Professor Skeat. He was born a franklin or freeman's son about 1332, probably at Cleobury Mortimer in Shropshire; went to school, possibly in the monastery at Great Malvern; became a clerk, but, having married early, could not take more than minor orders, and earned a poor living by singing the *placebo*, *dirige*, and 'seven psalms' for men's souls, and by copying legal documents. He lived many years in London, was named 'Long Will' from his stature, and prolonged poverty seems to have made him embittered and somewhat churlish in disposition. The last trace of him is in his poem of *Richard the Redeles* (850 lines), from which we learn that he was at Bristol in 1399.

The full title of his famous poem is *The Vision of William concerning Piers the Plowman, together with Vita de Do-wel, Do-bet, et Do-best secundum Wit et Resoun*. It exists in three different forms or recensions, distinguished by Professor Skeat as the A, B, and C texts. Of these the first was composed about 1362, and contains only 2567 lines. In it the Vision of Piers the Plowman is quite distinct from the Vision of Do-wel, Do-bet, and Do-best, the former consisting of a prologue and 8 passus (1833 lines), and the latter of a prologue and 3 passus (734 lines). The B text, the form of the poem which best represents the genius of the poet, was written after 1377, and contains about 7100 lines, consisting of the two Visions as before, the former arranged in a prologue and 7 passus, the latter in 3 prologues and 10 passus. The first part of the B text, giving the Vision of the Field full of Folk, of Holy Church, and of Lady Meed, next the Vision of the Seven Deadly Sins and of Piers the Plowman, was admirably edited by Professor Skeat as a school-book in the Clarendon Press series (1869). The C text was probably not composed till 1390. It adds about 250 lines to the poem, and is arranged, without prologues, continuously in 23 passus.

This long poem has great defects as a work of art, but the moral earnestness and energy of the author sometimes glow into really noble poetry, particularly in his invectives against injustice and wrong, the idleness and pride of the clergy, and especially the dissolute habits of the mendicant

friars. The theological discussions are not seldom tedious, but are brightened by vivid glimpses of the life of the poorer classes in his day, and some of the allegorical representations, as of the Glutton and Sloth, have something of the reality of life. The conception of the Plowman grows as the poem proceeds, and from a mere honest labourer he passes into a personification of the reforming spirit, and at one moment becomes identified with Christ himself. The writer is no precursor of Lollardism on its speculative side, or specially a Reformer other than in his revolt from the slavish hypocrisy of form apart from the inward power of religion, and his longing for a return to simple scripture truth without sacerdotal domination.

The metre of the poem is alliterative, but irregular. The dialect is mixed, but mainly Midland, with occasional introduction of Southern forms, and the vocabulary is of unusual extent.

The earlier editions of Crowley (1505), Rogers (1561), Whitaker (1813), and Thomas Wright (1842) were superseded by Professor Skeat's exhaustive edition for the Early English Text Society (1867-84); more compendiously in 2 vols. (Clar. Press, 1886). There is a modernised version by Miss Kate Warren (1895). See Jusserand's monograph (trans. 1894); and Manly in vol. ii. of the *Cambridge History of English Literature* (1908), who attributes the three texts, with Do-wel, Do-bet, and Do-best, to five different authors. The controversy that followed was reprinted by the E.E.T.S. See also R. W. Chambers in *Essays and Studies* (vol. ix. 1923).

Langley, SAMUEL PIERPONT (1834-1906), born at Roxbury, Mass., and from 1887 secretary of the Smithsonian Institution, greatly advanced solar physics, invented the bolometer for measuring radiant heat, and devised an aeroplane for flight.

Langres, a town in the French department of Haute-Marne, 1530 feet above sea-level, is 184 miles ESE. of Paris by rail. It is strongly fortified, and has a cathedral of the 12th and 13th centuries. Langres was in Caesar's time the capital of the Lingones. Pop. 10,000.

Langside, a southern suburb of Glasgow, where, after her escape from Loch Leven, Queen Mary's forces were totally defeated by the Regent Moray, 13th May 1568. A monument (1887) commemorates the battle.

Lang-son, a town in Tongking, situated north-east of Ha-noi, near the frontier of the Chinese province of Kwang-si. It was a centre of operations in the Franco-Chinese war of 1884-85.

Langton, STEPHEN, famous in the history of the liberties of England, was born about 1150, but where is uncertain, Lincolnshire, Yorkshire, and Devonshire all claiming him. He received his education in the university of Paris, where he was the fellow-student and friend of the future Pope Innocent III.; he rose to the office of chancellor of the university. Innocent after his elevation gave Langton a post in his household, and afterwards made him a cardinal (1206). On occasion of the disputed election to the see of Canterbury in 1205-7 Langton was recommended by the pope to those electors who had come to Rome on the appeal, and, having been elected, was consecrated by Innocent himself at Viterbo, June 27, 1207. His appointment was resisted by King John (q.v.); and for six years Langton was kept out of the see, only being admitted when John made terms with Innocent in 1213. In the conflict of John with his barons Langton was a warm partisan of the latter, and his name is the first of the subscribing witnesses of Magna Charta. And, although the pope excommunicated the barons, Langton refused to publish the excommunication, and was in consequence suspended from his func-

tions by the pope in 1215. But after the accession of Henry III. he was reinstated (1218) in his see, and from that time chiefly occupied himself with church reforms till his death, which took place 9th July 1228. See Dr Hook's *Lives of the Archbishops of Canterbury*, vol. ii. (1861).

Language. See PHILOLOGY; and UNIVERSAL LANGUAGE, VOICE, DIALECTS, GRAMMAR, LINGUISTICS, PHONETICS, ENGLISH LANGUAGE, &c.

Languedoc, a former province of the south of France, between the Rhone, the Mediterranean, and Gascony and Guienne (for the corresponding departments, see table at FRANCE). The name is derived from *langue d'oc*, or Provençal (q.v.), from the southern French *oc* instead of *oui* for 'yes.' It was long part of the county of Toulouse (q.v.), and the home of the Albigenes (q.v.).

Lanier, SIDNEY (1842-81), was born at Macon in Georgia, of Huguenot stock, and graduated at Oglethorpe College before he entered the Confederate army. Shopman, teacher, lawyer, and professional musician in succession, he was in 1879 installed as lecturer on English literature in Johns Hopkins University. His lectures on *The Science of English Verse* were published in 1881, on *The English Novel* in 1883, and on *Shakespeare and his Forerunners* in 1902. In virtue of his poems he is by many regarded as the most important American poet of his time, 'Corn,' 'The Song of the Chattahoochee,' 'The Marshes of Glynn,' and his Centennial cantata (for the 1876 Exposition) being amongst the best known. His adaptations of Froissart and of the *Mabinogion* have made him known to several generations of youthful readers. See Memoir by Ward prefixed to his poems (1881; new ed. 1903), and the monograph by Mims (1905).

Lanius, LANIIDEÆ. See BUTCHER-BIRD.

Lankester, SIR EDWIN RAY, the son of Dr Edwin Lankester (1814-74), scientific writer, was born in London, 15th May 1847. Educated at St Paul's School and at Christ Church, Oxford, he was fellow and tutor of Exeter College, in 1872-90 was professor of Zoology in University College, London, and in 1898-1907 was director of the Natural History Department in the British Museum. Among works by him are a monograph of the Cephalaspidian Fishes (1870), *Comparative Longevity* (1871), *Degeneration* (1880), *Extinct Animals* (1905), and *The Kingdom of Man* (1907), besides collected essays and articles; and he edited a great treatise on zoology (10 vols. 1900-5). In 1907 he was made K.C.B.

Lanner. See FALCON.

Lannes, JEAN, DUKE OF MONTEBELLO, a French marshal, was born, the son of a livery-stables keeper, on 11th April 1769, at Lectoure (Gers), entered the army in 1792, and by his conspicuous bravery in most of the battles of the Italian campaign fought his way up to be general of brigade by 1796. He rendered Napoleon important service on the 18th Brumaire. On 9th June 1800 he won the battle of Montebello, whence his title, and bore a principal share in the battle of Marengo. He commanded the left wing at Austerlitz, and the centre at Jena, and distinguished himself at Eylau and Friedland. Being sent to Spain, he defeated General Castaños at Tudela, 22d November 1808, and took Saragossa. In 1809 he again served on the Danube, and commanded the centre at Aspern (22d May), where he had both his legs taken off by a cannon-shot. He died at Vienna, 31st May.

Lannion, a town in the French department of Côtes-du-Nord, on the Léguer, 69 miles by rail ENE. of Brest; pop. 6000.

Lanolin, extracted from the grease 'recovered' from wool before spinning, is used as a basis for ointments, as it easily penetrates the skin.

Lansdown, a hill (813 feet) to the north of Bath, commanding a prospect of exceptional beauty. Here stands a tower of 130 feet, built by Beckford, and two miles beyond was fought the battle of Lansdown, 5th July 1643, when Waller's entrenchments were stormed by the Cornish royalists. On the spot where the heroic Sir Bevil Grenville fell Lord Lansdowne raised a monument in 1723.

Lansdowne, HENRY PETTY FITZMAURICE, third MARQUIS OF, was the son of the first marquis, better known as the Earl of Shelburne (q.v.), and was born in London, July 2, 1780. He received his education at Westminster School, Edinburgh University, and Trinity College, Cambridge, where he graduated in 1801. Born in the purple of politics, he was returned for the burgh of Calne at the age of twenty-two. He ranked himself among the opponents of Pitt, and took a leading part in that attack on Lord Melville which brought home to him the charge of corruption. When Pitt died Lord Henry Petty—as he was then styled—succeeded him as member for Cambridge University, and also as Chancellor of the Exchequer in the administration of 'All the Talents' formed by Lord Grenville, but held office for about a year only. In 1809, and after having represented the borough of Camelford for a short time, he succeeded by the death of his half-brother to the marquise of Lansdowne. A sincere though cautious Liberal, he in 1826 entered the Canning cabinet; and in the short Goderich administration he presided at the Foreign Office. When, in 1830, the Whigs came into power under Lord Grey, Lansdowne became President of the Council, and took an active part in the passing of the Reform Bill of 1832. He held this office, with a short interval, till September 1841. Five years later, under Lord John Russell, he resumed his post, taking with it the leadership of the House of Lords, and held it till 1852. In that year he was requested to form an administration, but consented to serve without office in the coalition cabinet of Lord Aberdeen. When that ministry fell in 1855, Lansdowne was again asked to accept the premiership, but he once more declined, although he consented to help Lord Palmerston as he had helped Lord Aberdeen. He refused a dukedom. After the death of the Duke of Wellington Lansdowne was recognised as the patriarch of the House of Peers, while almost up to his death his advice was asked at his seat of Bowood by the leaders of the Liberal party. He was the attached personal friend of Queen Victoria. Fond of literature and of the company of men of letters, he formed a great library, and one of the best collections of pictures and statuary in the kingdom. He died 31st January 1863.

The political biographies of the period in which Lansdowne lived abound in references to him. A considerable number of his letters on public affairs appear in *Lord Melbourne's Papers*, edited by Lloyd C. Sanders (1889). *The Life of Lord John Russell*, by Spencer Walpole (1889), illustrates in a remarkable manner the quiet but great influence exerted by Lansdowne in the councils of his party.

Lansdowne, HENRY CHARLES KEITH PETTY FITZMAURICE, fifth MARQUIS OF, was born 14th January 1845. Educated at Eton and Balliol College, Oxford, he succeeded to the marquise in 1866, and, attaching himself to the Liberal party, was a Commissioner of Exchequer of Great Britain and of Treasury of Ireland from 1868 to 1872. Between 1872 and 1874 he was Under-secretary for War. In 1880 he again took office under Gladstone as

Under-secretary for India, but resigned owing to a difference with his chief over the Compensation for Disturbance (Ireland) Bill. In 1883 he was appointed Governor-general of the Dominion of Canada, in 1888 Governor-general of India, in 1895 Secretary for War, and as Foreign Secretary (1900-5) concluded the second alliance with Japan, and forwarded the *entente cordiale* with the United States and with France. He thereafter led the Unionist opposition in the House of Lords, and in 1915-16 was a minister without portfolio in the Coalition Cabinet. In 1917 he advocated peace by negotiation.

Lansing, the capital of Michigan, on the Grand River, 85 miles WNW. of Detroit. It contains the state capitol, library, reform school, and agricultural college, a school for the blind, and has varied manufactures, especially gas-engines and automobiles. Lansing was settled in 1837, made the state capital in 1847, and incorporated as a city in 1859. Pop. (1880) 8319; (1900) 16,485; (1920) 57,327.

Lansingburg, a village of New York State, annexed in 1901 to the city of Troy (q.v.).

Lantern, in Architecture, an ornamental structure raised over domes, roofs, &c., to give light and ventilation. The dome of St Paul's Cathedral and many other large domes are crowned with a lantern. Where a lantern is for the purpose of giving light it is called a *lantern-light*. In Gothic architecture a *lantern-tower* is frequently placed over the centre of cross churches—the vault being at a considerable height, and the light admitted by windows in the sides. York and Ely cathedrals, and many churches in England, have such lantern-towers.

Lantern-flies, a name applied to a number of Hemipterous insects, in the large and widely represented family Fulgoridæ, which have the front of the head prolonged into a huge lantern-like proboscis, formerly believed to be luminous. The Candle-fly, *Fulgora candelaria*, with a long, tapering, upturned head-projection, is often caught by

Lantern-fly (*Fulgora lanternaria*).

Chinese children, and sold in a little cage. The Brazilian Lantern-fly (*F. lanternaria*) has very beautiful colouring, and a length of about 3 inches; it is erroneously credited with luminosity and poisonousness. In many Fulgoridæ, such as the small British representatives of the genus *Cixius*, there is an abundant excretion of white flocculent wax, which is put to various uses in India and China.

Lanthanum (sym. La; atom. number, 57; atom. wt. 139), so named from the Greek *lanthanein*, 'to lie hid,' is a metal which was discovered by Mosander in 1839 in *Cerite*, a hydrated silicate of Cerium (q.v.). It is of little chemical interest, and is of no practical value. See DIDYMIUM.

Lanzi, LUIGI, Italian antiquary, was born at Monte dell' Olmo, near Macerata, 14th June 1732. He entered the order of the Jesuits, but devoted his time to the study of classical antiquities and of Italian painting. He resided chiefly at Florence,

where he died, 30th March 1810, and was buried by the side of Michelangelo in the church of Santa Croce. The principal monuments of his learning are the works *Saggio di Lingua Etrusca* (3 vols. 1789), in which he insisted upon the kinship of Etruscan with Latin, Oscan, Umbrian, and Greek; and *Storia Pittorica d'Italia* (1792-1806; Eng. trans. by Thomas Roscoe, 6 vols. 1828). Lanzi also wrote works on Etruscan vases, antique sculptures, &c. His posthumous works were published in 2 vols. at Florence in 1817. See Life in Italian by Cappi (1840).

Laocoön, according to classic legend, a priest of Apollo, afterwards of Poseidon, in Troy, who married against the will of the former god, and who warned his countrymen against admitting the wooden horse into Troy. For one or both of these reasons he was destroyed along with his two sons by two enormous serpents which came up out of the sea. This legend is not Homeric, but of later origin. It was a favourite theme of the Greek poets, and is introduced in the *Aeneid* (ii.) of Virgil. The subject is represented in one of the most famous works of ancient sculpture still in existence, a group discovered in 1506 at Rome, on the side of the Esquiline Hill, and purchased by Pope Julius II. for the Vatican. It was carried by Bonaparte to Paris in 1796, but recovered in 1814. The whole treatment of the subject, the anatomical accuracy of the figures, and the representation both of bodily pain and of passion, have always commanded the highest admiration. According to Pliny, it was the work of the Rhodian artists, Agesander, Polydorus, and Athenodorus; various dates have been assigned to it, from 200 B.C. till 200 A.D.; but the best authorities place its date at a little before 100 B.C. The arm found at Rome in 1905—probably part of a replica—proves that the restoration of it till then accepted, and illustrated above, is wrong; the right arm was held behind the head. See LESSING.

Laocoön.

Laodamia, in Greek heroic history, the daughter of Acastus and wife of Protesilaus. Her husband was the first of all the Greeks who fell by a Trojan hand, being killed as he leaped on shore from his ship. Laodamia prayed of the gods to give him back to her for but three hours. Her prayer was granted; Hermes led him back to the upper world; and, when the fatal moment to return had come, Laodamia died with him. This noble story has been treated by Wordsworth in verse worthy of the theme.

Laodicea, a name given to several cities—eight at least can be distinguished—founded or rebuilt by the Seleucid rulers of Syria; it is adapted from Laodice, a favourite name for the female relatives of these sovereigns. Of the cities so called, the most famous and most interesting was situated 2 miles from the banks of the river Lycus in Phrygia, and on the great commercial road leading from the Ionian cities to the Euphrates. The district in which it stands has frequently suffered from earthquakes, and the city was more than

once in part overthrown by them. It finally began to decay at the period of the Osmanli invasions, and is now a heap of uninteresting ruins, known as Eski-Hissar. Art and science flourished among the ancient Laodiceans: it was the seat of a renowned medical school, produced some famous philosophers, and in its mint was struck a valuable series of coins, which come down to the time of Diocletian. But its greatest importance is due to the fact that it was one of the chief homes of early Christianity, designated one of the seven churches of the Apocalypse, but doomed to unhappy memory as 'lukewarm and neither cold nor hot' (Rev. iii. 16). Probably the fact is traceable to the settlement here of great numbers of Jews at that period. The important ecclesiastical council of Laodicea, held here in 363, adopted resolutions concerning the canon of the Old and New Testaments, and concerning ecclesiastical discipline. A second council, held here in 476, condemned the Eutychians.—Another of these cities Laodicea will be found described under Latakia (q.v.).

Laom'edon, king of Troy (q.v.), and father of Priam.

Laon, chief town of the French department of Aisne, is situated on a steep isolated hill (594 feet), 87 miles by rail N.E. of Paris. Occupying a naturally strong position, it has been a fortress since the 5th century; its citadel is surrounded with ruinous walls. From 515 to 1790 it was the seat of a bishop. The cathedral, a Gothic edifice of the 12th century with a handsome façade, and the bishop's palace, now used as a law-court, still remain. The inhabitants are noted market-gardeners, producing excellent artichokes and asparagus. In the 10th century the city was the place of residence of the Carolingian kings, and capital of *Francia*. At Laon Napoleon was repulsed by the allies under Blücher and Bülow; and it surrendered to a German force in September 1870, when the explosion of the powder-magazine by a French soldier cost some 500 lives. It fell again to the Germans in September 1914, and was recovered in October 1918. Pop. 19,000.

Laos, a territory of French Indo-China, inland from Annam, including Luang Prabang. A French protectorate since 1893, the territory has an area of 96,500 sq. m., a pop. of 850,000. See SHANS.

Lão-tsze, a celebrated philosopher of China. According to the most likely account, his birth took place in 604 B.C., fifty-four years before that of Confucius. His surname was Lí (meaning 'Plum'), and his name Ērh (meaning 'Ear'), which after his death gave place to Tán, denoting some peculiarity in the form of his ears. He comes before us as a curator of the royal library in the capital city of Loh, not far from the present city of Loh-yang in Ho-nan. The designation Láo-tsze means the 'old philosopher.' The two Chinese characters may also be translated 'the old son or boy;' and the legendary writers have taken occasion from this to relate that the child was carried in his mother's womb for seventy-eight, some say for eighty-one, years, and that he was born with the white hair of an old man. Confucius and Láo seem to have met several times. One interview at the capital in 517 B.C. is pretty well established. It was not entirely amicable, but left a strong impression on the mind of Confucius. He said at the close of it to his disciples, 'To-day I have seen the Old Philosopher (Láo-tsze), and can only liken him to the dragon who mounts aloft on the clouds, I cannot tell how, and rises to heaven.' So it was that Lí Ērh came to be denominated 'Láo-tsze.' Nothing certain can be said of the length of Láo's life. Sze-ma-Ch'ien, the historian of ancient China, tells us that he cultivated 'the Táo and its characteristics,'

his chief aim being to keep himself unknown; that he resided long at the capital, and then seeing the decay of the dynasty of Cháu, went away to the gate which led out of the royal domain towards the regions of the north-west; that there he was recognised by Yin Hsi, the keeper of the gate, the place of which is shown in the present Shan Cháu of Honan, and was prevailed upon to write out for him the treatise called the *Táo Teh King*, which has come down to us as the only record of his teaching. Ch'ien adds that after giving this writing to the keeper 'he went away, and it is not known where he died.' Such is the substance of all of importance which the great historian, writing in the 2d century B.C., could tell of Láo-tsze. He says nothing of the pre-existences attributed to him, nor of his subsequent travels in the west, where he became acquainted with the wisdom of India and even Judea. These and other marvels are later and fabulous additions to Ch'ien's brief account, and arose in imitation of the legends of Buddhism and through misconceptions of the meaning of the *Táo Teh King*.

Some doctrine of the Táo had come down from the most ancient times, and a father, or at least a most important teacher, of it is claimed in Hwang Ti, the mythical sovereign of the 27th century B.C. It served especially as a discipline adapted to promote longevity and to preserve life. Láo-tsze entered into this, and the doctrine assumed in his hands a more subtle character. It is not easy, however, to say what he meant by his Táo. 'It was the originator of heaven and earth; it is the mother of all things.' At the same time it is not a personal being. 'It might appear,' he says, 'to have been before God.' 'It gave,' says Chwang-tsze, the ablest of all Láo's followers, 'their mysterious existence to spirits and to God (or to gods).' The character Táo properly means 'path,' 'course,' or 'way;' and it is in this sense that Láo uses it. His 'great way' is but a metaphorical expression for the way in which things came at first into being out of the primal nothingness, and how the phenomena of nature continue to go on, in stillness and quietness, without striving or crying. Of the same kind should be the influence of the Táo in the conduct of individuals and of government. That things may come to the right and successful issue they must be carried on without effort or purpose. The secret of good government is to let men alone. The appeal to arms is hateful. All learning is injurious. The wisdom of men defeats its own ends. Táo works by contraries, and the secret of its strength is its weakness. In many of these teachings Láo-tsze may seem to be only a visionary dreamer, but he enunciates many lessons of a very high morality. Its fundamental quality is humility, which he compares again and again to water, soft and weak in itself, yet able to attack and overthrow the strongest and firmest things. With humility he associates gentleness and economy, and calls them his 'three precious possessions.' He even rises to the greatest of all moral principles, the returning of good for evil, and enunciates 'recompensing injury with kindness.' He nowhere speaks clearly of the state of man after death; but Chwang-tsze teaches that life and death follow each other in endless succession, or like the sequence of the four seasons. There is nothing about religion or religious worship in the *Táo Teh King*. The origin of Taoism as a religion cannot be placed earlier than our 1st century. It was not till after Buddhism found its way to China that the other system began to have images, temples, monasteries, and nunneries. The pursuits of alchemy, communications with spirits, concoctions of the *elixir vitae* and pills of immortality are among the phases which it has assumed at different times; but such things have no connection with the teaching of Láo-tsze.

H. Parker in the *Asiatic Review*, October 1924; and CHINA.

La Paz, (1) a department of Bolivia, bordering on Peru, with an area of 40,000 sq. m., and a pop. of about 1,000,000, including a few thousands of wild Indians. The La Paz cordillera contains the loftiest peaks of the Bolivian Andes, and much of the surface of the department is a dry plateau; but in the east the great mountains sink to the plain, and the country is richly watered.—The capital, La Paz, lies at the foot of a steep valley 11,952 feet above the sea, 42 miles SE. of Lake Titicaca. It has a handsome but unfinished cathedral, and several colleges; but the mud houses, owing to the extremely uneven site, present a very irregular appearance. The inhabitants, mostly Indians and half-breeds, carry on an active trade in tin, copper, alpaca-wool, cinchona, &c. In 1898 La Paz became the seat of the executive government of Bolivia. Pop. about 100,000.—(2) A town of Entre Ríos province, in Argentina, on the Paraná, 530 miles by river N. by W. of Buenos Aires. Pop. 10,000.

La Pérouse, JEAN FRANÇOIS DE GALAUP, COMTE DE, a French navigator, was born near Albi, in Languedoc, on 22d August 1741. He distinguished himself in the naval war against England (1778–83), especially by destroying the forts of the Hudson's Bay Company. Two years after the conclusion of peace he was chosen to command an expedition of discovery sent out by the French government. He sailed in August 1785 with two ships, visited the north-west coast of America, explored the north-eastern coasts of Asia, where by sailing through La Pérouse Strait between Sakhalin and Yezo he discovered that each of these was a separate island. In February 1788 he sailed from Botany Bay; after that all trace of him was lost. In 1826 it was fully ascertained by the English Captain Dillon that both of La Pérouse's ships had been wrecked in a storm on a coral-reef off Vanikoro, an island lying north of the New Hebrides. The account of the early portions of La Pérouse's voyage, prepared from journals sent home by him, was published under the title of *Voyage autour du Monde* (4 vols. Paris, 1797; new ed. in 1 vol. 1888).

Lapis Lazuli (Lat. 'azure stone,' the *lazuli* being for Arabic *lāward*, the name of the stone; *azure* is a corruption of *lāward*), a material of beautiful ultramarine or azure colour, consisting of a matrix of calcite with embedded grains of *hawyne*, *lazurite*, and *sodalite*, the proportions of which determine depth of tint. Lapis lazuli is often marked by white spots and bands. It is generally found massive, and is translucent at the edges, with uneven, finely granular fracture. It is softer and lighter than stained agate with which it is sometimes confused. It is found associated with crystalline limestone amongst schistose rocks and in granite, in Siberia, China, Tibet, Chile, &c. The finest specimens are brought from Bokhara. It is extensively employed in ornamental and mosaic work, and for sumptuous altars and shrines. It is easily wrought, and takes a good polish. The valuable pigment called Ultramarine (q.v.) is made from it. It is one of the minerals sometimes called *Azure Stone*.

Lapithæ, a mythical race inhabiting the mountains of Thessaly. They were ruled by Pirithous, a son of Ixion and half-brother of the Centaurs. At the marriage of Pirithous to Hippodamia, the Centaurs, flown with insolence and wine, attempted

to carry off the bride and the other women, but were overpowered after a bloody struggle by the Lapithæ.

Laplace, PIERRE SIMON, MARQUIS DE, the greatest mathematician and theoretical astronomer since Sir Isaac Newton, born 28th March 1749, was the son of a poor farmer at Beaumont near Trouville, in Normandy. He studied at Caen, through the assistance of some charitable neighbours, and, after teaching mathematics at a military school in his native town, went to Paris and attracted the notice of D'Alembert by a paper on dynamics. When appointed professor in the Royal Military School he soon acquired a reputation by his mastery of the whole range of mathematical science and its application to certain difficulties in practical astronomy—solving a problem which both Euler and Lagrange had grappled with in vain. Chosen an associate of the Academy of Sciences in 1773 and member in 1785, he meanwhile, by his powerful grasp of the analytic method of dealing with gravitating masses, established the great generalisation that our planetary system is stable—that what had been termed irregularities were not disturbing the general equilibrium, but, on the contrary, necessary to it. This complete solution of the 'mechanical problem of the solar system,' as he termed it, has bestowed upon astronomy the 'Three Laws of Laplace.' Here, as well as in his great treatise to be presently mentioned, the special service of Laplace was that he set forth comprehensively in one homogeneous work the leading results which had severally been attained by Newton, Halley, Clairaut, and Euler, at the same time proving their harmony and interdependence. The singular insight of Laplace as an astronomer was apparent in his explanation of the 'secular inequalities' shown by ancient and modern observations in the motions of the planets Jupiter and Saturn. He was the first to construct a complete theory of the satellites of Jupiter, and his investigation of the tidal theory has been characterised by Airy as 'one of the most splendid works' in the history of mathematics.

The successive governments of France agreed in honouring Laplace. He helped to establish the Polytechnic and Normal Schools in Paris, became one of the first members of the Bureau des Longitudes, and soon after was appointed president. After the 18th Brumaire Bonaparte made Laplace Minister of the Interior, though only to supersede him in six weeks' time. In 1799 Laplace entered the senate, where he made a report on the necessity of returning from the Revolution calendar to the Gregorian; in 1803 he was appointed chancellor of the senate. He was created count under the empire, and in 1815 a peer, in 1817 a marquis, by Louis XVIII. His opponents attributed the latter honour to his having voted for the deposition of Napoleon in 1814, accusing him of servility, which was also alleged in 1827 when he became an 'ultra-royalist.' Elected to the Academy in 1816, he was next year appointed president. In his memoir on the 'attraction of spheroids' are first set forth the two celebrated means of applying analysis to physical problems—Laplace's coefficients and the potential function—which are requisite in the theory of attractions and in the more abstruse parts of electrical science.

Besides many original treatises on the application of mathematical methods to lunar and planetary problems, molecular physics, electricity, and magnetism—mostly memoirs to the French academies—Laplace published the four following books. The *Mécanique Céleste*, with supplements (5 vols. Paris, 1799–1825), stands alone amongst works on mathematical astronomy as a systematic demonstration of the highest results in natural philosophy. The *Exposition du Système du Monde* (1796; 6th ed.

1824) was written for non-mathematicians, and has been admired for the excellent style as well as for its clear and concise statement of all the leading astronomical facts and theories. In a note at the end of the later editions occurs the famous Nebular Hypothesis (see NEBULÆ), which many have deemed to be of not less importance than many of the results obtained by great mathematic effort. As early as 1784 Laplace issued his *Théorie du Mouvement et de la Figure des Planètes*, and in 1812-14-20 his *Théorie analytique des Probabilités*. The last remains a classical work to algebraists, though extremely difficult, the theory being applied not only to ordinary chances and averages, but to causes of phenomena and vital statistics.

Laplace was gifted with great power of memory and keen scientific sagacity, as well as with singular skill in interpreting nature by means of the higher mathematics. He showed some personal vanity, but was of an amiable disposition, frequently assisting young men of promising parts. His constant good health was partly attributable to his abstemiousness. Laplace died at Paris, 5th March 1827. In 1878-1912 the Academy published a 14-vol. edition of his *Œuvres Complètes*.

Lapland is neither a political nor a geographical unity; it is simply the collective name for the extensive region in the north of Europe that is inhabited by the Lapps. On the N. it is bounded by the Arctic Ocean, on the NW. by the Atlantic, on the E. by the White Sea; its southern limits coincide, roughly speaking, with 66° N. lat., though Lapps are sometimes found as far south as 60° N. lat. in Norway and Sweden. Norwegian Lapland is of course a mountainous country, its coasts cleft by the narrow, steep-walled fjords. In Swedish Lapland the most characteristic features are ridges with narrow valleys between, the latter generally partly filled with long, narrow lakes. Farther east, in Finnish and Russian Lapland, the surface is more level, the rivers and lakes become more numerous, marshes are frequent, and next the Arctic Ocean barren tundras; and many square miles are covered with forests of fir and spruce. Yet low ranges of hills occur in some districts, as, for instance, the Umbek Mountains, in the peninsula of Kola. Some of the lakes are of large size: Lake Enare or Inara, in Finnish Lapland, has an area of 1147 sq. m.; Lake Imandra is 65 miles long by 9 wide; and Lake Nuot, 35 miles long by 7 wide. The river Tana, which flows north to the Arctic Sea, is the second longest river of Norway; and several other rivers of considerable size flow into the White Sea and the Gulf of Bothnia, as the Tulom, the Kemi, &c. The summer is short and comparatively hot, owing to the fact that the sun scarcely ever sinks below the horizon during the three months that summer lasts. During this period the mosquitoes are a terrible plague. For seven or eight weeks in winter the sun does not rise above the horizon; comparative darkness prevails all the time, except when the snow-covered landscape is illuminated by the weird coruscations of the aurora borealis. The cold in winter is excessive, the thermometer generally indicating sixty degrees of frost, and sometimes more; but owing to the prevalent stillness of the air the cold is not felt so severely as might be expected. The total Lapp population is about 30,000, thus distributed; 19,000 in Norway, 7000 in Sweden, about 2000 in Finland, and 2000 in Russia. But there are also numerous settlers belonging to these four nationalities in Lapland, chiefly engaged in agriculture, hunting, trading, and in administrative work, some of them no doubt the descendants of the criminals transported thither from Denmark three centuries ago.

The Lapps, who call themselves *Sabme* or *Sabme-*

ladsjak (the Norwegians call them Finns, whilst the Finns they call *Kvæns* or *Qvæns*), belong to the Ural-Altaic stock, and are consequently closely related to the Finns (Suomi). As a race they are the shortest people in Europe (4 or 5 feet in height), and the most brachycephalic. In other respects they are spare of body, with dark, bristly hair and scanty beard, and short, often bandy, legs. Although not very muscular they are capable of great exertion and fatigue, and frequently live to a great age (eighty or more). The mouth is large, the lips thick, and the eyes small and piercing, but not obliquely set. The Lapps are usually distinguished as Mountain, Sea, Forest, and River Lapps. The Mountain Lapps, the backbone of the race, are nomads; they move constantly from place to place in order to find sustenance (Arctic moss) for their reindeer herds, their only source of wealth. In summer they go down to the fjords and coasts, but spend the rest of the year in the mountains and on the plains of the interior. The Sea Lapps, mostly impoverished Mountain Lapps, or their descendants, dwell in scattered hamlets along the coast, and live by fishing. The Forest and River Lapps are nomads who have taken to a settled mode of life; they not only keep domesticated reindeer, but hunt and fish. The nomad Lapps live all the year round in tents. The reindeer supplies nearly all their wants, except coffee, tobacco, and sugar. They live on its flesh and milk; they clothe themselves in its skin; and use it as a beast of burden. In winter, harnessed to a boat-shaped sledge (*pulk*), it takes them the longest journeys, across frozen lakes and rivers, and over the mountains and through the forests. In his personal habits and in his clothing the Lapp is the reverse of cleanly. He is, however, very good-natured, rather prone to self-indulgence when the opportunity presents itself (which is not often), but at other times sober enough. As a rule, he is 'saving, almost miserly,' 'selfish and 'cute in all his dealings,' not very trustworthy in the matter of speaking the truth, but on the whole inclined to take life easily. His imagination is easily excited, and he is readily susceptible to religious impressions of a sensational type; a notable 'epidemic' occurred at Koutokeino in Norwegian Lapland in 1848-51. The Lapps all profess Christianity; those of Norway and Sweden belong to the Lutheran Church, those of Russia to the Greek Church. Lapland witches, who are, more correctly speaking, wizards, have been famous from very early times. The principal instrument of divination was a curious oval-shaped drum, covered with a variety of figures and signs. It has been held that formerly the Lapps came much farther south in both Scandinavia and Russia; the bones of men of a short race, discovered in several ancient Scandinavian burial mounds, have been thought to favour this view. The Norsemen treated the Lapps as a subject race as early as the 9th century, but had to reconquer them in the 14th; the Russians followed suit in the 11th, and the Swedes in the 16th. From the 13th to the 17th century the Lapps were kept in a state little better than slavery by Swedish adventurers known as Birkarlans. But at the present day both the Scandinavian governments bestow upon them every kindness.

Roy. Geog. Soc.* (1880); Leem, *An Account of the Laplanders of Finmark* (Pinkerton's *Voyages*); David MacRitchie, *The Testimony of Tradition* (1890); Butler, *Through Lapland* (1917). For folklore, see also Friis, *Lappisk Mythologi*, &c. (1871); Donner, *Lieder der Lappen* (1876); and

Poestion, *Lappländische Märchen*, &c. (1885). Many Lapp and Finnish parallels are given in Jones and Kropf's *Magyar Folk-tales* (1889).

La Plata, the capital of the Argentine province of Buenos Aires, was founded in 1882, after Buenos Aires city, from which it is about 30 miles SE., had been made the federal capital. The new city was rapidly built, with wide streets and open squares, and for some time was 'a half-empty official city.' Buildings of note are the handsome capitol and other offices of the government, the national museum, famous for its extinct animals, an observatory, several chapels, and a fine railway station. The city has a state university founded in 1906, a college, a cathedral, a zoological garden, and, 7 miles away, a hospital and an asylum for the insane. A canal connects the harbour with a larger outer harbour at Ensenada, on the La Plata River. Pop. of the municipality (including Ensenada and a country district of nearly 60 sq. m.), 100,000.

La Plata, Río DE, a wide estuary of South America, between Uruguay on the north and the Argentine Republic on the south, through which the waters of the Paraná and the Uruguay sweep down to the ocean. It is about 200 miles long, 28 wide at Buenos Aires, and 140 miles broad at its mouth, between Maldonado and Cape San Antonio. The northern shore is comparatively steep and lofty, but that along the province of Buenos Aires is low and flat. The estuary has thus no shelter from the tempestuous storms that come from the south-south-east; but the only good harbour, that at Montevideo, is now protected by a breakwater. The navigable channel is kept open by the ships themselves ploughing a way through the mud. The affluents of the La Plata drain an area estimated at 1,600,000 sq. m., and the outflow of the estuary is calculated at about 52,000,000 cubic feet per minute—a volume exceeded only by that of the Amazon; the yellow, muddy stream is recognisable 60 miles out at sea. For the navigation of the affluents, see PARAGUAY, PARANÁ, and URUGUAY. The estuary was discovered in 1515 or 1516 by Diaz de Solis, who was shortly afterwards roasted and eaten by the Indians on its bank.

La Porte, capital of La Porte county, Indiana, at the junction of several important railways, 59 miles ESE. of Chicago. It manufactures wooden and woollen goods. Pop. 15,000.

Laportea, a genus of Urticaceæ, in which the stinging powers of the family seem to culminate. The East Indian shrub *Laportea crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is a slight tingling, but within an hour it is as if a red-hot iron were continually applied; the pain extends far from the original spot, and after about twenty-four hours abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all nettles. A magnificent tree-nettle, *L. Gigas*, in Northern Australia and Papua, 25 to 50 feet high, sometimes 120 or 140, has a trunk of great thickness, and very large green leaves, which when young sting violently. Papua has several other species of which *L. armata* is dreaded for its painful stings. *L. sessilifolia* is suspected of killing cattle. The Formosan tree, *L. pterostigma*, is known to the natives as the 'man-biting dog.' The fibre of *L. canadensis* can be made into either fine lace or strong ropes.

Lapenberg, JOHANN MARTIN, a German historian, was born 30th July 1794 in Hamburg,

and pursued historical and political studies in Edinburgh, London, Berlin, and Göttingen. He became the representative of his native city at the Prussian court in 1820, and in 1823 was appointed keeper of the archives to the Hamburg senate, an appointment which he held for forty years. He died at Hamburg on 28th November 1865. The book by which he is best known is the careful and painstaking *Geschichte von England* (2 vols. 1834-37), which was continued by Pauli (3 vols. 1853-58), and translated into English by B. Thorpe (3 vols. 1845-57). Besides this Lapenberg completed Sartorius's *History of the Origin of the German Hansa* (2 vols. 1830), wrote books on the history of Heligoland and the Steelyard in London, and edited valuable historical documents relating to Hamburg and Bremen, and old chroniclers, such as Thietmar of Merseburg, Arnold of Lübeck, &c.—these latter for Pertz's *Monumenta Germanice Historica*. See Memoir by E. H. Meyer (1867).

Lapsed (*Lapsi*), the designation applied, in the early centuries of the Christian church, to those who, overcome by heathen persecution, did not continue faithful to the Christian religion. They were distinguished according as they had sacrificed (*sacrificati*) or burned incense (*thurificati*) to idols, or had purchased a certificate (*libellus*) from the authorities to the effect that they had done so (*libellatici*). Afterwards, during the Diocletian persecution, those were included among the lapsed who had given up copies of the Scriptures (*traditores*). The lapsed were at first punished by excommunication, and their reception into the church again was strenuously resisted; but in the 3d century a milder course was generally adopted with regard to them. The treatment of the lapsed was one of the practical questions most earnestly discussed in the early church. See NOVATIAN; also DONATISTS.

Lapwing (*Vanellus vulgaris*), a common British bird in the plover family Charadriidæ. The familiar cry is echoed in the names *Peewit*, Scots *Peesweep*, Old English *Wype*, and French *Dizhuit*; while the regular, slow flapping of the long, rounded wings is referred to in the title lapwing. It

Lapwing (*Vanellus vulgaris*).

usually resides in Britain all the year, and is widely distributed across Europe and Asia. Its haunts are marshy pastures and moorlands; its food worms, slugs, and insects; its nest little more than a depression in the ground; its eggs, four in number, olive-green to stone-buff in ground colour, with blackish-brown blotches, are laid in April. When disturbed the female runs from the nest, while her mate, with devious flight and anxious cries, strives to divert attention away from the nest. After the young are hatched, the parents both exhibit loving solicitude. The adults are about a foot long, with crested head and very beautiful plumage, which almost

baffles brief description. The birds themselves are eaten, and the eggs are highly esteemed. Most of the plover eggs sold in Britain are lapwings' eggs gathered in the Netherlands and North Germany. It is sometimes called Plover or Green Plover. See PLOVER; and Howard Saunders, *Manual of British Birds*.

Lar, capital of the district of Laristan, in south Persia, situated on a well-wooded plain, 60 miles from the Persian Gulf and 170 SE. of Shiraz, with trade in tobacco, cotton, and grain; pop. 12,000.

Larache, Laraish. See EL ARAISH.

La Ramée. See OUIDA.

Laramie, a river which rises in northern Colorado, flows generally NE. through south-eastern Wyoming, and enters the North Fork of the Platte at Fort Laramie, after a course of about 200 miles. It gives name to a large county of Wyoming; to the Laramie Plains, a treeless plateau of Wyoming, about 7500 feet above sea-level, and some 3000 sq. m. in extent; and to the Laramie Mountains, a Rocky Mountain range which bounds this plateau on the north and east. Laramie City, Wyoming, on this great plain, and on the Union Pacific Railroad, 573 miles W. of Omaha, has a university and some manufactures; pop. 6000.

LARAMIE BEDS, the name given by American geologists to certain strata which appear to be intermediate in age between the Cretaceous and Tertiary. The strata are well developed in Utah and Wyoming, and consist chiefly of lacustrine strata; they contain numerous seams of lignite, and hence are often called the lignitic series. While the vertebrate remains of the Laramie are essentially Mesozoic in character, the plants are just as unequivocally Tertiary. It would seem from this that a Tertiary flora was contemporaneous with a Cretaceous fauna.

Larboard. See STEERING.

Larceny. See THEFT.

Larch (*Larix*), a genus of trees of the natural order Coniferae, differing from firs (*Abies*) in having

the cones ovate-oblong, about an inch in length, the scales of which are attenuated at the tip, and do not fall off from the axis of the cone when fully ripe, and the leaves deciduous and in clusters, except on shoots of the same year, on which they are single and scattered. The Common Larch (*L. europæa*) is a native of the mountains of the south and middle of Europe, and

Common Larch (*Larix europæa*):

a, twig with shoots; b, twig with male (m) and female (f) flowers; c, mature cone; d, needle with section.

is found also in Asia, where it extends much farther north than in Europe, even to the limits of perpetual snow. The date of the introduction of the larch into Britain is fixed by some authorities at about 1629; but it was for many years treated as a rare and curious plant, and

grown in pots in greenhouses by the few that possessed it, till about the middle of the 18th century, when it began to be extensively planted as a forest-tree. It has changed the aspect of whole districts, particularly in Scotland, where it was introduced at Dawick, Peeblesshire, in 1725, and at Dunkeld and Blair, Perthshire, in 1738. The perfectly erect and regularly tapering stem of the larch, its small branches, its regular conical form, and its very numerous and very small leaves, make its aspect peculiar, and very different from that of any other tree seen in Britain. It attains a height of 60 to 100 feet, and an age of 200 years. The larch grows rapidly, and is useful even from an early age; the thinnings of a plantation being employed for hop-poles, palings, &c., and the older timber for a great variety of purposes. It is very resinous, does not readily rot (many notable Italian pictures are painted on panels of larch), is not readily attacked by worms, and was much used in shipbuilding. It is, however, very apt to warp, and is therefore not well suited for planks. Larch-bark is used for tanning, although not nearly equal in value to oak-bark. In Siberia, where large tracts of larch-forest are not unfrequently consumed by accidental fires, the scorched stems yield, instead of a resin, a gum similar to gum-arabic, reddish, and completely soluble in water, which is known as *Orenburg Gum*, and is used for cementing and in medicine, and, notwithstanding a somewhat resinous smell, even as an article of food. In warm countries a kind of Manna (q.v.) encrusts the leaves of the larch in the hottest season of the year, having a sweetish taste, with a slight flavour of turpentine. It is gathered principally in France, and is known as *Briançon Manna*, or *Larch Manna*. It seems to result from the drying of a honeydew produced by an aphid, *Lachnus laricis*. The larch woods of Britain have suffered greatly from the attacks of the Larch Canker (*Periza Willkommii*), which ruptures the bark, ruins the timber, and may kill the trees. It produces orange-coloured cups, white outside. It is combated by under-planting, and mixing with other trees. The larch does not dislike moisture, but stagnation of water is very injurious to it, and thorough drainage is therefore necessary. There are varieties of the common larch remarkable for crowded branches, for pendulous branches, and for other peculiarities, which are sometimes planted as ornamental trees. The Common American Larch (*L. americana*)—the Tamarack or Hackmatack—distinguished by very small cones, is common in the northern parts of North America, and on the Alleghany Mountains, often covering extensive tracts. It is a noble tree, much resembling the common larch, and its timber is highly valued. Another American species is the Western Larch (*L. occidentalis*), also called Tamarack. The Himalayan Larch (*L. Griffithsii*) abounds in the Himalayas, but is generally a small tree, 20 to 40 feet high. Its cones are larger than those of the common larch. The Japanese *L. leptolepis* is now much planted. The Golden Larch (*Pseudolarix Kaempferi*), a native of China, is described by Fortune, who introduced it in 1852, as a beautiful tree growing to the height of about 120 to 130 feet, with corresponding girth of bole. It has not proved hardy in any except the mildest parts of Britain.

Lard, the result of heating the fatty tissue of the pig, and cooling after removal of associated solids. It is a mixture of fats, notably palmitin, olein, and stearin. Until after the first quarter of the 19th century it was little used, except in cooking and making ointment. The huge American supply led to more manifold utilisation. The olein furnishes 'lard-oil,' a lubricant and an illuminant; the stearin is used in making candles. Lard is

also used in soap-making, and glycerine is another important derivative. See OIL, STEARINE.

Lardner, DIONYSIUS, a successful populariser of physical science, was born in Dublin, 3d April 1793, and, after four years as clerk to his father, a solicitor, entered Trinity College. He first attracted attention by a *Treatise on Algebraic Geometry* (1823), and a work on *Differential and Integral Calculus* (1825). But he is best known as the originator and editor of *Lardner's Cyclopaedia*, a series of 132 volumes on scientific subjects, published between 1830 and 1844. Lardner himself wrote the volumes treating of mechanics, hydrostatics, geometry, arithmetic, heat, and electricity. This was followed up by the historical series entitled *The Cabinet Library* (12 vols. 1830-32) and *Museum of Science and Art* (12 vols. 1854-56). He also wrote several useful handbooks of various branches of natural philosophy. In 1828 Lardner had been appointed professor of Natural Philosophy and Astronomy in University College, London; but in 1840 he lost his chair through running away with the wife of an army officer, who claimed £8000 damages from him. However, Lardner went to the United States, and there made five times that sum by lecturing. He lived in Paris from 1845 to 1859, and died at Naples on 29th April 1859.

Lardner, NATHANIEL, an English divine, was born at Hawkhurst, in Kent, in 1684, and studied in London, afterwards at Utrecht and Leyden. He belonged to a body of English Presbyterians who had become Unitarians. He died at Hawkhurst on 24th July 1768. His *Credibility of the Gospel History* (2 vols. in 1727 and 12 vols. in 1733-55) and his *Jewish and Heathen Testimonies* (4 vols. 1764-67) have secured for him a place among the modern apologists for Christianity. See the *Life* by Kippis prefixed to his works (11 vols. 1788).

Lareau, EDMUND (1848-90), born at St Gregoire, Quebec, was educated at Victoria College and McGill University, called to the bar in 1870, became professor of Law in McGill University in 1876, and in 1886 was elected, as a Liberal, to the provincial legislature. His works, in French, include histories of Canadian law and literature, and *Mélanges historiques et littéraires* (1877).

Laredo, a city of Texas, in a fertile region on the Rio Grande, producing also iron and coal, 153 miles SW. of San Antonio; pop. 23,000.

Lares, Penates, Manes. The Lares were tutelary deities belonging originally to the Etruscan religion, and worshipped especially as the protectors of a particular locality. In Roman usage they were usually regarded as the tutelary deities of a house (*familiares* or *domestici*), and their images stood on the hearth in a little shrine (*aedes*), or in a small chapel (*lararium*). We find also *Lares compitales* (of cross-roads), *Lares vicorum* (of streets), *Lares rurales* (of the country), &c. See ANCESTOR WORSHIP.

The Penates were the old Latin guardian deities of the household, and of the state regarded as a union of households. Their seat was originally in Lavinium, and the name is generally joined with *Di*. By a natural enough case of metonymy both the words Penates and Lares came to be used as equivalent to a home or a hearth.

The Manes were the deified souls of the departed, the gods of the Lower World considered as benevolent spirits, in contrast to *larvae* and *temures*, malevolent spirits; but the name frequently applied merely to the departed spirit, ghost, or shade of a dead person.

These divinities were by no means exactly differentiated from each other, and obviously all owed their existence to the fundamental ideas under-

lying the worship of ancestors, with its altar, the domestic hearth—the most persistent and perhaps the oldest of all the religions of man.

Largo, a village of Fife, on Largo Bay, and at the base of Largo Law (965 feet), 14 miles NE. of Kirkcaldy. It has a bronze statue by T. Stuart Burnett (1885) of Alexander Selkirk, who was born here, as was, perhaps, Sir Andrew Wood. Pop. 3000.

Largs, a watering-place of Ayrshire, on the Firth of Clyde, 14 miles S. of Greenock, and 11 N. of Ardrossan. Here on 12th October 1263, in a war between Scotland and the Norse colonies of Man and the Isles, Alexander III. with 1500 Scots defeated Haakon of Norway, who with over 100 ships and perhaps 1000 men (Boece says 24,000!) had descended on the coast of Ayrshire. Pop. 4000 (in summer, 10,000).

Laricio. See PINE.

Laridæ. See GULL.

Larissa (called by the Turks *Yenisher*), famous in ancient times as the chief town of Thessaly, is now a place of 20,000 inhabitants. Larissa was ceded by Turkey to Greece in 1881. It stands on the Salambría (anc. *Peneus*), and the main railway line, in the fertile plain of Thessaly, and has manufactures of silk, cotton, and tobacco. It was the centre of the Turkish operations in the war of Greek Liberation, and was occupied by the Turks during the war of 1897.

Laristan, the south-east part of the Persian province of Fars (q.v.).

Lark (*Alauda arvensis*), a familiar songster, otherwise well known as the symbol of poets and the victim of epicures. It is included among Passerine birds, type of the family Alaudidæ,

Lark (*Alauda arvensis*).

which comprises over 100 species, widely distributed in Europe, Asia, and Africa, with spreading stragglers in Australia and North America. The plumage is usually sandy brown, the colour of the ground; the lower legs bear scales, behind and before; the hind-claw is very long and straight; the bill is strong and conical. The skylark measures about 7 inches in length; the males and females are alike in plumage; the food consists of insects, worms, and seeds. It nests in April, making a structure of dry grass in a hollow in the ground, usually among growing grass or cereals. The eggs (three to five) are dull gray, mottled with olive-brown; two broods are usually reared in the season. Great crowds of larks come to Britain from the Continent in autumn, and later on there is a general movement southwards. It has been introduced into Australia and New Zealand, and to some extent in the United States.

'The lark is a creature of light and air and motion, whose nest is in the stubble and whose tryst is in the clouds.' Its song 'at heaven's gate,'

idealised by Shelley, Wordsworth, Hogg, and other poets, 'is not especially melodious, but blithesome, sibilant, and unceasing.' 'Its type,' Burroughs well says, 'is the grass, where the bird makes its home, abounding, multitudinous, the notes nearly all alike and in the same key, but rapid, swarming, prodigal, showering down as thick and fast as drops of rain in a summer shower.' The bird very rarely sings on the ground, but when soaring or descending.

There is no doubt that larks when very numerous, as they often are, may do considerable damage to autumn-sown wheat or young green crops. This fact is sometimes urged to excuse the custom of catching them for the cage or table. In spite of severe persecution, the skylark, according to Mr W. P. Pyecraft, 'still outnumbered any other Passerine bird in northern Europe.' This may be due to its wide range and adaptability; 'it is also probably a long-lived bird, retaining its reproductive powers to the last.'

In Europe there are several other common species of lark—e.g. the Wood-lark (*A. arborea*) and the Crested Lark (*A. cristata*), the former of which is locally distributed in England and Wales, and the latter a rare visitor. Among the other genera may be noted the Shore or Horned Larks (*Otocorys*), with a hornlet over each eye; these are 'the only larks which occur regularly in the western hemisphere.' One species (*O. alpestris*) has occasionally been found as a straggler in Britain, just as the species of *Alauda* occasionally wander beyond their usual range. See Kirkman's *British Bird Book*.

Larkhall, a small town of Lanarkshire, 3 miles SE. of Hamilton, with coal-pits, bleaching-works, and mills; pop. 13,000.

Larkhana, the capital of a district called 'the Eden of Sind,' stands 150 miles N. of Hyderabad by rail. It manufactures silk and cotton cloth, and has a great cotton market. Pop. 16,000.

Larkspur (*Delphinium*), a showy and popular genus of garden-flowers of the natural order Ranunculaceæ, natives of the temperate and cold regions of the northern hemisphere, and comprising both annual and perennial species. The well-known Rocket Larkspur (*D. Ajacis*), a native of Switzerland, and the Branching Larkspur (*D. Consolida*), a native of most parts of Europe, doubtfully so of Britain, are familiar examples of the annual species; and Barlow's Larkspur (*D. Barlowii*) and the Great-flowered Larkspur (*D. grandiflorum*) are not unfrequent examples of the perennial species; but many more showy varieties have been produced by cultivation and selection which have displaced the older-fashioned species. *D. glaciale* is one of the most distinctively alpine plants in the world. *D. Staphisagria*, corrupted to Stavesacre, yields an alkaloid extract from its seeds, named *Delphine*, which is highly poisonous even in very small doses, acting chiefly on the nervous system.

Larmor, SIR JOSEPH, born in Co. Antrim in 1857, became professor in Cambridge in 1903, and has contributed largely to mathematics and physics, and written on *Ether and Matter*. He was knighted in 1909, and in 1911 he became M.P. for his university.

Larnaka (ancient *Citium*), a port of Cyprus, 27½ miles S. of Nicosia, with iron piers accessible at all times by boats. Sea-going vessels anchor in the bay, owing to the shallow water. The Greek church of St Lazarus, an ancient Byzantine building, is in good preservation, and there is an English burial-ground attached to it with monumental inscriptions as old as 1685. Even if *Citium* be not the *Chittim* of the Old Testament, it is certain that the king of *Citium* paid tribute to the Assyrian Sargon in 707 B.C.,

as appears from a cuneiform inscription on a bas-relief dug up at Larnaka in 1846, now at Berlin. Carobs, or locust-beans, cotton, and grain are exported. A most interesting fair called *katakismus*, 'the deluge,' and held every year fifty days after the Greek Easter, is traditionally supposed to be the anniversary of the birth of Aphrodite, and is attended by Orthodox Christian Cypriots from all parts of the island in immense numbers. See CYPRUS. Pop. 10,000.

Larne, a market and seaport town of Co. Antrim, at the entrance of Lough Larne, 25 miles NE. of Belfast by rail. Alumina is prepared at Larne from bauxite obtained in the district. Pop. 8000.

La Rochefoucauld, FRANÇOIS, DUC DE, was born at Paris on the 15th September 1613. He belonged to an old family, and his father was made a duke by Louis XIII. in 1622. During his youth he was known as the Prince de Marsillac. His education was somewhat neglected. He joined the army when a boy, and was present in his seventeenth year at the siege of Casal. His life, says Sainte-Beuve, might be divided into four periods, to each of which might be assigned the name of a woman—viz. Mme de Chevreuse, Mme de Longueville, Mme de Sablé, and Mme de la Fayette. As a young man he showed an ultra-romantic temperament. Under the influence of Mme de Chevreuse he devoted himself to the cause of the queen in opposition to Richelieu, and became entangled in a series of love-adventures and political intrigues, the result being that on the flight of Mme de Chevreuse he was forced to live in exile at Verteuil from 1639 to 1642. About 1645 he formed a liaison with the beautiful Mme de Longueville. He then joined the Frondeurs and was severely wounded at the siege of Paris. He was very unlucky in his political schemings. His father died in 1650, and in 1652 he was again badly wounded, whereupon he retired to the country to restore his health, which had been shattered by twenty years of battle and adventure. On Mazarin's death in 1661 he repaired to the court of Louis XIV., and about the same time began his liaison with Mme de Sablé. A surreptitious edition of the *Mémoires*, which he had written while living in retirement, was published by the Elzevirs in 1662, and as the book gave wide offence he disavowed its authorship, without, however, finding many to accept his denial. His *Réflexions, ou Sentences et Maximes Morales* appeared in 1665. No book, said Voltaire, did more to form the taste of the nation. The first edition contained 316 *pensées*, which were afterwards expanded to about 700. His last years were brightened by his friendship with Mme de la Fayette, which lasted until he died at Paris on March 17, 1680. In his early life he had married Andrée de Vivonne, by whom he had five sons and three daughters.

The *Maxims* vary in length from two or three lines to about half a page. For brevity, clearness, and finish of style they could hardly be excelled. Their writer did not seek to play the part of the mere epigrammatist, though he has now and then sacrificed his thought for the sake of striking and pointed expression. A vein of melancholy runs through the book. It is the work of a man of singularly keen and subtle intellect, who was deeply versed in life, and had formed independent judgments on most of its relations. He was a remorseless analyst of man's character. 'Everything is reducible to the motive of self-interest'—such is usually said to be the keynote of all his philosophy. That is not, however, exactly correct, though it is true of the book in the main. La Rochefoucauld tracks out self-love in its most elusive forms and under its cunningest disguises. He lays it bare with the most piercing insight and pitiless trench-

ancy. But he occasionally overstates his case against humanity, through forgetfulness of the fact that self-love is not the only motive by which men are impelled. Read in certain moods, the *Maxims* seem a crushing exposure of man's baseness and folly; read in others, they seem little better than a morbid libel on human nature. But of their writer's depth and keenness as a thinker there can be no more question than there can of his wonderful mastery of terse and incisive phrase.

See French Life by Bourdeau (1895), and the article on 'La Rochefoucauld' included in Sainte-Beuve's *Portraits de Femmes*. The best edition of his works is that by Gilbert and Gourdauld (3 vols. 1868-84), in the series of *Grands Écrivains de la France*.

Larochejaquelein, DU VERGER DE, an old noble family of France. The name Du Verger is derived from a place in Poitou. Guy du Verger married, in 1505, the heiress of the seigneur of Larochejaquelein. Several of his descendants distinguished themselves by their devoted loyalty to the old royal house against the fury of the French Revolution.—HENRI, Comte de Larochejaquelein, born in 1772, was an officer in the guard of Louis XVI., and after the 10th of August 1792 left Paris to put himself at the head of the insurgent royalists in La Vendée. He signalled himself by many heroic deeds, and for a time successfully repelled the republican forces, but was severely defeated by Westermann, 21st December 1793, and escaped with difficulty. He raised a new body of troops, however, in Upper Poitou, but was killed in a battle at Nouaillé, 4th March 1794. His heroic words to his soldiers are memorable beyond most: 'Si je recule, tuez-moi; si j'avance, suivez-moi; si je meurs, vengez-moi!'—His brother, LOUIS DU VERGER, Marquis de Larochejaquelein, born in 1777, emigrated at the commencement of the Revolution; returned to France in 1801, but resisted all Napoleon's efforts to win him, and in 1813 placed himself at the head of the royalists in La Vendée. Louis XVIII. appointed him in 1814 to the command of the army of La Vendée, and during the Hundred Days he maintained the royalist cause there, supported by the British. He fell in battle at Pont-des-Mathis, 4th June 1815. His wife, MARIE-LOUISE VICTOIRE, Marquise de Larochejaquelein (1772-1857), published *Mémoires* of the war, of which she was an eyewitness (Bordeaux, 1815), which are of real value to the historian. See her Life by Nettement (3d ed. Paris, 1876).

La Rochelle. See ROCHELLE.

Larrey, DOMINIQUE JEAN, BARON, a celebrated French surgeon, was born at Beaudéan, near Bagnères-de-Bigorre, in the Pyrenees, in July 1766, studied medicine in Toulouse, and after graduating served as surgeon in the navy. But in 1793 he transferred his skill to the army, and introduced the 'flying ambulance' service. After teaching for a short time at Toulon and Val de Grâce, he joined Napoleon in Italy in 1797; and from that time onwards invariably accompanied the successful Corsican in his campaigns. In 1805 he was placed at the head of the medico-surgical department of the French army, and a few years later was created a baron of the empire. Larrey continued to fill important offices till 1836, when he retired from that of surgeon-general of the Hôtel-des-Invalides. He died at Lyons, 25th July 1842. From his pen came valuable treatises on army surgery and the treatment of wounds; they were translated into most European languages. See the German memoir by Werner (1885).

Larva, the young form of an animal after hatching or birth, if it has not yet assumed the adult form. The developing animal within the egg-

shell or egg-envelope is called an embryo, or, in the special case of viviparous birth in vertebrates, a fetus. If what comes out of the egg is a miniature of the full-grown creature, it should be called simply the young animal or the juvenile stage. But if what comes out of the egg is markedly different from the full-grown creature, and does not become like it without some metamorphosis, it should be called a larva. Tadpoles of Frogs (q.v.) and Caterpillars (q.v.) of Lepidoptera are familiar examples of larvæ. A larva feeds for itself, and is often specially adapted for a mode of life entirely different from that of the adult.

Larynx (Gr. *larynx*) is the organ of voice, and plays an important part in the respiratory process, as all air passing either to or from the lungs must pass through it. It is a complex piece of mechanism, resembling a box composed of pieces of cartilage which are capable of executing movements, and enclosing the vocal cords by which phonation is produced. The larynx is situated between the trachea, or windpipe, and the base of the tongue, at the upper and front part of the neck, where it forms a considerable projection (especially in men); it opens superiorly into the pharynx, or throat, and inferiorly into the windpipe. The principal cartilages of which the skeleton of the larynx is composed are five in number—viz. the thyroid and cricoid cartilages, the epiglottis, and the two arytenoid cartilages.

The thyroid (Gr., 'shield-like') consists of two square plates of cartilage united in front at an acute angle, which forms the projection commonly known as the *prominentia laryngea*, or Adam's apple. Each of these plates is prolonged at the upper and lower posterior corners. The thyroid cartilage forms almost the whole of the anterior and lateral walls of the larynx. The cricoid (Gr., 'ring-like') cartilage is a ring the lower margin of which is parallel to the first ring of the trachea, and to the last-named it is united by fibrous membrane. Its upper border is connected in front with the lower border of the thyroid cartilage by a thick yellow fibrous tissue. It presents two articular surfaces on either side—viz. a lower, which articulates with the inferior cornu of the thyroid cartilage, and an upper, which is oval in form, and supports an arytenoid cartilage. The arytenoid (Gr., 'ladle-like') cartilages are pyramidal bodies resting on the oval articular surfaces at the upper and posterior part of the cricoid cartilage. When *in situ* they present a concave posterior surface. From their connection with the vocal cords, and from their great mobility as compared

Fig. 1.

Cartilages of larynx and epiglottis, and upper rings of trachea, seen from behind: a, arytenoid cartilages; b, superior cornu of thyroid cartilage; c, its inferior cornu; d, posterior surface of cricoid; e, epiglottis, with its perforations; f, upper margin of thyroid; g, its left inferior tubercle; h, trachea.

With their connection with the vocal cords, and from their great mobility as compared

with the two larger cartilages, the arytenoids play a very important part in the mechanism of the larynx. The *epiglottis* is a very flexible cartilaginous valve (fig. 1, f), situated at the base of the tongue, and covering the opening of the larynx. Its direction is vertical, except during deglutition, when it becomes horizontal. It is attached inferiorly by a kind of pedicle to the angle of the thyroid cartilage. Upon removing the investing mucous membrane the cartilage is found to be perforated by numerous foramina. Each perforation admits some fasciculi, of yellow, elastic, ligamentous tissue, which expands on its anterior aspect, and secures the return of the epiglottis to its vertical position, independently of any muscular action. Such is the skeleton of the larynx, hanging as it does from the hyoid bone, with which it is connected by the thyro-hyoid ligament and certain muscles.

The various cartilages which have been described are connected with one another by ligaments, the chief of which are those known as the true and false vocal cords. In their quiescent state the former do not lie parallel to each other, but converge from behind forwards. The length of the vocal cords is greater in the adult male than in the adult female, in the ratio of three to two. In infancy they are very short, and increase regularly from that period to the age of puberty. The mucous membrane of the larynx is part of the extensive respiratory tract, and is remarkable for its extreme sensibility. The length of the chink or aperture of the glottis, which is directed horizontally from before backwards, varies, like the

Fig. 2.

A, larynx and trachea on deep inspiration; B, on phonation; C, during falsetto note; D, approximation of the ventricular bands or false cords as it occurs in straining.

vocal cords, until the period of puberty, when its length, in the male, undergoes a sudden development, while in the female it remains stationary. In the adult male it is about eleven lines in length.

The larynx is provided with two sets of muscles: the *extrinsic*, by which the whole organ is elevated or depressed, and the *intrinsic*, which regulate the movements of the various segments of the organ in relation to one another. By the action of these latter muscles, aided, in some cases, by the extrinsic muscles, the tension of the vocal cords may be increased or diminished, and the size of the opening of the glottis regulated at will (see VOICE). The nerves of the larynx are derived from the superior and inferior laryngeal branches of the pneumogastric or vagus nerve.

That the larynx is the organ of voice is easily proved. Thus, alteration in the mucous membrane covering the vocal cords causes hoarseness or other change of voice; ulceration of the vocal cords destroys or injures the voice; opening the trachea below the vocal cords, or section of the inferior laryngeal nerves, destroys the voice; and sounds

like those of the voice may be produced by experiments on the dead larynx.

EXAMINATION OF THE LARYNX.—It was Garcia, the famous teacher of singing, who was the first to succeed in viewing the larynx in the living subject. He made use of a small mirror, the forerunner of the 'laryngeal mirror,' now universally employed. His epoch-making discovery was not immediately turned to account by physicians; indeed, it was not until two German physiologists, Türk and Czermak, took up the subject a few years later (1857 and 1858) that the great importance of laryngoscopy was first generally recognised.

The laryngeal mirror is a small circular mirror, placed on a stalk attached to its margin, at an angle of about 120°.

Good illumination is essential for a proper examination of the larynx, though a tolerable view may even be obtained in a dark room by the light of a candle. Whatever the source of light may be, it is placed on one side of the patient. The observer sits opposite the patient, and uses a reflector with a central aperture, through which he looks. The reflector is attached to a spectacle frame or forehead band. The rays of light are concentrated by means of this reflector on the laryngeal mirror, which has been previously warmed, and which is placed against the soft palate and uvula. The mirror is introduced with the right hand, and is maintained at such an inclination that it throws the light downwards and illuminates the parts to be examined, while at the same time it reflects the images of these parts into the eye of the observer through the central opening of the reflector. By this means we can diagnose the various morbid conditions which affect the larynx; at the same time, by means of instruments introduced under guidance of the eye, it is possible for the expert to make topical applications to the larynx, to remove with precision small tumours, or to cure ulcers.

In 1894 Kirstein devised a method by which the larynx could be inspected directly without the aid of a mirror. He used a long tongue spatula, with which he forced the root of the tongue forward, while the patient sat with the head bent as far back as possible. In this manner, with a tolerant patient, it was possible to obtain a direct view, but his method was so unpleasant for the patient that his discovery did not have the attention paid to it that it deserved. It was not until a few years later, when Killian further elaborated this method, that direct laryngoscopy came into general use. Killian made use of rigid tubes, which were passed down to the larynx, and, if necessary, through the larynx into the trachea and bronchi. Illumination was obtained by means of an electric lamp fixed to the observer's forehead. Killian's method constituted an important advance in laryngoscopy, and threw open an entirely new field of surgery to the laryngologist. By its means it is possible to examine thoroughly not only the larynx and trachea, but also the bronchi of the first and second degree. It is of special value for the removal of foreign bodies which have found their way into the air passages, and may also be used in the detection of mediastinal growths, aneurysms, and bronchiectatic cavities. To Killian also we owe another ingenious method of directly examining the larynx, which he has termed 'suspension laryngoscopy.' The instrument for this procedure consists of a 'gallows' and a detachable 'suspension hook,' which ends in a tongue spatula. The patient lies on his back, with his head hanging over the end of the table where the gallows is fixed. The spatula is placed in the patient's mouth, and the suspension hook is then attached to the gallows. The spatula thus bears the whole weight of the head, and presses up the structures at the root of the tongue, so that a very

perfect and comprehensive view of the larynx is obtained. The method is valuable for operative procedures on the larynx, as both hands of the observer are free, whereas, when any of the older methods are employed, only one hand is available. Owing to the discomfort of the position, it is frequently desirable to give a general anæsthetic.

DISEASES OF THE LARYNX.—The diagnosis of diseases of the larynx can only be made after an inspection of the larynx. As this procedure in itself requires special training, it is beyond the scope of this article to attempt any description of the various affections of this part of the body. Some remarks, however, on the symptoms of laryngeal disease may not be out of place.

Interference with phonation is one of the most common symptoms in affections of the larynx; it may vary from slight huskiness to complete loss of voice. It is noteworthy, however, that marked changes in the larynx, such as certain forms of paralysis, or the presence of new growths, may be unattended by alteration in the voice; while in certain hysterical conditions there may be complete loss of voice. In the latter cases, however, the patient is usually able to cough loudly, which would be impossible if the aphonia were due to organic changes in the larynx. Difficulty in breathing is less commonly met with in laryngeal affections, and is usually a symptom of acute disease. Pain is not a very common symptom; in acute catarrh, a feeling of rawness is complained of; in malignant disease, pain shooting up to the ears is a frequent symptom; in superficial ulceration, especially of the epiglottis, there may be severe pain and extreme dysphagia (pain on swallowing). Cough is not a common symptom, and expectoration, when due to laryngeal disease, is usually scanty. Hæmorrhage may occur in the larynx, but is very unusual, and when it occurs is small in quantity.

La Salette. See SALETTE.

La Salle, a city of Illinois, at the head of steam-navigation on the Illinois River (here crossed by bridges), 99 miles by rail WSW. of Chicago, with which it is also connected by the Illinois Canal. Bituminous coal is mined here, and the city has a large zinc-rolling mill and smelting-furnaces, besides manufactures of glass and iron wares. Pop. 13,000.

La Salle, ABBÉ DE. See SCHOOLS (CHRISTIAN).

La Salle, ROBERT CAVELIER, SIEUR DE, one of the greatest French explorers in North America, was born at Rouen in 1643. Settling in Canada at the age of twenty-three, he began his travels with an attempt to reach China by descending the Ohio River, which he supposed to empty into the Pacific. As soon as he found that the great southern streams drained into the Gulf of Mexico he formed the project of descending the Mississippi to the sea. After many and severe hardships this long voyage was concluded, and the arms of France set up at the mouth of the great river, on 9th April 1682. Two years later an expedition was fitted out to establish a permanent French settlement on the Gulf, which should secure France's claims to the Mississippi valley. But La Salle's bad fortune pursued him; he mistook Matagorda Bay for a mouth of the Mississippi, landed there, and then spent two years in unsuccessful journeys to discover the great river, while his colonists and soldiers gradually dwindled away. His harshness of manner, more than his want of success, embittered his followers, and he was assassinated by some of them in March 1687. See works by Francis Parkman (q.v.).

Lascar, in the East Indies, signifies properly a camp-follower, but is generally applied to native sailors on board of British ships, as, for instance, the large steamers of the Peninsular and Oriental

Company. The Lascars make good seamen, being both temperate and docile. They are mostly Mohammedans, and speak, besides their native dialects, a *lingua franca* based on Hindustani, with English, Arabic, and other words.

Las'caris, CONSTANTINE, a Greek scholar, who, after the capture of Constantinople by the Turks, fled to Italy, where he was instrumental in reviving the study of Greek. He was a descendant of the royal family of Nicæa. Francesco Sforza, Duke of Milan, made him tutor to his daughter Hippolyta. But more important scenes of Lascaris's labours were Rome (where he settled in the train of Bessarion), Naples, and Messina; at this last city he taught rhetoric and Greek letters until his death in 1493. His Greek grammar, entitled *Erotemata*, and dated 1476, was the earliest Greek book printed in Italy. His library, which is very valuable, is now in the Escorial.—**JOHN** or **JANUS** LASCARIS, a member of the same family, surnamed RHYNDACENUS, born about 1445, who also found an asylum in Italy after the fall of Constantinople, was employed by Lorenzo de' Medici in the collection of ancient, especially Greek, classical authors. On the death of Lorenzo, Lascaris went to Paris, where he taught Greek with the countenance of Charles VIII. and Louis XII.; but he eventually settled in Rome, and was appointed by Leo X. superintendent of his Greek press and of a seminary for young Greeks. He was, moreover, employed as ambassador at the court of Francis I., and afterwards at Venice, and died in Rome in 1535. From Rome he edited several *éditiones principes* of the Greek classics. His own works were chiefly grammatical, with a volume of letters and epigrams. See Villemain's *Lascaris, ou les Grecs du 15^{me} Siècle* (Paris, 1825).

Las Casas, BARTOLOMÉ DE, Bishop of Chiapa, in Mexico, surnamed the *Apostle of the Indians*, was born in Seville in 1474. He studied at Salamanca, sailed with his father in the third voyage of Columbus, and again in 1502 accompanied Nicolas de Ovando, the new governor, to Hispaniola. Eight years later he was ordained to the priesthood. In 1511 he was summoned to accompany Diego Velasquez to Cuba, and he assisted in the pacification of the island, and its division into *repartimientos* or allotments of natives, and was rewarded in the usual way by an *encomienda* or commandery of Indians, held together with his friend Pedro de Renteria. But ere long a burning love for the unhappy natives and indignation at their sufferings filled his heart; and he gave up his own slaves, and went to Spain, where he prevailed on Cardinal Ximenes to send a commission of inquiry to the West Indies. Its proceedings by no means satisfying his zeal, he revisited Spain to procure the adoption of stronger measures for the protection of the natives. Finally, to prevent the entire extirpation of the native race by the toils to which they were subjected, he proposed that the colonists should be permitted to import negro slaves for the more severe labours of the mines and sugar-plantations; and the proposal was adopted. Las Casas has on this account been represented as the author of the slave-trade, although it has been proved to have existed before this proposal was made, and it should be remembered that afterwards he bitterly repented the advice that he had given. He also attempted to carry out Castilian peasants as colonists to the West Indies, but failed in his scheme, and spent eight years (1522-30) of mortification in austere seclusion and devoted study within the walls of a Dominican convent in Hispaniola. In 1530 he again visited Spain, and, after missionary travels in Mexico, Nicaragua, Peru, and Guatemala, returned to devote four years to advocate the cause that lay closest to his heart. During this period

he wrote his *Veynte Razones* and his *Brevissima Relacion de la Destruccion de las Indias*, which was soon translated into the other languages of Europe. The rich bishopric of Cuzco was offered to him, but he preferred the poor one of Chiapa, and reached its chief city, Ciudad Real, in 1544. He was received with the most active hostility by the colonists, and was soon mortified to the heart by Charles V.'s time-serving revocation of the New Laws, which his own devoted energy had extorted. He maintained his ground that the granting of *encomiendas* to private persons was flagrant injustice, but bowed his head to the storm, returned to Spain, and resigned his see (1547). Three years later he argued before a Junta at Valladolid with splendid force and eloquence against Sepulveda, who defended the right of carrying on war against the Indians. In 1555 he appealed in terms of marvellous boldness to Philip II. not to sell the claims of the crown to the reversion of the *encomiendas*, and was successful in thus averting a measure which would have brought final and hopeless slavery upon the Indians. His last work was to get the *audiencia* or court of justice restored to the oppressed natives of Guatemala. He ended his life in a convent in Madrid, July 1566, at the age of ninety-two. His most important work, the unfinished *Historia de las Indias*, was printed in 1875-76. See the admirable Life by Helps (1868).

Las Cases, EMMANUEL DIEUDONNÉ, COMTE DE (1766-1842), the historiographer and companion of Napoleon in St Helena, was born near Revel in Languedoc. He was a lieutenant in the navy before the Revolution, but then fled to England. His *Atlas historique* (1803-4) won him European fame. A royalist by birth and taste, he was fascinated by Napoleon, and insisted on sharing his exile in St Helena; but deported to the Cape by Sir Hudson Lowe in 1816, he returned ultimately to Europe, and made a great sensation with his *Mémorial de Ste-Hélène* (8 vols. 1821-23), of which O'Meara's *Napoleon in Exile* is a kind of continuation. Both works attack Sir Hudson Lowe.

Lasco, JOHANNES A., or JAN LASKI, Polish reformer, was a man of high family and was born at Lask, in the modern government of Piotrkow, about 1499. He was educated at Cracow by his uncle, chancellor and primate of Poland, and chose to enter the church. He studied further in Rome and Bologna, was ordained in 1521, and two years later at Basel came in contact with Erasmus and Farel; the former by his will left his library to A Lasco. From this journey the young Pole returned in 1526, his mind greatly exercised with the question of church reform. At length he was caught in the current of the Reformation, and, quitting his native land in 1538, he settled at Louvain in the Netherlands. But a year or two later he moved to Emden in East Friesland. The countess of that little province appointed him superintendent of church affairs, and he used his influence to establish a presbyterian form of church government. The *Emden Catechism*, defining the religious doctrines of the East Friesland Church, was in great part his work. But in 1550 he accepted an invitation by Cranmer to visit England—he had already passed the winter of 1548-49 there—and became head of an influential congregation of Protestant refugees in Austin Friars, London. Mary's accession in 1553 drove him back to Emden and scattered his flock. After staying a while in Frankfurt-on-Main, he finally returned to Poland in 1556. There the Reformation was making rapid headway, and was assisted in no inconsiderable degree by the labours of A Lasco as superintendent of the churches in Little Poland. He died at Pircow, on 8th Jan-

uary 1560. See Dalton's *John a Lasco* (Eng. trans. from the German, 1886), which only brings the narrative down to A Lasco's second arrival in England; G. Pascal, *Jean de Lasco* (1894).

Lashkar. See GWALIOR (city).

Las Palmas, chief town of the Canary Islands (q.v.), on the north-east coast of Gran Canaria, is the seat of a bishop, and has sea-bathing and ship-building-yards. Pop. 70,000.

Lassa. See LHASA.

Lassalle, FERDINAND, who may justly be regarded as the historic originator of the social-democratic movement in Germany, was born at Breslau, 11th April 1825. Like Karl Marx, the founder of international socialism, he was of Jewish extraction. Lassalle's father was a prosperous merchant, who intended that his son also should follow a business career. But as young Ferdinand preferred a student life, he went to the universities of Breslau and Berlin, where he devoted his time chiefly to philology and philosophy. In philosophy he was a disciple of Hegel; and it was his first literary ambition to write a work on Heraclitus from the Hegelian point of view. During a stay in Paris he made the acquaintance of Heine, who, like so many of Lassalle's friends, formed the highest opinion of his talent and energy.

On his return to Berlin in 1845 he met the Countess Hatzfeldt, a lady at variance with her husband, a wealthy German noble of high rank. Taking up her case, Lassalle prosecuted it before thirty-six tribunals, and after eight years of litigation forced the husband to a compromise on terms most favourable to the countess.

As a decided adherent of the democratic republic Lassalle took a part in the revolution of 1848, and for disobedience to the authorities at Düsseldorf, where he then resided, spent six months in prison. He lived in the Rhine country till 1858, when he returned to Berlin; and in 1858 brought out the work on Heraclitus, which had been laid aside during the Hatzfeldt suit. It at once gave him a high place in the learned circles of Germany. In conducting the Hatzfeldt case Lassalle had gained a very considerable legal knowledge, and this he now utilised in writing a work on the philosophy of law, entitled *System of Acquired Rights* (1861). It was an attempt to apply the historical method to legal ideas and institutions, but we may well question whether he has not often read into history theories of very doubtful validity.

For many years after 1848 no opportunity for fruitful action had occurred to men of democratic opinions. The opening of the Bismarck era in 1862 was therefore a welcome event for Lassalle, the aim of the latter being to resuscitate the democracy in face of the half-hearted Liberalism of his time. His first effort was to show the futility of the Liberal policy in opposing army reform. A lecture delivered in the spring of 1862 'On the connection of the present period of history with the idea of the working-class' strongly brought out the contrast between Lassalle's position and the Liberalism of his day. In his *Open Letter* to a committee of German workmen at Leipzig (1863) he still more clearly expressed his dissent from the current Liberalism, and in luminous and comprehensive language expounded the leading points of his social democratic programme. His success in advocating his views now encouraged him at Leipzig to found the Universal German Workingmen's Association. Its programme was a simple one—by all legal means to agitate for universal suffrage. In the autumn of 1863 Lassalle continued his agitation on the Rhine, and in the winter of 1863-64 he attempted to gain Berlin over to his cause, but without success. The chief

literary product of the winter was his *Bastiat-Schulze, or Capital and Labour*, in which he attacked Schulze-Delitzsch, the prominent representative of German Liberalism. In May 1864 Lassalle held the last 'glorious review of his army' on the Rhine.

In the summer of 1864 Lassalle met on the Rigi Helene von Dönniges, a lady whom he had previously known, and by whom he had been fascinated. They resolved to marry, but encountered the strongest opposition from the lady's parents. Under pressure from them she at last renounced Lassalle in favour of the Wallachian Count Racowitza. Mad with rage and mortification, Lassalle sent to both her father and lover a challenge, which was accepted by the latter. At the Carouge, a suburb of Geneva, Lassalle fell mortally wounded, and died two days afterwards, 31st August 1864. His unworthy end in such a miserable affair was the outcome of the weaker elements in a remarkable character. Helene von Racowitza died by suicide at Munich in 1911.

Lassalle has left no systematic exposition of his views. In the *Bastiat-Schulze*, which is the nearest approach to such an exposition, we find philosophical statement too frequently interrupted by unprofitable controversy and unjustifiable abuse of his opponent. We can only glean from his works the most important points of his teaching. Lassalle held that the historical development of Europe is to culminate in a democracy of labour, in which political interests shall be subservient to social—the social democracy. The democracy of workers, who are destined to be the makers and representatives of the new order, are to be guided by science and the highest ideals of culture and morality. But they cannot by their isolated efforts fulfil this high mission; they need organisation. This organisation they will find in the state, which is, and should be, simply the great association of workers, inasmuch as they constitute the overwhelming majority of every community. The Liberal or bourgeois regime has degraded the state to the function of policeman or mere protector of property. It will be the aim of the new epoch to raise the state to its high and ancient position, as the promoter of freedom, culture, morality, and progress; its mission is the development of the human race in the way of freedom.

The working-class, however, need adequate material means to enable them to rise to the high vocation reserved for them. At present they are crushed by the *iron law of wages*, the law which holds the central and decisive position in the system of Lassalle, and which therefore requires a more lengthened statement. In his exposition of the law Lassalle founds on Ricardo and the classical economists generally. It was the doctrine of those economists that the workman's wage represents what is necessary for his subsistence (in accordance with the standard of living usual among his class) and for the continued supply of labour in his family. It is not a fixed quantity; it rises or falls according as the supply of labour decreases or increases in proportion to the demand for it. A rise in wages leads to greater comfort, more marriages, &c., and these tend to increase the supply of labour, and thereby again to lower wages. A fall in wages leads to want, sickness, abstinence from marriage, &c., and these tend to diminish the supply of labour, and thereby to raise wages. There is continual oscillation, but it never rises permanently above or falls permanently below the point necessary for subsistence and the continuance of the working-class. Thus, so long as the present economic order, of which the iron law of wages is an implicate, continues, its inevitable operation leaves no hope of real improvement

for the working-class; in other words, it follows from the iron law that the existing order must be fundamentally changed.

For the iron law of wages is merely an implicate in the regime of capital, the exposition of which is the main theme of the *Bastiat-Schulze*. With Lassalle capital is a historical category, the rise of which we can trace, the disappearance of which under altered circumstances we can foresee. The historical conditions necessary for the rise of capital were the opening of the world-market through geographical discovery, colonisation and conquest, the development of machinery, and of the division of labour, and above all the appropriation of the instruments of labour by a class, who, employing another class of labourers free but destitute of capital, pay them a subsistence wage and pocket the surplus. Thus the general exposition of capital leads us back again to the iron law of wages.

It is the gist of Lassalle's polemic against Schulze-Delitzsch that the working-class cannot by their unassisted efforts escape from the iron law of wages. The state, whose function it is to promote and facilitate the great progressive movements of humanity, must furnish them with the necessary capital. As the easiest and mildest means of transition Lassalle brought forward his scheme of productive associations with state-credit, by which the workmen would be their own capitalists, would secure the full product of labour, and would thus gain for themselves the entire benefit of an ever-increasing production. His scheme would moreover provide the organic germ of an incessant development, for the associations would themselves combine into credit and insurance unions, until the industries of the whole country should form a well-ordered unity, superseding the present anarchic condition of things by a systematic, rational and equitable organisation of labour. As the associations would be self-governing, there would be most adequate guarantee for freedom; the state would simply see that its credit was not abused. In effect the socialism of Lassalle is a collectivism, resembling that of Rodbertus and Marx, but in many obvious points also differing from theirs. Since Lassalle's time, the political economy of Germany has been revolutionised, and the social democrats are an increasing power in the Reichstag and the country.

Bernstein edited for the social democratic party in 3 vols. an edition of Lassalle's socialistic writings (1891-94). See the articles MARX, SOCIALISM; monographs on Lassalle by Bernstein (Eng. trans. 1893), Brandt (1895), Aaberg (1883), Brandes (Eng. trans. 1911), Oncken (1904); Mehring, *Geschichte der Deutschen Sozialdemokratie*; Laveleye, *Le Socialisme contemporain* (Eng. trans. *Socialism of To-day*); J. Rae, *Contemporary Socialism*; W. H. Dawson, *German Socialism and Ferdinand Lassalle*; Helene von Racowitza's *Memoirs* (1879 and 1910); and George Meredith's *Tragic Comedians*.

Lassell, WILLIAM, astronomer, born at Bolton, in Lancashire, on 18th June 1799, 'belongs to that class of observers who have created their own instrumental means.' He built himself a private observatory at Starfield, near Liverpool, about 1820, and observed there down to 1861. There, too, he constructed and mounted equatorially reflecting telescopes of 9 inches aperture and 2 feet aperture successively. The speculum of the latter was polished by means of a machine of Lassell's own invention. With this same telescope he discovered the satellite of Neptune (1847); the eighth satellite of Saturn (1848), simultaneously with Prof. Bond of Harvard; and two new satellites of Uranus (1851). In 1861 he went out to Malta, and there set up a reflecting telescope of 4 feet aperture and 37 feet focal length, mounted equatorially; with this he made observations until

1865, chiefly of nebulae and the satellites he had discovered. After his return to England he transferred his observatory to near Maidenhead. There he died on 5th October 1880. See *Memoirs of Astron. Soc.*, vol. xxxvi., for his work in Malta, and *Trans. Roy. Soc.* (1874) for a description of his polishing-machine.

Lassen, CHRISTIAN, orientalist, was born on 22d October 1800 at Bergen, in Norway, and studied at Christiania, Heidelberg, and Bonn. He assisted Schlegel in the publication of the *Rāmāyana* and *Hitopadesa*, and translated into Latin Jayadeva's *Gītāgovinda*. He also associated himself with Eugène Burnouf in the *Essai sur le Pali* (Paris, 1826). In 1830 he became extra-ordinary and in 1840 ordinary professor of Ancient Indian Languages and Literature at Bonn, and taught there until disabled by blindness in 1864. He edited many Sanskrit works, deeply investigated the relations of the oriental languages and antiquities, and published several very important books. Amongst them are works on Persian Cuneiforms (1836 and 1845); on the Greek Kings in Bactria (1838); *Institutiones Linguae Praecritae* (1837); his great work on *Indische Alterthumskunde*, a critical history of Indian civilisation (1844-61; new ed. 1867-74), &c. He contributed much to our knowledge of the cuneiform inscriptions, of the inscriptions of ancient Italy, and of the ancient and modern Iranian dialects. He was one of the founders of the *Zeitschrift für die Kunde des Morgenlandes*. He died at Bonn, 9th May 1876.

Lasso (Spanish *lazo*), a thin, well-plaited rope of raw hide, used in Spanish America for catching wild cattle. One end is fastened to the saddle gear of the man who uses it, the other ends in a small brass ring, by means of which a running noose, usually 8 feet wide, is formed. The rider holds a coil of the lasso in the left hand; with the right he dexterously whirls the open noose round his head, and hurls it (to no great distance, but with a wonderfully sure aim) so as to fall over a given object—round the horns of a wild ox, or the like. In Mexico the lasso is *la reata* ('the rope'); thence the term *ariat* for a kind of lasso in the United States. The lasso has been used in warfare with deadly effect. See BOLAS.

Lassus, ORLANDUS, or ORLANDO DI LASSO (c. 1532-94), composer of many masses, motets, &c., was born at Mons, and died at Munich, having visited Italy, England, and France, and been ennobled by Maximilian II. in 1570. See LIVES by Declève (Mons, 1894) and Destouches (Mun. 1894).

Lastovo. See LAGOSTA.

Latakia (Turk. *Ladikiyeh*), a decayed seaport of Syria, with a sanded-up harbour, stands on a rocky cape 75 miles N. of Tripoli. It possesses remains of Roman buildings, having been a flourishing port during the early empire; it was still a wealthy city at the time of the Crusades. The present town occupies the site of the ancient *Laodicea ad Mare*, which was founded by Seleucus Nicator, and named after his mother. Pop. estimated at 20,000, who export the Latakia tobacco, grown on the hills in the interior, and some grain, silk, sponges, oils, &c.

Lateau, LOUISE. See STIGMATISATION.

Lateen-sail. See SAIL.

La Tène. See LAKE-DWELLINGS, IRON AGE.

Latent Heat. See HEAT, and EVAPORATION.

Latent Life, a phrase often used to describe the physiological condition of organisms in which the functions are for a time suspended, without losing the power of future activity. The condition

is one of the grades between full life and total death, and was contrasted by Claude Bernard with the 'constant life' of most organisms, and with the 'oscillant life' of those which hibernate. It is illustrated by dry seeds and quiescent spores, by encysted ova and Protists, and by those animals and plants (e.g. paste-eels and lichens) which survive desiccation. See DESICCATION, LIFE.

Lateran, CHURCH OF ST JOHN, the first in dignity of the Roman churches, styled in Roman usage 'the Mother and Head of all the churches of the city and the world'; as cathedral church of Rome it surpasses St Peter's in dignity. It is called Lateran from its occupying the site of the splendid palace of Plantius Lateranus, which, having escheated (66 A.D.) in consequence of Lateranus being implicated in the conspiracy of the Pisos, became imperial property, and was given to St Sylvester by the Emperor Constantine. It was destroyed under Innocent X. and rebuilt by Borromini; while Leo XIII. lengthened the church and rebuilt the apse—all that was left of the old church. It has been the scene of five councils, regarded as oecumenical by the Roman Church (see COUNCIL). The Lateran Palace was the habitual residence of the popes till the 14th century; in 1586 it was completely demolished by Sixtus V., and rebuilt from plans by Fontana. Possession was guaranteed to the popes in 1871. Pius IX. converted a portion of it into a museum of classical sculpture and early Christian antiquities. In the piazza of the church stands the celebrated 'Scala Santa,' or 'Holy Staircase,' which is reputed to be the stairs of Pilate's house at Jerusalem.

Laterite, a mineral substance, the product of the disintegration and partial decomposition of various igneous and schistose rocks. It often attains a very considerable thickness, especially in tropical regions, where the heat is extreme and the rainfall at certain seasons is copious. In such regions the chemical decomposition of rocks is more or less rapidly effected, and the resulting products may be swept by the rains over wide areas. The earth so formed is generally red in colour, as in Ceylon, where in the dry season it is blown about as a fine dust and imparts its hue to every neglected article and to the dresses of the inhabitants. The redness of the streets and roads attracts the notice of every stranger at Galle and Colombo. In the Deccan laterite derived from the decomposition of the basalts of the great plateaus reaches a thickness in many places of upwards of 150 feet. It differs from the 'clays' of temperate regions in consisting, not of hydrated aluminous silicates, but of mixtures of hydrous alumina, silica, and other oxides.

Latex, in Botany, the sap of plants after it has been elaborated in the leaves. See SAP.

Latgale, the eastern district of Lettland (q.v.).

Latham, ROBERT GORDON, ethnologist and philologist, was born 24th March 1812 at the vicarage of Billingborough, in Lincolnshire. From Eton he passed in 1829 to King's College, Cambridge, of which in due course he was elected fellow. In 1842 he took the degree of M.D.; but nine years before a tour in Denmark and Norway had led him to direct his attention particularly to Scandinavian philology. From 1842 to 1849 he held appointments in connection with London hospitals; already in 1839 he had been elected professor of the English Language and Literature in University College, London; and in 1852 he became director of the ethnological department of the Crystal Palace. His first work was *Norway and the Norwegians* (1840), followed by translations from Tegner's *Frithiof's Saga*. His well-known work, *English Language*, published in 1841, went

through numerous editions. *The Natural History of the Varieties of Mankind* (1850) was justly accepted as a valuable contribution to ethnology. Many other works on ethnology and philology followed. The fact should be specially emphasised that in 1862 Latham entered the field against Lassen, Bopp, Pott, Grimm, and Max Müller, rejecting the Central Asian theory of the 'good Aryan,' and affirming the view advanced before him by Omalius d'Halloy, and since by Penka, Schrader, Isaac Taylor, Sayce, and others, that the Aryan race originated in Europe. He suffered for years from aphasia, and died at Putney, 9th March 1888. Since 1863 he had had a government pension of £100. See the obituary by Watts-Dunton in the *Athenæum*.

Lathe. See TURNING.

Lathom House, the seat of the Earl of Lathom, in Lancashire, 2½ miles ENE. of Ormskirk. It is a Grecian mansion, built about 1750. Its predecessor was splendidly defended by the Countess of Derby (see DERBY, EARL OF) in 1644.

Lathræa. See INSECTIVOROUS PLANTS.

Laths, small strips of wood of various lengths, rarely more than 4 feet, are made either by splitting lathwood, which is the Norway spruce (*Abies peccinata*), or else they are sawn from Canada deal. The sawn laths are due to the development of sawmills in Canada, which thus use up the small portions of the lumber. Laths are used for nailing to the uprights of partition-walls and to the rafters of ceilings; they are placed slightly apart to receive the plaster, which, by being pressed into the intervals, is retained, and when dry is held securely on the wall. Slaters' laths are longer strips of wood, nailed on to the framework of the roof for the purpose of sustaining the slates, which are fastened to the laths by nails.

Lathyrus, a genus of Leguminosæ (Papilionaceæ), of which the best-known species is the Sweet-pea (*Lathyrus odoratus*). A native of Sicily and other parts of the south of Europe, it has been cultivated for its beautiful and fragrant flowers in British gardens for about two hundred years.

Bitter Vetch (*Lathyrus montanus*).
a, standard of the corolla.

species of *Lathyrus* are of interest either as ornamental plants or for the food for man or cattle which they yield. The Everlasting Pea (*L. latifolius*) is an old favourite in flower-gardens on account of its handsome but scentless flowers. The

roots of *L. tuberosus* are eaten in Holland and other countries where it grows plentifully. The Chickling Vetch (*L. sativus*) is much used in Switzerland as fodder for cattle. The seeds ground into meal make palatable bread, but to its use were ascribed sudden attacks of loss of power and rigidity of the limbs in both men and the lower animals, which were so prevalent in the latter part of the 17th and early in the 18th century that an edict was issued forbidding its use. Mixed with half the quantity of wheat-flour it is said to be wholesome; the peasantry in Italy use it in this way.

Of the ten British species, several are well known as 'vetchlings.' The Bitter Vetch (*Lathyrus montanus*) has creeping roots, which swell out into tubers at irregular intervals. The tubers have a sweet taste, resembling that of liquorice, and are sought after by children; in some parts of the Highlands of Scotland they have been made into a beverage by bruising and steeping in water, and also by steeping them in whisky; they are well flavoured and nutritious when boiled or roasted.

Latifundia, large private estates, were broken up by the Roman Agrarian Laws (q.v.). See GRACCHUS.

Latimer, HUGH, Protestant martyr, was born at Thurcaston, near Leicester, about the year 1485. 'My father,' he tells us, 'was a yeoman, and had no lands of his own; only he had a farm of three or four pound by year at the uttermost, and hereupon he tilled as much as kept half a dozen men. He had walk for a hundred sheep; and my mother milked thirty kine. He kept me to school . . . and was as diligent to teach me to shoot as to learn me any other thing.' An only son, Hugh was sent at fourteen to Cambridge, in 1510 (while still an undergraduate) was elected a fellow of Clare, and, having taken orders some nine years before, was in 1523 appointed a university preacher. In 1524 for his B.D. thesis he delivered a philippic against Melancthon, for he was, in his own words, 'as obstinate a papist as any in England.' Next year, however, through much talk with Bilney (q.v.), he 'began to smell the Word of God, forsaking the school doctors and such fooleries,' and soon becoming noted as a zealous preacher of the reformed doctrines. The consequence of this new-born zeal was that many of the adherents of the old faith were strongly excited against him, and he was embroiled in controversies. The question of the divorce brought Latimer more into notice. He was one of the Cambridge divines appointed to examine as to the lawfulness of Henry's marriage, and he declared on the king's side. This secured him the royal favour, and he was made chaplain to Anne Boleyn and rector of West Kingston in Wiltshire. In 1535 he was consecrated Bishop of Worcester; and at the opening of Convocation on 9th June 1536 he preached two powerful sermons urging the work of reformation. After a while that work rather retrograded than advanced, and Latimer found himself with his bold opinions in little favour at court. He retired to his diocese, and laboured there in a continual round of 'teaching, preaching, exhorting, writing, correcting, and reforming, either as ability would serve or the time would bear.' This was his true vocation; he was an eminently practical reformer. Twice during Henry's reign he was sent to the Tower, in 1539 and 1546, on the former occasion resigning his bishopric. At Edward VI.'s accession he peremptorily declined to resume his episcopal functions, but devoted himself to preaching and practical works of benevolence. The pulpit was his great power, and by his stirring, homely sermons he did much to rouse a spirit of religious earnestness throughout the land. At length by Edward's death (1553) he was stayed in his course of activity. In April 1554 he was examined at Oxford, and committed to Bocardo, the common gaol

there, where he lay for more than a twelvemonth, feeble, sickly, worn out with his hardships. In September 1555, with Ridley and Crammer, he was brought before a commission, and after an ignominious trial was found guilty of heresy and handed over to the secular power. On 16th October he was burned with Ridley opposite Balliol College.

His sermons and letters were edited for the Parker Society by Corrie (1844-45); and Arber reprinted some of the sermons. See Lives by Gilpin (1755), Demaus (1869; new ed. 1881), and R. M. and A. J. Carlyle (1899).

Latin Empire, part of the Byzantine empire seized in 1204 by Crusaders who made Constantinople their capital, overthrown by the Greeks in 1261. See BYZANTINE EMPIRE.

Latini, BRUNETTO, who died in old age towards the end of the 13th century, was born at Florence about 1210, became a conspicuous Guelph, spent some six years in France, and held several high offices at Florence, including that of *prior*. Dante's acknowledged debt to him is probably misinterpreted when Brunetto is said to have been his tutor. In France he wrote the *Tesoro* or *Tesoretto*, a heptasyllabic Italian poem of the type of the *Roman de la Rose*; and in French, as 'more delightful and widely known than Italian,' the prose *Livres dou Tresor*, a sort of encyclopædia of mediæval lore, from Latin and French sources mainly. See books on him by Sundby (French trans. 1884) and Marchesini (1887-90).

Latin Language and Literature. Latin is one of the members of the Aryan or Indo-European family of languages. In ancient Italy several languages were in use; of which Etruscan, spoken in Etruria (q.v.), was non-Aryan, and very distinct from all the other Italic tongues. The latter fall into two main groups: the *Umbro-Sabellian*, including Umbrian, Oscan or Samnite, and Sabine; and the *Latin*, spoken in Latium, and probably at one time in Campania and Lucania, afterwards partly Hellenised. This Italic group seems to have had closer affinities with the Celtic tongues than with Greek (see GREECE). For the 'Italic dialects' in general see the section *Ancient Languages* in the article ITALY, and for the relation of the Italian tribes to one another see ROME. Latin was the language of Rome. The growth of Rome led to dominance of Latin over the others; and under Greek influence Latin became a great literary tongue.

Latin has played a great part in the history of language, entering largely, as it did, after Rome's conquests into the dialects of Spain and Gaul, countries thoroughly permeated by Roman life and civilisation. The Romance languages are built up of Latin, are indeed Latin in a new dress. Italian may be described as modern Latin; French and Spanish, the latter especially, are based mainly on Latin; and English, of course, has borrowed largely from Latin. (See ROMANCE LANGUAGES, the relevant sections on the Italian, French, Spanish, and other Romance tongues.)

Latin reflects admirably the leading characteristics of the Roman people. It is the language of a practical, hard-headed people, who felt themselves called to rule, to give laws, and to establish order. Virgil's famous verse, 'Tu regere imperio populos, Romane, memento' (*Aeneid*, vi. 852), happily expressed the genius of Rome. Latin, it has been said, is the voice of Empire and of Law; it suits history, politics, jurisprudence, the business of the law-court, but it is not pliant or flexible enough to lend itself to the subtleties of philosophical speculation or to the refinements of the highest poetry. Horace, with all his skill, evidently found, in the composition of his odes, that Latin did not run very easily into a lyric mould.

Of literature, properly so called, there was nothing at Rome till the 3rd century B.C. It then took the form of annals; we can hardly dignify it with the name of 'history.' These annals were, in part at least, based on old family chronicles, which the conservative spirit of the Romans jealously guarded. Family life in the great houses of Rome was intensely strong; a funeral was always a very solemn and impressive ceremony, and was never complete without an oration commemorating the merits of the deceased man. These orations, or at anyrate the heads of them, were committed to writing and treasured in the family archives, and in them the annalists of the 3d century B.C. found their materials. The early history of Rome would, in fact, be made up of the memorials of a few noble families. The systematic treatment of it was undertaken towards the close of the 3d century by Fabius Pictor and Cincius Alimentus, who, however, wrote in Greek, feeling no doubt that as yet Latin was hardly equal to the demands of literary composition. The famous Marcus Porcius Cato, the Censor, as he was styled, who had fought in the great war with Hannibal, and who lived on into the middle of the 2d century B.C., seems to have been the father of Latin prose. His history of his own time, and his *Origines*, in which he discussed the origin of Rome and of some other cities of Italy, were the first important works written in the Latin language. Only a few meagre fragments have come down to us.
